copperhead Any of several unrelated species of snake named for their reddish head. The North American copperhead (*Agkistrodon contortrix*), also called the highland moccasin, is a pit viper of swampy, rocky, and wooded regions of the central and eastern U.S. It is usually less than 3 ft (1 m) long and is pinkish or reddish with a copper-coloured head and reddish brown, often hourglass-shaped crossbands on its back. Its venom is relatively weak, and a bite is rarely fatal to humans. The Australian copperhead is an elapid, and the Indian copperhead is a rat snake.

Coppermine River Stream, Northwest Territories and Nunavut territory, Canada. Rising in the Barren Grounds, a subarctic prairie region, it flows north for 525 mi (845 km) into Coronation Gulf, an arm of the Arctic Ocean, near the Inuit settlement of Kugluktuk (formerly Coppermine). Unnavigable because of numerous rapids and a short ice-free season, it is a noted Arctic char fishing stream.

Coppola \ˈkō-pə-lə**, Francis Ford** (b. April 7, 1939, Detroit, Mich., U.S.) U.S. film director, screenwriter, and producer. He worked under Roger Corman before achieving his first success with the low-budget but stylish *You're a Big Boy Now* (1967). He wrote or cowrote screenplays for several films, including *Patton* (1970, Academy Award). He won acclaim for writing and directing the Mafia epic *The Godfather* (1972, Academy Awards for best picture and screenplay). His other films include *The Conversation* (1974), *The Godfather, Part II* (1974, Academy Awards for best director, picture, and screenplay), *Apocalypse Now* (1979), *Peggy Sue Got Married* (1986), *The Godfather, Part III* (1990), and *The Rainmaker* (1997).

coprocessor Additional processor used in some personal computers to perform specialized tasks such as extensive arithmetic calculations or processing of graphical displays. The coprocessor is often designed to do such tasks more efficiently than the main processor, resulting in far greater speeds for the computer as a whole.

Coptic Orthodox Church Principal Christian church in Egypt. Until the 19th century it was called simply the Egyptian Church. It agrees doctrinally with Eastern Orthodoxy except that it holds that Jesus has a purely divine nature and never became human, a belief the Council of Chalcedon rejected (see Monophysite heresy) in AD 451. After the Arab conquest (7th century), service books were written with Coptic and Arabic in parallel texts. Church government is democratic, and the patriarch, who resides in Cairo, is elected. There are congregations outside Egypt, especially in Australia and the U.S., and the church is in communion with the Ethiopian, Armenian, and Syrian Jacobite churches.

copulation See sexual intercourse

copyhold In English law, a form of landholding defined as a "holding at the will of the lord according to the custom of the manor." Its origin is found in the occupation by villeins, or nonfreemen, of portions of land belonging to the manor of the feudal lord. It was occupation at the pleasure of the lord, but in time it grew into an occupation by right, called *villenagium*, which was recognized first by custom and then by law. In 1926 all copyhold land became freehold land, though lords of manors retained mineral and sporting rights.

copyright Exclusive right to reproduce, publish, or sell an original work of authorship. It protects from unauthorized copying any published or unpublished work that is fixed in a tangible medium (including a book or manuscript, musical score or recording, script or dramatic production, painting or sculpture, or blueprint or building). It does not protect mat-

© 2006 Encyclopædia Britannica, Inc.

ters such as an idea, process, or system. Protection in the U.S. now extends for the life of the creator plus 70 years after his or her death. Works made for hire are now protected for a maximum of 95 years from the date of publication or 120 years from the date of the creation of the work. In 1988 the U.S. joined the BERN CONVENTION, an agreement that governs international copyright. The Digital Millennium Copyright Act, adopted in the U.S. in 1998, expanded owners' control over digital forms of their creations and penalized persons who sought to evade technological shields (such as encryption) for copyrighted material. See also INTELLECTUAL PROPERTY; PATENT; TRADEMARK.

coquina \kō-'kē-nə\ LIMESTONE formed almost entirely of sorted and cemented fossil debris, most commonly coarse shells and shell fragments. Microcoquinas are similar sedimentary rocks composed of finer material. Common among microcoquinas are those formed from the remains of crinoids (marine invertebrates, such as sea lilies, that have limy disks and a limy internal skeleton). A distinction is made between a coquina, which is a rock formed from debris, and coquinoid limestone, which is composed of coarse shelly materials with a fine-grained matrix.

coquina (clam) \kō-'kē-nə\ Any CLAM of the genus *Donax*, inhabiting sandy beaches worldwide. Coquinas are very active; they migrate up and down beaches with the tide and can reburrow between waves. They have short siphons and feed on suspended plant material and detritus. A typical species, *D. variabili*s, measures about 0.4–1 in. (10–25 mm) in length. Its shell is wedge-shaped and varies from white, yellow, and pink to blue and mauve.

coral Any of about 2,300 species of marine CNIDARIANS in the class Anthozoa that are characterized by stonelike, horny, or leathery skeletons (external or internal). The skeletons of these animals are also called coral. Corals are found in warm seas worldwide. The body is of the POLYP type. Soft, horny, and blue corals are colonial in habit (i.e., they live in large groups). Stony corals, the most familiar and widely distributed forms, are both colonial and solitary. ATOLLS and CORAL REEFS, which are composed of stony coral, grow at an average rate of 0.2–1.1 in. (0.5–2.8 cm) per year. See also SEA FAN.

Soft coral (*Sarcophyton*)
VALERIE TAYLOR—ARDEA

coral reef Ridge or hummock formed in shallow ocean areas from the external skeletons of CORALS. The skeleton consists of calcium carbonate ($CaCO_3$), or limestone. A coral reef may grow into a permanent coral island, or it may take one of four principal forms. Fringing reefs consist of a flat reef area around a nonreef island. Barrier reefs may lie a mile or more offshore, separated from the landmass by a lagoon or channel. Atolls are circular reefs without a central landmass. Patch reefs have irregular tablelike or pinnacle features. Smaller patches occur inside atoll lagoons; larger patches occur as isolated parts of any of the other three reef categories, and they sometimes occur completely separate from other kinds of reefs.

Coral Sea Part of the South Pacific Ocean. It is located between QUEENSLAND, Australia, on the west and VANUATU and NEW CALEDONIA on the east, and bordered on the north by PAPUA NEW GUINEA and the SOLOMON ISLANDS. Occupying an area of 1,849,800 sq mi (4,791,000 sq km), it merges with the TASMAN SEA and Solomon Sea and is connected to the Arafura Sea via the TORRES STRAIT. It was named for its many coral formations, including the GREAT BARRIER REEF. During World War II it was the scene of a strategic U.S. naval and air victory over the Japanese (1942).

coral snake Any of about 90 species of strongly patterned burrowing ELAPIDS. "True" forms are limited to the New World, chiefly the tropics, but similar species live in Asia and Africa. Secretive and docile, coral snakes rarely bite when handled, but the venom of some can kill a person. Most prey on other snakes. More than 50 species in the largest genus, *Micrurus*, range from the southern U.S. to Argentina. They are ringed with red, black, and yellow or white. The eastern coral snake, or harlequin snake (*Micrurus fulvius*), ranges from North Carolina and Missouri in the U.S. to northeastern Mexico and is about 30 in. (76 cm) long, with wide bands of red and black separated by yellow. The rhyme "Red on yellow, dangerous fellow" distinguishes it from similarly coloured but harmless species.

Coralli, Jean *orig.* **Giovanni Coralli Peracini** (b. Jan. 15, 1779, Paris, France—d. May 1, 1854, Paris) French dancer and choreographer. He made his debut at the Paris Opera in 1802. His appointment as ballet master at the Opera (1831–50) coincided with the most brilliant phase of the Romantic ballet. In 1841 Coralli began to work with the ballerina CARLOTTA GRISI in *Giselle*, now regarded as a classic. Although attributed solely to Coralli, most of its principal action was arranged by JULES PERROT. The choreography of *La Péri* (1843), however, was entirely Coralli's.

corbel \'kȯr-bəl\ Block or brick partially embedded in a wall, with one end projecting out from the face. The weight of added masonry above counterbalances the CANTILEVER and keeps the block from falling out of the wall. Corbeling often occurs over several courses, with each block or brick overhanging the one below so as to resemble a set of inverted steps. The form may be continuous, as in a corbeled arch, or a series of separate brackets, as on a medieval BATTLEMENT. Corbeling was used extensively before the development of true ARCHES and VAULTS.

Corbusier, Le See LE CORBUSIER

Corday (d'Armont) \kȯr-'de**, (Marie-Anne-) Charlotte** (b. July 27, 1768, Saint-Saturnin, near Séez, Normandy, France—d. July 17, 1793, Paris) French political activist. A noblewoman from Caen, she moved to Paris to work for the GIRONDIN cause in the FRENCH REVOLUTION. Horrified at the excesses of the REIGN OF TERROR, she sought an interview with JEAN-PAUL MARAT, one of its leaders. On July 13, 1793, she stabbed him through the heart while he was in his bath. Arrested on the spot, she was convicted by the Revolutionary Tribunal and guillotined.

Charlotte Corday, engraving by É.-L. Baudran after a portrait by J.-J. Hauer.
COURTESY OF THE BIBLIOTHÈQUE NATIONALE, PARIS

Cordeliers \kȯr-dəl-'yā,\ *English* \ˌkȯr-də-'lērz\ **Club** *officially* **Society of the Friends of the Rights of Man and of the Citizen** Club founded in 1790 during the FRENCH REVOLUTION to prevent the abuse of power and "infractions of the rights of man." Popularly named for its original meeting place at the nationalized monastery of the Cordeliers (Franciscans), the club became a political force under JEAN-PAUL MARAT and GEORGES DANTON. Leadership later fell to JACQUES-RÉNE HÉBERT and others, who helped overthrow the GIRONDINS and gave the club a more radical tone. It fell into oblivion after Hébert's execution in 1794.

Cordilleran \ˌkȯr-dᵊl-'yer-ən\ **Geosyncline** Linear trough in the Earth's CRUST in which rocks of Late Precambrian to Mesozoic Age (roughly 600–65 million years ago) were deposited along the western coast of North America. The principal mountain-building phases of the geosyncline took place during Mesozoic time, but many earlier events have also been recorded. Deformation of the Cordilleran Geosyncline and the formation of the Cordilleran fold belt appear to have been related to the development of oceanic trenches along the western margins of the North American continent.

Córdoba \'kȯr-thō-bä\ City (pop., 1999 est.: 1,275,585), the second largest in Argentina. It lies on the Primero River along the foothills of the Sierra de Córdoba. Founded in 1573, its location between the coast and the interior settlements favoured its early development. In 1599 Jesuits settled in the city and founded the country's first university (1613). Córdoba's growth was stimulated by the completion of rail connections with the east in 1869 and the San Roque Dam in 1866, which provides irrigation water for orchards and grain fields and hydroelectric power for the city's many factories.

Córdoba *or* **Cordova** \'kȯr-də-və\ *ancient* **Corduba** City (pop., 2001: 308,072), capital of Córdoba province, southern Spain. On the banks of the GUADALQUIVIR RIVER, it probably had Carthaginian origins.

© 2006 Encyclopædia Britannica, Inc.

Occupied by the Romans in 152 BC, it became, under AUGUSTUS, the capital of the Roman province of Baetica. It declined under the Visigoths (6th–8th centuries AD), and it was captured by the Muslims in 711. Abd al-Rahman I, of the UMAYYAD family, made it his capital in 756 and founded the Great Mosque of Córdoba, which still stands. By the 10th century it was the largest city in Europe, filled with palaces and mosques. It fell to the Castilian king Ferdinand III in 1236 and became part of Christian Spain. Modern Córdoba's streets and buildings evoke its Moorish heritage.

Cordobés \ˌkȯr-thō-'bās**, El** *orig.* **Manuel Benítez Pérez** (b. May 4, 1936?, Palma del Río, Córdoba, Spain) Spanish bullfighter. He grew up an illiterate orphan in Córdoba (his nickname means "the Córdovan") and was once imprisoned for unauthorized entry into bullrings. He began his career in 1959 and became a full matador in 1963. In the month of August 1965 alone, he killed a record 64 bulls and is believed to have been paid 35 million pesetas. The crudity of his technique was offset by his exceptional reflexes and courage; handsome, dashing, and flamboyant, he became the most highly paid torero in history.

El Cordobés
MICHAEL KUH/BLACK STAR

core In earth science, the part of the Earth that starts about 1,800 mi (2,900 km) beneath the surface and extends downward. It consists largely of an iron-rich metallic alloy and is thought to have a two-part structure: an outer fluid region and a solid, extremely dense inner region that measures only about 1,500 mi (2,400 km) across. The alloy composition is mainly iron with small amounts of nickel. This composition is deduced from the chemistry of iron meteorites that presumably came from the breakup of a planetary body that also had an iron core. See also CRUST; MANTLE.

Corelli, Arcangelo (b. Feb. 17, 1653, Fusignano, near Imola, Papal States—d. Jan. 8, 1713, Rome) Italian composer and violinist. He studied in Bologna before settling in Rome. He became widely known as a violinist, director, and teacher, and he lived with his family at the palaces of Cardinals Pamphili and Ottoboni. His many students included Francesco Geminiani (1687–1762) and Pietro Locatelli (1695–1764). As a violinist, he had considerable influence on the development of violin style. As the first composer whose fame was based exclusively on his nonvocal music, his reputation rests mainly on his sonatas and his 12 *Concerti Grossi*, which established the concerto grosso form. He wrote four sets of 12 trio sonatas each (1681–95), a set of 12 solo sonatas (1700), and the concerti grossi (1714). Long after his death, his works were widely studied and imitated for their classic poise and serenity. With his music the ideal of full-blown TONALITY first became securely established.

coreopsis \ˌkōr-ē-'äp-səs\ Any ornamental summer-blooming plant of the genus *Coreopsis*, commonly known as tickseed, in the COMPOSITE FAMILY, consisting of about 100 species of annual and perennial herbaceous plants native to North America. Members have flower heads with yellow disk flowers and yellow, pink, white, or variegated ray flowers. The heads are solitary or in branched clusters, and some varieties have double flowers. Golden coreopsis (*C. tinctoria*) is a popular garden plant; swamp tickseed (*C. rosea*) is grown in wildflower gardens.

Corfu \kȯr-'fü\ *Greek* **Kérkira** \'ker-kē-rä\ One of the IONIAN ISLANDS, northwestern Greece. With adjacent small islands, it forms the Corfu department (pop., 1995 est.: 108,000) of Greece; the town of Corfu (pop., 1995 est.: 36,000) is the departmental capital. Corfu occupies 229 sq mi (593 sq km). It was settled by the Corinthians c. 734 BC. Off its coast the first naval battle in Greek history was fought, between Corfu and CORINTH c. 664 BC. About 435 BC it sought the aid of ATHENS against Corinth, precipitating the PELOPONNESIAN WAR. A Roman possession in 229 BC, it later passed to the Byzantines, then to the Normans. It was ruled by Venice from 1386 to 1797 and was under British administration from 1815 until it was ceded to Greece in 1864. Germans and Italians occupied it during World War II. It is now a popular tourist destination and produces olive oil, figs, oranges, lemons, and wine.

Corfu incident (1923) Brief occupation of the Greek island of Corfu by Italian forces. In August 1923 Italians forming part of an international boundary delegation were murdered on Greek soil, leading BENITO MUSSOLINI to order a naval bombardment of Corfu. After the Greeks appealed to the LEAGUE OF NATIONS, the Italians were ordered to evacuate but Greece was forced to pay Italy an indemnity.

coriander *or* **cilantro** Feathery annual herb (*Coriandrum sativum*) of the PARSLEY family, and its dried fruit, native to the Mediterranean and Middle East. The seeds go by the name coriander; they have a mild, fragrant aroma and aromatic taste and are used to flavour many foods. The delicate young leaves—known in the U.S. by their Spanish name, cilantro—are widely used in Latin American, Indian, and Chinese dishes.

Corinth \'kȯr-ənth\ *Greek* **Kórinthos** \'kȯr-ēn-thȯs\ Ancient city of the PELOPONNESE, Greece. Located on the Gulf of Corinth, the site was occupied before 3000 BC but developed as a commercial centre only in the 8th century BC. In the late 6th century BC, it was outstripped by ATHENS. Occupied in 338 BC by PHILIP II, it was destroyed in 146 BC by Rome. In 44 BC Julius CAESAR reestablished Corinth as a Roman colony; the New Testament includes the letters addressed to its Christian community by St. PAUL. It declined in the later Middle Ages; its ruins are near the modern city of Corinth.

Corinth, League of Alliance established at CORINTH in 337 BC. It comprised the ancient Greek states except SPARTA, and was led by PHILIP II of Macedonia. Delegates, elected in proportion to their state's military power, decided federal policies. The league declared war on Persia, but under ALEXANDER THE GREAT it contributed little to the war effort. Its major act was to condemn the Thebans to slavery and distribute their lands among other states following revolts in 336 and 335. It was disbanded after Alexander's death (323).

Corinth \kō-'rint**, Lovis** (b. July 21, 1858, Tapiau, East Prussia—d. July 12, 1925, Zandvoort, Neth.) German painter and graphic artist. He trained in Paris with the painter WILLIAM BOUGUEREAU. In 1902 he settled in Berlin and, with MAX LIEBERMANN, became a leading exponent of IMPRESSIONISM in Germany. After recovering from a stroke in 1911, his style became much looser and more powerfully EXPRESSIONIST. He was best known for his landscapes and portraits, including numerous powerfully expressive self-portraits, and he produced many etchings and lithographs (e.g., *Apocalypse*, 1921).

Coriolanus \ˌkȯr-ē-ə-'lā-nəs**, Gnaeus Marcius** Legendary Roman hero. He is said to have lived in the late 6th and early 5th century BC and to have owed his surname to his courage at the siege of Corioli (493 BC) in the war against the VOLSCI. For trying to have the office of TRIBUNE abolished during a famine in Rome, he was sent into exile. Taking refuge with the king of the Volsci, he led the Volscian army against Rome but turned back in response to pleas from his family. He is the subject of WILLIAM SHAKESPEARE's play *Coriolanus*.

Coriolis \ˌkōr-ē-'ō-ləs\ **force** Apparent FORCE that must be included if NEWTON'S LAWS OF MOTION are to be used in a rotating system. First described by Gustave-Gaspard Coriolis (1792–1843) in 1835, the force acts to the right of the direction of body MOTION for counterclockwise rotation and to the left for clockwise rotation. On Earth an object that moves along a north-south path, or longitudinal line, will be apparently deflected to the right in the Northern Hemisphere and to the left in the Southern Hemisphere. The deflection is related to the motion of the object, the motion of the Earth, and latitude. The Coriolis effect is important in meteorology and oceanography as well as BALLISTICS; it also has great significance in ASTROPHYSICS.

Cork Seaport city (pop., 2002 prelim.: 123,338), southwestern Ireland. The seat of County Cork, it is situated on Cork Harbour at the mouth of the River Lee. Founded as a monastery in the 7th century, it was often raided and was eventually settled by the Danes. It passed to HENRY II of England in 1172. The city was taken by Parliamentarian forces under OLIVER CROMWELL (1649) and by the duke of MARLBOROUGH (1690). It was heavily damaged in 1920 during the Irish uprising against England. Its industries include leatherworking, brewing, and distilling.

cork Outer bark of the EVERGREEN cork oak (*Quercus suber*), native to the Mediterranean. In its broad sense, cork consists of the irregularly shaped,

thin-walled, wax-coated cells that make up the peeling BARK of many trees, but commercially only cork-oak bark is called cork. Cork is obtained from the new outer sheath of bark that forms after the original rough outer bark has been removed. This outer sheath can be stripped repeatedly without hurting the tree. Cork is unique because it is made of air-filled, watertight cells that are a remarkably effective insulating medium. The air pockets make cork very light in weight. Though specialized plastics and other artificial substances have replaced cork in some of its former uses, it has retained its traditional importance as a stopper for bottles of wine and other alcoholic beverages.

Cork oak (*Quercus suber*) with sections of cork removed.
ERIC G. CARLE—SHOSTAL/EB INC.

corm Vertical, fleshy, underground stem that acts as a vegetative reproductive structure in certain seed plants. It bears membranous or scaly leaves and buds. Typical corms are those of the CROCUS and GLADIOLUS. Corms are sometimes called solid BULBS, or bulbo-tubers, but they are distinguished from true bulbs and TUBERS.

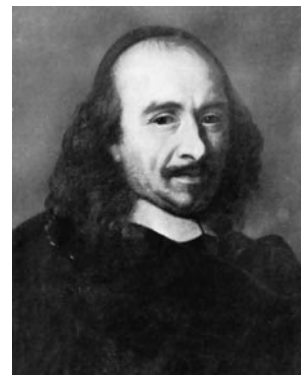
Corman, Roger (William) (b. April 5, 1926, Detroit, Mich., U.S.) U.S. film director and producer. He directed his first films, *Five Guns West* and *Apache Woman*,in 1955, and by 1960 he was one of the most prolific makers of low-budget "exploitation" films. His film versions of stories by EDGAR ALLAN POE, including *The House of Usher* (1960) and *The Masque of the Red Death* (1964), won him a cult following as a master of the macabre. In 1970 he formed New World Pictures, an independent distribution company that produced the work of such struggling young directors as Peter Bogdanovich, FRANCIS FORD COPPOLA, and MARTIN SCORSESE.

cormorant \'kȯr-mə-rənt\ Any of the 26–30 species of water birds, constituting the family Phalacrocoracidae, that dive for and feed on fish, mainly those of little value to humans. In the Orient and elsewhere, these glossy black underwater swimmers have been tamed for fishing. Their guano is valued as a fertilizer. Cormorants live on seacoasts, lakes, and some rivers, nesting on cliffs or in bushes or trees. They have a long, hook-tipped bill, patches of bare skin on the face, and a small throat pouch (gular sac). The most widespread species is the common, or great, cormorant (*Phalacrocorax carbo*), which grows up to 40 in. (100 cm) long and breeds from eastern Canada to Iceland, across Eurasia to Australia and New Zealand, and in parts of Africa.

corn *or* **maize** CEREAL plant (*Zea mays*) of the family Poaceae (or Gramineae). It originated in the New World and has been introduced globally. American Indians taught colonists to grow corn, including some varieties of yellow corn that are still popular as food, as well as varieties with red, blue, pink, and black kernels, often banded, spotted, or striped, that today are regarded as ornamental and in the U.S. are called Indian corn. The tall, annual grass has a stout, erect, solid stem and large narrow leaves with wavy margins. Corn is used as livestock feed, as human food, and as raw material in industry. Though it is a major food in many parts of the world, it is inferior to other cereals in nutritional value. Inedible parts of the plant are used in industry—stalks for paper and wallboard; husks for filling material; cobs for fuel, to make charcoal, and in the preparation of industrial solvents. Corn husks also have a long history of use in the folk arts for objects such as woven amulets and cornhusk dolls. Corn is one of the most widely distributed of the world's food plants. In the U.S. corn is the most important crop, but slightly more acres of SOYBEANS are planted.

Corn Belt Traditional area, midwestern U.S. Roughly covering western Ohio, Indiana, Illinois, Iowa, southern Minnesota, eastern South Dakota, Missouri, eastern Nebraska, and eastern Kansas, it is a region in which corn and soybeans are the dominant crops. Many farms are family-operated and average more than 300 acres (120 hectares). Despite the name, the region is agriculturally diverse, raising various feed-grains and livestock.

corn earworm *or* **cotton bollworm** *or* **tomato fruitworm** MOTH LARVA (*Heliothis zea*, family Noctuidae) that damages corn, tomato, cotton, and other seasonal crops. The smooth, fleshy, green or brown CATERPILLARS feed on corn kernels near the tip of the ear and burrow into tomatoes and cotton bolls. Four or five generations of the pale brown adult moths, with wingspans of 1.3 in. (3.5 cm), are produced annually.



Corn Islands *Spanish* **Islas del Maíz** \'ēs-lä-thel-'mīs\ Two small islands, Caribbean Sea. Known as Great Corn and Little Corn, they lie about 40 mi (64 km) off the coast of Nicaragua and were leased to the U.S. by Nicaragua for use as a naval base (1916–71). The islands produce copra, coconut oil, lobsters, and frozen shrimp. Tourism is important on Great Corn Island.

Corn Laws Any of the regulations governing the import and export of grain (called corn by the English) in Britain. Records mention the imposition of Corn Laws as early as the 12th century. They became politically important in the late 18th and early 19th century, during the grain shortage caused by Britain's growing population, bad harvests, and the blockades imposed in the Napoleonic Wars. When SIR ROBERT PEEL became prime minister the laws were finally repealed (1846). See also ANTI-CORN LAW LEAGUE.

corn sugar See GLUCOSE

corn syrup Sweet syrup produced by breaking down (hydrolyzing) cornstarch (a product of CORN). Corn syrup contains dextrins, maltose, and dextrose and is used in baked goods, JELLY AND JAM, and CANDY. High-fructose corn syrup is widely used in the manufacture of SOFT DRINKS and other foods because it is considerably cheaper than SUCROSE.

Corneille \kȯr-'nā**, Pierre** (b. June 6, 1606, Rouen, France—d. Oct. 1, 1684, Paris) French poet and playwright. He studied law and was a king's counselor in Rouen (1628–50). He wrote his first comedy, *Mélite* (performed 1629), before he was 20; other comedies followed. He responded to the call for a new approach to classical tragedy by writing *Médée* (1635) and then *Le Cid* (1637), an instant success that established him as the creator of French classical tragedy; the play has come to be regarded as the most significant in the history of French drama. His next tragedies, *Horace* (1641), *Cinna* (1643), and *Polyeucte* (1643), have joined *Le Cid* as Corneille's "classical tetralogy." He returned to comedy with *The Liar* (1644), which occupies a central place in French classical comedy. From 1660 he wrote one play a year, ending with the tragedy *Suréna* (1674).

cornelian See CARNELIAN

Cornell, Joseph (b. Dec. 24, 1903, Nyack, N.Y., U.S.—d. Dec. 29, 1972, New York, N.Y.) U.S. assemblage artist. He had no formal artistic training. In the 1930s and '40s he was associated with the Surrealists in New York City (see SURREALISM). He was an originator of the ASSEMBLAGE; his most distinctive works were "boxes," usually with glass fronts, containing objects and pieces of collage arranged in elegant but enigmatic compositions. Recurrent motifs include astronomy, music, birds, seashells, glamour photographs, and souvenirs of travel. His appeal rested on the Surrealist technique of irrational juxtaposition and on nostalgia.

Cornell, Katharine (b. Feb. 16, 1893, Berlin, Ger.—d. June 9, 1974, Martha's Vineyard, Mass., U.S.) U.S. actress. Born to American parents in Germany, she toured with a stock company before winning acclaim in *Little Women* in London (1919). She made her Broadway debut in 1921 and became a star in *A Bill of Divorcement* that year. She managed her own productions after 1931 and toured widely; most of her plays were directed by her husband, Guthrie McClintic (1893–1961). She starred in plays such as *Candida* (1924), *The Letter* (1925), *The Barretts of Wimpole Street* (1931, 1945)—in which she played the poet Elizabeth Barrett Browning, her best-remembered role—and *Dear Liar* (1960). She was often called the first lady of the American theatre.

Cornell University Comprehensive research university in Ithaca, New York, U.S., a traditional member of the IVY LEAGUE. It is both publicly and

privately supported. Founded as a land-grant university under the MORRILL ACT, it was privately endowed by Ezra Cornell (1807–74), a founder of WESTERN UNION. Nonsectarian from the beginning, it offered an exceptionally broad curriculum when it opened in 1868. It was the first U.S. university to admit women and the first to be divided into colleges offering different degrees. Agricultural science has long been important at Cornell; other strong programs include the life sciences, business management, engineering, the social sciences, and the humanities. Professional and graduate schools offer programs in law, medicine, and the arts and sciences.

cornerstone Ceremonial building block, dated or otherwise inscribed, usually placed in an outer wall of a building to commemorate its dedication. Often the stone is hollowed out to contain newspapers, photographs, or other documents reflecting current customs, with a view to their historical use when the building is remodeled or demolished. Originally placed at a corner, the stone may today be placed elsewhere on the facade.

cornet Valved BRASS INSTRUMENT. It evolved in the 1820s from the posthorn. Like the TRUMPET, it has three valves, but its bore is somewhat more conical. It is a transposing instrument (its music written a tone above the actual sound), usually built in the key of B-flat, though a higher-pitched E-flat instrument is used as well. Its range parallels that of the trumpet. Its agility made it a very popular solo instrument; it often displaced the TRUMPET in 19th-century orchestras, and it preceded the trumpet in modern dance and jazz bands. Recent developments have made the two instruments very similar, and the cornet's popularity has waned considerably as a result.

cornflower See BACHELOR'S BUTTON

Cornplanter *or* **John O'Bail** (b. c. 1732, New York?—d. Feb. 18, 1836, Warren county, Pa., U.S.) American Indian leader. Born to a white trader and a Seneca mother, he fought alongside the British in the American Revolution, leading attacks on white settlements in western New York and Pennsylvania. He later helped negotiate treaties that ceded large tracts of Indian land to the U.S. He earned the enmity of his tribe after advocating Indian nonresistance to white expansion and accepting a land grant from Pennsylvania.

Cornwall Administrative (pop., 2001: 501,267, including the Isles of SCILLY) and historic county, southwestern England. Located on a peninsula jutting into the Atlantic Ocean and terminating in LAND'S END, it is the most remote of English counties; its county seat is TRURO. Southern Cornwall is a popular tourist area; much of the coast is now protected by the National Trust. Tin, mined in Cornwall for at least 3,000 years, attracted prehistoric settlers, and there are stone relics in the area. Since 1337 the manors of Cornwall have belonged to the English sovereign's eldest son, who acts as duke of Cornwall.

Cornwallis, Charles Cornwallis, 1st Marquess and 2nd Earl (b. Dec. 31, 1738, London, Eng.—d. Oct. 5, 1805, Ghazipur, India) British soldier and statesman. In 1780, during the AMERICAN REVOLUTION, he was appointed British commander in the American South. He defeated HORATIO GATES at Camden, S.C., then marched into Virginia and encamped at Yorktown (see Siege of YORKTOWN). Trapped and besieged there, he was forced to surrender his army (1781), a defeat that effectively ended military operations in the war. Despite his defeat, he retained esteem in England. As governor-general of India (1786–93, 1805), he introduced legal and administrative reforms; the Cornwallis Code (1793) established a tradition of incorruptible British civil servants. In the third Mysore War he defeated Tippu Sultan in 1792. As viceroy of Ireland (1798–1801), he supported the parliamentary union of Britain and Ireland. He negotiated the Anglo-French TREATY OF AMIENS in 1802. Reappointed governor-general of India in 1805, he died shortly after his arrival there.

Lord Cornwallis, detail of pencil drawing by John Smart, 1792; in the National Portrait Gallery, London.
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

corona \kə-'rō-nə\ Outermost region of the SUN's (or any STAR's) atmosphere, consisting of PLASMA. The Sun's corona has a temperature of about 3.6 million °F (2 million °C) and a very low density. Extending more than 8 million mi (13 million km) from the PHOTOSPHERE, it has no definite boundaries, continually varying in size and shape as it is affected by the Sun's MAGNETIC FIELD. The SOLAR WIND is formed by expansion of coronal gases. Only about half as bright as the full moon, the corona is overwhelmed by the brilliance of the solar surface and normally not visible to the unaided eye, but a total ECLIPSE permits naked-eye observations.

Coronado, Francisco Vázquez de (b. c. 1510, Salamanca, Spain—d. Sept. 22, 1554, Mex.) Spanish explorer of the North American Southwest. Appointed governor of Nueva Galicia in west-central Mexico, Coronado was sent north with a large force to locate and capture the legendary Seven Cities of CÍBOLA, reported to be fabulously wealthy. He was disillusioned to discover instead the ZUNI pueblos of New Mexico and a seminomadic Indian tribe in Kansas. Though the treasure he sought eluded him, his explorers were the first Europeans to view the Grand Canyon, and he extended Spanish territory over huge areas of North America. His expedition's failure led to his indictment on his return to Mexico, but he was acquitted.

coronary bypass Surgical treatment for CORONARY HEART DISEASE to relieve ANGINA PECTORIS and prevent HEART ATTACKS. It became widely used in the 1960s. One or more blood vessels—usually an artery in the chest or a vein from the leg—are transplanted to create new paths for blood to flow from the AORTA to the heart muscle, bypassing obstructed sections of the coronary arteries.

coronary heart disease *or* **ischemic** \is-'kē-mik\ **heart disease** Progressive reduction of blood supply to the heart muscle due to narrowing or blocking of a coronary artery (see ATHEROSCLEROSIS). Short-term oxygen deprivation can cause ANGINA PECTORIS. Long-term, severe oxygen depletion causes a HEART ATTACK. CORONARY BYPASS or ANGIOPLASTY is needed if medication and diet do not control the disease.

coroner Public official whose principal duty is to inquire into any death that appears to be unnatural. The name of the office as it emerged in England in the late 12th century was originally "crowner" (also called "coronator"), a reference to the coroner's principal duty of protecting the crown's property. By the late 19th century, the coroner's role had shifted to that of conducting inquests into unnatural deaths. In Canada, all coroners are appointed. In the U.S., the office is elective or appointive, depending on the jurisdiction. Coroners often possess both legal and medical qualifications, but the office is sometimes filled by laypersons, including undertakers, sheriffs, and justices of the peace. In many states the office has been replaced by that of the medical examiner, who is usually a licensed pathologist.

Corot \kô-'rō**, (Jean-Baptiste-) Camille** (b. July 16, 1796, Paris, Fr.—d. Feb. 22, 1875, Paris) French landscape painter. Born to prosperous parents, he proved unsuited to the family business and at age 25 was given a small allowance to pursue art training. He traveled frequently and painted topographical landscapes throughout his career, but he preferred making small oil sketches and drawings from nature; from these he produced large finished paintings for exhibition. By the 1850s he had achieved critical success and a large income, and he was generous to less successful artists. His naturalistic oil sketches are now more highly regarded than his more self-consciously poetic finished paintings. He is often associated with the BARBIZON SCHOOL. A master of tonal gradation and soft edges, he prepared the way for the IMPRESSIONIST landscape painters and had an important influence on CLAUDE MONET, CAMILLE PISSARRO, and BERTHE MORISOT.

corporal punishment Infliction of physical pain upon a person's body as punishment for a crime or infraction. Such penalties include beating, branding, mutilation, blinding, and the use of the stock and pillory. The term also denotes the physical disciplining of children in the schools and at home. From ancient times through the 18th century, corporal punishment was commonly used in instances that did not call for CAPITAL PUNISHMENT, ostracism, or exile. But the growth of humanitarian ideals during the Enlightenment and afterward led to its gradual abandonment, and today it has been almost entirely replaced in the West by imprisonment or other nonviolent penalties. Several international conventions on HUMAN RIGHTS prohibit it. Beatings and other corporeal punishments continue to be administered in the prison systems of many countries. Whipping and even amputation remain prescribed punishments in some Middle Eastern and Asian societies. Corporal punishment of schoolchildren is still sanctioned in many states.

© 2006 Encyclopædia Britannica, Inc.

corporate finance Acquisition and allocation of a corporation's funds or resources, with the goal of maximizing shareholder wealth (i.e., stock value). Funds are acquired from both internal and external sources at the lowest possible cost and may be obtained through EQUITY (e.g., sale of STOCK) or DEBT (e.g., BONDS, bank loans). Resource allocation is the INVESTMENT of funds; these investments fall into the categories of current assets (such as cash and INVENTORY) and fixed assets (such as real estate and machinery). Corporate finance must balance the needs of employees, customers, and suppliers against the interests of the shareholders. See also BUSINESS FINANCE.

corporate income tax Tax imposed by public authorities on the incomes of corporations. Virtually all countries assess taxes on the net profits of corporations; most are flat-rate levies rather than extensively graduated taxes. A corporate income tax was adopted by the U.S. government in 1909; three-fourths of the states also levy corporate income taxes. See also CAPITAL GAINS TAX; INCOME TAX.

corporation Specific legal form of organization of persons and material resources, chartered by the state, for the purpose of conducting business. As contrasted with the other two major forms of business ownership, the sole proprietorship and the PARTNERSHIP, the corporation has several characteristics that make it a more flexible instrument for large-scale economic activity. Chief among these are LIMITED LIABILITY, transferability of shares (rights in the enterprise may be transferred readily from one investor to another without constituting legal reorganization), juridical personality (the corporation itself as a fictive "person" has legal standing and may thus sue and be sued, make contracts, and hold property), and indefinite duration (the life of the corporation may extend beyond the participation of any of its founders). Its owners are the shareholders, who purchase with their investment a share in the proceeds of the enterprise and who are nominally entitled to a measure of control over its financial management. Direct shareholder control became increasingly impossible in the 20th century, however, as the largest corporations came to have tens of thousands of shareholders. The practice of proxy voting by management was legalized and adopted as a remedy, and today salaried managers exercise strong control over the corporation and its assets. See also MULTINATIONAL CORPORATION.

Corporation for Public Broadcasting See PBS

corporatism Theory and practice of organizing the whole of society into corporate entities subordinate to the state. According to the theory, employers and employees would be organized into industrial and professional corporations serving as organs of political representation and largely controlling the people and activities within their jurisdiction. Its chief spokesman was Adam Müller (b. 1779—d. 1829), court philosopher to the FÜRST (PRINCE) VON METTERNICH, who conceived of a "class state" in which the classes operated as guilds, or corporations, each controlling a specific function of social life. This idea found favour in central Europe after the French Revolution, but it was not put into practice until BENITO MUSSOLINI came to power in Italy; its implementation there had barely begun by the start of World War II, which resulted in his fall. After World War II, the governments of many democratic western European countries (e.g., Austria, Norway, and Sweden) developed strong corporatist elements in an attempt to mediate and reduce conflict between businesses and trade unions and to enhance economic growth.

Corpus Christi City (pop., 2000: 277,454) and port on CORPUS CHRISTI BAY, southern Texas, U.S. Founded in 1839 as a trading post, it was the scene of MEXICAN WAR operations and AMERICAN CIVIL WAR skirmishes. The arrival of the railroad in 1881 stimulated a land boom. The exploitation of gas (1923), development of a deepwater port (1926), and discovery of the Saxtet oil field (1939) laid the city's economic foundation. Resort facilities are based on the bay and the coastal barrier islands, including PADRE ISLAND. It is also the site of the Corpus Christi Naval Air Station.

Corpus Christi Bay Inlet, Gulf of MEXICO, southern Texas, U.S. Forming a deepwater harbour for the port of CORPUS CHRISTI, it is 25 mi (40 km) long and 3–10 mi (5–16 km) wide and is sheltered on the east by Mustang Island. Its shipping serves the petroleum, chemical, and agricultural industries. The area is popular for sportfishing, waterfowl hunting, and boating. The bay was entered on the feast of Corpus Christi in 1519 by Alonso de Pineda, who claimed the region for Spain.

Correggio \kə-'re-jō\ *orig.* **Antonio Allegri** (b. August 1494, Correggio, Modena—d. March 5, 1534, Correggio) Italian painter. He studied the work of ANDREA MANTEGNA in Mantua and was influenced by LEONARDO DA VINCI. On a visit to Rome he was inspired by the Vatican frescoes of MICHELANGELO and RAPHAEL. By 1518 he was in Parma, the scene of his greatest activity. His first large-scale commission there was the ceiling decoration of the Camera di San Paolo, in the convent of St. Paul (c. 1518–19). His fresco in the dome of Parma Cathedral (c. 1525–30) features the dramatic illusionistic style that influenced dome painting in the BAROQUE PERIOD. His use of bold foreshortening, his brilliant, highly original approach to colour and light, and the exquisite grace of his figures established him as one of the most inventive artists of the High RENAISSANCE.

correlation In statistics, the degree of association between two RANDOM VARIABLES. The correlation between the graphs of two data sets is the degree to which they resemble each other. However, correlation is not the same as causation, and even a very close correlation may be no more than a coincidence. Mathematically, a correlation is expressed by a correlation coefficient that ranges from −1 (never occur together), through 0 (absolutely independent), to 1 (always occur together).

Correll, Charles See Freeman GOSDEN and Charles Correll

Correns \'kȯr-ens**, Carl Erich** (b. Sept. 19, 1864, Munich, Ger.—d. Feb. 14, 1933, Berlin) German botanist and geneticist. In the same year as ERICH TSCHERMAK VON SEYSENEGG and HUGO DE VRIES (1900), he independently rediscovered GREGOR MENDEL's paper outlining the principles of heredity. He conducted research with garden peas, from which he drew the same conclusions Mendel had. He helped provide the overwhelming body of evidence in support of Mendel's thesis, anticipating THOMAS HUNT MORGAN's development of the concept of linkage when he developed a theory of a physical coupling of genetic factors to account for the consistent inheritance of certain traits together. See also WILLIAM BATESON.

Correspondence, Committees of See COMMITTEES OF CORRESPONDENCE

Corrigan, Sir Dominic John (b. Dec. 1, 1802, Dublin, Ire.—d. Feb. 1, 1880, Dublin) Irish physician. He wrote several reports on heart diseases; his paper on aortic insufficiency (1832) is the classic description. He also produced well-known studies on cirrhosis of the lung (1838), aortitis as a cause of angina pectoris (1837), and mitral stenosis (1838). Eponyms such as Corrigan's respiration (shallow breathing in fever) and Corrigan's pulse (a jerking pulse beat) came into general use as a result of his investigations.

corrosion Wearing away due to CHEMICAL REACTIONS, mainly oxidation (see OXIDATION-REDUCTION, OXIDE). It occurs whenever a gas or liquid chemically attacks an exposed surface, often a metal, and is accelerated by warm temperatures and by ACIDS and SALTS. Normally, corrosion products (e.g., rust, patina) stay on the surface and protect it. Removing these deposits reexposes the surface, and corrosion continues. Some materials resist corrosion naturally; others can be treated to protect them (e.g., by coating, painting, GALVANIZING, or ANODIZING).

corruption Improper and usually unlawful conduct intended to secure a benefit for oneself or another. Its forms include BRIBERY, EXTORTION, and the misuse of inside information. It exists where there is community indifference or a lack of enforcement policies. In societies with a culture of ritualized gift giving, the line between acceptable and unacceptable gifts is often hard to draw. See also ORGANIZED CRIME.

corset Article of clothing worn to shape or constrict the torso. It dates to at least c. 2000 BC, when it was worn as an outer garment by men as well as women in Minoan Crete. In the 16th–17th century it was worn to flatten the chest and was reinforced with wood. Some outer corsets were jeweled and elaborately embroidered. After 1660 they were shaped to accentuate the breasts. In the 19th century the corset, now reinforced with whalebone or metal, changed with the style of dresses; over-tight lacing of corsets was blamed for numerous health problems. The corset was abandoned in the 1920s, when looser-fitting, straight clothes came into fashion, and in the 1930s it was replaced by the brassiere and girdle, made of elastic materials, and by the one-piece corselette.

Corsica \'kȯr-si-kə\ *French* **Corse** Island (pop., 1999: 260,196) in the Mediterranean Sea and an administrative region of France. The fourth largest island in the Mediterranean, it has an area of 3,352 sq mi (8,681 sq km). While remains of human occupation date from at least the 3rd millennium BC, recorded history begins c. 560 BC, when Greeks from Asia Minor founded a town there. Taken by the Romans in the 3rd–2nd centuries BC, it, together with SARDINIA, became a prosperous Roman province. Conquered later by several peoples, including Byzantines and Arabs, it was granted to PISA in the 11th century AD. Later ruled mainly by GENOA through the mid-18th century, in 1768 it became a province of France. It was the birthplace of NAPOLEON. The island's economic life is based on tourism and agriculture.

Corso, Gregory (b. March 26, 1930, New York, N.Y., U.S.—d. Jan. 17, 2001, Robbinsdale, Minn.) American poet. A troubled adolescent, Corso spent time in prison. In New York City he became acquainted with ALLEN GINSBERG, who became his mentor. Corso became a leading member of the Beat movement. His poetry is notable for its directness and its startling imagery. Among his poetry collections are *The Vestal Lady on Brattle* (1955), *The Mutation of the Spirit* (1964), *Herald of the Autochthonic Spirit* (1981), and *Mindfield* (1989).

Cort, Henry (b. 1740, Lancaster, Lancashire, Eng.—d. 1800, London) British inventor and industrialist. In 1783 he obtained a patent for producing iron bars quickly and economically in a rolling mill with grooved rolls. The following year he patented his PUDDLING PROCESS for converting PIG IRON into WROUGHT IRON in a REVERBERATORY FURNACE. His two inventions had a significant effect on Britain's iron-making industry, and iron production quadrupled in the next 20 years.

Cortázar \kȯr-'tä-sär**, Julio** (b. Aug. 26, 1914, Brussels, Belg.—d. Feb. 12, 1984, Paris, France) Argentine-French novelist and short-story writer. Born to Argentine parents, he was educated in Argentina. His first story collection, *Bestiario* (1951; "Bestiary"), was published the year he moved to Paris, where he spent much of the rest of his life. His masterpiece, *Hopscotch* (1963), is an open-ended novel, or ANTINOVEL, in which the reader is invited to rearrange the chapters. One of his stories became the basis for MICHELANGELO ANTONIONI's film *Blow-up* (1966).

Cortes \'kȯr-tās\ Representative assembly of the medieval Iberian kingdoms. The Cortes developed in the Middle Ages when elected representatives of the free municipalities acquired the right to take part in the affairs of the Curia Regis ("King's Court"). They were admitted because the crown was short of funds and lacked the right to raise taxes without the consent of the municipalities. Cortes were established in León and Castile by the early 13th century and soon appeared in Catalonia (1218), Aragon (1274), Valencia (1283), and Navarra (1300). Today the term refers to the national legislatures of Spain and Portugal.

Cortés \kȯr-'tez**, Hernán** *later* **marqués del Valle de Oaxaca** (b. 1485, Medellín, near Mérida, Extremadura, Castile—d. Dec. 2, 1547, Castilleja de la Cuesta, near Sevilla) Spanish CONQUISTADOR who won Mexico for Spain. Cortés left Spain for the New World at age 19, joining Diego Velázquez de Cuéllar (b. 1465—d. 1524) in the conquest of Cuba (1511). In 1519, with 508 men and 16 horses, he burned his ships on Mexico's southeastern coast, thus committing himself to conquest. After accumulating thousands of Indian allies who resented AZTEC domination, he forged ahead to TENOCHTITLÁN, the Aztec capital (today Mexico City). The emperor MONTEZUMA II, believing Cortés to be the god QUETZALCÓATL, welcomed him but was taken prisoner. Hearing that a Spanish force from Cuba was coming to relieve him of command, Cortés left Tenochtitlán under the command of a captain and set out to defeat his Spanish opponents. Returning with the opposition forces now under his command, he discovered that the city had revolted; he led his troops away by night in a costly retreat, but he returned in 1521 to conquer the city and with it the empire. The absolute ruler of a huge territory, he was forced to retire after a disastrous expedition in 1524 to the Honduran jungles. His final years were beset by misfortune.

Cortés, Sea of See Gulf of CALIFORNIA

cortex In plants, the tissue of unspecialized cells lying between the epidermis (surface cells) and the vascular, or conducting, tissues (see PHLOEM and XYLEM) of stems and roots. Cortical cells may contain stored food or other substances, such as RESINS, LATEX, ESSENTIAL OILS, and tannins. Cortical cells in herbaceous stems, young woody stems, and stems of SUCCULENTS contain CHLOROPLASTS and can therefore make food by PHOTOSYNTHESIS. Food, usually in the form of starch, in edible roots, BULBS, and TUBERS is stored mostly in the cortex.

cortisone STEROID HORMONE produced by the adrenal cortex (see ADRENAL GLAND). It participates in the regulation of the conversion of PROTEINS to CARBOHYDRATES, and to some extent it regulates salt METABOLISM. Introduced medically in 1948 for its anti-inflammatory effect to treat ARTHRITIS, it has been largely replaced by related compounds that do not produce its undesired side effects, which include EDEMA, increased stomach acidity, and imbalances in sodium, potassium, and nitrogen metabolism. See also CUSHING SYNDROME.

Cortona, Luca da See Luca SIGNORELLI

Cortona, Pietro da See PIETRO DA CORTONA

corundum \kə-'rən-dəm\ Aluminum oxide mineral (Al_2O_3) that is, after diamond, the hardest known natural substance. Gem varieties are SAPPHIRE and RUBY; mixtures with iron oxides and other minerals are called EMERY. Corundum is widespread in nature, although large deposits are rare. Rich deposits occur in India, Russia, Zimbabwe, and South Africa. In addition to being a precious gem, corundum is used as an abrasive for grinding optical glass and for polishing metals and has also been made into sandpapers and grinding wheels. For most industrial applications, however, it has been replaced by synthetic materials such as alumina; synthetic corundum is also manufactured.

corvée \kȯr-'vā\ Unpaid labor that a European vassal owed a lord or that a citizen in later times owed the state, either in addition to or in lieu of taxes. The corvée was often used when money payment did not provide sufficient labor for public projects, and in wartime it was sometimes used to augment regular troops in auxiliary capacities.

corvette Fast naval vessel smaller than a FRIGATE. In the 18th–19th century corvettes were three-masted ships with square rigging and carried about 20 guns on the top deck. Often used to send dispatches within a battle fleet, they also escorted merchant ships. Early U.S. corvettes won distinction in the War of 1812. They disappeared as a class after the shift to steam power in the mid-19th century, but in World War II the term was applied to small armed vessels that served as escorts for CONVOYS. Modern corvettes, usually displacing 500–1,000 tons (454–900 metric tons) and armed with missiles, torpedoes, and machine guns, perform antisubmarine, antiaircraft, and coastal-patrol duties in small navies.

Corybant \'kȯr-ə-ˌbant\ In Oriental and Greco-Roman mythology, any of the wild, half-demonic beings who were attendants of the GREAT MOTHER OF THE GODS. Often identified or confused with the Cretan Curetes (attendants of ZEUS), they were distinctly Asian in origin and their rites were more orgiastic. Their wild dance was credited with the power of healing mental disorder.

Cosby, Bill *in full* **William Henry Cosby, Jr.** (b. July 12, 1937, Philadelphia, Pa., U.S.) U.S. television actor and producer. He worked as a comedian in New York City nightclubs and on tour in the 1960s. In the series *I Spy* (1965–68) he became the first black actor to star in a dramatic role on network television. He later frequently appeared on the children's programs *Sesame Street* and *The Electric Company* as well as in several films. He starred in several other television series, most notably *The Cosby Show* (1984–92), which became one of the most durable family comedies in the history of television.

Cosgrave, William Thomas (b. June 6, 1880, Dublin, Ire.—d. Nov. 16, 1965, Dublin) Irish statesman, first president (1922–32) of the Irish Free State. Early attracted to Sinn Féin, he took part in the 1916 Easter Rising and was interned briefly by the British. As president he restored settled government in Ireland. He continued in office despite various cri-

© 2006 Encyclopædia Britannica, Inc.

ses until Eamon de Valera's victory in 1932. In 1944 he resigned as head of the United Ireland Party (Fine Gael). His son Liam (b. 1920) served as prime minister in 1973–77.

Cosimo I *orig.* **Cosimo de' Medici** (b. June 12, 1519—d. April 21, 1574, Castello, near Florence) Second duke of Florence (1537–74) and first grand duke of Tuscany (1569–74). The son of Giovanni de' Medici, Cosimo became head of the Florentine republic in 1537 after the assassination of his distant cousin Alessandro de' Medici. He continued Alessandro's tyrannical rule and defeated attempts to oust him with aid from Emperor Charles V. Seeking to expand his power, he attacked Siena in 1554 and brought nearly all of Tuscany under his control. He used his despotic power to improve the government's efficiency and to sponsor artistic projects. Far advanced for the time as an administrator, he united all public services into one building, the Uffizi ("Offices"), designed by Giorgio Vasari. He promoted the talents of such artists as Il Bronzino and Bartolommeo Ammannati, sponsored archaeological excavations of Etruscan sites, and established the Florentine Academy for linguistic studies. In 1569 he was given the title of grand duke of Tuscany.

Cosimo the Elder See Cosimo de' Medici

cosine See trigonometric function

Cosmati \'käz-ˌmä-tē\ **work** Type of decorative inlay or mosaic used by Roman decorators and architects in the 12th–13th centuries. Small pieces of coloured stone and glass were combined with strips and disks of white marble arranged in geometric patterns. Cosmati work was used for architectural decoration and church furnishings. The term derives from craftsmen of several families named Cosmatus.

cosmetics Any of several preparations (excluding soap) applied to the human body for beautifying, preserving, or altering the appearance or for cleansing, colouring, conditioning, or protecting the skin, hair, nails, lips, eyes, or teeth. The earliest known cosmetics were in use in Egypt in the 4th millennium BC. Cosmetics were in wide use in the Roman Empire, but they disappeared from much of Europe with the fall of the Roman Empire (5th century AD) and did not reappear until the Middle Ages, when Crusaders returned from the Middle East with cosmetics and perfumes. By the 18th century they had come into use by nearly all social classes. Modern cosmetics include skin-care preparations; foundation, face powder and rouge (blusher); eye makeup; lipstick; shampoo; hair curling and straightening preparations; hair colours, dyes, and bleaches; and nail polish. Related products include antiperspirants, mouthwashes, depilatories, astringents, and bath crystals.

cosmic background radiation Electromagnetic radiation, mostly in the microwave range, believed to be the highly redshifted residual effect (see redshift) of the explosion billions of years ago from which, according to the big-bang model, the universe was created. It was discovered by accident in 1964 by Robert W. Wilson and Arno Penzias; its presence supports the predictions of big-bang cosmology.

cosmic ray High-speed particle (atomic nucleus or electron) that travels through the Milky Way Galaxy. Some cosmic rays originate from the Sun, but most come from outside the solar system. Primary cosmic rays that reach Earth's atmosphere collide with nuclei in it, creating secondaries. Because lower-energy primaries are strongly influenced by the interplanetary magnetic field and Earth's magnetic field (see geomagnetic field), most of those detected near Earth have very high energy, corresponding to speeds about 87% that of light or more. Observations from spacecraft indicate that most cosmic rays come from the Galaxy's disk, but the highest-energy ones are probably extragalactic. Details of their production and acceleration remain unclear, but apparently expanding shock waves from supernovas can accelerate particles. From the early 1930s to the 1950s, cosmic rays were the only source of high-energy particles used in studying the atomic nucleus and its components. Short-lived subatomic particles were discovered through cosmic-ray collisions, leading to the rise of particle physics. Even powerful particle accelerators cannot impart energy anywhere near that of the highest-energy cosmic rays. See also Victor Francis Hess.

cosmogony See creation myth

cosmological argument Form of argument used in natural theology to prove the existence of God. Thomas Aquinas, in his *Summa theologiae*, presented two versions of the cosmological argument: the first-cause argument and the argument from contingency. The first-cause argument begins with the fact that there is change in the world, and a change is always the effect of some cause or causes. Each cause is itself the effect of a further cause or set of causes; this chain moves in a series that either never ends or is completed by a first cause, which must be of a radically different nature in that it is not itself caused. Such a first cause is an important aspect, though not the entirety, of what Christianity means by God. The argument from contingency follows by another route a similar basic movement of thought from the nature of the world to its ultimate ground.

cosmological constant Term reluctantly added by Albert Einstein to his equations of general relativity in order to obtain a solution to the equations that described a static universe, as he believed it to be at the time. The constant has the effect of a repulsive force that acts against the gravitational attraction of matter in the universe. When Einstein heard of the evidence that the universe is expanding, he called the introduction of the cosmological constant the "biggest blunder" of his life. Recent developments suggest that in the early universe there may well have been a cosmological constant with a nonzero value.

cosmology Field of study that brings together the natural sciences, especially astronomy and physics, in an effort to understand the physical universe as a unified whole. The first great age of scientific cosmology began in Greece in the 6th century BC, when the Pythagoreans introduced the concept of a spherical Earth and, unlike the Babylonians and Egyptians, hypothesized that the heavenly bodies moved according to the harmonious relations of natural laws. Their thought culminated in the Ptolemaic model (see Ptolemy) of the universe (2nd century AD). The Copernican revolution (see Copernican system) of the 16th century ushered in the second great age. The third began in the early 20th century, with the formulation of special relativity and its development into general relativity by Albert Einstein. The basic assumptions of modern cosmology are that the universe is homogeneous in space (on the average, all places are alike at any time) and that the laws of physics are the same everywhere.

cosmonaut See astronaut

cosmos \'käz-məs\ Any of the garden plants that make up the genus *Cosmos* (composite family), containing about 20 species native to the tropical New World. Heads of flowers are borne along long flower stalks or together in an open cluster. The disk flowers are red or yellow; the ray flowers, sometimes notched, may be white, pink, red, purple, or other colors. Most annual ornamental varieties have been developed from the common garden cosmos (*C. bipinnatus*).

Cossacks Peoples dwelling in the northern hinterlands of the Black and Caspian seas. The term (from the Turkic *kazak*, "free person") originally referred to semi-independent Tatar groups, which formed in the Dnieper River region. Later it was also applied to peasants who had fled from serfdom in Poland, Lithuania, and Muscovy to the Dnieper and Don regions. The Cossacks had a tradition of independence and received privileges from the Russian government in return for military services. They were used as defenders of the Russian frontier and advance guards for imperial territorial expansion. Attempts in the 17th–18th century to reduce their privileges caused revolts, led by Stenka Razin and Yemelyan Pugachov, and the Cossacks gradually lost their autonomous status.

cost Monetary value of goods and services that producers and consumers purchase. In a basic economic sense, cost is the measure of the alternative opportunities forgone in the choice of one good or activity over others (see opportunity cost). For consumers, cost describes the price paid for goods and services. For producers, cost has to do with the relationship between the value of production inputs and the level of output. Total cost refers to all the expenses incurred in reaching a particular level of output; if total cost is divided by the quantity produced, average or unit cost is obtained. A portion of the total cost known as fixed cost (e.g., the costs of building rental or of heavy machinery) does not vary with the quantity produced and, in the short run, cannot be altered by increasing or decreasing production. Variable costs, like the costs of labour or raw materials, change with the level of output. Economic decisions are based on marginal cost, the additional cost of an incremental unit of production or consumption.

cost of living Monetary cost of maintaining a particular standard of living, usually measured by calculating the average cost of a number of goods and services. Measurement of the cost of a minimum standard of

© 2006 Encyclopædia Britannica, Inc.

living is essential in determining relief payments, social-insurance benefits, and MINIMUM WAGES. The cost of living is customarily measured by a PRICE INDEX such as the CONSUMER PRICE INDEX. Measurements of change in the cost of living are important in wage negotiations. Cost-of-living measurements are also used to compare the cost of maintaining similar living standards in different areas. See also SOCIAL INSURANCE.

Costa Rica *officially* **Republic of Costa Rica** Country, Central America. Area: 19,730 sq mi (51,100 sq km). Population (2005 est.): 4,221,000. Capital: SAN JOSÉ. Most of the people are of Spanish ancestry

or are mestizos. Language: Spanish (official). Religion: Christianity (predominantly Roman Catholic [official]; also Protestant, other Christians). Currency: colón. Costa Rica's Pacific coast rises abruptly into central highlands and a volcanic mountain chain that forms the backbone of the country and descends gradually to the Caribbean coastal plain. The climate ranges from temperate to tropical, and the wide variety of plants and animals include species found in both North America and South America. The developing market economy is largely based on coffee and banana exports. Sugar is another significant cash crop, and beef is also important. Costa Rica is a multiparty republic with one legislative house; the head of state and government is the president. CHRISTOPHER COLUMBUS landed in what is now Costa Rica in 1502, in an area inhabited by a number of small independent Indian tribes. These peoples were not easily dominated by European adventurers who followed, and it took almost 60 years for the Spaniards to establish a permanent settlement there. Ignored by the Spanish crown because of its lack of mineral wealth, the colony grew slowly. Coffee exports and the construction of a rail line improved its economy in the 19th century. It joined the short-lived Mexican Empire in 1821, was a member of the United Provinces of Central America (1823–38), and adopted a constitution in 1871. In 1890 Costa Ricans held what is considered the first free and honest election in Central America, beginning a tradition of democracy for which Costa Rica is renowned. In 1987 President Oscar ARIAS SÁNCHEZ was awarded the Nobel Prize for Peace for his Central American peace plan. In the early 21st century many Costa Ricans looked to increasingly free trade with the United States as a solution to the country's economic woes.

Costa-Gavras \ˌkōs-tə-'gav-rəs**, Constantine** *orig.* **Konstantinos Gavras** (b. Feb. 12, 1933, Loutra-Iraias, Greece) Greek-French film director. He left Greece to study in Paris, where he became an assistant to filmmakers such as RENÉ CLAIR. He directed his first film, *The Sleeping Car Murders*, in 1966. His drama of political assassination, *Z* (1968, Academy Award), brought him international fame. He later directed political thrillers such as *The Confession* (1970), *State of Siege* (1972), *Missing* (1982, Academy Award), and *Mad City* (1997). He became president of the Cinémathèque Française in 1982.

cost-benefit analysis In governmental planning and budgeting, the attempt to measure the social benefits of a proposed project in monetary terms and compare them with its costs. The procedure was first proposed in 1844 by Arsène-Jules-Étienne-Juvénal Dupuit (1804–66). It was not seriously applied until the 1936 U.S. Flood Control Act, which required that the benefits of flood-control projects exceed their costs. A cost-benefit ratio is determined by dividing the projected benefits of a program by the projected costs. A wide range of variables, including nonquantitative ones such as quality of life, are often considered because the value of the benefits may be indirect or projected far into the future.

Cotán, Juan Sánchez See JUAN SANCHEZ COTAN

Côte d'Azur \ˌkōt-dȧ-'zür\ Region bordering the Mediterranean Sea, southeastern France. Encompassing the French RIVIERA between Menton and CANNES, it is a major tourist centre noted for its scenery. See also NICE; MONACO.

Côte d'Ivoire \ˌkōt-dē-'vwär\ *or* **Ivory Coast** *officially* **Republic of Côte d'Ivoire** Country, western Africa. Area: 123,863 sq mi (320,803 sq km). Population (2005 est.): 17,298,000. Capital: YAMOUSSOU-

KRO; de facto capital ABIDJAN. The population consists of various ethnic groups, notably the Akan and Mande. Languages: French (official), Baule, Anyi, Bete, Bambara, Dan. Religions: Islam, Christianity, traditional beliefs. Currency: CFA franc. Côte d'Ivoire can be divided into four major regions: a narrow coastal region, an equatorial rainforest in the west, a cultivated forest zone in the east, and a savanna region in the north. Agriculture employs about half of the workforce. The country is a major producer of cocoa and coffee; other exports include bananas, cotton, rubber, timber, and diamonds. It is a republic with one legislative house; its chief of state and government is the president, assisted by the prime minister. European powers came to the area to trade in ivory and slaves beginning in the 15th century, and local kingdoms gave way to French influence in the 19th century. The French colony of Côte d'Ivoire was founded in 1893, and full French occupation took place in 1908–18. In 1946 it became a territory in the FRENCH UNION; in 1947 the northern part of the country separated and became part of Upper Volta (now BURKINA FASO). Côte d'Ivoire peacefully achieved autonomy in 1958 and independence in 1960, when FÉLIX HOUPHOUËT-BOIGNY was elected president. The

country's first multiparty presidential elections were held in 1990. Political turmoil has persisted since Houphouët-Boigny died in 1993, and factional warfare broke out in 2002.

Cotonou \ˌkō-tō-ˈnü\ Port city (pop., 1998: 649,580), de facto capital of Benin. Situated along the Gulf of Guinea, it is the starting point of the Benin-Niger Railway and the site of deepwater port facilities, completed in 1965, that serve both Benin and Togo. Cotonou is the economic hub of Benin and its largest urban centre. Its industries include brewing, textile production, and palm-oil processing. It is home to the National University of Benin (1970).

Cotopaxi \ˌkō-tō-ˈpäk-sē\ Volcanic peak in the Andes Mountains, central Ecuador. Rising to 19,347 ft (5,897 m), it is the world's highest continuously active volcano. Its almost perfectly symmetrical cone is often hidden by clouds that are lit at night by the crater's fires. Its base stands on open mountain grassland, and its upper part is covered with permanent snow. With a long record of violent eruption, it has seldom remained quiet for more than 15 years.

cotton Seed-hair fibre of various plants of the genus *Gossypium*, in the mallow family, native to most subtropical countries. The shrubby plants produce creamy white flowers, followed by small green seedpods (cotton bolls), which contain the seeds. Fibres growing from the outer skin of the seeds become tightly packed within the boll, which bursts open at maturity to reveal soft masses of the white to yellowish white fibres. Cotton is harvested when the bolls open. One of the world's leading agricultural crops, cotton is plentiful and economically produced, making cotton products relatively inexpensive. The fibres can be made into a diverse array of fabrics suitable for a great variety of apparel, home furnishings, and industrial uses. Cotton fabrics can be extremely durable and are comfortable to wear. Nonwoven cotton, made by fusing or bonding the fibres, is useful for making disposable products including towels, polishing cloths, tea bags, tablecloths, bandages, and disposable uniforms and sheets for hospital and other medical uses.

Cotton (*Gossypium hirsutum*).
ROD HEINRICHS-GRANT HEILMAN

Cotton, John (b. Dec. 4, 1585, Derby, Derbyshire, Eng.—d. Dec. 23, 1652, Boston, Mass.) Anglo-American Puritan leader. He studied at the University of Cambridge, where he first encountered Puritanism. From 1612 to 1633 he served as a vicar in Lincolnshire. When English church authorities filed charges against him for his Nonconformism, he sailed for New England in 1633. As "teacher" of the First Church of Boston (1633–52), he became an influential leader of the Massachusetts Bay Colony. He wrote a widely used children's catechism and defended Puritan orthodoxy in such books as *The Way of the Churches of Christ in New England* (1645). He opposed freedom of conscience, as preached by Roger Williams, favoring a national theocratic society.

Cotton, King See King Cotton

Cotton, Sir Robert Bruce (b. Jan. 22, 1571, Denton, Lancashire, Eng.—d. May 6, 1631, London?) English antiquarian. From c. 1585 Cotton collected ancient records, manuscripts, books, and coins and welcomed scholars to his library. He entered Parliament in 1601 and was favoured at court until c. 1615. His acquisition of so many public documents aroused misgivings, and after he wrote several works criticizing policies of Charles I, his library was sealed in 1629. After his death his son regained possession of the library, and his great-grandson presented it to the nation in 1700. The Cottonian Library's historical documents formed the basis of the manuscript collection of the British Library.

Cotton Belt Agricultural region of the southeastern U.S. where cotton is the main cash crop. Once confined to the pre-Civil War South, the Cotton Belt was pushed west after the war. Today it extends primarily through North and South Carolina, Georgia, Alabama, Mississippi, western Tennessee, eastern Arkansas, Louisiana, eastern Texas, and southern Oklahoma.

cotton bollworm See corn earworm

Cotton Club Nightclub in New York City's Harlem district in the 1920s and '30s. It opened in 1922 at 142nd Street and Lenox Avenue under the management of the reputed bootlegger Owney Madden (1892–1964). It became fashionable and featured the finest African American performers in the U.S., performing for an exclusively white audience. Louis Armstrong, Cab Calloway, Duke Ellington, Lena Horne, Bill Robinson, and Ethel Waters were among its featured artists. The club later moved downtown (1936–40).

cotton gin Machine for cleaning cotton of its seeds. The design that became standard was invented in the U.S. by Eli Whitney in 1793. The mechanization of spinning in England had created a greatly expanded market for U.S. cotton, but production was bottlenecked by the manual removal of the seeds from the raw fibre. The cotton gin pulled the cotton through a set of wire teeth mounted on a revolving cylinder, the fibre passing through narrow slots in an iron breastwork too small to permit passage of the seed. The simplicity of the invention caused it to be widely copied. It is credited with making cotton the most important export crop of the U.S. before the American Civil War, as settlers and their slaves spread westward through prime cotton-growing regions of South Carolina, Georgia, Alabama, Mississippi, and Texas.

cottonmouth moccasin See water moccasin

cottonwood Any of several fast-growing North American trees of the genus *Populus*. Members of the willow family, cottonwoods have heart-shaped, toothed leaves and cottony seeds. The dangling leaves clatter in the wind. The eastern cottonwood (*P. deltoides*) has thick glossy leaves. Carolina poplar (*P. angulata*) and *P. eugenei* may be natural hybrids between *P. deltoides* and the Eurasian black poplar (*P. nigra*). The Alamo, or Fremont cottonwood (*P. fremontii*), is the tallest of the group. See also poplar.

Eastern cottonwood (*Populus deltoides*)
KITTY KOHOUT FROM ROOT RESOURCES—EB INC.

cottony-cushion scale Scale insect (*Icerya purchasi*, order Homoptera) that is a pest especially of California citrus trees. The adult lays bright red eggs in a distinctive large white mass that juts out from a twig. Distributed worldwide, cottony-cushion scale is found on many other plants, including acacia, pittosporum, and willow. Australian ladybird beetles (see ladybug), a natural enemy, have been imported to keep it from destroying the California citrus industry.

ROBERT C. HERMES—THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

cotyledon \ˌkä-tə-ˈlē-dᵊn\ Seed leaf within the embryo of a seed that provides energy and nutrients for the developing seedling. After the first true leaves have formed, they wither and fall off. Flowering plants whose embryos have a single cotyledon are grouped as monocots, or monocotyledonous plants; embryos with two cotyledons are grouped as dicots, or dicotyledonous plants. Unlike flowering plants, gymnosperms usually have several cotyledons rather than one or two. See illustration on opposite page.

Coubertin \kü-ber-ˈtaⁿ**, Pierre, baron de** (b. Jan. 1, 1863, Paris, France—d. Sept. 2, 1937, Geneva, Switz.) French educator, primarily responsible for the revival of the Olympic Games in 1894. He became one of the first advocates of physical education in France. His drive to restart the Olympics, after a 1,500-year suspension, was partly inspired by a visit to Greece, where excavators were uncovering the ancient Olympic site. He served as the second president (1896–1925) of the International Olympic Committee.

Monocotyledon (internal structures of a corn seed with stages of germination). Nutrients are stored in the cotyledon and endosperm tissue. The radicle and hypocotyl (region between the cotyledon and radicle) give rise to the roots. The epicotyl (region above the cotyledon) gives rise to the stem and leaves and is covered by a protective sheath (coleoptile). Dicotyledon (internal structures of a bean seed with stages of germination). All nutrients are stored in the enlarged cotyledons. The radicle gives rise to the roots, the hypocotyl to the lower stem, the epicotyl to the leaves and upper stem.

© MERRIAM-WEBSTER INC.

couch grass *or* **quack grass** Rapidly spreading GRASS (*Agropyron repens*) with flat, somewhat hairy leaves and erect flower spikes, native to Europe and introduced into other northern temperate areas for forage or EROSION control. In cultivated land, it is considered a weed because of its persistence. Its long, yellowish-white RHIZOMES must be completely dug up to eradicate the plant because broken rhizomes generate new plants. Couch grass has been used in various home remedies in Europe, and the rhizomes have been eaten during periods of famine.

Coué \ˈkwā**, Émile** (b. Feb. 26, 1857, Troyes, France—d. July 2, 1926, Nancy) French pharmacist and psychologist. Starting as a pharmacist at Troyes in 1882, he studied hypnosis, opened a free clinic at Nancy in 1910, and developed his own method of psychotherapy based on autosuggestion, "Couéism," which most famously required constant repetition of the formula "Every day, and in every way, I am becoming better and better."

cougar *or* **puma** \ˈpü-mə, ˈpyü-mə\ *or* **mountain lion** *or* **panther** Species (*Puma concolor*) of large, graceful CAT that lives in a wide variety of habitats in the Americas, from southern Alaska to Patagonia. In many regions, the species is restricted to wilderness areas, and some subspecies are considered endangered. Cougars' coloration ranges from pale buff to reddish brown, with dark ears and tail tip and white rump and belly. The adult weighs from 77 to more than 220 lb (35 to 100 kg). A male may be about 9 ft (3 m) long, one-third of which is tail, and stand 24–30 in. (60–75 cm) tall at the shoulder. Since the cougar occasionally kills livestock, it has been intensively hunted by farmers, especially in North America, and has been basically exterminated from the eastern U.S. It is valuable for preventing overpopulation of prey animals (mostly deer, in North America). In North America, cougar attacks on humans occur a few times per year, some being fatal.

Coughlin \ˈkäg-lən**, Charles E(dward)** *or* **Father Coughlin** (b. Oct. 25, 1891, Hamilton, Ont., Can.—d. Oct. 27, 1979, Bloomfield Hills, Mich., U.S.) Canadian-born U.S. clergyman. Ordained a Roman Catholic priest in 1923, he became pastor of a Michigan church. In 1930 he began radio broadcasts of his sermons, into which he gradually injected reactionary political statements and anti-Semitic rhetoric. His sermons attracted one of the first deeply loyal mass audiences in broadcast history. He attacked HERBERT HOOVER and later turned on FRANKLIN ROOSEVELT and the NEW DEAL. His magazine, *Social Justice*, targeted Wall Street, communism, and Jews. It was banned from the mails and ceased publication in 1942, the same year the Catholic hierarchy ordered Coughlin to stop broadcasting.

Coulomb \kü-ˈlōⁿ,\ *English* \ˈkü-ˌläm**, Charles-Augustin de** (b. June 14, 1736, Angoulême, France—d. Aug. 23, 1806, Paris) French physicist. After serving as a military engineer in the West Indies, he returned to France in the 1780s to pursue scientific research. To investigate JOSEPH PRIESTLEY's law of electrical repulsions, he invented a sensitive instrument to measure the electrical forces involved. A light rod made of an insulator, with a small conducting sphere at each end, was suspended horizontally by a fine wire so that it was free to twist when another charged sphere was brought close to it. By measuring the angle through which the rod twisted, Coulomb could measure the repulsive forces. He is best known for formulating COULOMB'S LAW. He also did research on friction of machinery, on windmills, and on the elasticity of metal and silk fibres. The coulomb, a unit of electric charge, was named in his honour.

Coulomb's \ˈkü-ˌlämz\ **law** Law formulated by C.-A. DE COULOMB that describes the ELECTRIC FORCE between charged objects. It states that (1) like charges repel each other and unlike charges attract each other, (2) the attraction or repulsion acts along the line between the two charges, (3) the size of the force varies inversely as the square of the distance between the two charges, and (4) the size of the force is proportional to the value of each charge.

Council for Mutual Economic Assistance *or* **Comecon** Organization founded in 1949 to facilitate and coordinate the economic development of Soviet-bloc countries. Its original members were the Soviet Union, Bulgaria, Czechoslovakia, Hungary, Poland, and Romania; other members joined later, including Albania (1949) and the German Democratic Republic (1950). Its accomplishments included the organization of Eastern Europe's railroad grid, the creation of the INTERNATIONAL BANK FOR ECONOMIC COOPERATION, and the construction of the "Friendship" oil pipeline. After the democratic revolutions of 1989, it largely lost its purpose and power. In 1991 it was renamed the Organization for International Economic Cooperation.

counseling Professional guidance of the individual by use of standard psychological methods such as collecting case-history data, using various techniques of the personal interview, and testing interests and aptitudes. The counselor's goal is generally to orient the individual toward opportunities that can best guarantee fulfillment of his personal needs and aspirations. The counselor usually attempts to clarify the client's own thinking rather than to solve his problems. Professional counselors (such as educational guidance and career counselors) and counseling psychologists (such as marriage and bereavement counselors) are found in a wide variety of institutional settings and in private practice. See also PSYCHOTHERAPY.

© 2006 Encyclopædia Britannica, Inc.

count *or* **earl** European title of nobility, ranking in modern times directly below a MARQUESS or (in countries without marquesses) a DUKE. In England the title of earl is the equivalent of count and ranks above a VISCOUNT. The wife of a count or earl is a countess. The Roman *comes* ("count") was originally a household companion of the emperor; under the Franks he was a local commander and judge. The counts were later incorporated into the feudal structure, some becoming subordinate to dukes, though a few countships were as great as duchies. As royal authority was reasserted over the feudatories, which took place at different times in the different kingdoms, the counts lost their political authority, though they retained their privileges as members of the nobility.

Counter-Reformation *or* **Catholic Reformation** In ROMAN CATHOLICISM, efforts in the 16th and early 17th century to oppose the Protestant REFORMATION and reform the Catholic Church. Early efforts grew out of criticism of the worldliness and corruption of the papacy and clergy during the Renaissance. PAUL III (r. 1534–49) was the first pope to respond, convening the important Council of TRENT (1545–63), which reacted to Protestant teachings on faith, grace, and the sacraments, and attempted to reform training for the priesthood. The Roman INQUISITION was established in 1542 to control HERESY within Catholic territories, and the JESUITS under Ignatius de LOYOLA undertook educational and missionary work aimed at conversion or reconversion. Emperors CHARLES V and PHILIP II took military action against Protestant growth. Later popes of the Counter-Reformation included PIUS V, GREGORY XIII, and SIXTUS V. Sts. Charles BORROMEO, Philip NERI, JOHN OF THE CROSS, TERESA OF ÁVILA, FRANCIS DE SALES, and VINCENT DE PAUL were among the most influential reforming figures.

counterfeiting Crime of making an unauthorized imitation of a genuine article, typically money, with the intent to deceive or defraud. Because of the value conferred on money and the high level of technical skill required to imitate it, counterfeiting is singled out from other acts of FORGERY. It is generally punished as a felony (see FELONY AND MISDEMEANOUR). The international police organization INTERPOL was established primarily to organize law-enforcement efforts against counterfeiting. Software, credit cards, designer clothing, and watches are among nonmoney items commonly counterfeited.

counterglow See GEGENSCHEIN

counterpoint Art of combining different melodic lines in a musical composition. The term is often used interchangeably with *polyphony* (music consisting of two or more distinct melodic lines), but *counterpoint* more specifically refers to the compositional technique involved in the handling of these melodic lines. The first recorded use of two melodic lines simultaneously was in 9th-century treatises showing examples of ORGANUM (a type of music for multiple voices), though improvised counterpoint—in which the voices probably moved mostly parallel to each other, and thus failed to convey an impression of independence—may date back to some centuries earlier. The desire to ensure pleasant consonances and avoid unpleasant dissonances when improvising (see CONSONANCE AND DISSONANCE) called for principles of simultaneous vocal motion (voice leading). Because the relative movement of voices approaching and leaving given INTERVALS was thought to produce effects that were more or less pleasing, rules were created to govern various types of relative motion. The "vertical" aspect of counterpoint—the relationship between the melodic lines—came to be studied as HARMONY, especially from the 18th century. Though harmony and counterpoint are intimately intertwined, most of the multivoiced music of the Middle Ages and the Renaissance is considered essentially polyphonic or contrapuntal—that is, consisting of a combination of relatively independent and integral melodic lines. In the Baroque era, with the invention of figured bass and the CONTINUO, the balance began to shift toward a harmonic orientation.

countertenor Adult male ALTO voice, either natural or falsetto. Some writers use the term only for the natural high TENOR, preferring "male alto" for the falsetto voice. Like the CASTRATO tradition, the countertenor developed as a result of the prohibition on women taking part in church choirs. Since the falsetto voice lacks power, it was little used in opera. The countertenor tradition was preserved in the English cathedral choir. Today it is again being widely cultivated internationally, primarily for Renaissance and Baroque music.

country dance *or* **contredanse** \ˈkän-trə-ˌdans\ Type of social dance for couples, popular in the 17th century. Derived from English folk dance, the country dance is performed in one of three forms: circular or round; "longways," with rows of couples facing each other; and geometric, in squares or triangles. The main source of country-dance steps and songs is John Playford's *The English Dancing Master* (1650). The dance was the basis for the 19th-century QUADRILLE. It was taken by colonists to North America as the Virginia reel and, in modified form, as the SQUARE DANCE. There was a modest revival in the 20th century.

country music *or* **country and western** Musical style that originated among whites in rural areas of the southern and western U.S. The term *country and western music* was adopted by the music industry in 1949 to replace the derogatory *hillbilly music*. Its roots lie in the music of the European settlers of the Appalachians and other areas. In the early 1920s the genre began to be commercially recorded; Fiddlin' John Carson recorded its first hit. Radio programs such as Nashville's *GRAND OLE OPRY* and Chicago's *National Barn Dance* fueled its growth, and growing numbers of musicians, such as the CARTER FAMILY and JIMMIE RODGERS, began performing on radio and in recording studios. With the migration of Southern whites to industrial cities in the 1930s and '40s, country music was exposed to new influences, such as BLUES and GOSPEL MUSIC. Its nostalgic bias, with its lyrics about poverty, heartbreak, and homesickness, held special appeal during a time of great population shifts. In the 1930s "singing cowboy" film stars, such as Gene Autry, altered country lyrics to produce a synthetic "western" music. Other variants include western swing (see BOB WILLS) and honky-tonk (see ERNEST TUBB and HANK WILLIAMS). In the 1940s there was an effort to return to country's root values (see BLUEGRASS), but commercialization proved a stronger influence, and in the 1950s and '60s country music became a huge commercial enterprise. Popular singers often recorded songs in a Nashville style, while many country music recordings employed lush orchestral backgrounds. Country music has become increasingly acceptable to urban audiences, retaining its vitality with diverse performers such as WILLIE NELSON, Waylon Jennings, Dolly Parton, Randy Travis, Garth Brooks, Emmylou Harris, and Lyle Lovett. Despite the influence of other styles, it has retained an unmistakable character as one of the few truly indigenous American musical styles.

coup d'état \ˌkü-dā-ˈtä\ *or* **coup** (French: "stroke of state") Sudden overthrow, often violent, of an existing government by a group of conspirators. Coups are most common in countries with unstable governments and in countries with little experience of successful democracy. Their success depends on surprise and speed. Coups rarely alter a nation's fundamental social and economic policies or significantly redistribute power. See also MILITARY GOVERNMENT, REVOLUTION.

Coup of 18–19 Brumaire See Coup of 18–19 BRUMAIRE

Couperin \küp-ˈraⁿ**, François** (b. Nov. 10, 1668, Paris, France —d. Sept. 12, 1733, Paris) French composer, harpsichordist, and organist. At age 17 he succeeded his father as organist at the important church of St. Gervais and kept the post for some 50 years. He was later also appointed organist and harpsichordist at the court of LOUIS XIV. Couperin is best known for four books of harpsichord pieces containing some 220 elegant, vivacious, and richly ornamented works (*Pièces de clavecin*, 1713–30). His other works include a collection of more than 40 organ compositions (*Pièces d'orgue*, 1709); much sacred vocal music (including the *Leçons de ténèbres*, c. 1715); and several sets of chamber music (including the *Concerts royaux*, 1722). His *Art of Playing the Harpsichord* (1716) is the most valuable instrumental treatise of its time. He was the foremost French composer of his generation. His uncle Louis Couperin (1626–61), also organist at St. Gervais, composed more than 200 keyboard works.

couple In physics, a pair of equal parallel FORCES that are opposite in direction. Couples produce or prevent the turning of a body. The forces used to turn the steering wheel of a car constitute a couple; each hand exerts a force, parallel but opposite in direction, yet they work together to achieve the same goal. A couple is also used to turn a screwdriver or a doorknob, and the pair of forces acting on the opposite poles of a compass needle as it points somewhere between north and south are a couple.

couplet Two successive lines of verse. A couplet is marked usually by rhythmic correspondence, rhyme, or the inclusion of a self-contained utterance. Couplets may be independent poems, but they usually function as parts of other verse forms, such as the Shakespearean SONNET, which concludes with a couplet. A couplet that cannot stand alone is an open couplet; a couplet whose sense is relatively independent is a closed couplet.

courante \kù-'ränt\ (from Latin *currere*, "to run") Court dance of the 16th century, fashionable in European ballrooms into the 18th century. It was originally performed with small back-and-forth springing steps, which later became stately glides. Danced to music in quick triple time, the courante followed the ALLEMANDE and later became part of the musical SUITE.

Courantyne \'kōr-ən-ˌtīn\ **River** *or* **Corantijn** \'kōr-ən-ˌtīn\ *or* **Coeroeni** \kü-'rü-nē\ River, northern South America. Rising in the Akarai Mountains, it flows north for 450 mi (700 km) and empties into the Atlantic Ocean near Nieuw Nickerie, Suri. It divides Suriname and Guyana; residents of the latter are free to navigate the river but have no fishing rights. It is navigable to small oceangoing vessels for about 45 mi (70 km) to the first rapids at Orealla. The Courantyne basin remains largely undeveloped, with much of it remaining unexplored forest.

Courbet \kür-'bā**, Gustave** (b. June 10, 1819, Ornans, France—d. Dec. 31, 1877, La Tour-de-Peilz, Switz.) French painter. In 1839 he went to Paris, where, after receiving some formal training, he learned by copying Old Masters in the Louvre. His early works were controversial but received public and critical acclaim. In 1849 and 1850 he produced two of his greatest paintings: respectively, *The Stone-Breakers* and *Burial at Ornans*. Both works depart radically from the more-controlled, idealized pictures of either the NEOCLASSICAL or the ROMANTIC school; they portray the life and emotions not of aristocrats but of humble peasants, and they do so with a realistic urgency. Such images of everyday life, characterized by a powerful naturalism and boldly portrayed, cast him as a revolutionary socialist. An intimate of many writers and philosophers of his day, he became the leader of the new school of Realism, which in time prevailed over other contemporary movements. His audacity and disrespect for authority were notorious. In 1865 his series depicting storms at sea astounded the art world and opened the way for IMPRESSIONISM.

Detail from *Pierre-Joseph Proudhon and His Children in 1853*, oil on canvas by Gustave Courbet, 1865; in the Musée du Petit Palais, Paris.

coureur de bois \kü-'rər-də-'bwä\ *French* **"wood runner"** French Canadian fur trader of the late 17th and early 18th centuries. Most of the *coureur de bois* traded illicitly (i.e., without the license required by the Quebec government). They sold brandy to Indians, which created difficulties for the tribes with whom they traded. Though they defied the colonial authorities, they ultimately benefited them by exploring the frontier, developing the fur trade, and helping ally the Indians with the French and against the English (see FRENCH AND INDIAN WAR).

Courland \'kür-ˌlänt,\ *English* \'kůr-lənd\ *Latvian* **Kurzeme** \'kůr-zə-ˌmā\ Historical region, Latvia. Located on the Baltic Sea, it was named for the Curonians, who had established a tribal kingdom there by the end of the 9th century. Conquered in the 13th century by the Livonians, in 1561 the area was incorporated into the duchy of Courland, which became a Polish fief. The duchy flourished during the 17th century with the development of industries and foreign trade. From 1737 its duke was a client of the Russian throne, and it came under Russian rule in 1795. It became part of the newly independent Latvia in 1918.

Courland Lagoon \'kůr-lənd\ *or* **Kursky Zaliv** \'kůr-skē-'zä-lif\ Inlet of the BALTIC SEA at the mouth of the NEMAN RIVER. Its northern portion is in Lithuania and its southern portion lies in Kaliningrad province, Russia. With an area of 625 sq mi (1,619 sq km), it is connected to the Baltic by a navigable strait, on which is the Lithuanian port of KLAIPEDA.

Cournand \kůr-'nä^{n}**, André F(rédéric)** (b. Sept. 24, 1895, Paris, Fr.—d. Feb. 19, 1988, Great Barrington, Mass., U.S.) French-born U.S. physician and physiologist. He shared a 1956 Nobel Prize with Dickinson W. Richards (b. 1895—d. 1973) and WERNER FORSSMANN for discoveries on heart catheterization and circulatory changes. Cournand and Richards perfected Forssmann's cardiac catheterization procedure for studying the functioning of diseased hearts to more accurately diagnose underlying anatomic defects. They also used the catheter in the pulmonary artery, improving diagnosis of lung diseases.

Cournot \kür-'nō**, Antoine-Augustin** (b. Aug. 28, 1801, Gray, France—d. March 31, 1877, Paris) French economist and mathematician. The first economist to apply mathematics effectively to the treatment of economic questions, he made important contributions with his discussion of SUPPLY AND DEMAND functions, the shifting of taxes, and problems of international trade, and he is best remembered for his discussion of strategic behaviour in a market with only two producers, a so-called *duopoly*. His principal work is *Researches into the Mathematical Principles of the Theory of Wealth* (1838).

Courrèges \kù-'rezh**, André** (b. March 9, 1923, Pau, Fr.) French fashion designer. He went to work in a small Parisian fashion house in 1948 and within a year joined the staff of CRISTOBAL BALENCIAGA. In 1961 he opened his own house and became established as one of the most original couturiers in Paris. His futuristic styles featured well-cut pants, trapezoidal lines, and miniskirts with white midcalf boots; white became his hallmark. In the 1960s his designs were widely copied. He established control over manufacturing and distribution through licensed outlets.

court In architecture, an outdoor room surrounded by buildings or walls. Courts have existed in all civilizations from the earliest recorded times. The small garden court (ATRIUM) of a Roman house was the center of domestic activity. In medieval Europe the court was a feature of all major residential buildings, as the CLOISTER of a monastery, ward of a CASTLE, or QUADRANGLE of a college. A courtyard is often a utilitarian court (as for stables).

court Official assembly with judicial authority to hear and determine disputes in particular cases. In early judicial tribunals, judges sat in enclosures (courts in an architectural sense), and lawyers and the general public remained outside a bar (hence the term *bar* in legal contexts). Modern British courts are divided into those trying criminal cases and those trying civil cases; a second distinction is made between inferior courts, or courts of first instance, and superior courts, or courts of appeal. In the U.S. each state has its own system of courts, usually consisting of a superior (appellate) court, trial courts of general jurisdiction, and specialized courts (e.g., PROBATE courts). The U.S. also has a system of federal courts, established to adjudicate distinctively national questions and cases not appropriately tried in state courts. At the apex of the national system is the SUPREME COURT OF THE UNITED STATES. The secondary level consists of the UNITED STATES COURTS OF APPEALS. UNITED STATES DISTRICT COURTS form the tertiary level. Crimes committed by military figures may be tried in a COURT-MARTIAL. In the past, ecclesiastical courts had broad jurisdiction. See also INTERNATIONAL COURT OF JUSTICE; JUDICIARY.

Court, Margaret Smith *orig.* **Margaret Smith** (b. July 16, 1942, Albury, N.S.W., Austl.) Australian tennis player. She dominated women's tennis in the 1960s, winning 66 grand-slam championships in her career, more than any other person. In 1970 she became the second woman (after MAUREEN CONNOLLY) to win the grand-slam (the Wimbledon, U.S., Australian, and French singles titles). In 1963, with fellow Australian Kenneth Fletcher, she became the only player to achieve the grand-slam in doubles as well as singles.

Court of High Commission See Court of HIGH COMMISSION

courtly love Late-medieval code that prescribed the highly conventionalized behaviour and emotions of aristocratic ladies and their lovers. It was the theme of an extensive literature that began with late 11th-century TROUBADOUR poetry in France and swiftly pervaded Europe. The courtly lover, who saw himself as enslaved by passion but fired by respect, faithfully served and worshiped his lady-saint. Courtly love was invari-

© 2006 Encyclopædia Britannica, Inc.

ably adulterous, largely because upper-class marriage at the time was usually the result of economic interest or the seal of a power alliance. Its literary sources are believed to be found in Arabic literature, transmitted to Europe through Arab-dominated Spain; the growing religious cult of MARY was another influence. Examples of works inspired by the ideal are the *ROMAN DE LA ROSE*, PETRARCH's sonnets to Laura, DANTE's *Divine Comedy*, and the lyrics of the TROUVÈRES and MINNESINGERS. See also CHIVALRY.

court-martial Military court for hearing charges brought against members of the armed forces or others within its jurisdiction; also, the legal proceeding of such a court. Most countries today have military codes of justice administered by military courts, often subject to civilian appellate review. Courts-martial are generally convened as ad hoc courts to try one or more cases referred by some high military authority. The convening officer chooses officers, and sometimes enlisted personnel, from his or her command to sit on the court, determine guilt or innocence, and hand down sentences. See also MILITARY LAW.

Courts of Appeals, U.S. See UNITED STATES COURTS OF APPEALS

courtship behaviour Animal activity that results in mating and reproduction. Courtship may simply involve a few chemical, visual, or auditory stimuli, or it may be a highly complex series of acts by two or more individuals using several modes of communication. Females of some insect species use PHEROMONES to attract males from a distance. Painted turtles court by touch, and the courtship songs of frogs are heard on spring nights across much of the world. Certain bird species have complex courtship patterns. Courtship is important as an isolating mechanism to prevent different species from interbreeding, and elaborate courtship rituals help strengthen pair bonds that may last through the raising of the young or longer. See also DISPLAY BEHAVIOUR.

Cousteau \kü-'stō**, Jacques-Yves** (b. June 11, 1910, Saint-André-de-Cubzac, France—d. June 25, 1997, Paris) French ocean explorer. A navy officer, he coinvented the Aqua-Lung, or scuba. He founded the French Office of Underseas Research (now the Centre of Advanced Marine Studies) in Marseille. For decades, beginning in 1950, he traveled the world in research vessels named *Calypso*. He invented a process for using television underwater, and he hosted an internationally successful television series (1968–76). He served as director of Monaco's Oceanographic Museum (1957–88). In his later years he issued increasingly dire warnings about human destruction of the oceans. His many popular books include *The Silent World* (1953) and *The Living Sea* (1963); his films include *The Golden Fish* (1960, Academy Award).

Cousy \'kü-zē**, Bob** *in full* **Robert Joseph Cousy** (b. Aug. 9, 1928, New York, N.Y., U.S.) U.S. basketball player and coach. He played collegiate ball at Holy Cross College and joined the Boston Celtics in 1950. One of the game's great ball-handling guards and playmakers, he led the NBA in assists from 1953 to 1960. He left the Celtics to coach at Boston College (1963–69), but he eventually returned to the professional game as coach of the Cincinnati Royals (1969–73).

covalent \'kō-'vā-lənt\ **bond** Force holding ATOMS in a MOLECULE together as a specific, separate entity (as opposed to, e.g., colloidal aggregates; see BONDING). In covalent bonds, two atoms share one or more pairs of valence ELECTRONS to give each atom the stability found in a NOBLE GAS. In single bonds (e.g., H—H in molecular hydrogen), one electron pair is shared; in double bonds (e.g., O=O in molecular oxygen or $H_2C{=}CH_2$ in ethylene), two; in triple bonds (e.g., HC≡CH in acetylene), three. In coordinate covalent bonds, additional electron pairs are shared with another atom, usually forming a FUNCTIONAL GROUP, such as SULFATE (SO_4) or PHOSPHATE (PO_4). The number of bonds and the atoms participating in each (including any additional paired electrons) give molecules their CONFIGURATION; the slight negative and positive charges at the opposite ends of a covalent bond are the reason most molecules have some polarity (see ELECTROPHILE; NUCLEOPHILE). Carbon in organic compounds can have as many as four single bonds, each pointing to one vertex of a tetrahedron; as a result, certain molecules exist in mirror-image forms (see OPTICAL ACTIVITY). Double bonds are rigid, leading to the possibility of geometric ISOMERS (see ISOMERISM). Some types of bonds, such as the AMIDE linkages that join the AMINO ACIDS in PEPTIDES and PROTEINS (peptide bonds), are apparently single but have some double-bond characteristics because of the electronic structure of the participating atoms. The configurations of ENZYMES and their substrates, determined by their covalent bonds (particularly the peptide bonds) and hydrogen bonds, are crucial to the reactions they participate in, which are fundamental to all life. See also AROMATIC COMPOUND; compare IONIC BOND.

cove See COVING

covenant \'kə-və-ˌnant\ In the Hebrew scriptures, an agreement or treaty among peoples or nations, but most memorably the promises that God extended to humankind (e.g., the promise to NOAH never again to destroy the earth by flood or the promise to ABRAHAM that his descendants would multiply and inherit the land of Israel). God's revelation of the law to MOSES on Mount SINAI created a pact between God and Israel known as the Sinai covenant. In Christianity, Jesus' death established a new covenant between God and humanity. Islam holds that the Last Covenant was between God and the Prophet MUHAMMAD.

Covenant, Ark of the See ARK OF THE COVENANT

covenant, restrictive See RESTRICTIVE COVENANT

Covenanters Scottish Presbyterians of the 17th century who made convenants in which they pledged to maintain specific forms of worship and church government. After the signing of the National Covenant of 1638, the Scottish Assembly abolished the episcopal system. In the Bishops' Wars of 1639–40 the Scots fought against England to maintain their religious liberty. In England the expenses of these wars were a factor in the ENGLISH CIVIL WAR, and in the Solemn League and Covenant of 1643 the Scots promised their aid to the parliamentarian faction provided that the Church of England was reformed along Presbyterian lines. Cromwell's settlement failed to satisfy the Covenanters, but their situation worsened considerably once CHARLES II came to the throne in 1660. Episcopacy was brought back, and the Covenanters endured severe persecutions. Not until the GLORIOUS REVOLUTION of 1688 was PRESBYTERIANISM reestablished in Scotland.

Covent \'kə-vənt\ **Garden** Square in London. It is now the site of the Royal Opera House, home of the British national opera and ballet companies. The land around the site, once a convent garden, was laid out as a residential square in 1630. The original Covent Garden playhouse, called the Theatre Royal, was built in 1732 and served for performances of plays, pantomimes, and opera. Twice destroyed by fire and rebuilt, the theatre became the Royal Italian Opera House (1847) and was replaced by the Royal Opera Co. (1888). The square was also the site of a fruit, flower, and vegetable market from 1670 to 1974.

Coventry City and metropolitan borough (pop., 2001: 300,844), central England. The city was the home of Lady GODIVA who, with her husband, founded a Benedictine abbey there in 1043. It was probably the centre of the presentation of the Coventry MYSTERY PLAYS in the 15th–16th centuries. During World War II, heavy bombing by the Germans left the town severely damaged. The spire of the 15th-century St. Michael's Cathedral and its ruined nave stand beside the new cathedral built in 1962. Chief industries are motor vehicle manufacturing and telecommunications.

cover crop Fast-growing CROP, such as RYE, BUCKWHEAT, COWPEA, or VETCH, planted to prevent soil EROSION, increase nutrients in the soil, and provide organic matter. Cover crops are grown either in the season during which cash crops are not grown or between the rows of some crops (e.g., fruit trees). See also GREEN MANURE.

Coverdale, Miles (b. 1488?, York, Yorkshire, Eng.—d. Jan. 20, 1569, London) English bishop who issued the first printed English Bible. Ordained in 1514, he became an AUGUSTINIAN friar at Cambridge, where he adopted LUTHERAN beliefs. By 1528 he was preaching against graven images and the mass. He lived abroad during 1528–34 to escape persecution, and while in Antwerp he translated the entire Bible into English; his Bible was published in 1535. He returned to England and edited the Great Bible (1539) but was soon forced to flee by the religious policies of HENRY VIII. He returned after Henry's death and became bishop at Exeter in 1551. Under the Catholic MARY I, he lost his office but was spared execution.

covering-law model Model of explanation according to which to explain an event by reference to another event necessarily presupposes an appeal to laws or general propositions correlating events of the type to be explained (explananda) with events of the type cited as its causes or conditions (explanantia). It is rooted in DAVID HUME's doctrine that, when two events are said to be causally related, all that is meant is that they instantiate certain regularities of succession that have been repeatedly observed to hold between such events in the past. This doctrine was given more rigorous expression by the logical positivist Carl Hempel (1905–1997).

coverture \'kə-vər-ˌchůr\ In law, the inclusion of a woman in the legal person of her husband upon marriage. Because of coverture, married

© 2006 Encyclopædia Britannica, Inc.

women formerly lacked the legal capacity to hold their own PROPERTY or to contract on their own behalf (see CONTRACT); similarly, a husband's tax payments or jury duty "covered" his wife as well. Aspects of coverture survived well into the 20th century; the term is still used in law when dividing jointly held property in divorce proceedings.

coving *or* **cove** Concave MOLDING or deeply arched section of a wall surface. The curve typically describes a quarter-circle and serves to connect walls and ceiling (cove ceiling). The arched sections may be used to conceal light fixtures for dramatic effect, hence the term cove lighting. Coving can also refer to the curved soffit connecting the top of an exterior wall to a projecting eave.

cow In animal husbandry, the mature female of domesticated CATTLE. The name is also applied to the mature female of various, usually large, animals (e.g., ELEPHANT, WHALE, or MOOSE), or, more broadly, to any domestic bovine animal (see BOVID) regardless of gender or age.

Coward, Sir Noël (Peirce) (b. Dec. 16, 1899, Teddington, near London, Eng.—d. March 26, 1973, St. Mary, Jam.) British playwright, actor, and songwriter. An actor from age 12, he wrote light comedies between engagements, but it was a serious drama, *The Vortex* (1924), that established his reputation. His classic comedies came later: *Hay Fever* (1925), *Private Lives* (1930), *Design for Living* (1933), *Present Laughter* (1939), and *Blithe Spirit* (1941) presented sophisticated characters in a worldly milieu. He often wrote for and performed with his close friend GERTRUDE LAWRENCE. His most popular musical play was *Bitter Sweet* (1929). He wrote the poignant film *Brief Encounter* (1945), and he acted in the film versions of many of his plays. He also wrote short stories, novels, and numerous songs, including "Mad Dogs and Englishmen."

cowbird Any of six PASSERINE species related to New World blackbirds (family Icteridae) that exhibit brood parasitism. Cowbirds lay their eggs in the nests of other birds, usually one to each host nest. Young cowbirds, which displace nestlings or outcompete them for food, may grow larger than the foster parents. In parts of North America, the brown-headed cowbird (*Molothrus ater*) parasitizes the nests of more than 200 other bird species; others use the nests of only one or two kinds of ORIOLE. Cowbirds forage on the ground, often associating with cattle in order to catch insects stirred up by the cows' hooves. The male of most species is a uniform glossy black, the female grayish brown.

cowboy Horseman skilled at handling cattle in the U.S. West. From c. 1820, cowboys were employed in small numbers on Texas ranches, where they had learned the skills of the *vaquero* (Spanish: "cowboy"). After the Civil War, their numbers rapidly multiplied as cattle raising evolved into a lucrative industry throughout the western territories. Cowboys rounded up and branded the cattle, kept watch over the herd, and drove those ready for market to railroad towns. As the agricultural frontier moved west, the open range was transformed into farms, and by 1890 cowboys had been forced to settle on ranches. The romance of their image lived on in U.S. folklore and through movies and television.

Cowell, Henry (Dixon) (b. March 11, 1897, Menlo Park, Calif., U.S.—d. Dec. 10, 1965, Shady, N.Y.) U.S. avant-garde composer. He began early to experiment with techniques such as tone clusters and direct manipulation of piano strings. Five tours of Europe as composer-pianist (1923–33) expanded his reputation. He coinvented the Rhythmicon, an instrument for producing several conflicting rhythms simultaneously. Immensely prolific, he wrote nearly 1,000 pieces, including 19 completed symphonies, hundreds of piano works, and many ballets. In 1927 he founded the journal *New Music*. His book *New Musical Resources* (1930) presented his compositional ideas. He was one of the most important innovators in the history of American music.

Cowley, Abraham (b. 1618, London—d. July 28, 1667, Chertsey, Eng.) British poet and essayist. He was a fellow at the University of Cambridge but was ejected for his political opinions during the ENGLISH CIVIL WARS; he joined the queen's court, performing Royalist missions until 1656. In his poetic works—which include *The Mistress* (1647, 1656), the unfinished epic *Davideis* (1656), and *Pindarique Odes* (1656), in which he adapted the Pindaric ode to English verse—he used grossly elaborate, fanciful, poetic language that was more decorative than expressive. In his retirement he wrote sober, reflective essays.

Cowley, Malcolm (b. Aug. 24, 1898, Belsano, Pa., U.S.—d. March 27, 1989, New Milford, Conn.) U.S. literary critic and social historian. He was educated at Harvard and in France. As literary editor of the *New Republic* (1929–44), he took part in many Depression-era literary and political battles, usually on the leftist side. He revived the reputation of WILLIAM FAULKNER with *The Portable Faulkner* (1946). His books include *Exile's Return* (1934), a history of expatriate American writers; *The Literary Situation* (1954), on the role of writers in society; and the collections *Think Back on Us* (1967) and *A Many-Windowed House* (1970).

cowpea *or* **black-eyed pea** Any of the cultivated forms of the annual legume *Vigna unguiculata*. The plants are believed to be native to India and the Middle East but in early times were cultivated in China. The compound leaves have three leaflets. The white, purple, or pale-yellow flowers usually grow in twos or threes at the ends of long stalks. The pods are long and cylindrical. In the southern U.S. the cowpea is grown extensively as a HAY crop, as a COVER or GREEN-MANURE crop, or for the edible BEANS.

Cowper \'kü-pər**, William** (b. Nov. 26, 1731, Great Berkhamstead, Hertfordshire, Eng.—d. April 25, 1800, East Dereham, Norfolk) British poet. Throughout his life he was plagued by recurring mental instability and religious doubt. *Olney Hymns* (1779; with John Newton), a book of devotional verse, includes hymns that are still favourites in Protestant England. *The Task* (1785), a long discursive poem written "to recommend rural ease," was an immediate success. He also wrote many melodious, even humorous, shorter lyrics, and he is considered one of the best letter writers in English. His work, often about everyday rural life, brought a new directness and humanitarianism to 18th-century nature poetry, foreshadowing ROMANTICISM.

William Cowper, detail of an oil painting by Lemuel Abbott, 1792; in the National Portrait Gallery, London

COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

cowrie Any of several marine SNAILS (genus *Cypraea*) found chiefly in coastal waters of the Indian and Pacific oceans. Its humped, thick shell is beautifully coloured (often speckled) and glossy. That of the 4-in. (10-cm) golden cowrie was traditionally worn by royalty on Pacific islands. The money cowrie, a 1-in. (2.5-cm) yellow species, has served as currency in Africa and elsewhere.

Cowrie (*Cypraea*)

BUCKY REEVES FROM THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS—EB INC.

cowslip Any of several flowering plants, including (chiefly in British usage) the wild PRIMROSE (*Primula veris*) and (in U.S. usage) the MARSH MARIGOLD (*Caltha palustris*). *P. veris*, once so abundant that it was used freely to make cowslip wine, is now much less common. Both *P. veris* and *C. palustris* are used in herbal remedies.

Cox, James M(iddleton) (b. March 31, 1870, Jacksonburg, Ohio, U.S.—d. July 15, 1957, Dayton, Ohio) U.S. politician. He worked as a reporter in Cincinnati before buying the *Dayton News* (1898) and *Springfield Daily News* (1903). A supporter of WOODROW WILSON, he served in the U.S. House of Representatives (1909–13) and then was elected governor of Ohio (1913–15, 1917–21), where he introduced workers' compensation and the minimum wage. He won the Democratic presidential nomination in 1920 but was defeated by WARREN G. HARDING in a Republican landslide.

Coxey's Army Group of unemployed men who marched to Washington, D.C., in the depression year of 1894. Jacob S. Coxey (1854–1951), a businessman, led the group, which hoped to persuade Congress to authorize public-works programs to provide jobs. It left Ohio on March 25 and reached Washington on May 1 with about 500 men, the only one of several groups to reach its destination. It attracted much attention but failed to bring about any legislation.

coyote \kī-'ō-tē, 'kī-ˌōt\ Species (*Canis latrans*) of CANINE found in North and Central America. Its range extends from Alaska and Canada south

© 2006 Encyclopædia Britannica, Inc.

through the continental U.S. and Mexico to Central America. It weighs about 20–50 lbs (9–23 kg) and is about 3–4 ft (1–1.3 m) long, including its 12–16-in. (30–40-cm) tail. Its coarse fur is generally buff above and whitish below; its legs are reddish, and its tail is bushy and black-tipped. The coyote feeds mainly on small mammals such as rodents, rabbits, and hares but can also take down deer, sometimes doing so in packs. Vegetation and carrion are commonly eaten as well. Though persecuted by humans because of its potential (generally overstated) to prey on domestic or game animals, it has adapted well to human-dominated environments, including urban areas. A coyote-dog cross is called a coydog.

coypu See NUTRIA

Coysevox \kwȧz-'vôks**, Antoine** (b. Sept. 29, 1640, Lyon, Fr.—d. Oct. 10, 1720, Paris) French sculptor. In 1666 he became sculptor to LOUIS XIV and by 1678 was working at Versailles. He was known for his portrait busts, which show a naturalism and animation of expression that anticipates the ROCOCO STYLE. He also executed decorative sculpture for the royal gardens and did much interior decoration. Coysevox exerted considerable influence on the development of French portrait sculpture in the 18th century.

CP violation In PARTICLE PHYSICS, the violation of the combined CONSERVATION LAWS associated with charge conjugation, C (the operation of turning a particle into its antiparticle), and PARITY, P, by the WEAK FORCE. In 1957 it was discovered that parity is violated in BETA DECAY. No fully satisfactory explanation has been devised, but CP violation does enable physicists to make an absolute distinction between MATTER and ANTIMATTER.

CPR See CARDIOPULMONARY RESUSCITATION

CPU *in full* **central processing unit** Principal component of a DIGITAL COMPUTER, composed of a control unit, an instruction-decoding unit, and an arithmetic-logic unit. The CPU is linked to main memory, peripheral equipment (including input/output devices), and storage units. The control unit integrates computer operations. It selects instructions from the main memory in proper sequence and sends them to the instruction-decoding unit, which interprets them so as to activate functions of the system at appropriate moments. Input data are transferred via the main memory to the arithmetic-logic unit for processing (i.e., addition, subtraction, multiplication, division, and certain logic operations). Larger computers may have two or more CPUs, in which case they are simply called "processors" because each is no longer a "central" unit. See also MULTIPROCESSING.

crab Any of 4,500 species of short-tailed DECAPOD, found in all oceans, in freshwater, and on land. Its carapace (upper body shield) is usually broad, and its first pair of legs is modified into pincers. Most crabs live in the sea and breathe through gills, which in land crabs are modified to serve as lungs. They walk or crawl, generally with a sideways gait; some are good swimmers. Crabs are omnivorous scavengers, but many are predatory and some are herbivorous. Two of the largest known CRUSTACEANS are the giant crab of Japan (13 ft, or 4 m, from claw tip to claw tip), a SPIDER CRAB; and the Tasmanian crab (up to 18 in., or 46 cm, long, and weighing more than 20 lbs, or 9 kg). Other species are less than an inch long. Well-known crabs include the HERMIT CRAB, edible crab (Britain and Europe), BLUE CRAB, DUNGENESS CRAB, FIDDLER CRAB, and KING CRAB.

crab louse See human LOUSE

Crab Nebula Bright NEBULA in the constellation Taurus, about 5,000 light-years from Earth. Roughly 12 light-years in diameter, it is the remnant of a SUPERNOVA, first observed by Chinese and other astronomers in 1054, that was visible in daylight for 23 days and at night for almost two years. Identified as a nebula c. 1731, it was named (for its form) in the mid-19th century. In 1921 it was discovered to be still expanding; the present rate is about 700 mi/second (1,100 km/second). The Crab is one of the few astronomical objects from which ELECTROMAGNETIC RADIATION has been detected over the entire measurable SPECTRUM. In the late 1960s a pulsar, thought to be the collapsed remnant star of the supernova, was found near its centre.

Crabbe \'krab**, George** (b. Dec. 24, 1754, Aldeburgh, Suffolk, Eng.—d. Feb. 3, 1832, Trowbridge, Wiltshire) English poet. Reared in an impoverished seacoast village, Crabbe initially became a surgeon. In 1780 he left for London, where his poem *The Village* (1783) brought him fame; written partly as a protest against OLIVER GOLDSMITH's *Deserted Village* (1770), it was Crabbe's attempt to show the misery of rural poverty. *The Newspaper* followed in 1785, but he did not publish again until 1807. In "The Parish Register," he used the register of births, deaths, and marriages to depict the life of a rural community. Considered the last of the Augustan poets, he wrote in heroic couplets. His story of the isolated and violent Peter Grimes in *The Borough* became the basis of a famous opera by BENJAMIN BRITTEN.

crabgrass Any of about 300 species of GRASSES in the genus *Digitaria*, especially *D. sanguinalis* or the slightly shorter *D. ischaemum* (smooth crabgrass). *D. sanguinalis* has long hairs covering its leaves and five or six spikelets; *D. ischaemum* has no hair and only two or three spikelets. Both are natives of Europe that became widely naturalized as weeds in North America. They and a few closely related species are very troublesome in lawns and fields. One species, Arizona cottontop (*D. californica*), is a useful FORAGE grass in the American Southwest.

Cracow See KRAKÓW

Craig, (Edward Henry) Gordon (b. Jan. 16, 1872, Stevenage, Hertfordshire, Eng.—d. July 29, 1966, Vence, France) British actor, stage designer, and drama theorist. The son of ELLEN TERRY, he acted with HENRY IRVING's company (1889–97), then turned to designing stage sets, decor, and costumes. He moved to Florence (1906), where he opened the School for the Art of the Theatre (1913). His international journal *The Mask* (1908–29) made his theatrical ideas widely known. His books *On the Art of the Theatre* (1911), *Towards a New Theatre* (1913), and *Scene* (1923) outlined innovations in STAGE DESIGN based on the use of portable screens and changing patterns of light; his theories influenced the antinaturalist trends of the modern theatre.

Craig, Sir James (Henry) (b. 1748, Gibraltar—d. Jan. 12, 1812, London, Eng.) British army officer and governor-general of Canada (1807–11). In the AMERICAN REVOLUTION, he was wounded at the BATTLE OF BUNKER HILL in 1775 and helped repel the American army's invasion of Canada in 1776. He later served in India. As governor-general in Canada, he cooperated with the governing clique in Quebec but conducted an unpopular repressive policy toward French Canadians. He resigned in 1811 and returned to England.

Craigavon \krā-'ga-vən\ District (pop., 2001: 80,671), Northern Ireland. Established in 1973, it lies south of Lough Neagh. In the north it is flat and composed largely of peat soils; in the south it rises to lowlands. It is an important fruit-growing district and also has textile and pharmaceutical industries. Its administrative seat, Craigavon town, engages in light industry and commerce.

Craiova \krä-'yō-vä\ City (pop., 2002: 302,622), southwestern Romania. Situated near the Jiu River, the area has long been settled; the remains of a Roman fort built under TRAJAN have been excavated nearby. From the late 15th to the 18th century it was the residence of the region's military governors. It prospered as a regional trading centre despite an earthquake in 1790 and a Turkish assault in 1802 during which it was burned. It has a university (1966) and other cultural amenities.

cramp Painful, involuntary, sustained contraction of muscle in limbs or some internal organs. Causes may be neurological, reflex, or psychological. Common muscle cramps include swimmer's cramp from overexertion in cold water, heat cramps from loss of salt in sweat, leg cramps, and occupational (e.g., writer's) cramp. Menstrual cramps are uterine muscle

© 2006 Encyclopædia Britannica, Inc.

contractions before or during MENSTRUATION. Cramps occur in diseases including PARKINSONISM and HUNTINGTON CHOREA. Tetany is severe cramping noticed first in limb muscles.

Cranach \'krä-ˌnäk**, Lucas, the Elder** *orig.* **Lucas Müller** (b. 1472, Cranach, bishopric of Bamberg—d. Oct. 16, 1553, Weimar, Saxe-Weimar) German painter and printmaker. He took his name from the town of his birth. Little is known about his early life or training. In Vienna (c. 1501–04) he painted some notable portraits and landscapes characteristic of the DANUBE SCHOOL. From 1505 to 1550 he was court painter in Wittenberg, where he achieved great success and wealth painting portraits, mythological subjects, and altarpieces for Protestant and Catholic churches. He attracted so many young artists to Wittenberg that the town became an art centre. A friend of MARTIN LUTHER, Cranach became known as the chief pictorial propagandist of the Protestant cause in Germany. He produced numerous engravings and more than 100 woodcuts, notably for the first German edition of the New Testament (1522). After his death, his style was perpetuated by his son, Lucas the Younger (1515–86).

cranberry Fruit of any of several small creeping or trailing plants of the genus *Vaccinium* (HEATH FAMILY), related to the BLUEBERRY. The small-fruited, or northern, cranberry (*V. oxycoccus*) is found in marshy land in northern North America and Asia and in northern and central Europe. Its crimson berries, about the size of currants and often spotted, have an acid taste. The American cranberry (*V. macrocarpon*), found wild in most of the northeastern U.S. and grown extensively in Massachusetts, New Jersey, and Wisconsin and near the Pacific coast in Washington and Oregon, is more robust than *V. oxycoccus*, with larger, pink to very dark red or mottled red-and-white berries. Cranberries are used in drinks, sauces, jellies, and baked goods.

Cranberry (*Vaccinium macrocarpon*)
WALTER CHANDOHA

crane Any of a diverse group of machines that lift and move heavy objects. Cranes differ from hoists, elevators, and other devices intended for vertical lifting, and from conveyors, which continuously lift or carry bulk materials such as grain or coal. Cranes have been widely used only since the introduction of steam engines, internal-combustion engines, and electric motors in the 19th century. They range in type and function from the largest derrick cranes to small, mobile truck cranes. Most derrick cranes can lift 5–250 tons (4.5–230 metric tons). Floating cranes, built on barges for constructing bridges or salvaging sunken objects, may be able to lift 3,000 tons (2,700 metric-tons). Small truck cranes are mounted on heavy, modified trucks; they make up in mobility and ease of transport what they lack in hoisting capacity.

crane Any of 15 species (family Gruidae) of tall wading birds that resemble HERONS but are usually larger and have a partly naked head, a heavier bill, more-compact plumage, and an elevated hind toe. In flight, the long neck stretches out in front and the stiltlike legs trail behind. Cranes are found worldwide, living in marshes and on plains, except in South America. Many populations are endangered by hunting and habitat destruction. Cranes eat small animals, grain, and grass shoots. Two well-known species are the WHOOPING CRANE and the SANDHILL CRANE.

crane flower See BIRD-OF-PARADISE

crane fly Harmless, slow-flying DIPTERAN (family Tipulidae) usually found around water or abundant vegetation. It ranges in size from tiny to slightly over 1 in. (2.5 cm) long. Larvae of the range crane fly (*Tipula simplex*) are called leatherjackets because of their tough brown skin. In northern latitudes a wingless crane-fly species is found on snow. The crane fly is also called daddy longlegs in English-speaking countries other than the U.S. (in the U.S., DADDY LONGLEGS refers to an ARACHNID).

Crane, (Harold) Hart (b. July 21, 1899, Garrettsville, Ohio, U.S.—d. April 27, 1932, at sea, Caribbean Sea) U.S. poet. Crane worked at a variety of jobs before settling in New York City. *White Buildings* (1926), his first book, includes "For the Marriage of Faustus and Helen." His desire to respond to the cultural pessimism of T.S. ELIOT's *The Waste Land* resulted in the long and difficult poem *The Bridge* (1930), which attempts to create an epic myth of the American experience, celebrating the richness of modern life with visionary intensity. Alcoholic and despondent over his homosexuality, he committed suicide at 32 by jumping overboard from a ship in the Caribbean.

Crane, Stephen (b. Nov. 1, 1871, Newark, N.J., U.S.—d. June 5, 1900, Badenweiler, Baden, Ger.) U.S. novelist and short-story writer. Crane briefly attended college before moving to New York City. His *Maggie: A Girl of the Streets* (1893), a sympathetic study of a slum girl's descent into prostitution, was a milestone of literary naturalism. He achieved international fame with his masterwork, *The Red Badge of Courage* (1895), depicting the psychological turmoil of a young Civil War soldier, and with his first book of poems, *The Black Riders* (1895). While traveling as a war correspondent, his ship sank and he almost drowned, resulting in his great story "The Open Boat" (1898). His story collections include *The Little Regiment* (1896), *The Monster* (1899), and *Whilomville Stories* (1900). He died at 28 of tuberculosis.

Stephen Crane, detail of a painting by C.K. Linson, 1896.

Crane, Walter (b. Aug. 15, 1845, Liverpool, Eng.—d. March 14, 1915, Horsham) English illustrator, painter, and designer. The son of a portrait painter, he studied Italian Old Masters and Japanese prints. The ideas of the PRE-RAPHAELITES and JOHN RUSKIN inspired his early paintings. He achieved international popularity designing ART NOUVEAU textiles and wallpapers but is chiefly known for his illustrations of children's books. In 1894 he worked with WILLIAM MORRIS on *The Story of the Glittering Plain*, a book printed in the style of 16th-century German and Italian woodcuts. He belonged to the Art Workers' Guild, and in 1888 he founded the Arts and Crafts Exhibition Society. See also ARTS AND CRAFTS MOVEMENT.

craniosynostosis \ˌkrā-nē-ō-ˌsin-ˌäs-ˈtō-səs\ *or* **craniostosis** \ˌkrā-nē-ō-ˈstō-səs\ Cranial deformity produced when the bones of the SKULL fuse too early. Pressure from the growing brain normally causes the skull bones to grow along the seams (cranial sutures) between them. If all the sutures fuse early, the head remains abnormally small, which can cause mental retardation or blindness. If only one or some fuse early, the skull grows in other directions and becomes deformed. Surgery in the first two years to keep the sutures open longer minimizes these complications.

crank In MECHANICS, an arm secured at right angles to a shaft with which it can rotate or oscillate. Next to the wheel, the crank is the most important motion-transmitting device, because, with the connecting rod, it provides means for converting linear to rotary motion, and vice versa. The first recognizable crank is said to have appeared in China in the 1st century AD. The carpenter's brace was invented c. 1400 by a Flemish carpenter. The first mechanical connecting rods were reportedly used on a treadle-operated machine in 1430. About this time, FLYWHEELS were added to the rotating members to carry the members over the "dead" positions when the rod and the crank arm are lined up with each other.

Cranmer, Thomas (b. July 2, 1489, Aslacton, Nottinghamshire, Eng.—d. March 21, 1556, Oxford) First PROTESTANT archbishop of Canterbury. Educated at the University of Cambridge, he was ordained in 1523. He became involved in HENRY VIII's negotiations with the pope over divorcing CATHERINE OF ARAGON. In 1533 Henry appointed him arch-

Thomas Cranmer, detail of an oil painting by Gerlach Flicke, 1545; in the National Portrait Gallery, London.

© 2006 Encyclopædia Britannica, Inc.

bishop of Canterbury, putting him in a position to help overthrow papal supremacy in England. He annulled Henry's marriage to Catherine, supported his marriage to Anne Boleyn, and later helped him divorce her. After Henry's death in 1547, Cranmer became an influential adviser to the young Edward VI, moving England firmly in a Protestant direction. He wrote the Forty-two Articles, from which the Thirty-nine Articles of Anglican belief were derived. When the strongly anti-Protestant Mary I became queen, Cranmer was tried, convicted of heresy, and burned at the stake.

crannog \'kra-ˌnȯg, kra-'nōg\ In Scotland and Ireland, an artificially constructed site for a house or settlement, usually on an islet or in the shallows of a lake. Made of timber or sometimes stone, crannogs date from the Late Bronze Age into the Middle Ages. Usually fortified by stockades, they were among the latest prehistoric strongholds. See also Lake Dwellings.

crape myrtle Shrub (*Lagerstroemia indica*) of the loosestrife family, native to China and other tropical and subtropical countries and widely grown in warm regions for its flowers. About 25 varieties are cultivated, known primarily by the color of their clustered flowers, which range from white to pink, red, lavender, and bluish.

crappie Either of two deep-bodied freshwater North American fish species (family Centrarchidae) that are popular as food and prized by sport fishermen. Native to the eastern U.S. but introduced elsewhere, crappies may reach a length of about 12 in. (30 cm) and a weight of about 4 lb (2 kg). The white crappie (*Pomoxis annularis*) generally inhabits warm, silty lakes and rivers. Silvery with irregular dark markings, it is usually lighter in colour than the similar black crappie, or calico bass (*P. nigromaculatus*), which typically lives in clear lakes and streams.

craps Gambling game in which each player in turn throws two dice, attempting to roll a winning combination. The term derives from a Louisiana French word, *crabs*, which means "losing throw." The player with the dice (the shooter) must first put up a stake; the other players bet against the shooter up to the amount of the stake. In some games, bettors may also bet against each other or against the house. A shooter who wins may continue to roll. A 7 or 11 on the first roll wins; a 2, 3, or 12 (craps) loses. Any other number requires the shooter to continue rolling until he or she rolls the same number again for a win or rolls a 7 (craps) and loses.

Crash of 1929, Stock Market See Stock Market Crash of 1929

Crassus, Lucius Licinius (b. 140—d. 91 BC) Roman lawyer and politician. He is regarded, with Marcus Antonius (b. 143—d. 87), as one of the greatest Latin orators before Marcus Tullius Cicero and is portrayed in Cicero's *De oratore* (55 BC). Made consul in 95, he cosponsored a law (Lex Licinia Mucia) that provided for the prosecution of anyone falsely claiming Roman citizenship, which led to the revolt of Rome's Italian allies in 90–88.

Crassus, Marcus Licinius (b. c. 115—d. 53 BC) Roman financier and politician. He sided with Lucius Cornelius Sulla against Gaius Marius in the civil war of 83–82 BC and came into conflict with Pompey the Great. In 72–71 he put down the slave rebellion led by Spartacus. He made loans to indebted senators, including Julius Caesar. In 70 Crassus and Pompey were elected co-consuls. Ten years later Crassus, Caesar, and Pompey formed the First Triumvirate (see triumvirate). As governor of Syria (54) Crassus invaded Parthia; his death at the Battle of Carrhae led to civil war between Caesar and Pompey.

crater Circular depression in the surface of a planetary body. Most craters are the result of impacts of meteorites or of volcanic explosions. Meteorite craters are more common on the Moon and Mars and on other planets and natural satellites than on Earth, because most meteorites either burn up in the Earth's atmosphere before reaching its surface or erosion soon obscures the impact site. Craters made by exploding volcanoes (e.g., Crater Lake, Ore.) are more common on the Earth than on the Moon, Mars, or Jupiter's moon Io, where they have also been identified.

Crater Lake Lake, Cascade Range, southwestern Oregon, U.S. The lake is in a huge volcanic caldera 6 mi (10 km) in diameter and 1,932 ft (589 m) deep. It is the remnant of a mountain destroyed in an eruption more than 6,000 years ago. The intensely blue lake and its surrounding region became a national park in 1902; the park covers 250 sq mi (647 sq km).

Craters of the Moon National Monument and Preserve Region of volcanic cones and craters, south-central Idaho, U.S. Established in 1924 as a national monument, it has more than 35 craters, probably extinct only a few millennia. Some are nearly a half-mile across and several hundred feet deep and reach a height of more than 6,000 ft (1,800 m). Tunnels formed by fissure eruptions feature stalactites and stalagmites in red and blue. In 2000 the monument was expanded from 83 to 1,117 sq mi (215 to 2,893 sq km); in 2002 part of it was designated a national preserve.

Crawford, Cheryl (b. Sept. 24, 1902, Akron, Ohio, U.S.—d. Oct. 7, 1986, New York, N.Y.) U.S. actress and theatre producer. She acted with the Theatre Guild from 1923 and became its casting manager (1928–30). She helped found the Group Theatre in 1931. A cofounder of the Actors Studio in 1947, she went on to serve as its executive producer. Her notable Broadway productions included *Brigadoon* (1947) and Tennessee Williams's *The Rose Tattoo* (1951) and *Sweet Bird of Youth* (1959).

Crawford, Isabella Valancy (b. Dec. 25, 1850, Dublin, Ire.—d. Feb. 12, 1887, Toronto, Ont., Can.) Irish-born Canadian poet. She immigrated to Canada with her family in 1858. From 1875 until her death, she lived with her mother in Toronto, meagrely sustained by sales of stories and poems to periodicals. The only book published during her lifetime (at her own expense) was *Old Spookses' Pass, Malcom's Katie, and Other Poems* (1884). Her work, notable for its vivid descriptions of the Canadian landscape, was rediscovered in the 1970s, and many collections have since been published.

Crawford, Joan *orig.* **Lucille Fay LeSueur** (b. March 23, 1908, San Antonio, Texas, U.S.—d. May 10, 1977, New York, N.Y.) U.S. film actress. She was a dancer in a Broadway chorus line when she won her first Hollywood contract in the mid 1920s. After portraying flappers in such films as *Our Dancing Daughters* (1928), she played opportunistic girls in such Depression-era dramas as *Grand Hotel* (1932) and *The Women* (1939). With her dark eyebrows, padded shoulders, and hysterical intensity, she reinvented herself as a suffering heroine in *Mildred Pierce* (1945, Academy Award) and in psychological melodramas including *Possessed* (1947) and *Sudden Fear* (1952). Her later films included *Queen Bee* (1955) and *What Ever Happened to Baby Jane?* (1962).

Crawford, William H(arris) (b. Feb. 24, 1772, Amherst county, Va.—d. Sept. 15, 1834, Elberton, Ga., U.S.) U.S. political leader and presidential aspirant. He taught school and practiced law before being elected to the Georgia legislature in 1803. He served in the U.S. Senate (1807–13), where he backed the declaration of war against Britain in 1812 (see War of 1812). He later served as minister to France (1813–15), secretary of war (1815–16), and secretary of the treasury (1816–25). Nominated for president by the congressional caucus of the Democratic-Republican Party, he was one of four presidential candidates in the 1824 election, which was won by John Quincy Adams.

Crawford Seeger, Ruth *orig.* **Ruth Porter Crawford** (b. July 3, 1901, East Liverpool, Ohio, U.S.—d. Nov. 18, 1953, Chevy Chase, Md.) U.S. composer. She studied piano as a child and was self-taught as a composer until she entered the American Conservatory. After early works influenced by Alexander Scriabin, she wrote several astonishing serial pieces, including her *String Quartet* (1931). She married the musicologist Charles Seeger (1886–1979) in 1931, becoming folk singer Pete Seeger's stepmother. She composed little after that but became an influential curator of American folk music.

Craxi \'kräk-sē**, Bettino** *orig.* **Benedetto Craxi** (b. Feb. 24, 1934, Milan, Italy—d. Jan. 19, 2000, Al-Hammamet, Tun.) Italian politician, Italy's first socialist prime minister (1983–87). Involved initially with the socialist youth movement, he won election to the Chamber of Deputies in 1968 and rose to become the Socialist Party's general secretary in 1976. He united the faction-ridden party, committed it to moderate social and economic policies, and tried to dissociate it from the much larger Italian Communist Party. As prime minister, he pursued anti-inflationary fiscal policies and steered a pro-U.S. course in foreign affairs. In 1993 multiple

© 2006 Encyclopædia Britannica, Inc.

charges of political corruption forced Craxi, who denied the allegations, to resign as party leader. He moved to Tunisia, and in 1994 he was twice sentenced in absentia to prison terms.

Cray, Seymour R(oger) (b. Sept. 28, 1925, Chippewa Falls, Wis., U.S.—d. Oct. 5, 1996, Colorado Springs, Colo.) U.S. electronics engineer. He worked in the 1950s on the UNIVAC I, a landmark first-generation digital computer, and he led the design of the world's first transistor-based computer (the CDC 1604). In 1972 he founded Cray Research, Inc., and there built the fastest and most powerful supercomputers in the world, using his innovative MULTIPROCESSING design. The Cray-2 (1985) could perform 1.2 billion calculations per second, an incredible pace in its day.

crayfish *or* **crawfish** *or* **crawdad** Any of more than 500 species of DECAPODS that are closely related to the LOBSTER. Nearly all the species live in freshwater, and over half are found in North America. They have a joined head and thorax (midsection) and a segmented body that is yellow, green, red, or dark brown. The head has a sharp snout, and the eyes are on movable stalks. The exoskeleton is thin but tough, and the front pair of legs have large pincers. Crayfish are usually about 3 in. (7.5 cm) long but range from 1 to 16 in. (2.5–40 cm) long.

Crazy Horse (b. 1842?, near present-day Rapid City, S.D., U.S.—d. Sept. 5, 1877, Fort Robinson, Neb.) Oglala SIOUX Indian chief. Refusing to abide by an 1868 treaty granting the Sioux a large reservation in the Black Hills, Crazy Horse led his warriors in continued raids against enemy tribes as well as against whites. In 1876 he joined with CHEYENNE forces in a surprise attack against Gen. George Crook in southern Montana, forcing Crook's withdrawal. Crazy Horse then united with Chief SITTING BULL for the Battle of the LITTLE BIGHORN, where he helped annihilate Lt. Col. GEORGE ARMSTRONG CUSTER's troops. In 1877, his tribe weakened by cold and hunger, Crazy Horse surrendered to Crook; removed to a military outpost in Nebraska, he was killed in a scuffle with soldiers.

cream Yellowish part of MILK, rich in butterfat, that rises to the surface naturally if milk is allowed to stand. In the dairy industry, cream is separated mechanically. Cream is graded by percentage of fat content. In the U.S., half-and-half, a mixture of milk and cream, contains 10.5–18% butterfat; light cream, commonly served with coffee, contains no less than 18%; and medium and heavy creams (the latter including whipping cream) contain about 30% and 36% respectively. Commercial sour cream, about 18–20% butterfat, is inoculated with lactic-acid-producing bacteria. See also ICE CREAM.

creamware Cream-coloured English EARTHENWARE made in the late 18th century. It was designed as a substitute for Chinese porcelain. In 1762 JOSIAH WEDGWOOD achieved commercial success with this modestly priced utilitarian ware; restrained designs and elegant transfer printing (see BATTERSEA ENAMELWARE) were compatible with his cream-glazed products. By 1790 many other factories (e.g., Liverpool, Bristol, Staffordshire) were producing creamware with success; continental imitations were generally inferior. Creamware was continually made throughout the 19th century and later.

Leeds creamware teapot decorated with green enameling and pierced work, Yorkshire, England, late 18th century; in the Victoria and Albert Museum, London

creation myth *or* **cosmogony** \kāz-'mä-gə-nē\ Symbolic narrative of the creation and organization of the world as understood in a particular tradition. Not all creation myths include a creator, though a supreme creator deity, existing from before creation, is very common. Myths in which the world emerges gradually emphasize the latent power of the earth. In other creation myths, the world is the offspring of primordial parents, derives from a cosmic egg, or is brought up from primordial waters by an animal or devil. Humans may be placed on earth by a god or rise from its depths or from a cultic rock or tree. There are often three stages of creation: that of primordial beings or gods, that of human ancestors who are often semidivine, and that of humans. Creation myths explain or validate basic beliefs, patterns of life, and culture. Rituals dramatize the myth and, particularly in initiations, validate the community's organization and rankings.

creationism The belief that matter, the various forms of life, and the world were created by God out of nothing. Biblical creationists believe that the story told in Genesis of God's six-day creation of the universe and all living things is literally correct. Scientific creationists believe that a creator made all that exists, though they may not hold that the GENESIS story is a literal history of that creation. Creationism became the object of renewed interest among conservative religious groups following the wide dissemination of the theory of biological EVOLUTION, first systematically propounded by CHARLES DARWIN in *On the Origin of Species* (1859). In the early 20th century some U.S. states banned the teaching of evolution, leading to the SCOPES TRIAL. In the late 20th century many creationists advocated a view known as INTELLIGENT DESIGN, which was essentially a scientifically modern version of the ARGUMENT FROM DESIGN for the existence of God as set forth in the late 18th century by the Anglican clergyman WILLIAM PALEY.

creativity Ability to produce something new through imaginative skill, whether a new solution to a problem, a new method or device, or a new artistic object or form. The term generally refers to a richness of ideas and originality of thinking. Psychological studies of highly creative people have shown that many have a strong interest in apparent disorder, contradiction, and imbalance, which seem to be perceived as challenges. Such individuals may possess an exceptionally deep, broad, and flexible awareness of themselves. Studies also show that INTELLIGENCE has little correlation with creativity; thus, a highly intelligent person may not be very creative. See also GENIUS; GIFTED CHILD.

Crécy \krā-'sē**, Battle of** (August 26, 1346) English victory in the first phase of the HUNDRED YEARS' WAR against the French. At Crécy-en-Ponthieu, EDWARD III of England defeated PHILIP VI of France, even though the English forces were greatly outnumbered. The English gained the advantage because their archers were armed with LONGBOWS and because of their strong defensive position.

credit Transaction between two parties in which one (the creditor or lender) supplies money, goods, services, or securities in return for a promised future payment by the other (the debtor or borrower). Such transactions normally include the payment of INTEREST to the lender. Credit may be extended by public or private institutions to finance business activities, agricultural operations, consumer expenditures, or government projects. Large sums of credit are usually extended through specialized financial institutions such as COMMERCIAL BANKS or through government lending programs.

credit bureau Organization that provides information to merchants or other businesses concerning the creditworthiness of their customers. Credit bureaus may be private enterprises or may be operated on a cooperative basis by the merchants in one locality. Users of the service pay a fee and receive information from various sources, including businesses that have granted the customer credit in the past, public records, newspapers, the customer's employment record, and direct investigation.

credit card Small card that authorizes the person named on it to charge goods or services to his or her account. It differs from a debit card, with which money is automatically deducted from the bank account of the cardholder to pay for the goods or services. Credit-card use originated in the U.S. in the 1920s; early credit cards were issued by various firms (e.g., oil companies and hotel chains) for use at their outlets only. The first universal credit card, accepted by a variety of establishments, was issued by Diners' Club in 1950. Charge cards such as AMERICAN EXPRESS require cardholders to pay for all purchases at the end of the billing period (usually monthly). Bank cards such as MasterCard and Visa allow customers to pay only a portion of their bill; INTEREST accrues on the unpaid balance. Credit-card companies get revenue from annual fees and interest paid by cardholders and from fees paid by participating merchants.

Crédit Mobilier \'kred-it-mō-'bēl-yər,\ *French* \krā-'dē-ˌmō-bēl-'yā\ **scandal** (1872–73) Illegal manipulation of construction contracts for the UNION PACIFIC RAILROAD that became a symbol of corruption after the American Civil War. The railroad's major stockholders created Crédit Mobilier of America to divert its construction profits and gave or sold stock to influential politicians in return for favours. A newspaper exposed the scheme in 1872, and after a Congressional investigation two members of the House of Representatives were censured.

credit union Credit COOPERATIVE formed by a group of people with some common bond who, in effect, save their money together and make low-

© 2006 Encyclopædia Britannica, Inc.

cost loans to each other. The loans are usually short-term consumer loans, mainly for automobiles, household needs, medical debts, and emergencies. Credit unions generally operate under government charter and supervision. They are particularly important in less developed countries, where they may be the only source of credit for their members. The first cooperative societies providing CREDIT were founded in Germany and Italy in the mid-19th century; the first North American credit unions were founded by Alphonse Desjardins in Lévis, Quebec (1900), and Manchester, N.H. (1909). The Credit Union National Association (CUNA), a federation of U.S. credit unions, was established in 1934 and became a worldwide association in 1958.

creditor See DEBTOR AND CREDITOR

Cree One of the major ALGONQUIAN-speaking Indian peoples of Canada living mainly in Saskatchewan and Alberta. The name is a truncated form of the name "Kristineaux," the French traders' version of the self-name of the James Bay band. The Cree formerly occupied an immense area from western Quebec to eastern Alberta. They acquired firearms and engaged in the fur trade with Europeans beginning in the 17th century. There were two major divisions: the Woodland Cree, whose culture was essentially an EASTERN WOODLANDS type, and the Plains Cree, bison hunters of the northern Great Plains (see PLAINS INDIAN). Social organization in both groups was based on local BANDS. Among the Woodland Cree, rituals and taboos relating to the spirits of game animals were pervasive, as was fear of witchcraft. Among the more militant Plains Cree, rites intended to foster success in warfare and the bison hunt were common. Some 600,000 Canadians claim some portion of Cree ancestry, and about 2,500 individuals claimed sole Cree descent in the 2000 U.S. census.

creed Officially authorized, usually brief statement of the essential articles of faith of a religious community, often used in public worship or initiation rites. Creeds are most numerous in Western traditions. In ISLAM the *shahāda* declares that only God is God and MUHAMMAD is his prophet. In JUDAISM early creeds are preserved in Hebrew scripture, and later creeds include the THIRTEEN PRINCIPLES OF FAITH. In CHRISTIANITY the NICENE CREED was formulated in AD 381 to exclude ARIANISM, and the Apostles' Creed was drafted in the 8th century from earlier baptismal creeds. BUDDHISM, ZOROASTRIANISM, and modern movements of HINDUISM also possess creeds; in other religions faith is confessed chiefly through liturgical expressions.

Creek *or* **Muscogee** MUSKOGEAN-speaking North American Indian people living mainly in Oklahoma, U.S., but also in Georgia and Alabama. A loose and shifting confederation of groups that once occupied much of the Georgia and Alabama flatlands, the Creek comprised two major divisions: the Upper Creeks (living on the Coosa and Tallapoosa rivers) and the Lower Creeks (living on the Chatahootchee and Flint rivers). They cultivated corn, beans, and squash. Each Creek town had a plaza or community square, often with a temple, around which were built the rectangular houses. Religious observances included the Busk (Green Corn) ceremony, an annual first-fruits and new-fire rite. In the 18th century a Creek Confederacy—including the Natchez, Yuchi, SHAWNEE, and others—was organized to present a united front against both European and Indian enemies. It proved a failure, however, since at no time did all groups contribute warriors to a common battle. The Creek War against the U.S. (1813–14) ended with the defeated Creeks ceding 23 million acres. Most were forcibly removed to Indian Territory (Oklahoma). Some 40,200 individuals claimed sole Creek ancestry in the 2000 U.S. census.

Ben Perryman, a Creek Indian, painting by George Catlin, 1836; in the National Museum of American Art, Smithsonian Institution, Washington, D.C.

NATIONAL MUSEUM OF AMERICAN ART (FORMERLY NATIONAL COLLECTION OF FINE ARTS), SMITHSONIAN INSTITUTION, WASHINGTON, D.C., GIFT OF MRS. SARAH HARRISON

creep Slow change in the dimensions of a material from prolonged STRESS. Most common METALS exhibit creep behaviour. In the creep test, loads below those that ordinarily cause plastic flow or fracture are applied to the material, and the DEFORMATION over a period of time (creep strain) under constant load is measured, usually with an extensometer or STRAIN GAUGE. Time to failure is also measured against stress. Once creep strain versus time is plotted, various mathematical techniques are available for extrapolating creep behaviour beyond the test times; thus, designers can use thousand-hour test data, for example, to predict ten-thousand-hour behaviour. See also TESTING MACHINE.

cremation Disposing of a corpse by burning. In the ancient world cremation took place on an open pyre. It was practiced by the Greeks (who considered it suitable for heroes and war dead) and the Romans (among whom it became a status symbol). The pagan Scandinavians also cremated their dead. In India the custom is very ancient. In some Asian countries only certain people may be cremated (e.g., high lamas in Tibet). Christianity opposed cremation, and it became rare in Europe after AD 1000 except under extreme circumstances, such as that brought on by the BLACK DEATH. The practice reemerged in the late 19th century and was eventually accepted by both Protestants and Roman Catholics.

Creole In the 16th–18th centuries, a person born in Spanish America of Spanish parents, as distinguished from one born in Spain but residing in America. Under Spanish colonial rule, Creoles suffered from discrimination; it was consequently Creoles who led the 19th-century revolutions against Spain and became the new ruling class. Today Creole has widely varying meanings. In Louisiana it can mean either French-speaking white descendants of early French and Spanish settlers, or people of mixed descent who speak a form of French and Spanish. In Latin America the term may denote a local-born person of pure Spanish extraction or a member of the urban Europeanized classes as opposed to rural Indians. In the West Indies it refers to all people, regardless of ancestry, who are part of the Caribbean culture. See also CREOLE language.

creole Any PIDGIN language that has become established as the native language of a speech community. A creole usually arises when speakers of one language become economically or politically dominant over speakers of another. A simplified or modified form of the dominant group's language (pidgin), used for communication between the two groups, may eventually become the native language of the less powerful community. Examples include Sea Island Creole (formerly Gullah, derived from English), spoken in South Carolina's Sea Islands; Haitian Creole (derived from French); and Papiamento (derived from Spanish and Portuguese), spoken in Curaçao, Aruba, and Bonaire.

creosote \'krē-ə-ˌsōt\ Either of two entirely different substances, distilled from coal tar or wood tar. Coal-tar creosote is a complex mixture of organic compounds, largely HYDROCARBONS. It is a cheap water-insoluble wood preservative used for railroad ties, telephone poles, and marine pier pilings and as a disinfectant, fungicide, and biocide. Wood-tar creosote consists mainly of PHENOLS and related compounds and was once widely used for pharmaceutical purposes.

Cresilas \'kre-si-ləs\ *or* **Kresilas** (fl. 5th century BC, Athens, Greece) Greek sculptor. He was a contemporary of PHIDIAS. His portrait of PERICLES (c. 445 BC) generated a type of noble, idealized portraiture. A figure of a wounded Amazon (c. 440 BC) is ascribed to him because of its resemblance to this head. Works attributed to Cresilas are known only in copies of lost bronze originals.

cress Any of several plants of the MUSTARD FAMILY, of interest for their spicy young basal leaves, which are used in salads and as seasonings and garnishes. WATERCRESS is perhaps the most popular of the edible cresses. Common garden cress, or peppergrass (*Lepidium sativum*) is widely grown, especially in its curl-leaved form, and used as a garnish. Others include weeds (e.g., *Barbarea vulgaris*), wild varieties (e.g., *Cardamine pratensis*), and ornamentals (e.g., *Arabis* species).

Cressent \kres-'ä^{n}**, Charles** (b. Dec. 16, 1685, Amiens, Fr.—d. Jan. 10, 1768, Paris) French cabinetmaker. He also studied sculpture and became an accomplished metalworker. In 1710 he went to Paris, where he worked in the studio of the cabinetmaker ANDRÉ-CHARLES BOULLE. In 1715 Cressent was appointed official cabinetmaker to Philippe II, duke d'Orléans. He was elected to the Academy of St.-Luc in 1719, and he consequently received important commissions from French aristocrats, including Madame de POMPADOUR. His early works were in the LOUIS XIV STYLE, but later pieces (c. 1730–50) were lighter and more curvilinear. Cressent was the leading proponent of the RÉGENCE STYLE and introduced marquetries of coloured wood and ormolu to case decoration.

Creston, Paul *orig.* **Giuseppe Guttoveggio** (b. Oct. 10, 1906, New York, N.Y., U.S.—d. Aug. 24, 1985, San Diego, Calif.) U.S. composer. Born to a poor immigrant family, he was largely self-taught in music. His numerous works, many of which achieved wide performance, are highly rhythmical and tonally accessible. They include six symphonies, a *Requiem* and three masses, and several concertos. He is noted for the rhythmic vitality and full harmonies of his music, which is marked by modern dissonances and polyrhythms.

Cretaceous \kri-'tā-shəs\ **Period** Interval of geologic time from c. 144 to 65 million years ago. During the Cretaceous the climate was warmer than today. In the seas, marine invertebrates flourished, and bony fishes evolved. On land, flowering plants arose, and insects, bees in particular, began their thriving partnership with them. Mammals and birds remained inconspicuous throughout the Cretaceous, while the reptiles continued their dominance. The DINOSAURS reached the peak of their evolution during this period but rather suddenly became extinct at its end.

Crete *Greek* **Kríti** \'krē-tē\ *ancient* **Creta** Island (pop., 2001: 601,159) in the eastern Mediterranean Sea and an administrative region of Greece. It stretches for 152 mi (245 km) and varies in width from 7.5 to 35 mi (12 to 56 km), with a total area of 3,218 sq mi (8,336 sq km). Dominated by mountains, it was home to the MINOAN civilization from c. 3000 BC and was known for its palaces at KNOSSOS, Phaestus, and Mallia; it reached its peak in the 16th century BC. A major earthquake c. 1450 BC marked the end of the Minoan era. In 67 BC Rome annexed Crete; in AD 395 it passed to Byzantium. In 1204 Crusaders sold the island to Venice, from which it was wrested by the Ottoman Turks in 1669 after one of history's longest sieges. Taken by Greece in 1898, it was autonomous until its union with Greece in 1913. Agriculture is the economic mainstay, and the island is one of Greece's leading producers of olives, olive oil, and grapes; tourism is also important. The museum at Iráklion houses a fine collection of Minoan art.

Creutzfeldt-Jakob \'krȯits-ˌfelt-'yä-ˌkōb\ **disease** *or* **CJD** Rare fatal disease of the central nervous system. It destroys brain tissue, making it spongy and causing progressive loss of mental functioning and motor control. The disease commonly arises in adults between the ages of 40 and 70. Patients usually die within a year. There is no known cure. The disease is caused by a PRION that builds up in neurons. Inherited or random mutation accounts for 99% of cases; the rest come from prion exposure during medical procedures and possibly from eating the meat of cattle with MAD COW DISEASE.

crevasse \kri-'vas\ Fissure or crack in a GLACIER resulting from stress produced by movement. Crevasses range up to 65 ft (20 m) wide, 150 ft (45 m) deep, and several hundred yards long. Crevasses may be bridged by snow and become hidden, and they may close up as the glacier moves.

Crevasse in the Mozama Glacier on Mount Baker, Washington
BOB AND IRA SPRING

Crèvecoeur \krev-'kœr**, Michel-Guillaume-Saint-Jean de** *or* **J. Hector St. John** *or* **Hector St. John de Crèvecoeur** (b. Jan. 31, 1735, Caen, France—d. Nov. 12, 1813, Sarcelles) French-U.S. writer and naturalist. He traveled to the New World in 1755 as an officer and mapmaker and became a farmer, then served as French consul for many years. He returned to Europe in 1790. His fame rests on *Letters from an American Farmer* (1782, 1784, 1790), essays that paint a broad picture of American life. His *Travels in Upper Pennsylvania and New York* appeared in 1801. Newly discovered essays were published as *Sketches of Eighteenth Century America* in 1925. In his time he was the most widely read commentator on America.

crib death See SUDDEN INFANT DEATH SYNDROME

cribbage Card game, usually for two players, in which each tries to form various counting combinations of cards, the score being kept by moving pegs on a narrow rectangular board. Each player receives six cards. (There is also a five-card variant, as well as four-hand and three-hand variants.) Cribbage was invented by the 17th-century English poet SIR JOHN SUCKLING. The rules of play, though somewhat involved, are simple enough to make cribbage a popular pastime, particularly in Britain and the northern U.S. The game usually ends at 121 (twice around the board plus one).

Crichton \'krī-tən**, James** (b. August 1560, Eliock House, Dumfries, Scot.—d. July 1582, Mantua, Mantua) Scottish scholar and adventurer. After graduating from the University of St. Andrews, he publicly distinguished himself in Europe in learned activities. He entered the service of the duke of Mantua but was slain in a street fight at age 21. Reputedly a fine orator, linguist, debater, and man of letters, he was considered the model of the cultured gentleman, though admirers probably exaggerated his accomplishments. Years later he became known as "the Admirable Crichton."

Crick, Francis (Harry Compton) (b. June 8, 1916, Northampton, Northamptonshire, Eng.—d. July 28, 2004, San Diego, Calif., U.S.) British biophysicist. Educated at University College, London, he helped develop magnetic mines for naval use during World War II but returned to biology after the war. He worked at the University of Cambridge with JAMES D. WATSON and MAURICE WILKINS to construct a molecular model of DNA consistent with its physical and chemical properties, work for which the three shared a 1962 Nobel Prize. Crick also discovered that each group of three bases (a codon) on a single DNA strand designates the position of a specific amino acid on the backbone of a protein molecule, and he helped determine which codons code for each amino acid normally found in protein, thus clarifying the way the cell uses DNA to build proteins. See also ROSALIND FRANKLIN.

cricket (from Middle French *criquet*, "goal stake") Game played by two teams with a ball and bat on a large field centring on two wickets. Each wicket is two sets of three sticks. The teams have 11 players each. A bowler from the defending team throws the ball (with a straight-arm overhand delivery), attempting to hit the wicket, which is one of several ways the batsman may be put out. The team batting fields two batsman at a time, and the batsman being bowled to (the striker) tries to hit the ball away from the wicket. If the batsman hits the ball away from the wicket but has no time to run to the opposite wicket, he need not run; play will resume with another bowl. After a hit, when possible, the striker and the second batsman (the nonstriker) at the other wicket change places. Each time both batsmen can reach the opposite wicket, one run is scored. The batsmen may continue to cross back and forth between the wickets, earning an additional run for each time both reach the opposite side. Matches are divided into innings consisting of one turn at bat for each team; depending on pregame agreement, a match may consist of either one or two innings. Cricket's origins are uncertain, but the first set of rules was written in 1744. During England's colonial era, cricket was exported to countries around the world.

cricket Any of the approximately 2,400 species of leaping insects (family Gryllidae) known for the musical chirping of the male. Crickets vary in length from around 0.1 to 2 in. (3–50 mm) and have thin antennae, hind legs modified for jumping, and two abdominal sensory appendages (cerci). Their two forewings are stiff and leathery, and the two long, membranous hind wings are used in flying. Male crickets chirp by rubbing a scraper located on one forewing along a row of 50–250 teeth on the opposite forewing. The most common cricket songs are the calling song, which attracts the female; the courtship, or mating, song, which induces the female to copulate; and the fighting chirp, which repels other males.

crime the intentional commission of an act usually deemed socially harmful or dangerous and specifically defined, prohibited, and punishable under CRIMINAL LAW. Crimes in the COMMON-LAW tradition were originally defined primarily by judicial decision. Most common-law crimes are now codified. According to a generally accepted principle, *nullum crimen sine lege*, there can be no crime without a law. A crime generally consists of both conduct (the *actus reus*) and a concurrent state of mind (the *mens rea*). Criminal acts include ARSON, ASSAULT AND BATTERY, BRIBERY, BURGLARY, CHILD ABUSE, COUNTERFEITING, EMBEZZLEMENT, EXTORTION, FORGERY, FRAUD, HIJACKING, HOMICIDE, KIDNAPPING, PERJURY, PIRACY, RAPE, SEDITION, SMUGGLING, TREASON, THEFT, and USURY. See also ARREST; CONSPIRACY; CRIMINOLOGY; FELONY AND MISDEMEANOUR; INDICTMENT; rights of the ACCUSED; SELF-INCRIMINATION; SENTENCE; statute of LIMITATIONS; WAR CRIME.

Crimea \krī-'mē-ə\ Autonomous republic (pop., 2001: 2,033,700), southern UKRAINE. It is coextensive with the Crimean Peninsula, which

© 2006 Encyclopædia Britannica, Inc.

extends into the Black Sea. It covers 10,077 sq mi (26,100 sq km); its capital is Simferopol. Early inhabitants were Cimmerians, though the area later was settled by Greeks in the 6th century BC and was ruled by the kingdom of the Cimmerian Bosporus from the 5th century BC. It became subject to Rome, and part of it later belonged to the Byzantine Empire. Russia annexed Crimea in 1783. It was the scene of the Crimean War (1853–56). In 1921 it became an autonomous republic of the U.S.S.R. During World War II, Nazi armies overran it in 1941; it was retaken by the Soviets in 1944. The area became an oblast of the Ukrainian S.S.R. in 1954. After the dissolution of the Soviet Union in 1991, Crimea obtained partial autonomy from Ukraine.

Crimean War (October 1853–February 1856) War fought mainly in the Crimea between the Russians and an alliance consisting of the Ottoman empire, Britain, France, and Sardinia-Piedmont. It arose from the conflict of great powers in the Middle East and was more directly caused by Russian demands to exercise protection over the Orthodox subjects of the Ottoman sultan. The war was managed and commanded poorly by both sides. Battles were fought at the Alma River, Balaklava, and Inkerman, before the besieged Sevastopol was taken by the allies. Disease accounted for many of the approximately 250,000 men lost by each side. After Austria threatened to join the allies, Russia accepted preliminary peace terms, which were formalized at the Congress of Paris. The war did not settle the relations of the powers in Eastern Europe, but it did alert Alexander II to the need to modernize Russia.

criminal law Body of law that defines criminal offenses, regulates the apprehension, charging, and trial of suspected offenders, and fixes punishment for convicted persons. Substantive criminal law defines particular crimes, and procedural law establishes rules for the prosecution of crime. In the U.S., substantive criminal law originated for the most part in common law, which was later codified in federal and state statutes. Modern criminal law has been affected considerably by the social sciences, especially in the areas of sentencing, legal research, legislation, and rehabilitation. See also criminology.

criminology Scientific study of nonlegal aspects of crime, including its causes and prevention. Criminology originated in the 18th century when social reformers began to question the use of punishment for retribution rather than deterrence and reform. In the 19th century, scientific methods began to be applied to the study of crime. Today criminologists commonly use statistics, case histories, official records, and sociological field methods to study criminals and criminal activity, including the rates and kinds of crime within geographic areas. Their findings are used by lawyers, judges, probation officers, law-enforcement and prison officials, legislators, and scholars to better understand criminals and the effects of treatment and prevention. See also delinquency, penology.

Cripps, Sir (Richard) Stafford (b. April 24, 1889, London, Eng.—d. April 21, 1952, Zürich, Switz.) British statesman. A successful lawyer, he served in Parliament (1931–50). He was on the extreme left of the Labour Party and helped found the Socialist League in 1932. After serving as ambassador to Moscow (1940–42), he joined the British war cabinet and conducted the Cripps Mission (1942), an unsuccessful attempt to rally Indian support against the Japanese. As chancellor of the Exchequer (1947–50), he instituted a rigid austerity program to revive Britain's economy.

Crispi \'krēs-pē**, Francesco** (b. Oct. 4, 1819, Ribera, Sicily—d. Aug. 12, 1901, Naples) Italian politician. Exiled from Sicily for his revolutionary activities, he became an associate of Giuseppe Mazzini and encouraged Giuseppe de Garibaldi to conquer Sicily in 1860. He served as a deputy from Sicily in the newly unified Italian parliament (1861–96) and held office in several leftist governments. As premier (1887–91, 1893–96), he instituted liberal reforms and later improved the economy but became increasingly repressive. He embarked on a disastrous foreign policy, organizing Eritrea as a colony and attempting colonial expansion in Africa. He was forced to resign after the Italian defeat at the Battle of Adwa.

Cristofano de Giudicis, Francesco di See Franciabigio

Cristofori \krē-'stō-fō-ˌrē**, Bartolomeo** (b. May 4, 1655, Padua, Republic of Venice—d. Jan. 27, 1731, Florence) Italian maker of musical instruments. As custodian of musical instruments at the court of Prince Ferdinand de' Medici, he maintained a variety of instruments. His most famous experiment was the pianoforte, ancestor of the modern piano, which he worked on from 1698, an instrument that, unlike the harpsichord, could produce changes in volume of sound depending on the force with which the keys were struck. A diagram of its workings was published in 1711 and soon copied by others. Some of his original pianofortes survive.

critical care unit See intensive care unit

critical mass Minimum amount of a given fissionable material necessary to achieve a self-sustaining nuclear chain reaction under specified conditions. Critical mass depends on several factors, including the kind of fissionable material used, its concentration and purity, and the composition and geometry of the surrounding reaction system.

critical point In science, the set of conditions under which a liquid and its vapour become identical. The conditions are the critical temperature, the critical pressure, and the critical density. If a closed vessel is filled with a pure substance, partly liquid and partly vapour, and the average density equals the critical density, the critical conditions can be achieved. As the temperature is raised, the vapour pressure increases, and the gas phase becomes denser while the liquid expands and becomes less dense. At the critical point, the densities of liquid and vapour become equal, eliminating the boundary between the two.

critical theory Marxist inspired movement in social and political philosophy originally associated with the work of the Frankfurt school. Drawing particularly on the thought of Karl Marx and Sigmund Freud, critical theorists maintain that a primary goal of philosophy is to understand and to help overcome the social structures through which people are dominated and oppressed. Believing that science, like other forms of knowledge, has been used as an instrument of oppression, they caution against a blind faith in scientific progress, arguing that scientific knowledge must not be pursued as an end in itself without reference to the goal of human emancipation. Since the 1970s, critical theory has been immensely influential in the study of history, law, literature, and the social sciences.

Critius and Nesiotes \'kri-shəs, 'kri-tē-əs...ˌnes-ē-'ō-ˌtēz\ *or* **Kritios and Nesiotes** (fl. late 5th century BC, Athens, Greece) Greek sculptors. They executed the first masterpieces of freestanding sculpture of the early Classical period: the bronze figures of the *Tyrannicides* (477 BC), commissioned to replace those by Antenor, which were looted in the Persian sack of Athens (480 BC). Marble copies survive in the National Archaeology Museum, Naples.

Crittenden, John J(ordan) (b. Sept. 10, 1787, near Versailles, Ky., U.S.—d. July 26, 1863, Frankfort, Ky.) U.S. politician. A graduate of the College of William and Mary (1807), he became territorial attorney general in Illinois (1809). He also served in the U.S. Senate (1817–19, 1835–40, 1842–48, 1855–61), as U.S. attorney general (1840–41, 1850–53), and as governor of Kentucky (1848–50). He is best known for the Crittenden Compromise. In 1861 he chaired the Frankfort convention of leaders of border states, which asked the South to reconsider its position on secession.

Crittenden Compromise Series of compromises in 1860–61 intended to forestall the American Civil War. Sen. John J. Crittenden proposed constitutional amendments that would reenact provisions of the Missouri Compromise and extend them to the western territories, indemnify owners of fugitive slaves whose return was prevented by antislavery elements in the North, allow a form of popular sovereignty in the territories, and protect slavery in the District of Columbia. The plan was rejected by president-elect Abraham Lincoln and narrowly defeated in the Senate.

Crivelli \krē-'vel-lē**, Carlo** (b. c. 1430/35, Venice, Republic of Venice—d. c. 1493/95) Italian painter. The son of a painter, he worked mainly in the Marches, a provincial region of central Italy. All his works were of religious subjects, done in an elaborate, old-fashioned style reminiscent of the linearism of Andrea Mantegna. Characterized by heavy ornamentation, sharp outlines, and exaggerated facial expressions, his paintings are closer to the religious intensity of Gothic art than to the rationalism of the Renaissance.

croaker See drum

Croatia \krō-'ā-shə\ *officially* **Republic of Croatia** Country, west-central Balkans, southeastern Europe. Area: 21,851 sq mi (56,594 sq km). Population (2005 est.): 4,440,000. Capital: Zagreb. The people are mainly Croats, with a large Serbian minority. Language: Croatian (official). Religions: Christianity (predominantly Roman Catholic [Croats]; also Eastern Orthodox [Serbs]); also Islam. Currency: kuna. Croatia includes the traditional regions of Dalmatia, Istria, and Croatia-Slavonia. Istria and Dal-

© 2006 Encyclopædia Britannica, Inc.

matia, in the west and south, cover the rugged Adriatic coast. The central mountain belt contains part of the Dinaric Alps. The northeast is a fertile agricultural area; cattle breeding is important. The central mountain belt is known for fruit, and the farms of Istria and Dalmatia produce grapes and olives. The most important industries are food processing, wine making, textiles, chemicals, and petroleum and natural gas. Croatia is a republic with a unicameral legislature; its head of state is the president, and the head of government is the prime minister. The Croats, a southern Slavic people, arrived in the 7th century AD and came under CHARLEMAGNE's rule in the 8th century. They converted to Christianity soon afterward and formed a kingdom in the 10th century. Croatia retained its independence under native kings until 1102, when the crown passed into the hands of the Hungarian dynasty. Nonetheless, even under dynastic union with Hungary, institutions of separate Croatian statehood were maintained. The area associated with the name Croatia shifted gradually north and west as its territory was eroded, first with the loss of Dalmatia to Venice by 1420 and then as a result of Ottoman conquests in the 16th century. During the 16th century the remainder of Croatia came under the rule of the Austrian Habsburgs. In 1867 it became part of the Austro-Hungarian Empire, with Dalmatia and Istria ruled by VIENNA and Croatia-Slavonia a Hungarian crown land. In 1918, after the defeat of AUSTRIA-HUNGARY in World War I, Croatia joined other southern Slavic territories to form the Kingdom of SERBS, CROATS, AND SLOVENES, which was renamed YUGOSLAVIA in 1929. In World War II an independent state of Croatia was established by Germany and Italy, embracing Croatia-Slavonia, part of Dalmatia, and Bosnia and Herzegovina; after the war Croatia was rejoined to Yugoslavia as a people's republic. Croatia declared its independence in 1991, sparking insurrections by Croatian Serbs, who carved out autonomous regions with Yugoslav army help; Croatia took back most of these regions by 1995. With some stability returning, Croatia's economy began to revive in the late 1990s and early 21st century.

Croce \'krō-chā**, Benedetto** (b. Feb. 25, 1866, Pescasseroli, Italy—d. Nov. 20, 1952, Naples) Italian patriot, aesthetician, critic, and cultural historian. He founded *La Critica*, an influential journal of cultural criticism, in 1903 and was its editor until 1937. A passionate antifascist, he helped revive liberal institutions in the years following World War II, including the Liberal Party, which he led from 1943 to 1952. In 1947 he founded the Italian Institute for Historical Studies. His philosophical work has been influential in AESTHETICS and in studies of GIAMBATTISTA VICO, which he helped to revive. See photograph opposite.

crocidolite \krō-'si-dᵊl-ˌīt\ *or* **blue asbestos** Gray-blue to green, highly fibrous (asbestiform) form of the AMPHIBOLE mineral riebeckite. It has higher tensile strength than CHRYSOTILE asbestos. The major commercial source is South Africa, where it occurs in Precambrian banded-iron formations; it is also found in Australia and Bolivia.

Crockett, Davy *orig.* **David Crockett** (b. Aug. 17, 1786, eastern Tennessee, U.S.—d. March 6, 1836, San Antonio, Texas) U.S. frontiersman and politician. He made a name for himself in the Creek War (1813–15). In 1821 he was elected to the Tennessee legislature, winning popularity through campaign speeches filled with yarns and homespun metaphors. He won election to the U.S. House of Representatives in 1827, 1829, and 1833. During his first congressional term, Crockett broke with ANDREW JACKSON and the new Democratic Party over Crockett's desire for preferential treatment of squatters occupying land in western Tennessee. The Whigs early courted and publicized Crockett in the hope of creating a popular "coonskin" politician to offset Jackson. In 1834 Crockett was conducted on a triumphal speech-making tour of Whig strongholds in the East. From the many stories about him in books and newspapers, there grew the legend of an eccentric but shrewd "b'ar hunter" and Indian fighter. In 1835 he went to Texas to join the war against Mexico and was killed at the ALAMO.

crocodile Any of about a dozen tropical reptile species (family Crocodilidae) found in Asia, the Australian region, Africa, Madagascar, and the Americas. Crocodiles are long-snouted, lizardlike CARNIVORES. Most feed on fishes, turtles, birds, and small mammals; large individuals may attack domestic livestock or humans. Crocodiles swim and feed in the water, floating at the surface to wait for prey, but bask in the sun and breed on land. They are reputed to be livelier than ALLIGATORS and more likely to attack humans. They have a narrower snout than alligators and a tooth on each side of the jaw that is visible when the jaw is closed.

crocus Any of about 75 species of low-growing plants, with CORMS, that make up the genus *Crocus* (IRIS FAMILY), native to the Alps, southern Europe, and the Mediterranean and widely grown for their cuplike blooms in early spring or fall. The spring-flowering sorts have a floral tube so long that the ovary is belowground, sheltered from climatic changes. SAFFRON comes from *C. sativus* of western Asia. The alpine *C. vernus* is the chief ancestor of the common garden crocus. Dutch yellow crocus (*C. flavus*) and *C. biflorus* are popular spring-flowering species.

crocus, autumn See AUTUMN CROCUS

Croesus \'krē-səs\ (d. c. 546 BC) Last king of LYDIA, famous for his great wealth. He succeeded his father as king c. 560 BC, and, after completing the conquest of mainland Ionia, he faced the rising threat of the Persians under CYRUS II. He forged an alliance with Babylon, Egypt, and Sparta to combat the Persians, but, after an inconclusive effort to invade Cappadocia, he returned to his capital at SARDIS. The Persians pursued him, storming Sardis in 546 BC and conquering Lydia. Croesus's later fate is uncertain. HERODOTUS claims he was condemned to be burned alive but was saved by APOLLO.

Croghan \'krō-ən**, George** (b. c. 1720, near Dublin, Ire.—d. Aug. 31, 1782, Passyunk, near Philadelphia, Pa., U.S.) American trader and Indian agent. He immigrated from Ireland in 1741, settling near Carlisle, Pa., where he learned Indian customs and languages to assist him in his trade. He was named Indian agent (an official representative to Indian tribes) for Pennsylvania in the 1740s. Later, as deputy to WILLIAM JOHNSON (1756–72), he negotiated with tribes complaining of encroachments on their land by colonists. In 1765 he achieved an end to PONTIAC's War. He espoused the patriot cause in the AMERICAN REVOLUTION.

Benedetto Croce
H. ROGER-VIOLLET

Croix de Feu \'krwä-də-'fœ\ (French: "Cross of Fire") French political movement (1927–36). Originally an organization of World War I veterans, it espoused ultranationalistic views with vaguely fascist overtones. Under François de la Rocque (1885–1946), it organized popular demonstrations in reaction to the STAVISKY AFFAIR, hoping to over-

© 2006 Encyclopædia Britannica, Inc.

throw the government. It subsequently lost prestige and was dissolved by the Popular Front government in 1936.

Cro-Magnon \krō-'mag-nən, krō-'man-yən\ Population of anatomically modern *Homo sapiens* dating from the Upper Paleolithic Period (c. 35,000–10,000 BC). First discovered in 1868 at the Cro-Magnon rock shelter in the Dordogne region in southern France, the human skeletons that came to be called Cro-Magnon are now considered representative of humans at that time. Cro-Magnons were relatively more robust and powerful than today's humans, with a somewhat larger brain capacity. The Cro-Magnons are generally associated with the Aurignacian tool industry and artistic tradition (see Aurignacian culture). Cro-Magnons seem to have been a settled people, living in caves or primitive huts and lean-tos, moving only when necessary to find new hunting or because of environmental changes. It is difficult to determine how long the Cro-Magnons lasted and what happened to them; presumably they were gradually absorbed into the European populations that came later.

Cromer, Evelyn Baring, 1st earl of (b. Feb. 26, 1841, Cromer Hall, Norfolk, Eng.—d. Jan. 29, 1917, London) British administrator in Egypt. After serving as an army officer (1858–72), he became private secretary to his cousin Lord Northbrook, viceroy of India. In 1877 he went to Egypt to help resolve Egypt's financial problems. Named British agent and consul general in 1883, he instituted a form of government known as the Veiled Protectorate, whereby he ruled the Egyptian khedives. Egypt was made financially solvent by 1887, and Cromer's parsimony and encouragement of agricultural projects increased its prosperity. Until his resignation in 1907, he remained the country's real ruler, profoundly influencing Egypt's development as a modern state.

Crompton, Samuel (b. Dec. 3, 1753, Firwood, Lancashire, Eng.—d. June 26, 1827, Bolton, Lancashire) British inventor. His spinning mule (probably called a mule because it was a cross between inventions of Richard Arkwright and James Hargreaves) permitted large-scale manufacture of high-quality thread and yarn by simultaneously drawing out and giving the final twisting to the cotton fibres fed into it, reproducing mechanically the actions of hand spinning.

Cromwell, Oliver (b. April 25, 1599, Huntingdon, Huntingdonshire, Eng.—d. Sept. 3, 1658, London) English soldier and statesman, lord protector of the republican Commonwealth of England, Scotland, and Ireland (1653–58). He was elected to Parliament in 1628, but Charles I dissolved that Parliament in 1629 and did not call another for 11 years. In 1640 Cromwell was elected to the Short and the Long Parliament. When differences between Charles and Parliament erupted into the English Civil Wars, Cromwell became one of the leading generals on the Parliamentary side, winning many notable victories, including the Battles of Marston Moor and Naseby. He was among those who brought the king to trial and signed his death warrant. After the British Isles were named the Commonwealth, he served as the first chairman of the Council of State. In the next few years he fought against the Royalists in Ireland and Scotland and suppressed a mutiny inspired by the Levelers. When Charles II advanced into England, Cromwell destroyed his army at Worcester (1651), the battle that ended the civil wars. As lord protector, Cromwell raised his country's status once more to that of a leading European power and concluded the Anglo-Dutch War. Though a devout Calvinist, he pursued policies of religious toleration. He refused the title of king offered to him by Parliament in 1657. After his death he was succeeded by his son Richard Cromwell.

COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Cromwell, Richard (b. Oct. 4, 1626—d. July 12, 1712, Cheshunt, Hertfordshire, Eng.) Lord protector of England (September 1658–May 1659). He was the eldest surviving son of Oliver Cromwell, who groomed him for high office. He served in the Parliamentary army and was a member of Parliament and the council of state. After his father's death he was proclaimed lord protector, but he soon encountered serious difficulties and was forced to abdicate. Having amassed large debts, he fled to Paris in 1660 to escape his creditors; in 1680 he returned and lived in seclusion.

Cromwell, Thomas, earl of Essex (b. c. 1485, Putney, near London, Eng.—d. July 28, 1540, probably London) English politician and principal adviser (1532–40) to Henry VIII. He was a confidential adviser to Thomas, Cardinal Wolsey, before entering Parliament (1529), where his abilities attracted the king's notice. Entering Henry's service in 1530, he was chiefly responsible for establishing the Reformation in England, for the dissolution of the monasteries, and for strengthening the royal administration. He eventually came into complete control of the government, though he pretended to be acting on the king's authority. In 1539 he made the mistake of inducing Henry to marry Anne of Cleves, which led to his fall. At his enemies' instigation he was arrested for heresy and treason, condemned without a hearing, and executed.

Cronenberg \'krō-nən-ˌbərg**, David** (b. May 15, 1943, Toronto, Ont., Can.) Canadian film director, screenwriter, and actor. He began making horror films in the 1970s and acquired a cult following with films such as *Scanners* (1981) and *Videodrome* (1982). He found a wider horror-film audience with *The Dead Zone* (1983), *The Fly* (1986), and *Dead Ringers* (1988). Later films included *Naked Lunch* (1991), *Crash* (1996), and *eXistenZ* (1999).

Cronin, A(rchibald) J(oseph) (b. July 19, 1896, Cardross, Dumbartonshire, Scot.—d. Jan. 6, 1981, Montreux, Switz.) Scottish novelist. Trained as a surgeon, he practiced medicine mostly in mining communities, but he ceased because of ill health and used his leisure to write. His books combine sentimentality with social criticism. His first novel, *Hatter's Castle* (1931; film, 1941), was an immediate success. His classic *The Stars Look Down* (1935; film, 1939) chronicles social injustice in a mining community. Other works include *The Citadel* (1937; film, 1938), *The Keys of the Kingdom* (1942; film, 1944), *The Green Years* (1944; film, 1946), *The Judas Tree* (1961), and *A Thing of Beauty* (1956).

Cronkite, Walter (Leland, Jr.) (b. Nov. 4, 1916, St. Joseph, Mo., U.S.) U.S. journalist and television newscaster. He began his career as a reporter with the *Houston Post* and later worked for United Press (1939–48) and served as a war correspondent in Europe (1942–45). He joined CBS in 1950 as a news reporter and became managing editor and anchor of the widely watched *CBS Evening News* (1962–81). He hosted numerous documentaries and special reports, notably on the assassination of Pres. John F. Kennedy and the 1969 Moon landing. His reassuring, avuncular manner made him one of the most trusted figures in U.S. broadcasting.

Cronus *or* **Cronos** *or* **Kronos** In Greek religion, a male agricultural deity. He was the youngest of the 12 Titans borne by Uranus and Gaea, and his castration of his father separated heaven from earth. With his sister and consort Rhea, he fathered Hestia, Demeter, Hera, Hades, and Poseidon, all of whom he swallowed because he had been warned that he would be overthrown by his own child. Rhea hid his son Zeus and tricked Cronus into swallowing a stone; Zeus later forced Cronus to disgorge the others and then vanquished him in war. He was identified with the Roman god Saturn.

Cronyn \'krō-nən**, Hume and Jessica Tandy** (respectively b. July 18, 1911, London, Ont., Can.—d. June 15, 2003, Fairfield, Conn., U.S.; b. June 7, 1909, London, Eng.—d. Sept. 11, 1994, Easton, Conn., U.S.) U.S. husband-and-wife actors. Cronyn made his Broadway debut in 1934. He was a successful character actor in many plays, including Polonius in *Hamlet* (1964, Tony Award), and directed plays such as *Hilda Crane* (1950) and *The Egghead* (1957). Tandy made her Broadway debut in 1930. She was the original Blanche DuBois in *A Streetcar Named Desire* (1947, Tony Award). She and Cronyn married in 1942 and acted together in such successful plays as *The Fourposter* (1951), *A Delicate Balance* (1966), *The Gin Game* (1977), and *Foxfire* (1982), the last two of which earned Tony Awards for Tandy. Cronyn's many films include *Lifeboat* (1944) and *Sunrise at Campobello* (1960), and Tandy's include *The Birds* (1963), *Driving Miss Daisy* (1989, Academy Award), and *Fried Green Tomatoes* (1991).

crop In agriculture, a plant or plant product that can be grown and harvested extensively for profit or subsistence. By use, crops fall into six categories: food crops, for human consumption (e.g., wheat, potatoes); feed crops, for livestock consumption (e.g., oats, alfalfa); fibre crops, for

© 2006 Encyclopædia Britannica, Inc.

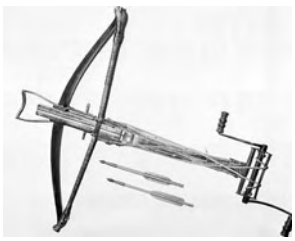
cordage and textiles (e.g., cotton, hemp); oil crops, for consumption or industrial uses (e.g., cottonseed, corn); ornamental crops, for landscape gardening (e.g., dogwood, azalea); and industrial and secondary crops, for various personal and industrial uses (e.g., rubber, tobacco).

crop duster Usually, an aircraft used for dusting or spraying large acreages with PESTICIDES, though other types of dusters are also employed. Aerial spraying and dusting permit prompt coverage of large areas at the moment when application of pesticide is most effective and avoid the need for wheeled vehicles that might damage crops. The technique was greatly improved in the 1960s with the development of ultra-low-volume applicators, in which concentrated pesticides are distributed in extremely small amounts. See also SPRAYING AND DUSTING.

crop rotation Successive cultivation of different CROPS in a specified order on the same fields. Some rotations are designed for high immediate returns, with little regard for basic resources. Others are planned for high continuing returns while protecting resources. A typical scheme selects rotation crops from three classifications: cultivated row crops (e.g., corn, potatoes), close-growing grains (e.g., oats, wheat), and sod-forming, or rest, crops (e.g., clover, clover-timothy). In general, cropping systems should include deep-rooting LEGUMES. In addition to the many beneficial effects on soils and crops, well-planned crop rotations make the farm a more effective year-round enterprise by providing more efficient handling of labour, power, and equipment, reduction in weather and market risks, and improved ability to meet livestock requirements.

croquet \krō-'kā\ (French dialect for "crook," "hockey stick") Game in which players using mallets drive wooden balls through a series of wickets, or hoops, set out on a lawn. The object is to be the first to complete the course by passing through all the wickets and hitting a goal peg. Croquet evolved from the 13th-century French game pall-mall. Championship matches are organized by governing bodies in the U.S. and Britain.

Crosby, Bing *orig.* **Harry Lillis Crosby** (b. May 3, 1903, Tacoma, Wash., U.S.—d. Oct. 14, 1977, near Madrid, Spain) U.S. singer and actor. Crosby began to sing and play drums while studying law in Spokane, Wash. As a singer with the Paul Whiteman orchestra in 1927, he exhibited a mellow "crooning" style and casual stage manner that proved highly popular. He appeared in the early sound film *King of Jazz* (1931), and he later had his own radio program. By the late 1930s his records had sold millions of copies. His recordings of "White Christmas" and "Silent Night" were among the most popular songs of the 20th century. In the 1940s he starred in a popular radio variety show. His film career included the seven Road comedies with BOB HOPE and Dorothy Lamour, beginning with *The Road to Singapore* (1940); *Going My Way* (1944, Academy Award); *The Bells of St. Mary's* (1945); and *White Christmas* (1954). More than 300 million of his records have been sold, a total surpassed only by ELVIS PRESLEY among solo artists.



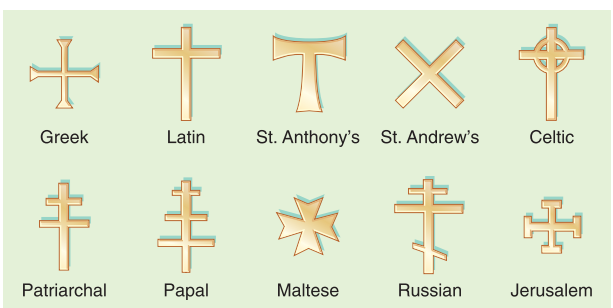
Bing Crosby
BROWN BROTHERS

cross Principal symbol of CHRISTIANITY, recalling the CRUCIFIXION of JESUS. There are four basic iconographic representations: the *crux quadrata*, or Greek cross, with four equal arms; the *crux immissa*, or Latin cross, with a base stem longer than the other arms; the *crux commissa* (St. Anthony's cross), resembling the Greek letter tau (T); and the *crux decussataa* (St. Andrew's cross), resembling the Roman numeral 10 (X). Tradition holds that the *crux immissa* was used for Christ's crucifixion. Coptic Christians used the ancient Egyptian ANKH. Displaying the cross was not common before CONSTANTINE I abolished crucifixion in the 4th century. A crucifix shows Christ's figure on a cross and is typical of Roman Catholicism and Eastern Orthodoxy. Making the sign of the cross with the hand may be a profession of faith, prayer, dedication, or benediction. See illustration opposite.

Cross River River, western Africa. Rising in the highlands of Cameroon, it flows west and south through Nigeria. Its course, some 300 mi (485 km) long, runs through dense tropical rainforest and mangrove swamps to the Bight of BIAFRA. It is navigable through its estuary, which it shares with the Calabar River.

cross section In nuclear physics, a measure of the probability that a given atomic NUCLEUS will exhibit a specific reaction (ABSORPTION, SCATTERING, or NUCLEAR FISSION) in relation to a particular incident particle. Cross section is expressed in terms of area, and its value is chosen so that, if the bombarding particle hits a circular target of this size perpendicular to its path and centred at the nucleus, the given reaction occurs. If it misses the area, the reaction does not occur. The unit of cross section is the barn, which equals 10^{-24} sq cm. Cross-section values for a given nucleus depend on the energy of the bombarding particle and the kind of reaction and are often different from the actual cross-sectional area of the nucleus.

crossbow Leading missile weapon of the Middle Ages, consisting of a short bow fixed transversely on a stock, with a groove to guide the missile and a trigger to release it. The missile, known as a bolt, was usually an arrow or dart. First used in antiquity, it was an important advance in warfare. Its destructive power came from its metal bow, which could propel a bolt with enough velocity to pierce CHAIN MAIL and gave it a range of up to 1,000 ft (300 m). Powerful and versatile, it remained in use even after the introduction of the LONGBOW and firearms and was not discarded until the 15th century. It has been used in modern times to hunt big game.



Stirrup crossbow, French, 14th century

cross-country running Long-distance running over open country. It developed as a competitive event in the mid-19th century. Though originally included in the revived Olympics, it was dropped after 1924 as not suitable for summer competition (most cross-country races are held in the fall or early winter). The first international women's competition was held in 1967. Standard distances are 12,000 m (7.5 mi) for men, and 2,000–5,000 m (1.25–3 mi) for women. Though rules for championship competitions have been established, world records are not kept because of the varying difficulty of courses.

cross-country skiing Skiing in open country over rolling, hilly terrain. It originated in Scandinavia as a means of travel as well as recreation. The skies used are longer, narrower, and lighter than those used in ALPINE SKIING, and bindings allow more heel movement. The standard lengths of international races range from 10 to 50 km (6.2–31 mi) for men and 5 to 30 km (3.1–18.6 mi) for women. It has been included on the Olympics program since the first Winter Olympics in 1924.

cross-fertilization Fusion of male and female sex cells from different individuals of the same species. Cross-fertilization is necessary in animal and plant species that have male and female organs on separate individuals. Methods of cross-fertilization are diverse in animals. Among most species that breed in water, the males and females shed their sex cells into the water, where FERTILIZATION takes place outside the body. Among land breeders, fertilization is internal, with the sperm being introduced into the body of the female. By recombining genetic material from

Several traditional types of crosses.

© 2006 Encyclopædia Britannica, Inc.

two parents, cross-fertilization maintains a greater range of variability for NATURAL SELECTION to act on, thereby increasing the capacity of a species to adapt to environmental change. See also SELF-FERTILIZATION.

crossword puzzle Puzzle in which words are filled into a pattern of numbered squares in answer to correspondingly numbered clues and in such a way that words can be read across and down. The first crosswords, intended primarily for children, appeared in England in the 19th century. In the U.S., the puzzle developed into a popular adult pastime. By 1923, crosswords were being published in most of the leading U.S. newspapers, and the craze soon reached England. Today crosswords in various forms are found in almost every country and language.

croton \'krō-tᵊn\ Colourful-leaved plant (*Codiaeum variegatum*) of the SPURGE family. Native to Malaysia and Pacific islands, it is popular as a houseplant. Its numerous varieties grow as shrubs or small trees with brilliant, glossy, leathery leaves that can be solid in colour or occur in combinations of green, yellow, white, orange, pink, red, crimson, and purple. Another plant of the same family but of a different genus is purging croton (*Croton tiglium*), a small tree native to Southeast Asia with seeds that yield croton oil.

croup \'krüp\ Acute laryngeal INFLAMMATION and spasms in young children, with harsh cough, hoarseness, and difficulty breathing. Causes include infection, allergy, and physical irritation of the larynx. Viral croup, the most common, usually occurs before age 3. It can usually be treated at home with a cool mist vaporizer. Bacterial croup (epiglottitis) generally strikes between ages 3 and 7. Swelling of the epiglottis rapidly causes severe breathing and swallowing difficulty, requiring antibiotics and insertion of a breathing tube.

Crow North American PLAINS INDIAN people of southern Montana, U.S. The Crow, whose language belongs to the SIOUAN language stock, were historically affiliated with the HIDATSA. Historically, they occupied the area around the Yellowstone River in northern Wyoming and southern Montana. Much of Crow life revolved around the buffalo and the horse. The Crow were prominent as middleman traders, trading horses, bows, and other items to local village Indians in return for guns and metal goods that they carried to the SHOSHONE in Idaho. The basic element in Crow religious life was the supernatural vision, induced by fasting and isolation. The Crow continually suffered losses from wars with the BLACKFOOT and SIOUX and sided with the whites in the Indian wars of the 1860s and '70s. In 1868 they accepted a reservation carved from former tribal lands in southern Montana. Some 9,100 individuals claimed sole Crow descent in the 2000 U.S. census.

crow Any of more than 20 species of black perching birds (see PASSERINE) of the genus *Corvus* (family Corvidae) that are smaller than most RAVENS and have a thinner bill. They are named for the sound of their call. Common crows are found in North America and Eurasia. They eat grain, berries, insects, carrion, and the eggs of other birds. Crows may damage grain crops, but they also eat many economically harmful insects. At times tens of thousands roost together, but most species do not nest in colonies. Crows are considered the most intelligent of all birds (tool use is documented), and pet crows can be taught to imitate speech.

Carrion crow (*Corvus corone corone*)
ERIC HOSKING

Crowe \'krō**, Sir Eyre (Alexander Barby Wichart)** (b. July 30, 1864, Leipzig, Ger.—d. April 28, 1925, Swanage, Dorset, Eng.) British diplomat. In the years before World War I he strongly urged an anti-German policy, arguing in a 1907 memorandum that Germany aimed at the domination of Europe, that concessions would only increase its appetite for power, and that the entente with France must not be abandoned. On July 25, 1914, he urged a show of force by the British navy to forestall war, and when war began a few days later he induced the government to seize German vessels in British ports. He served as permanent undersecretary of state for foreign affairs (1920–25).

crowfoot See BUTTERCUP

crown gall Disease of plants caused by the bacterium *Agrobacterium tumefaciens*. Thousands of plant species are susceptible, including especially rose, grape, pome and stone fruits (e.g., apples, peaches), shade and nut trees, many shrubs and vines, and perennial garden plants. Symptoms include roundish, rough-surfaced GALLS, several inches or more in diameter. At first cream-coloured or greenish, they later turn brown or black. As the disease progresses, affected plants lose vigour and may eventually die.

crown jewels Ornaments used at the coronation of a monarch and the formal ensigns of monarchy worn or carried on state occasions, as well as collections of personal jewelry consolidated by European sovereigns as valuable assets of their royal houses and the offices they filled. Most familiar are those of Britain, which include St. Edward's Crown, the Royal Sceptre (with the Star of Africa diamond), the Sceptre of Equity and Mercy, and the Sword of Offering, as well as the coronation ring, anointing spoon, ampulla (flask), and coronation bracelets. Many collections of royal jewelry have been assembled, confiscated, and dispersed over the centuries.

crown-of-thorns starfish Reddish and heavy-spined STARFISH (*Acanthaster planci*) that has 12–19 arms and is often 18 in. (45 cm) across. It feeds on the POLYPS of CORAL. Beginning c. 1963, its population on Australia's Great Barrier Reef exploded. Destruction of coral reefs and islands was feared, and intensive efforts were made to kill it off. Since then other outbreaks have been recorded throughout the southern Pacific. The cause of the outbreaks is unknown, but several factors have been proposed, such as the decimation of the starfish's chief predator, the Pacific triton (a marine snail), by shell collectors. Other factors, including the runoff of nutrient-rich soil into reef waters as a result of shorefront development, have also been implicated. Population fluctuations could also be a feature of the starfish's natural ecology, and human influence may alter these cycles.

Crown-of-thorns starfish
A. GIDDINGS—BRUCE COLEMAN INC.

crown vetch Vigorous trailing LEGUME (*Coronilla varia*), native to the Mediterranean but widely grown in temperate areas as a ground cover. It has fernlike leaves and clusters of white to pink flowers. The sturdy roots are useful in binding the soil of steep slopes and roadside embankments. As a legume, crown vetch draws nitrogen from the air, trapping it in the roots, and thus improves soil fertility. It dies back to the crown each fall in cold areas, resuming growth in spring. Cutting the plant back in the fall or early spring encourages quick growth.

crucible \'krü-sə-bəl\ Pot of CLAY or other REFRACTORY material, used from ancient times as a container for melting METALS or other materials. Modern crucibles may be small laboratory utensils for conducting high-temperature chemical reactions and analyses, or large industrial vessels for melting and calcining metal, ore, or glass, and may be made of clay, graphite, porcelain, or a relatively infusible metal.

crucible process Technique for producing cast or TOOL STEEL. It was invented in Britain c. 1740 by BENJAMIN HUNTSMAN, who heated small pieces of CARBON STEEL in a closed fireclay crucible placed in a COKE fire. This was the first process used in Europe in which the temperature (2,900°F, or 1,600°C) was high enough to melt the STEEL, producing a homogeneous metal of uniform composition. After 1870 the Siemens regenerative gas furnace replaced the coke-fired furnace. Capable of producing even higher temperatures, the Siemens furnace had a number of combustion holes, each holding several crucibles, and heated as many as 100 crucibles at a time. All high-quality tool steel and HIGH-SPEED STEEL was long made by the crucible process. In the 20th century the ELECTRIC FURNACE has replaced it in countries with inexpensive electric power. See also WOOTZ.

crucifixion Method of CAPITAL PUNISHMENT among the Persians, Seleucids, Jews, Carthaginians, and Romans from about the 6th century BC to the 4th century AD. The condemned man was usually whipped and forced to drag the crossbeam to where the upright was standing. His hands were tied or nailed to the crossbeam, which was attached to the upright 9–12 ft (2.5–3.5 m) above the ground, and his feet bound or nailed to the upright. Death was by heart failure or asphyxiation. Political or religious agitators and those without civil rights were crucified. Its overwhelming association

today is with Jesus. Crucifixion was abolished by Constantine I in AD 337 after his conversion to Christianity. See also stigmata.

crude oil See petroleum

Cruikshank, George (b. Sept. 27, 1792, London, Eng.—d. Feb. 1, 1878, London) English painter, illustrator, and caricaturist. His series of political caricatures for *The Scourge* (1811–16) established him as the leading political cartoonist of his generation, and he continued to satirize the policies of the Tories and Whigs in political cartoons until c. 1825. In the 1820s and '30s he produced book illustrations, notably for Charles Dickens's *Sketches by "Boz"* (1836) and *Oliver Twist* (1838). In later life he embraced the cause of temperance with his series *The Bottle* (1847) and *The Drunkard's Children* (1848).

Cruise, Tom *orig.* **Thomas Cruise Mapother IV** (b. July 3, 1962, Syracuse, N.Y., U.S.) U.S. actor. He made his screen debut in 1981 and rose to stardom as the leading man in *Risky Business* (1983) and *Top Gun* (1986). He received acclaim for his dramatic roles in *The Color of Money* (1986), *Rain Man* (1988), *Born on the Fourth of July* (1989), and *Magnolia* (1999). His other films include *A Few Good Men* (1992), *Mission: Impossible* (1996), *Jerry Maguire* (1996), Stanley Kubrick's *Eyes Wide Shut* (1999), and Steven Spielberg's *Minority Report* (2002).

cruise missile Type of low-flying strategic guided missile developed by the U.S. and the Soviet Union in the 1960s and '70s. The V-1 missile was a precursor. Powered by jet engines, cruise missiles may carry either a nuclear or a conventional warhead. They are designed to hug the ground, which makes them hard to detect by radar. They are launched from ships, submarines, airplanes, and the ground.

cruiser Warship built for high speed and great cruising radius, smaller than a battleship but larger than a destroyer. The term originally meant frigates of the sailing era, used to scout for enemy fleets and raid convoys. After 1880, it was a specific type of armoured warship. By World War II, cruisers served mainly as floating bases for amphibious assaults and as protection for aircraft-carrier task forces. Today U.S. cruisers carry surface-to-air missiles vital to a fleet's air-defense screen. Nuclear propulsion has given some cruisers virtually unlimited range.

Crumb, George (Henry) (b. Oct. 24, 1929, Charleston, W.Va., U.S.) U.S. composer. Born to musician parents, he studied at the University of Michigan and from 1965 taught at the University of Pennsylvania. His style is known particularly for its unusual and hauntingly evocative timbres. *Echoes of Time and the River* (1967, Pulitzer Prize) and *Ancient Voices of Children* (1970) brought him wide fame. His other works include *Madrigals, Books I-IV* (1965–70), *Night of the Four Moons* (1969), *Black Angels* (1970), *Makrokosmos I* and *II* (1972, 1973), and *Star-Child* (1977).

Crumb, R(obert) (b. Aug. 20, 1943, Philadelphia, Pa., U.S.) U.S. cartoonist. He had no formal art training but was obsessed with drawing as a child. In 1960 he moved to Cleveland, Ohio, to work for a greeting-card company. In 1967 he moved to San Francisco and became a prominent member of the hippie counterculture and a founder of the genre of underground "comix," satirical magazines that poked fun at U.S. culture. His often obscene strips with their various obsessive themes, starring such characters as Fritz the Cat, the Furry Freak Brothers, and Mr. Natural, had great influence and are still regarded as classics of the genre.

Crusade, Children's See Children's Crusade

Crusade, Stedinger See Stedinger Crusade

crusader states Former territories on the Palestine coast taken by the Christian army during the first of the Crusades. The states were established as the kingdom of Jerusalem (1099–1187), the principality of Antioch (1098–1268), the county of Edessa (1098–1144), and the county of Tripoli (1109–1289). Threats to the states led the pope to call for future crusades.

Crusades Military expeditions, beginning in the late 11th century, that were organized by Western Christians in response to centuries of Muslim wars of expansion. Their objectives were to check the spread of Islam, to retake control of the Holy Land, to conquer pagan areas, and to recapture formerly Christian territories. The Crusades were seen by many of their participants as a means of redemption and expiation for sins. Between 1095, when the First Crusade was launched by Pope Urban II at the Council of Clermont, and 1291, when the Latin Christians were finally expelled from their kingdom in Syria, there were numerous expeditions to the Holy Land, to Spain, and even to the Baltic; the Crusades continued for several centuries after 1291, usually as military campaigns intended to halt or slow the advance of Muslim power or to conquer pagan areas. The Crusaders initially enjoyed success, founding a Christian state in Palestine and Syria, but the continued growth of Islamic states ultimately reversed those gains. By the 14th century the Ottoman Turks had established themselves in the Balkans and would penetrate deeper into Europe despite repeated efforts to repulse them. Crusades were also called against heretics (the Albigensian Crusade, 1209–29) and various rivals of the popes, and the Fourth Crusade (1202–04) was diverted against the Byzantine Empire. Crusading declined rapidly during the 16th century with the advent of the Protestant Reformation and the decline of papal authority. The Crusades constitute a controversial chapter in the history of Christianity, and their excesses have been the subject of centuries of historiography. Historians have also concentrated on the role the Crusades played in the expansion of medieval Europe and its institutions, and the notion of "crusading" has been transformed from a religio-military campaign into a modern metaphor for zealous and demanding struggles to advance the good ("crusades for") and to oppose perceived evil ("crusades against").

crush injury Effects of compression of the body (e.g., in a building collapse). Victims with severe chest and abdominal injuries usually die before help arrives. In survivors, pulse and blood pressure are usually normal at first, then blood leakage from ruptured vessels causes shock and local swelling, and blood pressure falls. Release of proteins from crushed muscles can cause kidney failure a day or two afterwards. Later, emboliSMS form from fat droplets that have merged after being squeezed out of fat cells and bone marrow.

crust Outermost solid part of the Earth, essentially composed of a range of igneous and metamorphic rock types. In continental regions, the crust is made up chiefly of granitic rock, whereas the composition of the ocean floor corresponds mainly to that of basalt and gabbro. On average, the crust extends 22 mi (35 km) downward from the surface to the underlying mantle, from which it is separated by the Mohorovičić discontinuity (the Moho). The crust and top layer of the mantle together form the lithosphere.

crustacean \krəs-'tā-shən\ Any member of the 45,000 arthropod species in the subphylum Crustacea. Distributed worldwide, crustaceans are distinguished by having two pairs of antenna-like appendages in front of the mouth and other paired appendages near the mouth that act like jaws. Most species are marine, including shrimps and barnacles. Some, including crayfishes, live in freshwater habitats; others (e.g., sand fleas, land crabs, and sow bugs) live in moist terrestrial environments. The typical adult body is composed of a series of segments (somites) either fused or linked to each other by flexible areas that form movable joints. The carapace (shell) varies in thickness among species and must be periodically molted to allow growth. Many species of marine crustaceans are scavengers, and many (including copepods and krill) are significant components of the diets of larger organisms. See also decapod.

Cruveilhier \krüē-ve-'yā**, Jean** (b. Feb. 9, 1791, Limoges, Fr.—d. March 10, 1874, Sussac) French pathologist and anatomist. He published a series of multivolume works on the anatomy of disease. The greatest, the beautifully illustrated *Pathological Anatomy of the Human Body* (2 vol., 1829–42), contains the first description of multiple sclerosis, depictions of gastric ulcer, and an early account of progressive muscular atrophy.

Cruz \krüs**, Celia** (b. Oct. 21, c. 1929, Havana, Cuba—d. July 16, 2003, Fort Lee, N.J., U.S.) Cuban-born U.S. singer. She was studying to become a teacher in her native Havana when she won a talent show, after which she began to pursue a singing career. In the early 1950s she became lead singer with the popular orchestra La Sonora Matancera, often headlining at the famous Tropicana nightclub. After Cuba's revolution of 1959, the orchestra moved to Mexico and later to the U.S. In 1962 Cruz married its first trumpet player, Pedro Knight, who became her manager after she

© 2006 Encyclopædia Britannica, Inc.

left the group. In the 1960s she released more than 20 albums in the U.S., including seven with TITO PUENTE. She became identified with SALSA, a dance music that evolved from the musical experimentation of various Hispanic musicians with Caribbean sounds during the late 1960s. Cruz was the subject of a 1988 BBC documentary and appeared in films such as *The Mambo Kings* (1992).

Cruz, Sor Juana Inés de la (b. Nov. 12, 1651, San Miguel Nepantla, Viceroyalty of New Spain—d. April 17, 1695, Mexico City) Mexican poet, dramatist, scholar, nun, and an early feminist. Born out of wedlock to a family of modest means, she was sent to relatives in Mexico City, where her great intelligence became known to the viceroy. She soon became a nun, remaining cloistered for the rest of her life. Sor Juana had one of the largest private libraries in the New World. Her most important works are the poem "Primero sueño" (1692; "Sor Juana's Dream"), which recounts the soul's quest for knowledge, and the "Respuesta" (1691; "The Answer"), her defense of women's right to knowledge.

cryogenics \ˌkrī-ə-ˈje-niks\ Study and use of low-temperature phenomena. The cryogenic temperature range is from –238°F (–150°C) to ABSOLUTE ZERO. At low temperatures, matter has unusual properties. Substances that are naturally gases can be liquefied at low temperatures, and metals lose electrical RESISTANCE as they get colder (see SUPERCONDUCTIVITY). Cryogenics dates from 1877, when oxygen was first cooled to the point at which it became a liquid (–297°F, or –183°C); superconductivity was discovered in 1911. Applications of cryogenics include the storage and transport of liquefied gases, food preservation, cryosurgery, rocket fuels, and superconducting ELECTROMAGNETS.

crypt Subterranean chamber, usually under a church floor. The CATACOMBS of the early Christians were known as *cryptae,* and when churches came to be built over the tombs of saints and martyrs, subterranean chapels were built around the actual tomb. As early as the reign of CONSTANTINE I (AD 306–37), the crypt was considered a normal part of a church. Later its size was increased to include the entire space beneath the choir or chancel; the crypt of Canterbury Cathedral is an elaborate underground church with its own APSE. Many secular medieval European buildings also had richly decorated crypts.

Crypt, Canterbury Cathedral (12th century), England.
A.F. KERSTING

cryptographic key See cryptographic KEY

cryptography \krip-ˈtä-grə-fē\ Practice of the enciphering and deciphering of messages in secret code in order to render them unintelligible to all but the intended receiver. Cryptography may also refer to the art of cryptanalysis, by which cryptographic codes are broken. Collectively, the science of secure and secret communications, involving both cryptography and cryptanalysis, is known as cryptology. The principles of cryptography are today applied to the encryption of FAX, TELEVISION, and computer NETWORK communications. In particular, the secure exchange of computer data is of great importance to banking, government, and commercial communications. See also DATA ENCRYPTION.

cryptomonad \ˌkrip-tō-ˈmō-ˌnad\ Any small organism with two flagella that is considered both a PROTOZOAN and an alga (see ALGAE). Occurring in both fresh and salt water, cryptomonads contain pigments found only in red algae and blue-green algae (CYANOBACTERIA). They sometimes live harmlessly within other organisms. Some species conduct PHOTOSYNTHESIS. Others lack pigment-containing structures and eat organic matter, under certain conditions surviving on minerals alone.

crystal Any solid material whose ATOMS are arranged in a definite pattern and whose surface regularity reflects its internal symmetry. Each of a crystal's millions of individual structural units (unit cells) contains all the substance's atoms, molecules, or ions in the same proportions as in its chemical formula (see FORMULA WEIGHT). The cells are repeated in all directions to form a geometric pattern, manifested by the number and orientation of external planes (crystal faces). Crystals are classified into seven crystallographic systems based on their symmetry: isometric, trigonal, hexagonal, tetragonal, orthorhombic, monoclinic, and triclinic. Crystals are generally formed when a liquid solidifies, a vapour becomes supersaturated (see SATURATION), or a liquid SOLUTION can no longer retain dissolved material, which is then precipitated. METALS, ALLOYS, MINERALS, and SEMICONDUCTORS are all crystalline, at least microscopically. (A noncrystalline solid is called amorphous.) Under special conditions, a single crystal can grow to a substantial size; examples include gemstones and some artificial crystals. Few crystals are perfect; defects affect the material's electrical behaviour and may weaken or strengthen it. See also LIQUID CRYSTAL.

crystal lattice Three-dimensional configuration of points connected by lines used to describe the orderly arrangement of ATOMS in a CRYSTAL. Each point represents one or more atoms in the actual crystal. The lattice is divided into a number of identical blocks or cells that are repeated in all directions to form a geometric pattern. Lattices are classified according to their dominant symmetries: isometric, trigonal, hexagonal, tetragonal, orthorhombic, monoclinic, and triclinic. Compounds that exhibit a crystal-lattice structure include sodium chloride (table salt), cesium chloride, and boron nitride. See also SOLID-STATE PHYSICS.

Crystal Night See KRISTALLNACHT

Crystal Palace Giant glass-and-iron exhibition hall in Hyde Park, London, that housed the Great Exhibition of 1851. It was taken down and rebuilt (1852–54) at Sydenham Hill, where it survived until its destruction by fire in 1936. Designed by the greenhouse builder Sir Joseph Paxton (1801–1865), it was a remarkable assembly of prefabricated parts. Its intricate network of slender iron rods sustaining walls of clear glass established an architectural standard for later international exhibitions, likewise housed in glass CONSERVATORIES.

The Crystal Palace at Sydenham Hill, London. It was designed by Sir Joseph Paxton for the Great Exhibition of 1851 and rebuilt in 1852–54 at Sydenham Hill but was destroyed in 1936.
BBC HULTON PICTURE LIBRARY

crystalline rock Any rock composed entirely of crystallized minerals without glassy matter (matter without visible crystals). Intrusive igneous rocks (see INTRUSIVE ROCK) are nearly always crystalline; extrusive igneous rocks (see EXTRUSIVE ROCK) may be partly to entirely glassy. Metamorphic rocks are also always completely crystalline and are termed crystalline SCHISTS or GNEISSES. Sedimentary rocks can also be crystalline, such as crystalline limestones that precipitate directly from solution; the term is not generally applied to clastic sediments (made of fragments of preexisting rock), even though they are formed largely from the accumulation of crystalline materials.

crystallography \ˌkris-tə-ˈläg-rə-fē\ Branch of science that deals with discerning the arrangement and bonding of atoms in crystalline solids and with the geometric structure of CRYSTAL LATTICES. Classically, the optical properties of CRYSTALS were of value in mineralogy and chemistry for the identification of substances. Modern crystallography is largely based on the analysis of the DIFFRACTION of X-RAYS by crystals acting as optical gratings. Using X-ray crystallography, chemists are able to determine the internal structures and bonding arrangements of minerals and molecules, including the structures of large complex molecules such as proteins and DNA.

ctenophore \ˈte-nə-ˌfōr\ *or* **comb jelly** Any of nearly 90 species (phylum Ctenophora) of usually colourless marine invertebrates that have

© 2006 Encyclopædia Britannica, Inc.

a series of vertical ciliary combs over their bodies. Ctenophores are sometimes mistaken for JELLYFISH. The body is round or spherical, with tentacles to capture food, and the combs beat to provide locomotion. Most species are small (not much greater than 0.1 in. [3 mm] in diameter), but at least one species grows larger than 3 ft (1 m). Ctenophores live in almost all ocean regions, floating freely in the water. All comb jellies except one parasitic species are carnivores, consuming young mollusks, crustacean and fish larvae, COPEPODS, and other ZOOPLANKTON.

Ctesibius \te-'sib-ē-ˌōs\ **of Alexandria** *or* **Ktesibios** \te-'sib-ē-əs\ **of Alexandria** (fl. c. 270 BC) Greek physicist and inventor. He was the first great figure of the ancient engineering tradition of Alexandria, Egypt, which culminated with HERON OF ALEXANDRIA and Philo of Byzantium. He discovered the ELASTICITY of air and invented several devices using compressed air, including force PUMPS and an air-powered CATAPULT; an improvement of the WATER CLOCK, in which water dripping at a constant rate raised a float with a pointer; and a hydraulus (water organ), in which the weight of water forced air through the organ pipes. His writings have not survived, and his inventions are known only from references to them.

Ctesiphon \'te-sə-ˌfän\ Ancient city, central Mesopotamia. Located on the TIGRIS RIVER, southeast of modern BAGHDAD, Iraq, it was first a Greek army camp opposite the Hellenistic city of SELEUCIA. It was the capital of PARTHIA in the 2nd century BC. Destroyed by the Romans in the 1st century AD, it was resettled by the Persian SĀSĀNIAN DYNASTY in the 3rd century. The Arabs conquered the city in 637 but abandoned it by 763 in favour of a new city, Baghdad. The site is famous for the remains of a gigantic vaulted hall, the Ṭāq Kisrā, which has one of the largest single-span brick arches in the world.

Cú Chulainn *or* **Cuchulain** \kü-'ku̇l-ən\ In ancient Irish Gaelic literature, a powerful warrior and the central character in the ULSTER CYCLE. The son of the god LUGUS and Dechtire, sister of CONCHOBAR MAC NESSA, he was the greatest of the warriors loyal to Conchobar. He had seven fingers on each hand, seven toes on each foot, and seven pupils in each eye. He defended Ulster single-handed at 17 against the forces of Medb, queen of Connaught. In times of rage he could become uncontrollable.

Cuauhtémoc \kwaù-'te-ˌmōk\ *or* **Guatimozin** \ˌgwät-ə-'mōt-sən\ (b. c. 1495—d. Feb. 26, 1522) Last AZTEC emperor, nephew and son-in-law of MONTEZUMA II. He became emperor on the death of Montezuma's successor in 1520, while HERNÁN CORTÉS was marching for the second time on TENOCHTITLÁN, the Aztec capital. He defended the city during a four-month siege that left most buildings destroyed and few Indians surviving. Tortured by the Spaniards in an effort to make him reveal the location of hidden Aztec wealth, his stoicism became legendary. Later Cortés, hearing of a plot against the Spaniards, had Cuauhtémoc hanged.

Cuba *officially* **Republic of Cuba** Island country, WEST INDIES. Located 90 mi (145 km) south of Florida, it comprises the island of Cuba and surrounding small islands. Area: 42,804 sq mi (110,861 sq km). Population (2005 est.): 11,269,000. Capital: HAVANA. The population is largely of African-European or African descent; most of the rest are of European ancestry. Language: Spanish (official). Religions: Christianity (predominantly Roman Catholic; also Protestant), Santería (both formerly discouraged). Currency: Cuban peso. The main island of Cuba is 777 mi (1,250 km) long and 19–119 mi (31–191 km) wide. About one-quarter is mountainous, with Turquino Peak at an elevation of 6,476 ft (1,974 m) the highest peak; the remainder is extensive plains and basins. The climate is semitropical. Cuba was the first communist republic in the Western Hemisphere. It has a centrally planned economy that depends on the export of sugar and, to a much lesser extent, tobacco and nickel. Its cigars are considered the world's best. It is a republic with one legislative house; its head of state and government is the president. Several Indian groups, including the CIBONEY and the ARAWAK, inhabited Cuba at the time of the first Spanish contact. CHRISTOPHER COLUMBUS claimed the island for Spain in 1492, and the Spanish conquest began in 1511, when the settlement of Baracoa was founded. The native Indians were eradicated over the succeeding centuries, and African slaves, from the 18th century until slavery was abolished in 1886, were imported to work the sugar plantations. Cuba revolted unsuccessfully against Spain in the Ten Years' War (1868–78); a second war of independence began in 1895. In 1898 the U.S. entered the war (see SPANISH-AMERICAN WAR); Spain relinquished its claim to Cuba, which was occupied by the U.S. for three years before gaining its independence in 1902. The U.S. invested heavily in the Cuban sugar industry in the first half of the 20th century, and this, combined with tourism and

gambling, caused the economy to prosper. Inequalities in the distribution of wealth persisted, however, as did political corruption. In 1958–59 the communist revolutionary FIDEL CASTRO overthrew its longtime dictator FULGENCIO BATISTA and established a socialist state aligned with the Soviet Union, abolishing capitalism and nationalizing foreign-owned enterprises. Relations with the U.S. deteriorated, reaching a low point with the 1961 BAY OF PIGS INVASION and the 1962 CUBAN MISSILE CRISIS. In 1980 about 125,000 Cubans, including many officially labeled "undesirables," were shipped to the U.S. in the so-called Mariel Boat Lift. When communism collapsed in the U.S.S.R., Cuba lost important financial backing, and its economy suffered greatly. The economy gradually began improving in the 1990s with the encouragement of tourism and the legalization of small businesses and private employment, though diplomatic relations with the U.S. were not resumed.

Cuban missile crisis (1962) Major confrontation between the U.S. and the Soviet Union over the presence of Soviet nuclear missiles in Cuba. In October 1962 a U.S. spy plane detected a ballistic missile on a launching site in Cuba. Pres. JOHN F. KENNEDY placed a naval blockade around the island, and for several days the U.S. and the Soviet Union hovered on the brink of war. Soviet premier NIKITA KHRUSHCHEV finally agreed to remove the missiles in return for a secret commitment from the U.S. to withdraw its own missiles from Turkey and to never invade Cuba. The incident increased tensions during the Cold War and fueled the nuclear arms race between the two countries. See also FIDEL CASTRO.

Cubango River See OKAVANGO RIVER

Cubism Movement in the visual arts created by PABLO PICASSO and GEORGES BRAQUE in Paris between 1907 and 1914. They were later joined by JUAN GRIS, FERNAND LÉGER, ROBERT DELAUNAY, and others. The name derives from a review that described Braque's work as images composed of cubes. Picasso's *Demoiselles d'Avignon* (1907) signaled the new style, which was inspired by African sculpture and the later paintings of PAUL CÉZANNE. Cubist work emphasized the flat, two-dimensional, fragmented surface of the picture plane, rejecting perspective, foreshortening, modeling, and chiaroscuro in favour of geometric forms. The work made in this style from 1910 to 1912 is often referred to as Analytical Cubism. Paintings executed during this period show the breaking down, or analysis, of form. Artists favoured right-angle and straight-line construction and colour schemes that were nearly monochromatic. After 1912 the phase known as Synthetic Cubism began. Works from this phase emphasize the combination, or synthesis, of forms in the picture. Colour assumes a strong role in the work; shapes, while remaining fragmented and flat, are larger and more decora-

© 2006 Encyclopædia Britannica, Inc.

tive; and collage is often used. Many subsequent 20th-century avant-garde movements were influenced by the experimentation of the Cubists.

cuckoo Any of some 138 species of tree-dwelling and terrestrial birds of the family Cuculidae. They are found worldwide in temperate and tropical regions but are most diverse in the Old World tropics. New World species are sometimes classified as a separate family (Coccyzidae) and include the ROADRUNNER. Cuckoos range from 6.5 to 36 in. (16 to 90 cm) long. Most are drab gray, but a few are partially or completely brightly coloured or iridescent. Aside from the European cuckoo's familiar two-note call, cuckoos are best known for their habit of brood PARASITISM (see COWBIRD); their eggs resemble those of the host species (egg mimicry), and the adult cuckoo removes one or more host eggs to ensure that the substitution is not detected. The newly hatched cuckoo may also eject eggs or nestlings.

Cuckoo (*Cuculus*).
GRAEME CHAPMAN/ARDEA LONDON

cucumber Creeping plant (*Cucumis sativus*), of the GOURD family (Cucurbitaceae), or its oblong fruit, for which it is widely cultivated. It probably originated in northern India. The plant is a tender annual with a rough, succulent, trailing stem and hairy leaves with pointed lobes; the stem bears branched tendrils by which the plant can suspend itself. The food value of the fruit is low, but its delicate flavour makes it a popular vegetable for salads and relishes.

cucumber beetle Any of several leaf BEETLES (genus *Diabrotica*) that are important PESTS. They are greenish yellow, marked with black spots or stripes, and 0.1–0.5 in. (2.5–11 mm) long. The striped cucumber beetle and spotted cucumber beetle both feed on garden plants, and their larvae feed on the roots.

Cudworth, Ralph (b. 1617, Aler, Somerset, Eng.—d. June 26, 1688, Cambridge) English theologian and philosopher. Reared as a Puritan, he eventually adopted Nonconformist views such as the notion that church government and religious practice should be individual rather than authoritarian. He became a leader of the CAMBRIDGE PLATONISTS. In ethics, his outstanding work is *A Treatise Concerning Eternal and Immutable Morality* (1731), which was directed against Puritan Calvinism, the theology of RENÉ DESCARTES, and the attempt by THOMAS HOBBES to reduce morality to obedience to civil authority. He stressed the natural good or evil inherent in an event or act, in contrast to the Calvinist-Cartesian notion of divine law. "Things are what they are," he wrote, "not by Will but by Nature." See also INTUITIONISM; VOLUNTARISM.

Cuéllar, Javier Pérez de See Javier PEREZ DE CUELLAR

Cuernavaca \ˌkwer-nə-ˈvä-kə\ City (pop., 2000: 327,162), capital of MORELOS state, south-central Mexico. As the capital city of the Tlahuica Indians, it was known as Cuauhnáhuac. The name was changed (c. 1521) when it was taken by HERNÁN CORTÉS; his palace, now the Morelos State House (decorated with murals by painter DIEGO RIVERA), is located there. Nearby are pre-Columbian ruins. A favourite retreat of the emperor MAXIMILIAN, the area is still popular with tourists. The University of Morelos was established there in 1953.

Cuiabá \ˌkü-yə-ˈbä\ **River** *or* **Cuyabá River** River, Brazil. Rising in central Mato Grosso state, it flows 300 mi (480 km) southwest to join the São Lourenço River. These two rivers' combined courses enter the PARAGUAY RIVER north of Corumbá. Gold deposits are found in the Cuiabá's headwaters.

Cukierman, Yizhak See Itzhak ZUCKERMAN

Cukor \ˈkyü-kər**, George (Dewey)** (b. July 7, 1899, New York, N.Y., U.S.—d. Jan. 24, 1983, Los Angeles, Calif.) U.S. film director. He directed plays on Broadway before going to Hollywood in 1929. His first film, *Tarnished Lady* (1931), was followed by the acclaimed *Little Women* (1933), *David Copperfield* (1935), *The Philadelphia Story* (1940), and *Gaslight* (1944). He directed several comedies starring KATHARINE HEPBURN and SPENCER TRACY, including *Adam's Rib* (1949) and *Pat and Mike* (1952). He was noted for his skill in working with actors, particularly women. Among his other memorable films are *Dinner at Eight* (1933), *The Women* (1939), *A Star Is Born* (1954), and *My Fair Lady* (1964, Academy Award).

Culiacán \ˌkül-yə-ˈkän\ City (pop., 2000: 540,823), capital of SINALOA state, western Mexico. Located on the Culiacán River, it was founded on the site of an Indian settlement in 1531 and played an important role in early colonial days as a base for Spanish expeditions. An elaborate irrigation system in the valley provides for a variety of crops, including corn, sugarcane, tobacco, and fruits and vegetables. It is the seat of the University of Sinaloa (1873).

Cullen, Countee *orig.* **Countee Porter** (b. May 30, 1903, Louisville, Ky.?, U.S.—d. Jan. 9, 1946, New York, N.Y.) U.S. poet of the HARLEM RENAISSANCE. Reared in New York City, he was unofficially adopted at age 15 by a minister. He won a citywide poetry contest and later attended New York and Harvard universities, winning academic honours. His first collection of poems, *Color* (1925), received critical acclaim while he was still in college. *Copper Sun* (1927) was criticized in the black community for not giving enough attention to the issue of race. He taught in the city's public schools from 1934 until his death.

Cullen, William (b. April 15, 1710, Hamilton, Lanarkshire, Scot.—d. Feb. 5, 1790, Kirknewton, near Edinburgh) Scottish physician and professor. One of the first to teach in English rather than Latin, he was celebrated for his clinical lectures, which he gave in the infirmary from his own notes instead of a text. He taught that life was a function of nervous energy and that muscle was a continuation of nerve. His influential classification of disease included febrile diseases, nervous diseases, diseases produced by bad bodily habits, and local diseases.

Cullinan \ˈkə-lə-nən\ **diamond** Largest gem diamond ever discovered. It weighed about 3,106 carats in rough form when it was found in 1905 at the Premier mine in Transvaal, S.Af. Named for Sir Thomas Cullinan, who had discovered the mine, the colourless stone was purchased by the Transvaal government and presented to Britain's King Edward VII. It was cut into 9 large stones and about 100 smaller ones, all flawless; they are now part of the British CROWN JEWELS.

Culloden \kə-ˈlä-dᵊn**, Battle of** (April 16, 1746) Last battle of the "Forty-five Rebellion," which took place on a moor near Inverness, Scot. The JACOBITES, under CHARLES EDWARD, THE YOUNG PRETENDER, were defeated by British forces under the duke of Cumberland. Some 1,000 of the Young Pretender's army of 5,000 were killed by the 9,000 Redcoats, who lost only 50 men. The battle, which lasted only 40 minutes, marked the end of any serious attempt to restore the house of STUART to the British throne.

Culpeper's Rebellion (1677–79) Popular uprising in the Albemarle section of Carolina to protest the British NAVIGATION ACTS, which denied the colonists free markets. Led by John Culpeper and George Durant, the rebels imprisoned the deputy governor (and customs collector) and other officials. They convened a legislature, chose Culpeper as governor, and ran the colony for two years. Culpeper was removed by the colony's proprietors and tried for treason but never punished.

cult Collective veneration or worship (e.g., the cult of the saints—meaning collective veneration of the saints—in Roman Catholicism). In the West, the term has come to be used for groups that are perceived to have deviated from normative religions in belief and practice. They typically have a charismatic leader and attract followers who are in some way disenfranchised from the mainstream of society. Cults as thus defined are often viewed as foreign or dangerous.

cultivar \ˈkəl-tə-ˌvär\ Any variety of a plant, originating through cloning or hybridization (see CLONE, HYBRID), known only in cultivation. In asexually propagated plants, a cultivar is a clone considered valuable enough to have its own name; in sexually propagated plants, a cultivar is a pure line (for self-pollinated plants) or, for cross-pollinated plants, a population that is genetically distinguishable.

cultivation Loosening and breaking up (tilling) of the soil. The soil around existing plants is cultivated (by hand using a hoe, or by machine using a cultivator) to destroy weeds and promote growth by increasing soil aeration and water infiltration. Soil being prepared for the planting of a crop is cultivated by a harrow or plow.

© 2006 Encyclopædia Britannica, Inc.

Cultivation System *or* **Culture System** Revenue system in the Dutch East Indies (modern Indonesia) that forced farmers to pay revenue to The Netherlands in the form of export crops or compulsory labour. The system was introduced in 1830 by the colonial governor-general Johannes van den Bosch. In theory, it required that villagers set aside one-fifth of their land to grow export crops (e.g., coffee, sugar) for the government and that landless peasants work for one-fifth of the year on government fields. In fact, much more land and time were required, and the system proved burdensome. Though roundly criticized in the mid-1850s, the system was not abolished until 1870.

cultural anthropology Branch of ANTHROPOLOGY that deals with the study of CULTURE. The discipline uses the methods, concepts, and data of ARCHAEOLOGY, ETHNOGRAPHY, FOLKLORE, LINGUISTICS, and related fields in its descriptions and analyses of the diverse peoples of the world. Called social anthropology in Britain, its field of research was until the mid 20th century largely restricted to the small-scale (or "primitive"), non-Western societies that first began to be identified during the age of discovery. Today the field extends to all forms of human association, from village communities to corporate cultures to urban gangs. Two key perspectives used are those of holism (understanding society as a complex, interactive whole) and cultural relativism (the appreciation of cultural phenomena within their own context). Areas of study traditionally include social structure, law, politics, religion, magic, art, and technology.

Cultural Revolution *officially* **Great Proletarian Cultural Revolution** (1966–76) Upheaval launched by MAO ZEDONG to renew the spirit of revolution in China. Mao feared urban social stratification in a society as traditionally elitist as China and also believed that programs instituted to correct for the failed GREAT LEAP FORWARD showed that his colleagues lacked commitment to the revolution. He organized China's urban youths into groups called the RED GUARDS, shut down China's schools, and encouraged the Red Guards to attack all traditional values and "bourgeois things." They soon splintered into zealous rival groups, and in 1968 Mao sent millions of them to the rural hinterland, bringing some order to the cities. Within the government, a coalition of Mao's associates fought with more moderate elements, many of whom were purged, were verbally attacked, were physically abused, and subsequently died; leaders LIU SHAOQI and LIN BIAO both died under mysterious circumstances. From 1973 to Mao's death in 1976, politics shifted between the hard-line GANG OF FOUR and the moderates headed by ZHOU ENLAI and DENG XIAOPING. After Mao's death the Cultural Revolution was brought to a close. By that time, nearly three million party members and countless wrongfully purged citizens awaited reinstatement. The Cultural Revolution subsequently was repudiated in China. See also JIANG QING.

cultural studies Interdisciplinary field concerned with the role of social institutions in the shaping of CULTURE. Originally identified with the Center for Contemporary Cultural Studies at the University of Birmingham (founded 1964) and with such scholars as Richard Hoggart, Stuart Hall, and Raymond Williams, today cultural studies is recognized as a discipline or area of concentration in many academic institutions and has had broad influence in SOCIOLOGY, ANTHROPOLOGY, HISTORIOGRAPHY, LITERARY CRITICISM, PHILOSOPHY, and ART CRITICISM. Among its central concerns are the place of RACE (or ethnicity), CLASS, and gender in the production of cultural knowledge.

culture Integrated pattern of human knowledge, belief, and behaviour that is both a result of and integral to the human capacity for learning and transmitting knowledge to succeeding generations. Culture thus consists of language, ideas, beliefs, customs, taboos, codes, institutions, tools, techniques, works of art, rituals, ceremonies, and symbols. It has played a crucial role in HUMAN EVOLUTION, allowing human beings to adapt the environment to their own purposes rather than depend solely on NATURAL SELECTION to achieve adaptive success. Every human society has its own particular culture, or sociocultural system. Variation among cultures is attributable to such factors as differing physical habitats and resources; the range of possibilities inherent in areas such as language, ritual, and social organization; and historical phenomena such as the development of links with other cultures. An individual's attitudes, values, ideals, and beliefs are greatly influenced by the culture (or cultures) in which he or she lives. Culture change takes place as a result of ecological, socioeconomic, political, religious, or other fundamental factors affecting a society. See also CULTURE CONTACT; SOCIOCULTURAL EVOLUTION.

culture, pure See PURE CULTURE

culture contact Contact between peoples with different cultures, usually leading to change in one or both systems. Forms of culture contact traditionally include acculturation, assimilation, and amalgamation. Acculturation is the process of change in material culture, traditional practices, and beliefs that occurs when one group interferes in the cultural system of another, directly or indirectly challenging the latter to adapt to the ways of the former. Such change has characterized most political conquests and expansions over the centuries. Assimilation is the process whereby individuals or groups of differing ethnicity are absorbed into the dominant culture of a society—though not always completely. In the U.S. millions of European immigrants became assimilated within two or three generations; factors included the upheaval of overseas relocation, the influences of the public school system, and other forces in American life. Amalgamation (or hybridization) occurs when a society becomes ethnically mixed in a way that represents a synthesis rather than the elimination or absorption of one group by another. In Mexico, for example, Spanish and Indian cultures became increasingly amalgamated over centuries of contact.

culture hero Mythological figure who secures for humanity the attributes of culture either in cooperation with or in opposition to the gods. The culture hero is often an animal or trickster figure, the most common motif being the animal who steals fire from the gods for the benefit of humans. In other stories the culture hero is human and must overcome the opposition of animals. In still others, the culture hero must travel to an inaccessible place to reach a life-giving or healing tree or other plant; supernatural animals may assist or obstruct him. See also PROMETHEUS.

Culture System See CULTIVATION SYSTEM

Cumae \'kyü-mē\ Ancient city west of Naples, Italy. Probably the oldest Greek mainland colony in the West, it was home to the Cumaean SIBYL, whose cavern still exists. Founded c. 750 BC by Greeks from CHALCIS, it came to control much of the Campanian plain. Taken by the Samnites in the 5th century BC, it was subjugated by Rome in 338 BC. Under the empire it became a quiet country town. It was destroyed in AD 1205. Remains of fortifications and graves from all these periods have been found throughout the area.

Cumberland Gap National Historical Park National historical park, Tennessee, U.S. Created in 1940 to preserve the Cumberland Gap, a natural pass at 1,640 ft (500 m) through the Cumberland Plateau, it includes the Wilderness Road, blazed by DANIEL BOONE, which became the main artery that opened the Northwest Territory. The park covers 32 sq mi (83 sq km).

Cumberland Plateau Tableland in the U.S. that forms the western section of the APPALACHIAN MOUNTAINS and a part of the Allegheny Plateau. It extends southwest for 450 mi (725 km) from southern West Virginia to northeastern Alabama, averages 50 mi (80 km) in width, and is 2,000–4,145 ft (600–1,263 m) high. The roughest and highest portion is a narrow ridge about 140 mi (225 km) long that forms its eastern margin in eastern Kentucky and northeastern Tennessee; the name Cumberland Mountains is generally applied to this area, which includes the CUMBERLAND GAP NATIONAL HISTORICAL PARK. The plateau has large deposits of coal, limestone, and sandstone.

Cumberland River River, Kentucky and Tennessee, U.S. It rises in southeastern Kentucky and flows west, looping through northern Tennessee before returning north to join the OHIO RIVER after a course of 687 mi (1,106 km). It drops 92 ft (28 m) at Cumberland (or Great) Falls, the site of a state park. A series of lakes on the Cumberland were developed as part of the TENNESSEE VALLEY AUTHORITY system. Wolf Creek Dam (1952) created Lake Cumberland, which extends to the base of Cumberland Falls.

Cumberland Sound Inlet of DAVIS STRAIT, Nunavut, Canada. Indenting the southeastern coast of BAFFIN ISLAND, it is 170 mi (270 km) long and 100 mi (160 km) wide. John Davis, an English navigator, sailed into the sound in 1585 in search of the NORTHWEST PASSAGE. By the late 19th century the area was noted for whaling. The Anglican church established missions early in the 20th century at settlements along its shores.

Cumbria Administrative county (pop., 2001: 487,607), northwestern England. Extending along the IRISH SEA coast from Morecambe Bay to Solway Firth, it includes the famous LAKE DISTRICT. It was established in 1974, with its seat at CARLISLE. Human occupation dates from the NEOLITHIC PERIOD. The Romans constructed several roads, a series of forts, and the great complex of HADRIAN'S WALL. After the mid-10th century, northern

Cumbria alternated between Scottish and English rule until it was taken by the English in 1157. Lead, silver, and iron ore have been mined in the district since the 12th century.

cumin \'kə-mən, 'kyü-mən\ Small, slender annual herb (*Cuminum cyminum*) of the carrot family (Apiaceae). It is cultivated in the Mediterranean region, India, China, and Mexico. Its seeds, which are actually dried fruits, are used in many spice mixtures such as chili and curry powders. Cumin is especially popular in Asian, North African, and Latin American cuisines. Its oil is used in perfumes, for flavouring liquors, and for medicinal purposes.

Cummings, E(dward) E(stlin) (b. Oct. 14, 1894, Cambridge, Mass., U.S.—d. Sept. 3, 1962, North Conway, N.H.) U.S. poet and painter. Cummings attended Harvard University. His experience in World War I of being held in a detention camp because of a censor's error gave rise to his first prose book, *The Enormous Room* (1922). His first book of poems, *Tulips and Chimneys* (1923), was followed by 11 more. Cummings's poetry, rooted in New England traditions of dissent and self-reliance, attracted attention for its lack of capitalization, eccentric punctuation and phrasing, and often childlike playfulness, which won it a wide readership. His Norton lectures at Harvard were published as *i: six nonlectures* (1953).

Cuna \'kü-nə\ Chibchan-speaking Indian people who once occupied the central region of what is now Panama and the neighbouring San Blas Islands and who still survive in marginal areas. In the 16th century they lived in federated villages under chiefs who wielded considerable power. They had a hierarchical society and enslaved prisoners of war. Today they live in small villages and depend on agriculture, which is supplemented by hunting and fishing, for subsistence.

Cunard \kyù-'närd**, Sir Samuel, 1st Baronet** (b. Nov. 21, 1787, Halifax, Nova Scotia—d. April 28, 1865, Kensington, London, Eng.) Canadian-British merchant and shipowner. He became prosperous in commerce and began laying plans in 1830 to establish mail service between England and North America. He went to England in 1838 and in 1839 cofounded the British and North American Royal Mail Steam Packet Co., known as the Cunard Line. In 1840, four Cunard liners began the first regular service across the Atlantic Ocean.

cuneiform law \ˌkyù-'nē-ə-ˌfȯrm\ Body of laws revealed by documents written in cuneiform script (see CUNEIFORM WRITING). It includes the laws of the Sumerians, Babylonians, Assyrians, Elamites, Hurrians, Kassites, and Hittites. Unlike modern legal codes, these ancient codes do not systematically treat all the rules applicable to a given area of law; rather, they treat a variety of matters but often ignore many highly important rules simply because such rules were so grounded in CUSTOM that they went unquestioned. The most important of the ancient codes is the Babylonian Code of HAMMURABI.

cuneiform \kyù-'nē-ə-ˌfȯrm\ **writing** System of writing employed in ancient times to write a number of languages of the Middle East. The original and primary writing material for cuneiform texts was a damp clay tablet, into which the scribe would press a wedge-shaped stroke with a reed stylus. A configuration of such impressions constituted a character, or sign. Proto-cuneiform signs dating from c. 3200–3000 BC were drawn rather than impressed and were largely pictographic (see PICTOGRAPHY), though these features were lost as the script evolved. A single cuneiform sign could be a logogram (an arbitrary representation of a word) or a syllabogram (a representation of the sound of a syllable). The first language to be written in cuneiform was Sumerian (see SUMER). AKKADIAN began to be written in cuneiform c. 2350 BC. Later the script was adapted to other South Asian languages. Cuneiform was slowly displaced in the first millennium BC by the rise of ARAMAIC, written in an ALPHABET script of Phoenician origin. Knowledge of the value of cuneiform signs was lost until the mid-19th century, when European scholars deciphered the script.

Cunene \kü-'nā-nə\ **River** *or* **Kunene River** River, southwestern Angola. It flows south to enter the northern KALAHARI DESERT. Forming part of the boundary between Angola and Namibia, it passes through the NAMIB DESERT before emptying into the Atlantic Ocean after a total course of 700 mi (1,125 km).

Cunningham, Imogen (b. April 12, 1883, Portland, Ore., U.S.—d. June 24, 1976, San Francisco, Calif.) U.S. photographer. She began taking pictures in 1901; her earliest prints imitated contemporary academic painting. She opened a portrait studio in Seattle, Wash., in 1910 and soon established a national reputation as a portrait photographer. Encouraged by EDWARD WESTON, she exhibited her plant photographs in San Francisco, where she would work for the remainder of her career. In 1932 she joined the West Coast photographers known as Group *f*.64. Later in her career she taught at the San Francisco Art Institute.

Two Callas, by Imogen Cunningham, c. 1929.
IMOGEN CUNNINGHAM

Cunningham, Merce (b. April 16, 1919, Centralia, Wash., U.S.) U.S. avant-garde dancer and choreographer. In 1939 he joined MARTHA GRAHAM's company, where he created roles in several of her works. As an independent choreographer in 1945–52, he began his long collaboration with the composer JOHN CAGE. In 1952 Cunningham formed his own company, developing his interest in isolated movement and "choreography by chance." His *Suite by Chance* (1952) was the first dance performed to an electronic score. Other works include *The Seasons* (1947), *Summerspace* (1958), and *Locale* (1980).

Merce Cunningham, 1970.
JACK MITCHELL

Cuno \'kü-nō**, Wilhelm (Carl Josef)** (b. July 2, 1876, Suhl, Ger.—d. Jan. 3, 1933, Aumühle) German politician and business leader. After serving in government positions from 1907, in 1918 he became general director of the Hamburg-American Line, the largest German shipping concern. He served as chancellor of the WEIMAR REPUBLIC (1922–23), enjoying the strong support of German business and industry but failing to readjust war reparations or halt inflation. During the RUHR OCCUPATION he urged a national policy of passive resistance, which ultimately overtaxed the economy. Obliged to resign, he returned to Hamburg-American and again served as chairman (1926–33).

cupellation \ˌkyü-pə-'lā-shən\ Separation of GOLD or SILVER from impurities by melting the impure metal in a cupel (a flat, porous dish made of a refractory material) and directing a blast of hot air on it in a special furnace. The impurities, including lead, copper, tin, and other unwanted metals, are oxidized and partly vaporized and partly absorbed into the pores of the cupel.

Cupid Ancient Roman god of love in all its varieties, identified with the Greek Eros. Cupid was the son of Mercury and Venus. He was usually represented as a winged infant who carried a bow and quiver of arrows, which he shot at humans to inflict wounds that inspired love or passion. He was also sometimes depicted as a beautiful youth. Though generally considered beneficent, he could be mischievous in matchmaking, often at his mother's behest.

Curaçao \ˌkůr-ə-ˈsō, ˌkyůr-ə-ˈsaů\ Largest island (pop., 2000 est.: 143,387) of the Netherlands Antilles. It is located in the Caribbean Sea north of the coast of Venezuela; Willemstad is its chief town. It occupies 171 sq mi (444 sq km) and has the best natural harbour in the West Indies. First visited by Europeans in 1499, it was settled by the Spanish in 1527; Sephardic Jews from Portugal migrated there in the 1500s, originating the oldest continuously inhabited Jewish community in the Western Hemisphere. The Dutch West India Co. gained control of the island in 1634. It was awarded to The Netherlands by the 1815 Treaty of Paris. Internal self-government was granted in 1954. Products include oranges, Curaçao liqueur, and aloes. The chief industry is the refining of oil from Venezuela; tourism is of growing importance.

curare \kyů-ˈrär-ē\ Organic compound, an alkaloid that occurs in various tropical American plants (mostly of the genus *Strychnos*) and causes paralysis. Crude preparations have long been used by native people as an arrow poison. It relaxes skeletal muscle by competing with acetylcholine at nerve endings. A purified form is used in anesthesiology to prevent any movement of patients during surgery. Small amounts bring profound relaxation, with prompt recovery and few complications.

curassow \ˈkyůr-ə-ˌsō\ Any of numerous tropical American bird species (family Cracidae); strictly defined, one of 7–12 species in which the male is glossy black and has a curled crest of feathers and a brightly coloured bill ornament. The smaller female is brownish and unornamented. Curassows have delicious flesh and are hunted as game. Large species (measuring up to nearly 40 in. [100 cm] long) include the great curassow (*Crax rubra*), found from Mexico to Ecuador; the helmeted curassow (*Pauxi pauxi*), of the Venezuelan and Colombian mountains; and the critically endangered razor-billed curassow (*C. mitu*), of the Amazon.

curia \ˈkyůr-ē-ə\ In medieval Europe, a court, or a group of persons who attended a ruler at a given time for social, political, or judicial purposes. The ruler and curia made policy decisions (as on war, treaties, finances, church relations), and under a powerful ruler the curia often became active as a court of law. Indeed, curiae became so loaded down with judicial work that they were gradually forced to delegate it to special groups of judges. In England the Curia Regis (King's Court) began at the time of the Norman Conquest (1066) and lasted to about the end of the 13th century. It was the germ from which the higher courts of law, the Privy Council, and the cabinet were to spring. See also Roman Curia.

Curie \kyůr-ˈē**, Marie** *orig.* **Maria Skłodowska** (b. Nov. 7, 1867, Warsaw, Pol., Russian Empire—d. July 4, 1934, near Sallanches, France) Polish-born French physical chemist. She studied at the Sorbonne (from 1891). Seeking the presence of radioactivity—recently discovered by Henri Becquerel in uranium—in other matter, she found it in thorium. In 1895 she married fellow physicist Pierre Curie (1859–1906). Together they discovered the elements polonium (which Marie named after her native Poland) and radium, and they distinguished alpha, beta, and gamma radiation. For their work on radioactivity (a term she coined), the Curies shared the 1903 Nobel Prize for Physics with Becquerel. Marie thus became the first woman to receive a Nobel Prize. After Pierre's death, Marie was appointed to his professorship and became the first woman to teach at the Sorbonne. In 1911 she won a Nobel Prize for Chemistry for discovering polonium and isolating pure radium, becoming the first person to win two Nobel Prizes. She died of leukemia caused by her long exposure to radioactivity. In 1995 she became the first woman whose own achievements earned her the honour of having her ashes enshrined in the Pantheon in Paris. See also Frédéric Joliot-Curie.

Marie Curie.
THE GRANGER COLLECTION, NEW YORK CITY

Curitiba \ˌkůr-ə-ˈtē-bə\ City (pop., 2002 est.: city, 1,644,600; metro. area, 2,866,000), capital of Paraná state, southern Brazil. It lies about 3,000 ft (900 m) above sea level in the Brazilian Highlands near the headwaters of the Iguazú River. Founded in 1654 as a gold-mining camp, it became the state capital in 1854. From the early 19th century it received many European settlers, and immigration continued during the 20th century with the arrival of newcomers from Syria and Japan. It is a modern commercial centre. Its cathedral (1894) was inspired by that of Barcelona, Spain.

curl In mathematics, a differential operator that can be applied to a vector-valued function (or vector field) in order to measure its degree of local spinning. It consists of a combination of the function's first partial derivatives. One of the more common forms for expressing it is:

$$\operatorname{curl}\,\mathbf{v} = i\left(\frac{\partial \mathbf{v}_3}{\partial y} - \frac{\partial \mathbf{v}_2}{\partial z}\right) + j\left(\frac{\partial \mathbf{v}_1}{\partial z} - \frac{\partial \mathbf{v}_3}{\partial x}\right) + k\left(\frac{\partial \mathbf{v}_2}{\partial x} - \frac{\partial \mathbf{v}_1}{\partial y}\right)$$

in which $\mathbf{v}$ is the vector field ($\mathbf{v}_1$, $\mathbf{v}_2$, $\mathbf{v}_3$), and $\mathbf{v}_1$, $\mathbf{v}_2$, $\mathbf{v}_3$ are functions of the variables x, y, and z, and $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k}$ are unit vectors in the positive x, y, and z directions, respectively. In fluid mechanics, the curl of the fluid velocity field (i.e., vector velocity field of the fluid itself) is called the vorticity or the rotation because it measures the field's degree of rotation around a given point.

curlew Any of eight species (genus *Numenius*) of shorebirds having a sickle-shaped bill that curves downward at the tip, a streaked, gray or brown body, and a long neck and legs. Curlews breed inland in temperate and subarctic regions of the Northern Hemisphere and migrate far south. They eat insects and seeds during migration but feed on worms and fiddler crabs while wintering on marshes and coastal mudflats. The eastern curlew is the largest species (24 in., or 60 cm, long); the common, or Eurasian, curlew, almost as large, is the largest European shorebird. The Eskimo curlew is now virtually extinct.

Curley, James Michael (b. Nov. 20, 1874, Boston, Mass., U.S.—d. Nov. 12, 1958, Boston) U.S. politician. He served in the U.S. House of Representatives (1911–14). As Boston's mayor (1914–18, 1922–26, 1930–34, 1947–50), he dominated the city's politics for 50 years. He owed much of his success to serving the needs of Irish immigrants in exchange for votes. He centralized the powers of patronage in his own hands and distributed public works jobs so as to retain the loyalty and support of his working-class electoral base. As mayor, he brought the city close to bankruptcy by spending enormous sums on parks and hospitals to satisfy his various constituencies. Unable to win a seat in the Massachusetts delegation to the 1932 Democratic convention, Curley contrived by means he never explained to be elected a delegate from Puerto Rico. As governor of Massachusetts (1935–37), he spent New Deal funds lavishly on roads, bridges, and other public works programs. He won a seat in the House of Representatives in 1942 and was reelected two years later. His last mayoral term included five months in prison following a conviction for mail fraud; Pres. Harry Truman secured his release and later granted him a full pardon. His colourful career inspired Edwin O'Connor's novel *The Last Hurrah* (1956). His autobiography, *I'd Do It Again*, was published in 1957.

curling Game in which two teams of four players each slide a round stone by means of a gooseneck handle on the top over a 138-ft (42-m) stretch of ice toward a target circle. The object is to deliver the stone closest to the centre (called the house). Each player delivers two stones, which average 40 lbs (18.1 kg) apiece, often applying a curl to the stone's trajectory. The player's teammates use a broom to sweep the ice ahead of the oncoming stone in order to facilitate a longer slide or to adjust the arc of the curl. Blocking and knocking out an opponent's stones are important strategies of the sport. Curling originated in Scotland in the early 16th century. World championships have been held since 1959 and are usually dominated by Canadians and Scandinavians. In 1998 curling became a medal sport in the Winter Olympic Games.

currant Any shrub of at least 100 species in the genus *Ribes*, in the GOOSEBERRY family, native to temperate climates of the Northern Hemisphere and western South America. The Rocky Mountains are especially rich in species. The flavorful, juicy red or black berries are used chiefly in jams and jellies. Black currants are used in lozenges and for flavoring, and are occasionally fermented. Currants are extremely high in vitamin C and also supply calcium, phosphorus, and iron. The name currant is also given to a seedless raisin frequently used in cooking.

Currant (*Ribes*)
WALTER CHANDOHA

currency In industrialized nations, the portion of the national MONEY SUPPLY (consisting of banknotes and government-issued paper MONEY and coins) that does not require endorsement to serve as a medium of exchange. Since the abandonment of the GOLD STANDARD, governments have not been obligated to repay the holders of currency in any form of precious metal. Consequently, the volume of currency has been determined by the actions of the government or CENTRAL BANK and not by the supply of precious metals. In less-developed societies, or in times of economic scarcity, items such as livestock or tobacco (cigarettes) may serve as currency. See also COINAGE.

current, density See DENSITY CURRENT

current, electric See ELECTRIC CURRENT

Currie, Sir Arthur William (b. Dec. 5, 1875, Napperton, Ont., Can.—d. Nov. 30, 1933, Montreal, Que.) Canadian military leader. He was a businessman in Victoria, B.C., before enlisting in the militia. Given command of a battalion in 1914, he won distinction in several battles of World War I; within three years he was promoted to lieutenant general and given command of the four divisions of the Canadian Corps. After the war he served as the first general in the Canadian army. In 1920 he became principal and vice chancellor of McGill University.

Currier and Ives *partnership of* **Nathaniel Currier and James Merritt Ives** (respectively b. March 27, 1813, Roxbury, Mass., U.S.—d. Nov. 20, 1888, New York, N.Y.; b. March 5, 1824, New York City—d. Jan. 3, 1895, Rye, N.Y.) U.S. lithographers. Currier served apprenticeships in Boston and Philadelphia before he set up in business in New York City in 1835. He hired Ives as a bookkeeper and made him his partner in 1857. Currier and Ives greatly increased the public demand for graphic images by publishing fine-quality, black-and-white and hand-coloured lithographs (see LITHOGRAPHY) depicting disasters, political satire, views of city life, outdoor country scenes, and sentimental domestic scenes. They established outlets across the country and in London. Between 1840 and 1890 they published more than 7,000 titles. The firm continued under their sons until 1907.

curry (from Tamil *kari*, "sauce") Dish or sauce in Indian cuisine. It is seasoned with a mixture of spices often including TURMERIC, CUMIN, CORIANDER, GINGER, as well as garlic and chiles. Some of the curry spices are known for their antiseptic and preservative properties. Curries have been a part of South Asian cookery since antiquity. The primarily vegetarian curries of southern India are the most pungent. Those of northern India, where lamb and poultry are eaten, generally avoid hot or pungent ingredients.

curtain Panel of decorative fabric hung to regulate the admission of light at a window and to prevent drafts. Curtains made of a heavy material, arranged to fall in ornamental folds to the floor, are called draperies. Mosaics from the 2nd–6th century show curtains suspended from rods spanning arches. From the Middle Ages to the 19th century, curtains ranged in style from simple to ornamented; beds were often curtained on all sides. In the 20th century, synthetic fabrics and mechanical devices for opening and closing curtains simplified their installation and use.

curtain wall Nonbearing wall of glass, metal, or masonry attached to a building's exterior structural frame. After World War II, low energy costs gave impetus to the concept of the tall building as a glass prism, an idea originally put forth by LE CORBUSIER and Ludwig MIES VAN DER ROHE in their visionary projects of the 1920s. The UN's Secretariat Building (1949), with its green-tinted glass walls, helped set a worldwide standard for skyscrapers.

Curtis, Charles Gordon (b. Jan. 25, 1860, Kansas Territory, U.S.—d. Feb. 8, 1936, Washington, D.C.) U.S. inventor. An associate of THOMAS ALVA EDISON, Curtis patented the Curtis steam TURBINE in 1896. Its principles are still used in large ocean liners and other naval vessels; General Electric Co. has used it worldwide in its power installations. Curtis is also credited with inventing the first U.S. gas turbine, held many patents for diesel-engine improvements, and helped develop propulsion mechanisms for naval torpedoes.

Curtis, Cyrus (Herman Kotzschmar) (b. June 18, 1850, Portland, Maine, U.S.—d. June 7, 1933, Wyncote, Pa.) U.S. publisher. Curtis began publishing a local weekly in Portland. When fire destroyed his plant, he moved to Boston; there he published *The People's Ledger* magazine, which he continued after his move to Philadelphia in 1876. In 1879 he founded *The Tribune and Farmer*, from the women's section of which he formed the *LADIES' HOME JOURNAL*. In 1890 he organized the Curtis Publishing Co. Later acquisitions included *The Saturday Evening Post* (1897) and several newspapers. His daughter Mary Louise (1876–1970) founded the CURTIS INSTITUTE OF MUSIC and named it for her father.

Curtis, Tony *orig.* **Bernard Schwartz** (b. June 3, 1925, New York, N.Y., U.S.) U.S. film actor. He appeared on Broadway before going to Hollywood in 1949. He acted in adventure films, becoming known for his pretty face and his Bronx accent, then earned acclaim for his roles in *Sweet Smell of Success* (1957) and *The Defiant Ones* (1958). His success in BILLY WILDER's *Some Like It Hot* (1959) was followed by roles in other light comedies in the 1960s. He continued to perform onstage and in films into the 21st century.

Curtis Cup Golf trophy awarded since 1932 to the winner of a biennial amateur women's match played between teams from Britain and the U.S. Teams consist of six players, two alternates, and a captain. The cup was donated by Harriot and Margaret Curtis, amateur golf champions of the early 20th century. Teams play six 18-hole foursomes and 12 18-hole singles matches.

Curtis Institute of Music Conservatory of music in Philadelphia, Pa., U.S. It was founded in 1924 by Mary Louise Curtis Bok (1876–1970),

wife of the editor Edward Bok, and named for her father, the inventor Charles Gordon Curtis. Her endowment was adequate to assure scholarships for gifted students throughout the world. Many eminent musicians have served on its faculty, including Wanda Landowska, Bohuslav Martinů, and Rudolf Serkin. Graduates include Samuel Barber, Leonard Bernstein, and Gian Carlo Menotti.

Curtiss, Glenn (Hammond) (b. May 21, 1878, Hammondsport, N.Y., U.S.—d. July 23, 1930, Buffalo, N.Y.) U.S. aviation pioneer. He initially built engines for motorcycles. In 1904 he built a motor for a dirigible, and in 1908 he flew an experimental plane to win the first public U.S. flight of 1 km (0.6 mi). In 1911 he built the first practical seaplane and was awarded the first contract to build airplanes for the U.S. Navy. His factories later supplied planes to Britain and Russia as well. His best-known plane was the JN-4, or "Jenny," a trainer widely used in World War I and later by barnstormers. His company later merged with the Wright Company to become the Curtiss-Wright Corporation.

Curtiz \'kůr-tis**, Michael** *orig.* **Mihály Kertész** (b. Dec. 24, 1888, Budapest, Hung.—d. April 10, 1962, Hollywood, Calif., U.S.) Hungarian-U.S. film director. He directed films in Hungary and elsewhere in Europe before he was invited to Hollywood by Warner Brothers in 1926. He directed more than 100 Warner Brothers films, including adventure movies with Errol Flynn such as *Captain Blood* (1935), *The Adventures of Robin Hood* (1938), and *The Sea Hawk* (1940). His many other notable films include *Yankee Doodle Dandy* (1942), the hugely successful *Casablanca* (1942, Academy Award), *Mildred Pierce* (1945), and *White Christmas* (1954).

curvature Measure of the rate of change of direction of a curved line or surface at any point. In general, it is the reciprocal of the radius of the circle or sphere of best fit to the curve or surface at that point. This notion of best fit derives from the principle that only one circle can be drawn though any three points not on the same line. The radius of curvature at the middle point is approximately equal to the radius of that one circle. This calculation becomes more exact the closer the points are. The precise value is found using a limit. Because a straight line can be thought of as an arc of a circle of infinite radius, its curvature is zero.

curve In mathematics, an abstract term used to describe the path of a continuously moving point (see continuity). Such a path is usually generated by an equation. The word can also apply to a straight line or to a series of line segments linked end to end. A closed curve is a path that repeats itself, and thus encloses one or more regions. Simple examples include circles, ellipses, and polygons. Open curves such as parabolas, hyperbolas, and spirals have infinite length.

Curzon \'kər-zᵊn\ **(of Kedleston), George Nathaniel Curzon, Marquess** *or* **Lord Curzon** (b. Jan. 11, 1859, Kedleston Hall, Derbyshire, Eng.—d. March 20, 1925, London) British viceroy of India (1898–1905) and foreign secretary (1919–24). Eldest son of a baron, he studied at Oxford and entered Parliament in 1886. A world tour left him with an infatuation for Asia, and in 1891 he became undersecretary of state for India; he was named viceroy in 1898. There he reduced taxes and ordered immediate punishment of any Briton who ill-treated Indian nationals. He presided over the unpopular Partition of Bengal and resigned after a clash with Lord Kitchener. He later served in the cabinets of H.H. Asquith and David Lloyd George.

Curzon Line Demarcation line between Poland and Soviet Russia. The British foreign secretary, Lord Curzon, proposed it as a possible armistice line in the Russo-Polish War of 1919–20. His plan was not accepted, and the final peace treaty (1921) provided Poland with almost 52,000 sq mi (135,000 sq km) of land east of the line. With the outbreak of World War II, the Soviet Union revived the line, claiming all the territory east of it. In 1945 a Soviet-Polish treaty officially designated a line almost identical to the Curzon Line as their mutual border.

Cush *or* **Kush** Ancient country, Nubia region of the Nile River valley. In the 2nd millennium BC it was subject to Egypt. In the 8th century BC Cushite King Piye invaded and conquered Egypt. It was ruled from 719 BC by Piye's brother Shabaka, who also invaded Egypt and set up the 25th dynasty; he subsequently made Memphis his capital. In the mid-7th century BC the Cushite kingdom's capital was transferred to Meroë, where the Cushites ruled for another 1,000 years.

Cushing syndrome Disorder named for Harvey Williams Cushing, caused by adrenal cortex overactivity. If caused by a pituitary gland tumour, it is called Cushing disease. Symptoms include obesity of the trunk and face ("moon face"), muscle wasting, high blood pressure, easy bruising, osteoporosis, diabetes mellitus, and fat between the shoulders ("buffalo hump"). Excess glucocorticoid hormones, whether produced by the adrenal gland or given as drugs, cause the symptoms, which are treated by surgery, radiation, cortisol-blocking drugs, or ending of glucocorticoid treatment. Cortisol treatment may be necessary after surgery.

Cushing, Caleb (b. Jan. 17, 1800, Salisbury, Mass., U.S.—d. Jan. 2, 1879, Newburyport, Mass.) U.S. lawyer and diplomat. After serving in the U.S. House of Representatives (1835–43), he was appointed U.S. commissioner to China (1843–45). In that office he negotiated the Treaty of Wanghia (1844), which opened five Chinese ports to U.S. trade and established the principle of extraterritoriality. He later served as U.S. attorney general (1853–57), U.S. counsel at the Geneva Conference (1871–72) for the settlement of the Alabama claims, and minister to Spain (1874–77).

Cushing \'kůsh-iŋ**, Harvey Williams** (b. April 8, 1869, Cleveland, Ohio, U.S.—d. Oct. 7, 1939, New Haven, Conn.) U.S. surgeon. He taught principally at Harvard University and became known as the leading neurosurgeon of the early 20th century, developing many procedures and techniques still basic to brain surgery and greatly reducing its mortality rate. The leading expert in the diagnosis and treatment of intracranial tumours, he was also the first to ascribe to pituitary gland malfunction what is now known as Cushing syndrome. He wrote numerous scientific works, including *The Life of Sir William Osler* (1925, Pulitzer Prize).

Cushman, Charlotte (Saunders) (b. July 23, 1816, Boston, Mass., U.S.—d. Feb. 18, 1876, Boston) U.S. actress. She made her opera debut in Boston at age 19, but her singing voice soon failed and she turned to acting. In 1837 she first played her most popular role, Meg Merrilies in *Guy Mannering*, and she became the first native-born U.S. theatre star. From 1842 she managed a theatre in Philadelphia, where she starred with William Macready in *Macbeth*. In 1854–55 she toured England to great acclaim. Noted for her powerful emotional reach, she portrayed Lady Macbeth and male roles such as Romeo and Hamlet.

Charlotte Cushman as Meg Merrilies in *Guy Mannering*.
COURTESY OF THE LIBRARY OF CONGRESS, WASHINGTON, D.C.

cusk *or* **torsk** Long-bodied food fish (*Brosme brosme*) of the cod family, found along the bottom of deep offshore waters on either side of the North Atlantic Ocean. It is a small-scaled fish with a large mouth and a barbel (fleshy feeler) on its chin. It has one dorsal and one anal fin, both long and both connected to the rounded tail. It may grow to a length of 3–3.5 ft (90–110 cm). It varies from yellowish or brownish to a slaty colour and, when young, may be vertically barred with yellow.

cusp In architecture, the intersection of lobed or scalloped forms, particularly in arches (cusped arches) and tracery. Thus the three lobes of a trefoil (cloverleaf form) are separated by three cusps. Cusped forms appear in early Islamic work and were especially common in the Moorish architecture of North Africa and Spain. The form was adopted wholeheartedly by European Gothic architecture.

custard apple Any of various *Annona* species of shrubs or small trees of the family Annonaceae, native to the New World tropics and Florida. The family is the largest in the magnolia order and contains approximately 1,100 species of plants in 122 genera. Many species in the family are valuable for their large, pulpy fruits. Others are valued

Custard apple (*Annona reticulata*).
WALTER DAWN

© 2006 Encyclopædia Britannica, Inc.

for their timber, and still others as ornamentals. Leaves and wood are often fragrant. The fruit is a berry. The small, tropical American custard apple (*Annona reticulata*) bears fruits with reddish-yellow, sweetish, custard-like flesh. Other species include the sweetsop (*A. squamosa*) and the soursop (*A. muricata*). Bark, leaves, and roots of many species are important in folk medicine.

Custer, George Armstrong (b. Dec. 5, 1839, New Rumley, Ohio, U.S.—d. June 25, 1876, Little Bighorn River, Montana Territory) U.S. cavalry officer. He graduated from West Point and at age 23 became a brigadier general. His vigorous pursuit of Confederate troops under Gen. Robert E. Lee in retreat from Richmond hastened Lee's surrender in 1865. In 1874 he led U.S. troops to investigate rumours of gold in South Dakota's Black Hills, a sacred Indian hunting ground. The resulting gold rush led to hostile encounters with the Indians. In 1876 the 36-year-old Custer commanded one of two columns of a planned attack against Indians camped near Montana's Little Bighorn River. He rashly decided to attack without the other column, and in the Battle of the Little Bighorn he and all his troops were killed.

custom In law, long-established practice common to many or to a particular place or institution and generally recognized as having the force of law. In England during the Anglo-Saxon period, local customs formed most laws affecting family rights, ownership and inheritance, contracts, and violence between individuals. The Norman conquerors granted the validity of customary law, adapting it to their feudal system. In the 13th and 14th centuries, English law was given statutory authority under the crown, making the "customs of the realm" England's common law. See also culture; folklore; myth; taboo.

customs duty See tariff

customs union Trade agreement by which a group of countries charges a common set of tariffs to the rest of the world while allowing free trade among themselves. It is a partial form of economic integration, intermediate between free-trade zones, which allow mutual free trade but lack a common tariff system, and common markets, which both utilize common tariffs and allow free movement of resources including capital and labour between members. Well-known customs unions include the Zollverein, a 19th-century organization formed by several German states under Prussian leadership, and the European Union, which passed through a customs-union stage on the path to fuller economic integration. See also European Community; General Agreement on Tariffs and Trade; North American Free Trade Agreement; World Trade Organization.

Custoza \kü-'stōt-sə**, Battles of** Two attempts at Custoza, Italy, to end Austrian control over northern Italy. In the first battle (July 24, 1848), an Austrian army under Joseph Radetzky defeated the Sardinians, led by Charles Albert. In the second battle (June 24, 1866), as part of an Italian effort to acquire Austrian-held Venetia, a disorganized Italian army of 120,000 men, led by Victor Emmanuel II, was defeated by an 80,000-man Austrian force. Despite its defeats, Italy subsequently obtained Venetia in the Treaty of Vienna (1866).

cut glass Glassware characterized by a series of facets, or patterns, cut into its surface. A marked pattern is roughed out on a glass object with a revolving abrasive wheel; the pattern is then smoothed by a sandstone wheel and polished in an acid bath. The Romans introduced a crude form of glass cutting in the 1st century AD. Modern glass cutting developed in Germany in the late 17th century with the production of a heavy, colourless crystal glass. After Bohemian glass became popular, English and Irish glassmakers adopted the technique. The prismatic styles of their products, notably Waterford glass, became popular in the U.S. after 1780.

Cuthbert, Saint (b. 634/635, probably Northumbria, Eng.—d. March 20, 687, islet of Inner Farne, or House, off Northumbria; feast day March 20) English saint. A shepherd, Cuthbert entered the Northumbrian monastery of Melrose in 651 after receiving a divine vision. When plague struck 10 years later, he aided the afflicted, reportedly performing miracles. In 664 he became prior of Lindisfarne, where he instituted a severe rule. In 676 he retired to Inner Farne, where he devoted himself to prayer. His efforts to protect birds made him one of the earliest wildlife conservationists.

cutthroat trout Black-spotted game fish (*Salmo clarki*) of the salmon family, found in western North America. The cutthroat trout is named for the bright red streak beneath its lower jaw. Considered a good table fish, it strikes at flies, baits, and lures. It reaches a weight of 4 lb (1.8 kg). Many cutthroat trout that live in rivers migrate to sea. Like oceanic forms of other trout species, these fish are called sea trout and may not reenter freshwater for several years.

cutting In botany, a plant section originating from the stem, leaf, or root and capable of developing into a new plant. The cutting is usually placed in warm, moist sand. Many plants, especially horticultural and garden varieties, are propagated through cuttings; by the use of new techniques, many other plants formerly not susceptible to propagation through cuttings have more successfully reproduced. The plants that develop from cuttings are clones. See also graft, layering.

cutting horse Light saddle horse trained to cut (isolate) livestock, especially cattle, from herds. Most are quarter horses, with the intelligence, speed, and ability to make quick starts, stops, and turns. A well-trained cutting horse can maneuver an animal away from a herd and into a corner with little direction from a rider or, in some cases, without a rider.

cuttlefish Any of about 100 species of marine cephalopods in the order Sepioidea, characterized by a thick, internal calcium-containing shell called the cuttlebone. Species range between 1 and 35 in. (2.5–90 cm) in length and have a somewhat flattened body bordered by a pair of narrow fins. All have eight arms and two longer tentacles used to capture prey. Suction disks are located on the arms and at the tips of the tentacles. Cuttlefish inhabit tropical or temperate coastal waters. They feed mainly on crustaceans, small fishes, and each other. They are used by humans as food, as a source of ink, and for the cuttlebone, a dietary supplement for cage birds.

Cuttlefish (*Sepia officinalis*)
DOUGLAS P. WILSON

cutworm Larva of certain species of owlet moths (family Noctuidae). The cutworm (not a true worm) is a serious insect pest of tobacco and other crops. Some species attack such plants as corn, grasses, tomatoes, and beans at night, severing roots and stems near ground level. Other species live underground and feed on plant roots.

Cuvier \kü-'vyā**, Georges (-Léopold-Chrétien-Frédéric-Dagobert), Baron** (b. Aug. 23, 1769, Montbéliard, France—d. May 13, 1832, Paris) French zoologist and statesman who established the sciences of comparative anatomy and paleontology. As a staff member at the Museum of Natural History in Paris, he published *Le Règne animal distribué d'après son organisation* (1817), which described his "correlation of parts" theory, in which every animal organ is functionally related to all the other organs and that an animal's functions and habits determine its anatomic form. Cuvier's classification of all animals into four completely discrete groups was a significant advance over the system of Carolus Linnaeus. He applied his functional concept to the study of fossils, postulating that huge land upheavals and floods were the principal factor in the creation and destruction of species. Though the theory did not last, Cuvier's work put paleontology on a firm empirical foundation. As Napoleon's inspector of public instruction, he helped establish France's provincial universities, and he also served as chancellor of the University of Paris.

Cuyabá River See Cuiabá River

Cuyahoga \ˌkī-ə-'hó-gə, ˌkī-ə-'hō-gə\ **River** River, northeastern Ohio, U.S. It flows past Akron, where it drops into a deep valley and turns north, emptying into Lake Erie at Cleveland. It is navigable for lake freighters for only about 5 mi (8 km) of its total length of about 80 mi (130 km). It was at one time so severely polluted that it caught fire; by the late 1970s, antipollution measures had substantially improved its condition. The Cuyahoga Valley National Recreation Area covers about 32,000 acres (12,950 hectares) of river valley between Akron and Cleveland.

Cuyp \'kœip**, Aelbert Jacobsz(oon)** (baptized Oct. 20, 1620, Dordrecht, Neth.—d. November 1691, Dordrecht) Most famous member of a family of Dutch landscape painters. He was trained by his father, Jacob Gerritsz Cuyp (1594–after 1651), and influenced by Jan Josephs(zoon) van Goyen. He lived most of his life in his native Dordrecht, painting animals and birds, portraits, historical pictures, and most notably river scenes and landscapes with cattle and figures bathed in a subtle glow of light and

© 2006 Encyclopædia Britannica, Inc.

atmosphere. The Italianate style favoured in Utrecht, one of Holland's artistic centres, is evident in his work. Many of his surviving paintings are signed but few are dated.

Cuyuni \kù-'yü-nē\ **River** River, northern South America. Rising in Venezuela and flowing through Guyana, it is about 350 mi (560 km) long and forms the border between Venezuela and Guyana for some 60 mi (100 km). It then flows southeast to join the Mazaruni River before entering the Essequibo River, near Bartica. Rapids impede navigation, but the river is important for its alluvial gold and diamonds.

Cuzco \'kü-skō\ City (pop., 1998 est.: 278,590), south-central Peru. It is located high in the Andes Mountains at an elevation of about 11,000 ft (3,300 m). Founded in the 11th or 12th century, it was once the capital of the vast Inca empire. Spanish conquistador Francisco Pizarro captured the city in 1533. It suffered major earthquake damage in 1650 and again in 1950, though many sites have since been restored. Nearby ruins include an ancient Inca fortress, the city of Machu Picchu, and the Temple of the Sun. Cuzco's cathedral (1654) and university (1692) date from the colonial era. The city was designated a UNESCO World Heritage site in 1983.

Cwmbrân \kùm-'brän\ Town (pop., 1991: 46,020), southeastern Wales. One of 32 new towns established in Britain after World War II to relieve congestion and encourage development, Cwmbrân was inaugurated in 1949 in an area of small and decaying industrial villages. Its industries include automobile-parts production.

cyanide \'sī-ə-ˌnīd\ Any chemical compound containing the combining group CN. Ionic (see ion; ionic bond) and organic cyanide compounds differ in chemical properties, but both are toxic, especially the ionic ones. Cyanide poisoning inhibits cells' oxidative (see oxidation-reduction) processes; its action is extremely rapid, and an antidote must be given promptly. Cyanides occur naturally in certain seeds (e.g., apple seeds, wild cherry pits). Cyanides, including hydrogen cyanide (HCN, or hydrocyanic acid), are used industrially in the production of acrylic fibres, synthetic rubbers, and plastics as well as in electroplating, case-hardening of iron and steel, fumigation, and concentration of ores.

cyanide process *or* **MacArthur-Forrest process** Method of extracting silver and gold from their ores by dissolving them in a dilute solution of sodium cyanide or potassium cyanide. The process—invented in 1887 by the Scottish chemists John S. MacArthur, Robert W. Forrest, and William Forrest—includes contacting the finely ground ore with the cyanide solution, separating unwanted solids from the clear solution, and recovering the precious metals from the solution by precipitation with zinc dust.

cyanite See kyanite

cyanobacteria \ˌsī-ə-ˌnō-bak-'tir-ē-ə\ *or* **blue-green algae** Any of a large group of prokaryotic, mostly photosynthetic organisms. Though classified as bacteria, they resemble the eukaryotic algae in many ways, including some physical characteristics and ecological niches, and were at one time treated as algae. They contain certain pigments, which, with their chlorophyll, often give them a blue-green colour, though many species are actually green, brown, yellow, black, or red. They are common in soil and in both salt and fresh water, and they can grow over a wide range of temperatures, from Antarctic lakes under several metres of ice to Yellowstone National Park's hot springs in the U.S. Cyanobacteria are often among the first species to colonize bare rock and soil. Some are capable of nitrogen fixation; others contain pigments that enable them to produce free oxygen as a by-product of photosynthesis. Under proper conditions (including pollution by nitrogen wastes) they can reproduce explosively, forming dense concentrations called blooms, usually coloured an opaque green. Cyanobacteria played a large role in raising the level of free oxygen in the atmosphere of early Earth.

Cybele See Great Mother of the Gods

cybercrime *also known as* **computer crime** Any use of a computer as an instrument to further illegal ends, such as committing fraud, trafficking in child pornography and intellectual property, stealing identities, or violating privacy. Cybercrime, especially through the Internet, has grown in importance as the computer has become central to commerce, entertainment, and government. The international nature of cybercrimes has led to international cyberlaws.

cyberlaw Body of law bearing on the world of computer networks, especially the Internet. As traffic on the Internet has increased, so have the number and kind of legal issues surrounding the technology. Hotly debated issues include the obscenity of some on-line sites, the right of privacy, freedom of speech, regulation of electronic commerce, and the applicability of copyright laws.

cybernetics Science of regulation and control in animals (including humans), organizations, and machines when they are viewed as self-governing whole entities consisting of parts and their organization. It was conceived by Norbert Wiener, who coined the term in 1948. Cybernetics views communication and control in all self-contained complex systems as analogous. It differs from the empirical sciences (physics, biology, etc.) in not being interested in material form but in organization, pattern, and communication in entities. Because of the increasing sophistication of computers and the efforts to make them behave in humanlike ways, cybernetics today is closely allied with artificial intelligence and robotics, and it draws heavily on ideas developed in information theory.

cycad \'sī-kəd\ Any of the palmlike woody plants that constitute the order Cycadales, containing four families: Cycadaceae, Zamiaceae, Stangeriaceae, and Boweniaceae. Cycads have crowns of large, feathery compound leaves and cones at the ends of their branches. Some have tall, unbranched, armourlike trunks; others have partially buried stems with swollen trunks. Slow-growing cycads are used as ornamental conservatory plants, but some survive outdoors in temperate regions. The stems of some cycads yield starch that is edible if thoroughly cooked. The young leaves and seeds of others also are edible.

Cyclades \'sī-klə-ˌdēz\ *Greek* **Kikládhes** \kē-'klä-thēs\ Group of about 30 islands, southern Aegean Sea. They cover a land area of 976 sq mi (2,528 sq km) and constitute the Cyclades department of Greece, which has its capital at Ermoúpolis. Their name refers to the ancient tradition that they formed a circle around the sacred island of Delos. The chief islands are Andros, Tínos, Náxos, Amorgós, Melos, Páros, Syros, Kéa, Kíthnos, Serifos, Íos, and Thíra. They were the centre of a Bronze Age culture—the Cycladic, noted for its white marble idols—and later belonged to the Mycenaean culture in the 2nd millennium BC. Colonized by Ionians in the 10th–9th century BC, they later were successively held by Persians, Athenians, Ptolemaic Egyptians, and Macedonians. Ruled by Venice after the early 13th century AD, the islands fell to the Turks at different times during the 16th to 18th centuries. They became part of Greece in 1829. The economy is now based on tourism and on the export of wine, hides, pottery, and handicrafts.

cyclamen \'sī-klə-mən\ Any of about 15 species of flowering perennial herbaceous plants that make up the genus *Cyclamen*, in the primrose family (Primulaceae), native to the Middle East and southern and central Europe. The florist's cyclamen (*C. persicum*), the best-known species, is an indoor plant cultivated for its attractive white to pink to deep red flowers. Long-stalked, rounded, or kidney-shaped leaves, often variously marked, grow from the base of the plant, which has no aboveground stem. Solitary flowers grow on stalks less than 12 in. (30 cm) tall.

cycling Use of the bicycle in competitive sport or in recreation. The classic professional races are held mainly in Europe; the first was held in Paris in 1868. There are basically two types of race: road races and track races. The first U.S. cycling competition, a six-day race, was held in 1891. Six-day racing was reintroduced to Europe as a two-man team event in the 20th century, but it has largely died out in the U.S. The first Tour de France, the premier race, was held in 1903. Cycling has been part of the Olympics since the first modern games in 1896. Events include a variety of open-road and circuit races for both men and women.

cyclone Any large system of winds that circulates about a centre of low atmospheric pressure in a counterclockwise direction north of the Equator and in a clockwise direction south of it. Cyclones that occur in the mid- and high latitudes are known as extratropical cyclones; they are frequently preceded by thickening and lowering clouds, followed by precipitation. Cyclones that form in the lower latitudes are known as tropical cyclones; smaller than extratropical cyclones, they tend to be more violent and can cause considerable damage (see tropical cyclone). Wind systems that circulate around a high-pressure centre in directions opposite to that of cyclones are known as anticyclones.

Cyclops \'sī-ˌkläps\ In Greek mythology, any of several one-eyed giants. In the *Odyssey*, the Cyclopes were cannibals who lived in a faraway land (traditionally Sicily). Odysseus was captured by the Cyclops Polyphemus, but he escaped being devoured by blinding the giant. According to Hesiod,

© 2006 Encyclopædia Britannica, Inc.

there were three Cyclopes (Arges, Brontes, and Steropes) who forged thunderbolts for Zeus. In a later tradition, they were assistants to Hephaestus in this task. Apollo destroyed them after one of their thunderbolts killed Asclepius.

cyclotron \'sī-klə-ˌträn\ particle accelerator that accelerates charged atomic or subatomic particles in a constant magnetic field. It consists of two hollow semicircular electrodes, called dees, in a large evacuated cylindrical box. An alternating electric field between the dees continuously accelerates the particles from one dee to the other, while the magnetic field guides them in a circular path. As the speed of the particles increases, so does the radius of their path, and the particles spiral outward. In this manner, a cyclotron can accelerate protons to energies of up to 25 million electron volts.

Cydones \sī-'dō-nēz**, Demetrius** (b. c. 1324, Thessalonica, Byzantine Empire—d. c. 1398, Crete) Byzantine humanist scholar, statesman, and theologian. After studying under a Greek scholar, he made Greek translations of St. Augustine and St. Thomas Aquinas. He was twice prime minister of the Byzantine empire (1369–83, 1391–96). An academy of Greek culture that he established in Venice in 1390 diffused Greek thought throughout Italy, stimulating the Italian Renaissance. A convert to Latin Catholicism, he worked unsuccessfully for East-West Christian unity; in his *Symbouleutikoi* ("Exhortations") he vainly encouraged the Byzantine people to unite with the Latins against the Turks. He is considered the most brilliant Byzantine writer of the 14th century.

Cygnus \'sig-nəs\ **A** Radio-emitting galaxy lying in the constellation Cygnus, about 700 million light-years from Earth. It is the brightest cosmic source of radio waves in the sky and the first radio galaxy to be detected. Because of its peculiar divided appearance, it was once thought to be two galaxies colliding. Astronomers now believe it to be a single galaxy with a large black hole at its core; emanating from this central region are two opposing jets of hot gas that end in radio- and X-ray-emitting lobes called "hot spots." See also active galactic nucleus.

cylinder See piston and cylinder

cylinder seal Small stone cylinder engraved in intaglio on its surface to leave impressions when rolled on wet clay. It first appeared c. 3400–2900 BC and is considered to be one of the finest artistic achievements of Mesopotamia. The earliest examples used geometric or animal patterns; later seals incorporated the owner's name and depicted a variety of motifs. They were used to mark personal property and make documents legally binding. The seals were adopted in Egypt and the Indus civilization.

cymbal Percussion instrument consisting of a circular metal plate that is struck with a drumstick or two such plates that are struck together. They were used, often ritually, in Assyria, Israel (from c. 1100 BC), Egypt, and other ancient civilizations, spread to East Asia, and reached Europe by the 13th century AD. Western orchestral cymbals derive from those used in the Turkish military bands in vogue in 18th-century Europe. Though Asian cymbals are often flat, Middle Eastern and Western cymbals usually have a central concave dome, or boss, so that only the edges touch when they are clashed. The finest cymbals have long been manufactured in Turkey by means of closely guarded techniques. In popular music, cymbals are not clashed manually; instead, a cymbal suspended on a sticklike stand may be brushed or struck, and horizontal "hi-hat" cymbals are clashed lightly by use of a pedal mechanism.

Pair of modern hand-held symphonic orchestral cymbals
COURTESY OF AVEDIS ZILDJIAN COMPANY

Cynewulf *or* **Kynewulf** \'kin-ə-ˌwůlf\ *or* **Cynwulf** \'kin-ˌwůlf\ (fl. 9th century AD, Northumbria or Mercia) Anglo-Saxon poet. He is the author of four Old English poems from late 10th-century manuscripts: *Elene*, about St. Helena; *The Fates of the Apostles*, on the mission and death of each Apostle; *The Ascension*, part of a trilogy by different authors; and *Juliana*, a life of St. Juliana. Nothing is known of the poet outside of the text; its evidence suggests he was a learned cleric of Northumbria or Mercia. Runic characters woven into the text are thought to spell his name.

Cynics \'si-niks\ Greek philosophical sect that flourished from the 4th century BC to the 6th century AD. Antisthenes (c. 445–365 BC), a disciple of Socrates, is considered the founder of the movement, but Diogenes of Sinope was its paradigm. Named principally for their meeting place, the Cynosarges, the Cynics considered virtue—including a life of poverty and self-sufficiency and the suppression of desires—to be the sole good, but they were distinguished more for their unconventional manners and way of life than for any system of thought. The Cynics influenced the development of Stoicism.

cypress Any of about 20 species of ornamental and timber evergreen conifers constituting the genus *Cupressus* of the family Cupressaceae, which includes more than 130 species found throughout the world. The leaves are usually paired or in threes and are small and scalelike. A few of the many economically important genera in the cypress family are *Cupressus, Thuja* (arborvitae), *Calocedrus* (incense cedar), and *Juniperus* (juniper). Arborvitae, cypress, and juniper are especially important as timber sources or ornamentals. They also contain useful oils, resins, and tannins.

Italian cypress (*Cupressus sempervirens*)
W.H. HODGE

cypress, bald See bald cypress

Cyprian \'sip-rē-ən**, Saint** *Latin* **Thascius Caecilius Cyprianus** (b. c. 200, Carthage—d. Sept. 14, 258, Carthage; Western and Eastern feast day September 16; Anglican feast day September 26) Early Christian theologian and Church Father. He converted to Christianity c. 246 and within two years was elected bishop of Carthage. In 250 he went into hiding to escape the Decian persecution, when many Christians apostatized. The following year he returned; bishops in council supported his assertions that the church could remit the sin of apostasy, that bishops in council had final disciplinary authority, and that even unworthy laity must be accepted. In disputes with the bishop of Rome, Cyprian asserted that the people and their bishop constituted the church, that there was no "bishop of bishops" in Rome, that all bishops equally possessed the Holy Spirit, and that their consensus expressed the church's unity. He was martyred under Valerian.

Cyprus *officially* **Republic of Cyprus** Island and country, eastern Mediterranean Sea. Area: 3,572 sq mi (9,251 sq km). Population (2005 est.): 968,000 (whole island). Capital: Nicosia. Cyprus is currently divided into two de facto states. The Republic of Cyprus, the internationally recognized government, occupies the southern two-thirds of the island. Its population (2005 est.: 747,000) is predominantly Greek. Languages: Greek, Turkish (both official). Religion: Christianity (predominantly Eastern Orthodox). Currency: Cyprus pound. The Turkish Republic of Northern Cyprus occupies the northern third of the island. Its population (2005 est.: 221,000) is overwhelmingly Turkish. Languages: Turkish (official), English. Religion: Islam. Currency: Turkish lira. The third largest island in the Mediterranean, Cyprus lies about 40 mi (65 km) off the southern coast of Turkey. It is largely mountainous, with a fertile heartland and coastal plains. Mount Olympus is its highest peak, 6,401 ft (1,951 m) above sea level. The climate is Mediterranean. Cyprus has a free-enterprise economy based mainly on trade and manufacturing, and it ranks high in the world in merchant shipping. The internationally recognized government is a multiparty republic with a unicameral legislature; its head of state and government is the president. Cyprus was inhabited by the early Neolithic Period; by the late Bronze Age it had been visited and settled by Mycenaeans and Achaeans, who introduced Greek culture and language, and it became a trading centre. By 800 BC Phoenicians had begun to settle there. Ruled over the centuries by the Assyrian, Persian, and Ptolemaic empires, it was annexed by the Roman Republic and Empire in 58 BC. It was part of the Byzantine Empire in the 4th–12th centuries AD. It was conquered by the English king Richard I (the Lionheart) in 1191. A part of the Venetian

© 2006 Encyclopædia Britannica, Inc.

trading empire from 1489, it was taken by the Ottoman Empire in 1571. In 1878 the British assumed control, and Cyprus became a British crown colony in 1925. It gained independence in 1960. Conflict between Greek and Turkish Cypriots led to the establishment of a United Nations (UN) peacekeeping mission in 1964. In 1974, fearing a movement to unite Cyprus with Greece, the Republic of Turkey sent troops to occupy the northern third of the island. Turkish Cypriots established a functioning government, which obtained recognition only from Turkey. The UN peacekeeping mission has remained in place. Negotiations to reunify the island under a single government in 2004 were not successful, but border restrictions were relaxed by both sides.

Cypselus \'sip-sə-ləs\ (fl. 7th century BC) Tyrant of CORINTH (c. 657–627 BC). Though his mother belonged to the ruling Bacchiadae dynasty, clan members attempted to kill him at birth because his father was an outsider. When he grew up, he overthrew them and set up the first tyrant dynasty. He was encouraged in his quest for power by the oracle at DELPHI. He founded colonies in northwestern Greece, administering them through his bastard sons, including his successor, PERIANDER. Though he achieved power through demagoguery, he was reputedly so popular that he did not need a bodyguard.

Cyrano de Bergerac \'sir-ə-ˌnō-də-ˌber-zhə-'räk**, Savinien** (b. March 6, 1619, Paris, France—d. July 28, 1655, Paris) French satirist and dramatist. He was a soldier until 1641 and studied under the philosopher Pierre Gassendi (1592–1655). He wrote plays as well as fantastical works combining science-fantasy and political satire that inspired such later writers as JONATHAN SWIFT. He became the basis of many romantic legends, including EDMOND ROSTAND's play *Cyrano de Bergerac* (1897), in which he is portrayed as a gallant and brilliant but shy and ugly lover, with a remarkably large nose (which in fact he had).

Savinien Cyrano de Bergerac, engraving after a painting.
H. ROGER-VIOLLET

Cyrenaica *or* **Cirenaica** \ˌsir-ə-'nā-ə-kə\ Northeastern region of present-day LIBYA. It was colonized by the Greeks (c. 631 BC), who established five cities there. It became a Roman province in 67 BC. Arab armies conquered it in AD 642, as did the OTTOMAN EMPIRE in the 15th century. Italy colonized it in the early 20th century, but Italian forces were expelled during World War II (1939–45). In 1963 it was incorporated into Libya.

Cyrenaics \ˌsir-ə-'nā-iks, ˌsī-rə-'nā-iks\ Greek school of ETHICS. CYRENE was the centre of its activity and the birthplace of several of its members. Though the elder Aristippus (c. 435–366 BC), a pupil of SOCRATES, is generally recognized as its founder, the school flourished only in the late 4th century and early 3rd century BC. The Cyrenaics held that the only good is the pleasure of the moment; the good life thus consists of the pursuit of such pleasures. The doctrines of the later Cyrenaics were eventually incorporated into EPICUREANISM.

Cyrene \sī-'rē-nē\ Ancient city, North Africa. Located in modern-day Libya, it was founded c. 630 BC by a group of emigrants from the Aegean island of THÍRA. Their leader, Battus, became the first king; his dynasty ruled until c. 440 BC. Under the aegis of Ptolemaic Egypt (from 323 BC), Cyrene became one of the great intellectual centres of the Classical world, boasting such scholars as ERATOSTHENES and Aristippus, founder of the CYRENAICS. Taken by the Romans in 96 BC, it later declined and, with the Arab conquest of AD 642, ceased to exist. Areas of the old city have been excavated, revealing impressive ruins.

Sanctuary of Apollo, Cyrene
JOSEPHINE POWELL, ROME

Cyril and Methodius \'sir-əl... mi-'thō-dē-əs**, Saints** (respectively b. c. 827, Thessalonica, Macedonia—d. Feb. 14, 869, Rome; b. c. 825, Thessalonica—d. April 6, 884, Moravia; feast day for both, Western church February 14; Eastern church May 11) Brothers who Christianized the Danubian Slavs. They began missionary work among the Slavs of Moravia in 863. Gifted scholars and linguists, they translated the holy scriptures into the language later known as OLD CHURCH SLAVIC (or Slavonic) and are credited with inventing the Glagolithic alphabet (see CYRILLIC ALPHABET). In 868 they traveled to Rome to defend the use of a Slavic liturgy. When Cyril died, Methodius returned to Moravia as an archbishop. Known as the "apostles to the Slavs," the two brothers influenced the religious and cultural development of all Slavic peoples.

Cyril of Alexandria, Saint (b. c. 375—d. June 27, 444; Western feast day June 27; Eastern feast day June 9) Christian theologian and bishop. He became bishop of Alexandria in 412. Zealously orthodox, he closed the churches of the Novatians, a heterodox sect, and expelled the Jews from Alexandria. His greatest doctrinal conflict was with NESTORIUS over the nature of JESUS; Cyril emphasized the unity of Jesus' divine and human natures while Nestorius emphasized their distinctness. Cyril condemned Nestorius at the Council of Ephesus (431), only to be condemned himself by bishops who supported Nestorius. Eventually Nestorius was declared a heretic and a compromise on Christ's nature restored peace to the church (433).

Cyril of Jerusalem, Saint (b. c. 315, Jerusalem—d. 386?, Jerusalem; feast day March 18) Early leader of the Christian church. He became bishop of Jerusalem c. 350. He was exiled three times by the ARIANS but was suspected by the strictly orthodox many years later, at the Council of CONSTANTINOPLE (381), for his association with moderate Arians. He anticipated the doctrine of TRANSUBSTANTIATION in his writings and promoted Jerusalem as a pilgrimage centre. He was named a Doctor of the Church in 1883.

Cyrillic \sə-'ril-ik\ **alphabet** ALPHABET used for RUSSIAN, Serbian (see SERBO-CROATIAN LANGUAGE), BULGARIAN and Macedonian, BELARUSIAN, UKRAINIAN, and many non-Slavic languages of the former Soviet Union, as well as Khalka Mongolian (see MONGOLIAN LANGUAGE). The history of the Cyrillic alphabet is complex and much disputed. It is clearly derived from 9th-century Greek uncial capital letters, with the non-Greek letters probably taken from the Glagolitic alphabet, a highly original alphabet in which (along with Cyrillic) OLD CHURCH SLAVONIC was written. A commonly held hypothesis is that followers of Sts. CYRIL AND METHODIUS developed Cyrillic in the southern Balkans around the end of the 9th century. The 44

© 2006 Encyclopædia Britannica, Inc.

original Cyrillic letters were reduced in number in most later alphabets used for vernacular languages, and some wholly original letters introduced, particularly for non-Slavic languages.

Cyrus II *known as* **Cyrus the Great** (b. c. 585, Media or Persis—d. c. 529, Asia) Conqueror who founded the Achaemenian Empire (see ACHAEMENIAN DYNASTY). The grandson of Cyrus I (fl. late 7th century BC), he came to power by overthrowing his maternal grandfather, the king of the Medes. The empire he developed was thenceforth centered on Persia and included Media, Ionia, Lydia, Mesopotamia, Syria, and Palestine. Cyrus conquered by diplomacy as well as by force. The subject of a rich legend in Persia and Greece (recorded by XENOPHON and others), he was called the father of his people. He appears in the Bible as the liberator of the Jews held captive in Babylon. He died battling nomads in Central Asia. His legacy is the founding not only of an empire but of a culture and civilization that continued to expand after his death and lasted for two centuries. He exerted a strong influence on the Greeks and ALEXANDER THE GREAT. Awarded heroic qualities in legend, he has long been revered by Persians almost as a religious figure. In 1971 Iran celebrated the 2,500th anniversary of his founding of the monarchy.

cyst \'sist\ Enclosed sac within body tissues. It has a distinct MEMBRANE and generally contains liquid. Most cysts are benign, but several kinds may be malignant or precancerous. Benign cysts often press on nearby organs and require removal. Formed by overproduction of epithelium (surface tissue of anatomical structures), cysts may become detached from surrounding structures and move freely. They can contain natural secretions, abnormal breakdown products, or, in infections, bacteria, larval parasites, and microbial products. Some organs, including the kidney, liver, and breast, can become filled with cysts as a result of cystic diseases that may be dangerous or may hide more serious diseases. See also TUMOUR.

cysteine \'sis-tə-ˌēn\ Sulfur-containing nonessential AMINO ACID. In PEPTIDES and PROTEINS, the sulfur atoms of two cysteine molecules are bonded to each other to make cystine, another amino acid. The bonded sulfur atoms form a disulfide bridge, a principal factor in the shape and function of skeletal and CONNECTIVE TISSUE proteins and in the great stability of structural proteins such as KERATIN.

cystic fibrosis (CF) \'sis-tik-fī-'brō-səs\ *or* **mucoviscidosis** \ˌmyü-kō-ˌvis-ə-'dō-səs\ Inherited metabolic disorder characterized by production of thick, sticky mucus. It is recessive (see RECESSIVENESS) and the most common inherited disorder (about 1 per 2,000 live births) in those of European ancestry. Concentrated mucous secretions in the lungs plug the bronchi, making breathing difficult, promoting infections, and producing chronic cough, recurrent pneumonia, and progressive loss of lung function, the usual cause of death. The secretions interfere with digestive ENZYMES and block nutrient absorption. Abnormally salty sweat is the basis for diagnosis of cystic fibrosis. Treatment includes enzyme supplements, a diet high in calories, protein, and fat, vigorous physical therapy, and antibiotics. Persons with cystic fibrosis once seldom survived beyond childhood; now more than half reach adulthood, though males are usually sterile.

cystitis \sis-'tī-təs\ INFLAMMATION of the urinary bladder (see URINARY SYSTEM). Infections with bacteria, viruses, fungi, or parasites usually spread from nearby sites. Symptoms include burning pain during and right after urination, unusually urgent or frequent urination, and lower back pain. Women, with a shorter urethra than men, are more susceptible to cystitis, most cases resulting from *E. coli* bacteria from the rectum. Acute cystitis, usually bacterial, causes swelling, bleeding, small ulcers and cysts, and sometimes abscesses. Recurrent or persistent infection can lead to chronic cystitis, with bladder-wall thickening. Diagnosis is made by finding bacteria or other organisms in the (normally sterile) urine. It is treated with drugs or surgery.

cytochrome \'sī-tə-ˌkrōm\ Any of a group of cell PROTEINS (hemoproteins) that serve a vital function in the transfer of energy within cells. Hemoproteins are linked to a nonprotein, iron-bearing component (a heme group), which can undergo the reversible OXIDATION-REDUCTION REACTIONS that yield energy for the cell. Cytochromes are subdivided into three classes depending on what wavelengths of light they absorb. At least 30 different cytochromes have been identified.

cytology \sī-'tä-lə-jē\ Study of CELLS. Its earliest phase began with ROBERT HOOKE's microscopic investigations of cork in 1665, during which he introduced the term *cell* to describe dead cork cells. MATHIAS JACOB SCHLEIDEN (in 1838) and THEODOR SCHWANN (1839) were among the first to state clearly that cells are the fundamental units of both plants and animals. This pronouncement (the cell theory) was confirmed and elaborated by a series of discoveries and interpretations. In 1892 Oscar Hertwig (1849–1922) suggested that processes at the organism's level are reflections of cellular processes, thus establishing cytology as a separate branch of biology. See also PHYSIOLOGY.

cytomegalovirus (CMV) Any of several VIRUSES in the herpes family. Active infection produces enlarged cells enclosing foreign matter. Most prevalent in crowded, poor communities, it is transmitted by sexual contact or infected body fluids. It rarely causes serious illness in healthy adults; however, it can lead to serious consequences, including blindness, in those with depressed immune systems. In newborns, even without spleen and liver enlargement (10% of cases), CMV is the most common infection and a major cause of congenital deafness; it may also induce retardation and blindness. There is no effective treatment.

cytoplasm \'sī-tə-ˌpla-zəm\ Portion of a eukaryotic cell outside the NUCLEUS. The cytoplasm contains all the organelles (see EUKARYOTE). The organelles include the mitochondria, CHLOROPLASTS, ENDOPLASMIC RETICULUM, Golgi apparatus, LYSOSOMES, and peroxisomes. The cytoplasm also contains the CYTOSKELETON and the cytosol (the fluid mass that surrounds the various organelles).

cytosine \'sī-tə-ˌsēn\ Organic compound of the PYRIMIDINE family, often called a base, consisting of a single ring, containing both nitrogen and carbon atoms, and an amino group. It occurs in combined form in NUCLEIC ACIDS and several COENZYMES. In DNA its complementary base is GUANINE. It or its corresponding NUCLEOSIDE or NUCLEOTIDE may be prepared from DNA by selective techniques of HYDROLYSIS.

cytoskeleton \'sī-tə-ˌske-lə-tᵊn\ System of microscopic filaments or fibres, present in the CYTOPLASM of eukaryotic cells (see EUKARYOTE), that organizes other cell components, maintains cell shape, and is responsible for cell locomotion and for movement of the organelles within it. Three major types of filaments make up the cytoskeleton: actin filaments, MICROTUBULES, and intermediate filaments. Actin filaments occur as constantly changing bundles of parallel fibres; they help determine cell shape, help the cell adhere to surfaces, help the cell move, and assist in cell division during MITOSIS. Intermediate filaments are very stable structures that form the cell's true skeleton; they anchor the NUCLEUS within the cell and give the cell its elastic properties.

czar See TSAR

Czartoryski family \chȧr-tȯ-'ris-kē\ Leading noble family of Poland in the 18th century, known as the Familia. It first achieved widespread power through the efforts of Prince Michal Fryderyk Czartoryski (1696–1775) and his brother August. The Familia, which sought the enactment of constitutional reforms, attained the height of its influence in the court of AUGUSTUS III. The family estate at Pulawy was confiscated in 1794, during the third Partition of POLAND. However, the Familia continued to wield significant power, notably through the princes Adam Kazimierz Czartoryski (1734–1823), a patron of the arts, and Adam Jerzy Czartoryski (1770–1861), who worked for the restoration of Poland.

Czech language *formerly* **Bohemian language** West SLAVIC LANGUAGE spoken by some 12 million people in the historical regions of Bohemia, Moravia, and southwestern Silesia, all now in the Czech Republic, and in émigré communities, including perhaps a million speakers in North America. The earliest Old Czech texts date from the late 13th century. The distinctive orthographic system of Czech, which adds diacritics to letters of the LATIN ALPHABET to denote consonants that did not exist in Latin and to mark vowel length, was introduced in the early 15th century and is associated with the religious reformer JAN HUS. The system was later adopted by other Slavic languages that use the Latin alphabet, including SLOVAK, SLOVENE, and Croatian (see SERBO-CROATIAN LANGUAGE). When Czech was revived as a literary language in the early 19th century, JOSEF DOBROVSKÝ based his codification of the language largely on the norms of 16th-century Czech, as exemplified in the Kralice Bible (1579–93), an authoritative translation. This decision has resulted in a wide gulf between Standard Czech, the literary language, and Common Czech, the spoken language.

Czech Republic *formerly (1918–92, with Slovakia)* **Czechoslovakia** Country, central Europe. Area: 30,450 sq mi (78,866 sq km). Population (2005 est.): 10,221,000. Capital: PRAGUE. Czechs make up nine-

© 2006 Encyclopædia Britannica, Inc.

tenths of the population; Slovaks and Moravians are the largest minorities. Language: Czech (official). Religion: Christianity (predominantly Roman Catholic, also other Christians, Protestant). Currency: koruna. The landlocked country is dominated by the Bohemian Massif, a ring of mountains rising to 5,256 ft (1,602 m) at Mount Snezka to encircle the Bohemian Plateau. The Morava River valley, known as the Moravian Corridor, separates the Bohemian Massif from the Carpathian Mountains. Woodlands are a characteristic feature of the Czech landscape; most regions have a moderate oceanic climate. The economy has been privatized since the collapse of communism and is now largely market-oriented. The Czech Republic is a multiparty republic with two legislative houses; its chief of state is the president, and the head of government is the prime minister. Until 1918 its history was largely that of Bohemia. In that year the independent republic of Czechoslovakia was born through the union of Bohemia and Moravia with Slovakia. Czechoslovakia came under the domination of the Soviet Union after World War II, and from 1948 to 1989 it was ruled by a communist government. Its growing political liberalization was suppressed by a Soviet invasion in 1968 (see Prague Spring). After communist rule collapsed in 1989–90, separatist sentiments emerged among the Slovaks, and in 1992 the Czechs and Slovaks agreed to break up their federated state. At midnight on Dec. 31, 1992, Czechoslovakia was peacefully dissolved and replaced by two new countries, the Czech Republic and Slovakia, with the region of Moravia remaining in the former. In 1999 the Czech Republic joined NATO, and in 2004 it became a member of the European Union.

Czerny \'cher-nē**, Karl** (b. Feb. 20, 1791, Vienna, Austria—d. July 15, 1857, Vienna) Austrian composer, teacher, and pianist. Son of a musician, he made his piano debut at age 9 and began study with Ludwig van Beethoven at 10. A brilliant pianist, he later became a famous piano teacher; his students included Sigismond Thalberg (1812–71) and Franz Liszt. Though he was a prolific composer, he is known today almost exclusively for his hundreds of piano exercises and études.

Częstochowa \ˌchen(t)-stə-'kō-və\ City (pop., 2000 est.: 255,500), south-central Poland, situated on the Warta River. The two original settlements, Old Częstochowa (founded in the 13th century) and Jasna Góra (14th century), merged in 1826. Noted for its wealth by the 15th century, the city resisted sieges by the Swedes in 1655 and 1705 but was occupied by the Germans in World Wars I and II. Industries include textiles, paper, steel, iron, chemicals, and food products. The famous painting of *Our Lady of Częstochowa* (*The Black Madonna*) is kept in an ancient monastery.

© 2006 Encyclopædia Britannica, Inc.

D-Day In U.S. military history, any designated day for the commencement of a major operation. The designation apparently originated in World War I; its meaning is uncertain, though it is probable that the "D" stands for nothing more than "Day." (The designated time for commencement of action on any D-Day was referred to as H-Hour.) The most celebrated D-Day occurred on June 6, 1944, the first day of the Anglo-American invasion of Europe in World War II. See Normandy Campaign.

da Gama, Vasco See Vasco da Gama

Da Nang *formerly* **Tourane** Seaport city (pop., 2003 est.: 590,800), central Vietnam. It was first ceded to France in 1787, and after 1858 it became a French concession beyond the jurisdiction of the protectorate. Da Nang increased in importance after the partition of Vietnam in 1954, and during the Vietnam War it was the site of a U.S. military base. Its port has an excellent deepwater harbour; its manufactures include textiles and machinery.

Da Ponte \dä-'pōn-tā**, Lorenzo** *orig.* **Emanuele Conegliano** (b. March 10, 1749, Céneda, near Treviso, Veneto—d. Aug. 17, 1838, New York, N.Y., U.S.) Italian poet and librettist. When his Jewish father converted to marry a Roman Catholic, he adopted the name of the local bishop. He took priestly orders in 1768, while teaching literature and publishing poetry. At odds with the authorities for his progressive views, he was expelled from the Venetian republic in 1779 for adultery. In 1783 he was appointed court poet for Vienna's Italian theatre. There he wrote a remarkable series of more than 40 opera librettos, including the masterpieces *The Marriage of Figaro* (1786), *Don Giovanni* (1787), and *Così fan tutte* (1790) for Wolfgang A. Mozart. Court intrigue forced him to leave Vienna in 1791. He settled in New York in 1805, taught at Columbia College, wrote his colourful memoirs, and helped establish Italian opera in the city.

da Sangallo \dä-säŋ-'gäl-lō\ **the Younger, Antonio (Giamberti)** (b. April 12, 1484, Florence—d. Aug. 3, 1546, Terni) Italian architect. He was the nephew of the architects Giuliano da Sangallo (1445–1516) and Antonio da Sangallo the Elder (1460–1534). Throughout his career, Antonio worked on St. Peter's Basilica, first as Donato Bramante's assistant and after 1520 as chief architect. His imposing Palazzo Farnese in Rome (1534–46), a fortresslike Florentine-style palace, exercised immense influence well into the 19th century. His wooden model of St. Peter's (1539–46) still stands in the Vatican Museum.

Da Yu \'dä-'yü\ *or* **Ta Yu** One of China's three legendary emperors, supposed founder of the Xia dynasty. His years of strenuous labour provided outlets to the sea through dredging and made the world suitable for human habitation. See also Shun; Yao.

dabbling duck Any of about 43 species (tribe Anatini; including 38 species in genus *Anas*) of ducks found worldwide, chiefly on inland waters and most commonly in temperate regions of the Northern Hemisphere. Strongly migratory, dabbling ducks include some of the world's finest game birds: the black duck, the gadwall, the garganey, the mallard, the pintail (perhaps the world's most abundant waterfowl), the shoveler, the teals, and the wigeons. They feed mainly on water plants, which they obtain by tipping-up in shallows and infrequently by diving. They often forage near the shore for seeds and insects. They have a flat, broad bill, float high in the water, and are swift fliers. Males are slightly larger and more boldly coloured than females.

Common, or northern, pintail (*Anas acuta*)

Dąbrowska \dȯⁿm-'brȯf-skȧ**, Maria** *or* **Maria Dombrowska** *orig.* **Marja Szumska** (b. Oct. 6, 1889, Russów, Pol.—d. May 19, 1965, Warsaw) Polish writer and literary critic. Dąbrowska lived and studied in various European countries in her early years. She is best known for her epic narrative *Nights and Days*, 4 vol. (1932–34), a family saga on the theme of the human potential for development within uncertain circumstances. She also published four volumes of short stories, as well as plays, essays (including a series on Joseph Conrad), and translations (including the diary of Samuel Pepys). Long active in political and social causes, she was given a state funeral despite having protested communist censorship.

Dacca See Dhaka

dace Any of various small, slim, active freshwater fishes of the carp family (Cyprinidae). In England and Europe, the dace (*Leuciscus leuciscus*), a relative of the European chub, inhabits streams and rivers. It is a small-headed, silvery fish that grows to 10–12 in. (25–30 cm) long and weighs 1–1.5 lbs (0.5–0.7 kg). It lives in schools and eats plant and animal material. It is a good bait and sport fish but is not highly valued as food. In North America, the name is applied to various small cyprinids found in creeks and bogs, mostly in the central and southern U.S.

European dace (*Leuciscus leuciscus*).
JANE BURTON—BRUCE COLEMAN LTD.

Dachau \'dä-ˌkau̇\ First Nazi concentration camp in Germany, established in 1933. It became the model and training center for all other SS-organized camps. In World War II the main camp was supplemented by about 150 branches in southern Germany and Austria, which were collectively called Dachau. It was the first and most important camp at which laboratories were set up to perform medical experiments on inmates. Such experiments and the harsh living conditions made Dachau one of the most notorious camps, though it was not designed as an extermination camp.

dachshund \'däks-ˌhu̇nd, 'däk-sənt\ Dog breed of hound and terrier ancestry developed in Germany to pursue badgers (German, *Dachs*) into their burrows. It is a long-bodied, lively dog with a deep chest, short legs, tapering muzzle, and long ears. Usually reddish brown, or black and tan, it is bred in two sizes (standard and miniature) and in three coat types (smooth, long, and wiry). The standard dachshund stands about 7–10 in. (18–25 cm) high and weighs 16–32 lbs (7–14.5 kg); the miniature is shorter and weighs less than 9 lbs (4 kg).

Dacia \'dā-shə\ Ancient country, central Europe. Roughly equivalent to modern Romania, the area's earliest known inhabitants were Getae and Dacian people of Thracian stock. Known for its rich silver, iron, and gold mines, the region was made a Roman province in AD 107 after two centuries of hostilities. It was abandoned to the Goths in 270 and ultimately divided into the principalities of Walachia and Moldavia.

Dada \'dä-ˌdä\ Nihilistic movement in the arts. It originated in Zürich, Switz., in 1916 and flourished in New York City, Paris, and the German cities of Berlin, Cologne, and Hannover in the early 20th century. The name, French for "hobbyhorse," was selected by a chance procedure and adopted by a group of artists, including Jean Arp, Marcel Duchamp, Man Ray, and Francis Picabia, to symbolize their emphasis on the illogical and absurd. The movement grew out of disgust with bourgeois values and despair over World War I. The archetypal Dada forms of expression were the nonsense poem and the ready-made. Dada had far-reaching effects on the art of the 20th century; the creative techniques of accident and chance were sustained in Surrealism, Abstract Expressionism, conceptual art, and Pop art.

Daddi \'däd-dē**, Bernardo** (b. c. 1290, Florence?—d. c. 1355, Florence?) Italian painter. He became one of the leading painters in Florence after the death of his teacher, Giotto. He directed a busy workshop specializing in small devotional panels and portable altarpieces. His works include a triptych for the Church of Ognissanti (1328) and the polyptych *Crucifixion with Eight Saints* (1348). His style, a fusion of Giotto's seriousness and the lightness of Sienese art, featuring smiling Madonnas and abundant flowers and draperies, remained the dominant style of Florentine painting through the 14th century.

© 2006 Encyclopædia Britannica, Inc.

daddy longlegs *or* **harvestman** Any of the 3,400 ARACHNID species constituting the order Opiliones. Daddy longlegs differ from SPIDERS in having extremely long, thin legs and a spherical or oval body that is not divided in two. The body is approximately 0.05–1.0 in. (1–22 mm) long; the fragile legs may be 20 times the body length. Males are smaller than females. Adults have a pair of glands that secrete a foul-smelling fluid. Daddy longlegs are very widely distributed in temperate regions and in the tropics. The U.S. and Canada have about 150 species. They feed on insects, mites, spiders, carrion, and vegetable matter. See also CRANE FLY.

Daddy longlegs, or harvestman (order Opiliones).
E.S. ROSS

dado \'dā-dō\ In CLASSICAL ARCHITECTURE, the plain portion of the pedestal of a column, between the base and the cornice (or cap). In later architecture, a dado is a wall's paneled or decorated lower part, up to 2–3 ft (60–90 cm) above the floor and defined by a horizontal molding. Interior walls were so treated especially in the 16th–18th century. In carpentry, a dado is a rectangular groove cut across the grain of a wood member.

Dadra and Nagar Haveli \də-'drä...,nə-gər-ə-'ve-lē\ Union territory (pop., 2001 prelim.: 220,451), western India. Located between GUJARAT and MAHARASHTRA states and consisting of the entities of Dadra and Nagar Havali, it has a total area of 190 sq mi (491 sq km); its capital is SILVASSA. Forests cover part of the area; the rest is devoted to cultivation and grazing. Industrial development is limited. It came under Portuguese control in 1783–85. In 1954 indigenous freedom movements forced the Portuguese out, and it became a union territory of India in 1961. The population is predominantly Hindu.

Daedalic sculpture *or* **Daidalic sculpture** \dē-'da-lik\ Type of figurative sculpture attributed by later Greeks to the legendary Greek artist DAEDALUS (Daidalos), associated with Bronze Age Crete and early Archaic sculpture in Greece. Daedalic sculpture displays Eastern ("Orientalizing") influences: wiglike hair, large eyes, and prominent nose; the female body is flatly geometric with a high waist and formless drapery. The style was used in figurines, on clay plaques, and in relief decoration on vases.

Daedalus \'de-də-ləs, 'dē-də-ləs\ In GREEK MYTHOLOGY, a brilliant architect, sculptor, and inventor. He was credited with building for King MINOS of Crete the Labyrinth in which the MINOTAUR was kept. When the king turned against Daedalus and imprisoned him, Daedalus secretly made wings for himself and his son Icarus, intending to escape to Sicily. Despite his father's warnings, Icarus flew too close to the sun; the wax holding the feathers to his wings melted, and he fell into the sea and drowned.

daemon See DEMON

daffodil Bulb-forming flowering plant (*Narcissus pseudonarcissus*), also called common daffodil or trumpet narcissus, native to northern Europe and widely cultivated there and in North America. It grows to about 16 in. (41 cm) and has five or six leaves about 12 in. (30 cm) long that grow from the bulb. The stem bears one large yellow trumpet-shaped blossom. The daffodil's popularity has resulted in the production of many varieties differing from the yellow parent form mainly in colour.

Dafydd ap Llywelyn See DAVID AP LLYWELYN

Dagan \'dā-,gän\ West Semitic god of crop fertility, father of BAAL. He was the mythical inventor of the plow. He had an important temple at Ras Shamra and at sanctuaries in Palestine, where he was known as a god of the Philistines. At Ras Shamra he was second only to EL, though Baal assumed his functions as vegetation god by c. 1500 BC.

Dagda \'dȧg-thə\ *or* **Eochaid Ollathair** \'ō-ke̲-'ō-lə-hər\ In Irish mythology, a leader of the mythical TUATHA DÉ DANANN and father of the three BRIGITS and of MAPONOS. His name means "good god," referring to his many powers rather than to his moral character. The Dagda had an enormous appetite for food and sex and may have been associated with fertility. He possessed a cauldron that was never empty and a club that could kill men and restore them to life.

Dagobert \'dag-ə-,bərt\ I (b. 605—d. Jan. 19, 639, Saint-Denis, France) Last Frankish king of the MEROVINGIAN DYNASTY to rule a politically united realm. He became king of AUSTRASIA in 623 and of the entire Frankish realm in 629. Dagobert secured a treaty with the Byzantine emperor, defeated the Gascons and Bretons, and campaigned against the Slavs in the east. In 631 he sent an army to help the Visigothic usurper in Spain. He moved his capital from Austrasia to Paris, then made his son king of Austrasia in 634. Dagobert also revised Frankish law, patronized the arts, and founded the great abbey of Saint-Denis.

Daguerre \dä-'ger**, Louis (-Jacques-Mandé)** (b. Nov. 18, 1787, Cormeilles, Fr.—d. July 10, 1851, Bry-sur-Marne) French inventor. Initially a scene painter for the opera, in 1822 he opened the Diorama, an exhibition of views with effects induced by changes in lighting. In 1826 NICÉPHORE NIEPCE learned of Daguerre's experiments in obtaining permanent pictures by the action of sunlight, and the two became partners in the development of Niepce's heliographic process until Niepce's death in 1833. Continuing to experiment, Daguerre discovered that exposing an iodized silver plate in a camera would create a lasting image if the latent image on the plate was developed and fixed. In 1839 a description of his DAGUERREOTYPE process was announced at the Academy of Sciences.

daguerreotype \də-'ge-rō-,tīp\ First successful form of PHOTOGRAPHY. It is named for LOUIS DAGUERRE, who invented the technique in collaboration with NICÉPHORE NIEPCE. They found that if a copper plate coated with silver iodide was exposed to light in a CAMERA, then fumed with mercury vapour, and fixed (made permanent) by a solution of common salt, a permanent image would be formed. The first daguerreotype image was produced in 1837, by which time Niepce had died, so the process was named for Daguerre. Many daguerreotypes, especially portraits, were made in the mid 19th century; the technique was gradually replaced by the wet collodion process, introduced in 1851.

Dahl \'däl**, Roald** (b. Sept. 13, 1916, Llandaff, Wales—d. Nov. 23, 1990, Oxford, Eng.) British writer. A fighter pilot during World War II, he began his writing career when C.S. FORESTER encouraged him to write about his combat adventures; they were published by *The Saturday Evening Post*. The short-story collection *Someone Like You* (1953) was a best-seller; his later stories, many published in *The New Yorker*, often include bizarre or supernatural elements. His popular children's books *James and the Giant Peach* (1961) and *Charlie and the Chocolate Factory* (1964) were made into films.

dahlia \'dal-yə\ Any of the 12–20 species of tuberous-rooted herbaceous plants that make up the genus *Dahlia*, in the COMPOSITE FAMILY, native to higher elevations of Mexico and Central America. The leaves of most are segmented and toothed or cut. About six species have been bred for cultivation as ornamental flowers. Wild species have both disk and ray flowers in the flowering heads, but many varieties of ornamentals, such as the common garden dahlia (*D. bipinnata*), have shortened ray flowers. *Dahlia* flowers may be white, yellow, red, or purple.

Dahmer, Jeffrey (b. May 21, 1960, Milwaukee, Wis., U.S.—d. Nov. 28, 1994, Portage, Wis.) U.S. serial killer. In 1992 he confessed to killing, dismembering, and, in some cases, cannibalizing 16 young men, chiefly near his Milwaukee home, in a killing spree that started in 1978, when he murdered a young hitchhiker. The grim details, including his freezer packed with human body parts, made global news. His insanity plea was rejected by a jury, and he was sentenced to 15 consecutive life terms in 1992 (a 16th was later added for the 16th murder). He was murdered by a fellow inmate in 1994.

Dahomey See BENIN

Dahomey kingdom Western African kingdom that flourished in the 18th–19th century in what is now central Benin. Initially called Abomey, its name was changed to Dahomey after it had expanded by conquering the neighbouring kingdoms of Allada (1724) and Whydah (1727). It thrived on the slave trade with Europe, reaching its high point under Gezu (1818–58), under whom it became independent of the OYO EMPIRE. Society was rigidly stratified into royalty, commoners, and slaves; a centralized bureaucracy carried out the king's will. The nation was organized for war, both to increase its territory and to take captives for the slave market, and women served as soldiers along with men. With the end of the slave trade in the 1840s, Dahomey began exporting palm oil, which proved less profitable, and an economic decline followed. In 1892 Dahomey was defeated by a French expedition and became part of the French colony of the same name.

Dahshūr \dä-'shür\ Ancient pyramid site, northern Egypt. It is located near MEMPHIS on the western bank of the Nile. Two of its pyramids date

Daigak Guksa \'ta-'gäk-'kük-ˌsä\ (b. 1055, Korea—d. 1101, Korea) Korean BUDDHIST priest and introducer of Ch'ŏnt'ae (Chinese TIANTAI) Buddhism to Korea. He became a monk at age 11 and studied in China. On his return to Korea, he promoted the doctrines of Ch'ŏnt'ae, which attempted to reconcile the two main Korean sects, the Kyo (textual) and the Sŏn (Chinese Chan, Japanese ZEN; contemplative). The introduction of Ch'ŏnt'ae stimulated the reorganization of the Sŏn school and the development of its Chogye order, which became the main order of Korean Buddhism. Daigak Guksa collected and published 4,750 books of Buddhist scriptures and a catalog of sectarian writings.

Daimler \'dīm-lər**, Gottlieb (Wilhelm)** (b. March 17, 1834, Schorndorf, Württemberg—d. March 6, 1900, Cannstatt) German automotive inventor. Trained as an engineer, he cofounded an engine-–building company in 1882. He patented one of the first successful INTERNAL-COMBUSTION ENGINES in 1885 and was the first to use a gasoline engine to power a bicycle (see MOTORCYCLE). Further innovations culminated in 1889 in a commercially feasible four-wheeled automobile. In 1890 the Daimler company was founded at Cannstadt, and in 1899 it produced the first Mercedes car. In 1926 it merged with the company founded by KARL BENZ. See also DAIMLER-CHRYSLER AG.

DaimlerChrysler AG German automotive manufacturer. It was formed in 1998 by the merger of Daimler-Benz and U.S. automaker CHRYSLER CORP. Its German roots are in the auto companies founded by GOTTLIEB DAIMLER and KARL BENZ, which merged in 1926. The Mercedes-Benz luxury car, first produced by Daimler in 1901, is the basis of the company's financial success. DaimlerChrysler makes passenger cars, trucks, and commercial vehicles such as buses. Its brands include Mercedes, Dodge, Jeep, and Plymouth.

daimyo \'dī-mē-ˌō\ Any of the largest and most powerful landholding magnates in Japan (c. 10th–19th century). The term was originally applied to military lords who gained territorial control over the various private estates into which the country had been divided; later, in the 14th–15th centuries, daimyo acted as military governors for the Ashikaga shogunate (see MUROMACHI PERIOD). Though they held legal jurisdiction over areas as large as provinces, their private landholdings were relatively small. As the country descended into internecine war, daimyo tended to hold small but consolidated domains in which all the land belonged to themselves or their vassals. Gradually, through constant battles, fewer and fewer daimyo came to hold increasing amounts of territory. When TOKUGAWA IEYASU completed unification of Japan in 1603, roughly 200 daimyo had been brought under Tokugawa hegemony. During the TOKUGAWA PERIOD (1603–1867), the daimyo acted as local rulers in three-fourths of the country. After the MEIJI RESTORATION, the daimyo were converted into a pensioned nobility residing in Tokyo. See also *HAN*.

Dainan See T'AI-NAN

Dairen See DALIAN

dairy farming Form of animal husbandry that uses mammals, primarily COWS, for the production of MILK and products processed from it (including butter, cheese, and ice cream). Though CATTLE, GOATS, and SHEEP have been kept for the production of dairy products since the earliest historical times, modern dairy farming resulted from the technological advances of the past hundred years: the factory system for processing; sterile storage; refrigeration, fast vehicles and paved roads; and pasteurization and the enforcement of food-safety laws. Outstanding dairy breeds include the HOLSTEIN, GUERNSEY, JERSEY, AYRSHIRE, and Brown Swiss.

daisy Any of several species of garden plants in the COMPOSITE FAMILY, especially the oxeye daisy (*Chrysanthemum leucanthemum*) and the English, or true, daisy (*Bellis perennis*). Both are native to Europe but have become naturalized in the U.S. These and other plants called daisies are distinguished by a flower composed of 15–30 white ray flowers surrounding a bright yellow disk flower. The cultivated Shasta daisy (*C. maximum*) resembles the oxeye daisy but has larger flower heads. The English daisy is often used as a BEDDING PLANT.

Dakar \dä-'kär, 'da-ˌkär\ City (pop., 1999 est.: urban agglomeration, 1,999,000), capital of Senegal. One of the chief seaports on the western African coast, it lies midway between the mouths of the GAMBIA and SENEGAL rivers. Founded by the French in 1857, its development was spurred by the opening in 1885 of western Africa's first railway, from Saint-Louis to Dakar. In 1902 it became the capital of FRENCH WEST AFRICA and, in 1960, of Senegal. Dakar is one of tropical Africa's leading industrial and service centres. There are museums of ethnography and archaeology there and museums of the sea and of history in nearby Gorée.

Dakota See SIOUX

Dakota River See JAMES RIVER

Dal River River, southern central Sweden. Formed by two forks, the Öster Dal and Vässter Dal, it flows southeast for some 325 mi (520 km) from the mountains along the Norwegian border into the Gulf of BOTHNIA.

Daladier \dä-lȧd-'ye**, Édouard** (b. June 18, 1884, Carpentras, France—d. Oct. 10, 1970, Paris) French politician. He was elected to the Chamber of Deputies in 1919 as a member of the Radical Party, served in several different cabinets, and formed short-lived governments in 1933 and 1934. As premier (1938–40), he sought to avoid war by signing the MUNICH AGREEMENT. Arrested after France fell to Germany in World War II, he was imprisoned by the Germans until 1945. After the war he returned to the Chamber of Deputies (1946–58).

Dalai Lama \ˌdä-lī-'lä-mə\ Head of the dominant DGE-LUGS-PA order of TIBETAN BUDDHISM. The first of the line was Dge-'dun-grub-pa (1391–1475), founder of a monastery in central Tibet. His successors were regarded as his reincarnations and, like himself, manifestations of the BODHISATTVA AVALOKITESVARA. The second head of the order established the 'Brasspungs monastery near Lhasa as its base, and the third received the title Dalai ("Ocean") from ALTAN Khan. The fifth, Ngag-dbang-rgya-mtsho (1617–1682), established the supremacy of the Dge-lugs-pa over other orders. The 13th Dalai Lama, Thub-bstan-rgya-mtsho (1875–1933), held temporal and spiritual power after the Chinese were expelled in 1912. The 14th and current Dalai Lama, Bstan-'dzin-rgya-mtsho (b. 1935), was enthroned in 1940 but fled in 1959 with 100,000 followers after a failed revolt against the Chinese, who had gained control of Tibet in 1950–51. His government-in-exile is in Dharmsala, India. A respected figure worldwide, he was awarded the 1989 Nobel Peace Prize in recognition of his "constructive and forward-looking proposals" for solving world problems.

d'Alembert, Jean Le R. See Jean Le Rond d'ALEMBERT

Daley, Richard J(oseph) (b. May 15, 1902, Chicago, Ill., U.S.—d. Dec. 20, 1976, Chicago) U.S. politician, mayor of Chicago (1955–76). A lawyer in his native Chicago, Daley served as state director of revenue (1948–50) and clerk of Cook county (1950–55) before being elected mayor. He pushed urban renewal and highway construction and a sweeping reform of the police department, but he was criticized for failing to eliminate racial segregation in housing and public schools, for promoting downtown skyscraper construction, and for police brutality committed against demonstrators at the 1968 Democratic National Convention. His tight control of city politics through job patronage won him a reputation as "the last of the big-city bosses." His last years were marred by scandals surrounding members of his administration. His son Richard M. Daley (b. 1942) was first elected mayor of Chicago in 1989.

Dalhousie \dal-'haù-zē**, James Andrew Broun Ramsay, marquess of** (b. April 22, 1812, Dalhousie Castle, Midlothian, Scot.—d. Dec. 19, 1860, Dalhousie Castle) British governor-general of India (1847–56). He entered Parliament in 1837 and later served as president of the Board of Trade, gaining a reputation for administrative efficiency. As governor-general of India he acquired territory by both peaceful and military means. Though he created the map of modern India through his annexations of independent provinces, his greatest achievement was the molding of these provinces into a modern centralized state. He developed

© 2006 Encyclopædia Britannica, Inc.

a modern communication and transportation system and instituted social reforms. He left India in 1856, but his controversial policy of annexation was considered a contributing factor to the Indian Mutiny (1857).

Dalhousie University Privately endowed university in Halifax, Nova Scotia, Canada. It was founded in 1818 as Dalhousie College by the 9th earl of Dalhousie, then lieutenant governor of Nova Scotia, and became a university in 1863. It is organized into faculties of arts, science, management, architecture, engineering, computer science, law, medicine, dentistry, health professions, and graduate studies.

Dalí \'dä-lē,\ *Spanish* \dä-'lē\ **(y Domenech), Salvador (Felipe Jacinto)** (b. May 11, 1904, Figueras, Spain—d. Jan. 23, 1989, Figueras) Spanish painter, sculptor, printmaker, and designer. He studied in Madrid and Barcelona before moving to Paris, where, in the late 1920s, after reading Sigmund Freud's writings on the erotic significance of subconscious imagery, he joined the Surrealist group of artists. Once Dalí hit on this method, his painting style matured with extraordinary rapidity, and from 1929 to 1937 he produced the paintings that made him the world's best-known Surrealist artist. His paintings depict a dream world in which commonplace objects, painted with meticulous realism, are juxtaposed, deformed, or metamorphosed in bizarre ways. In his most famous painting, *The Persistence of Memory* (1931), limp watches melt in an eerie landscape. With Luis Buñuel he made the Surrealist films *Un Chien andalou* (1928) and *L'Âge d'or* (1930). Expelled from the Surrealist movement when he adopted a more academic style, he later designed stage sets, jewelry, interiors, and book illustrations. His highly accessible art—and the publicity attracted by the eccentricity, exhibitionism, and flamboyant behaviour he cultivated throughout his life—made him extremely wealthy.

Dalian \'dä-'lyen\ *or* **Ta-lien** *formerly (1950–81)* **Lüda** \'lüə-'dä\ *or* **Lü-ta** *Japanese and conventional* **Dairen** \'dī-'ren\ City (pop., 2003 est.: 2,181,600) and deepwater port on the Liaodong Peninsula, Liaoning province, China. Leased to Russia in 1898, it was made a free port and terminus of the Chinese Eastern Railway (1899). The Japanese occupied it (1904) during the Russo-Japanese War, and the lease was transferred to Japan by treaty in 1905. Soviet troops captured the city in 1945, but by a Chinese-Soviet treaty it remained under Chinese sovereignty with preferential rights to the port for the U.S.S.R.; Soviet troops withdrew in 1955. It annexed neighbouring Lüshun in 1950. Industries include fishing, shipbuilding, oil refining, and the manufacture of locomotives, machine tools, textiles, and chemicals.

Dallapiccola \ˌdäl-lä-pēk-'kō-lä**, Luigi** (b. Feb. 3, 1904, Pisino, Istria, Austrian Empire—d. Feb. 19, 1975, Florence) Croatian-born Italian composer. Originally influenced by the music of Claude Debussy, he later was strongly affected by that of Arnold Schoenberg, and he became the leading Italian 12-tone composer. His *Songs of Prison* (1941) was inspired by the experience of fascism, as was his opera *The Prisoner* (1948). Other important works include the operas *Night Flight* (1939), *Job* (1950), and *Ulisse* (1968).

Dallas City (pop., 2000: 1,188,580), north-central Texas, U.S. Located on the Trinity River, it was first settled in 1841 and was most likely named for either Joseph Dallas or George Mifflin Dallas. While cotton fed the town's growth, the discovery in 1930 of the great East Texas oil field made the city a major centre of the petroleum industry. It saw spectacular growth after World War II, when several large aircraft-manufacturing firms located in the area. These were followed by electronics and automobile-assembly plants. It is the headquarters of many insurance companies and the Southwest's leading financial centre, as well as a transportation hub. Its many educational institutions include Southern Methodist University (founded 1911). It is known for its cultural activities including opera, ballet, and symphony concerts. The city is also home to the Kalita Humphreys Theater, designed by Frank Lloyd Wright.

Dallas, George Mifflin (b. July 10, 1792, Philadelphia, Pa.—d. Dec. 31, 1864, Philadelphia) U.S. politician. He was the son of Alexander J. Dallas, who served as secretary of the treasury (1814–16). He completed an unexpired term as U.S. senator (1831–33) and later served as minister to Russia (1835–39). He was elected vice president under James K. Polk (1845–49). As minister to Britain (1856–61), he obtained a renunciation of Britain's claimed right to search vessels on the high seas. Dallas, Texas, was named for him.

Dalmatia \dal-'mā-shə\ *Serbo-Croatian* **Dalmacija** \ˌdäl-'mät-sē-yä\ Region of Croatia. Comprising a coastal strip and islands along the Adriatic Sea, it is divided from the interior by the Dinaric Alps. Its scenic beauty has made tourism a major economic factor; Dubrovnik and Split are Mediterranean tourist attractions. Occupied by Illyrians from c. 1000 BC, it was colonized by Greeks from the 4th century BC and controlled by Rome 2nd–5th century AD. Under Venetian rule in 1420, it passed to Austria after the fall of Napoleon. Most of Dalmatia came under Yugoslavia in 1920. Annexed by Italy during World War II, it passed to Yugoslavia in 1947 as part of the Croatian republic.

dalmatian Breed of dog named after the Adriatic coastal region of Dalmatia, its first definite home. The time and place of the breed's origin are unknown. Though it has served as a guard dog, war dog, fire-department mascot, hunter, shepherd, and performer, it became best known as a coach or carriage dog, functioning as an escort and guard for horse-drawn vehicles. Sleek and short-haired, it is distinguished by its dark-spotted white coat. It stands 19–23 in. (48–58.5 cm) high and weighs 50–55 lbs (23–25 kg), and is generally even-tempered and friendly.

Dalriada \ˌdal-rē-'ā-də\ Ancient kingdom, northeastern Ireland and western Scotland. Known from the 5th century AD, it included the northern part of the present County Antrim in Northern Ireland and part of the Inner Hebrides and Argyll in Scotland. Earlier, Argyll had received northern Irish people known as Scoti and had become an Irish (i.e., "Scottish") area. In the late 5th century the rulers of Irish Dalriada expanded into Scottish Dalriada. Irish Dalriada gradually declined, while the Dalriada of the Scottish mainland continued to expand. In the mid-9th century the Picts were brought permanently under Dalriadic rule, and the whole country was thereafter known as Scotland.

Dalton, John (b. Sept. 5 or 6, 1766, Eaglesfield, Cumberland, Eng.—d. July 27, 1844, Manchester) British chemist and physicist. He spent most of his life in private teaching and research. His work on gases led him to state Dalton's law (see gas laws). He devised a system of chemical symbols, ascertained the relative weights of atoms, and arranged them into a table. His masterpiece of synthesis was the atomic theory—the theory that each element is composed of tiny, indestructible particles called atoms that are all alike and have the same atomic weight—which elevated chemistry

© 2006 Encyclopædia Britannica, Inc.

to a quantitative science. He was also the first to describe colour blindness (1794), and his lifelong meteorological journal contains more than 200,000 observations. He is remembered as one of the fathers of modern physical science.

John Dalton, detail of an engraving by W. Worthington, after a portrait by William Allen, 1814.

Dalton brothers U.S. outlaws. Probably born in Cass Co., Mo., they worked as cowboys in Oklahoma but by 1889 had become horse thieves. In 1890–91 they robbed gambling houses, trains, and banks. In 1892 Bob, Grat, and Emmett Dalton and two other gang members rode into Coffeyville, Kan., to rob its banks; they were recognized, and vigilante citizens killed all but Emmett, who was wounded and sent to prison for 14 years. The fourth brother, Bill, had returned to Oklahoma before the raid; he later formed his own gang, and was shot by lawmen in 1894 while playing with his daughter.

Daly River \'dā-lē\ River, northwestern Northern Territory, Australia. Formed by the confluence of three smaller rivers, it flows about 200 mi (320 km) from the hills west of Arnhem Land to Anson Bay on the Timor Sea. Its basin supports cattle ranching and peanut and tobacco farming. It was first explored by Europeans in 1865. It is navigable for 70 mi (115 km) above its tidal mouth.

dam Barrier built across a stream, river, or estuary to conserve water for such uses as human consumption, irrigation, flood control, and electric-power generation. The earliest recorded dam is believed to be a masonry structure 49 ft (15 m) high built across the Nile River in Egypt c. 2900 BC. Modern dams are generally built of earth fill, rock fill, masonry, or monolithic concrete. Earth-fill (or embankment) dams, such as Egypt's Aswan High Dam, are usually used across broad rivers to retain water. The profile of an earth-fill dam is a broad-based triangle. Concrete dams may take various forms. The gravity dam uses its own dead weight to resist the horizontal force of the water. Concrete-buttress dams reduce material in the wall itself by using support buttresses around the outside base. An arch dam, such as Hoover Dam, is built in a convex arch facing the reservoir, and owes its strength essentially to its shape, which is particularly efficient in transferring hydraulic forces to supports.

damages In law, the money awarded to a party in a civil suit as reparation for the loss or injury for which another is liable. The theory of an award of damages in a personal-injury or other TORT case is that injured parties should be placed in the position they would have been in if the injury had not occurred, so far as this can be accomplished with a monetary award. Where the legal wrong at issue is the breach of a contract, the goal of the damages remedy is to give the injured parties the benefit they would have received had the contract been performed. More than one type of damages (e.g., direct, incidental, and punitive) may be awarded for a single injury.

Daman and Diu \də-'män...'dē-ü\ Union territory (pop., 2001 prelim.: 158,059), west-coastal India. Its capital is the town of Daman (pop., 2001 prelim.: 35,743). It consists of two widely separated districts: Daman, on the Gujarat coast north of Mumbai (Bombay), and the island of Diu, off the southern coast of the Kathiawar Peninsula; the territory's total area is 43 sq mi (112 sq km). Formerly Portuguese possessions, Daman and Diu were annexed by India in 1962. The population is predominantly Hindu. Agriculture and fishing are the major economic activities.

Damaraland \də-'mär-ə-ˌland, 'da-mə-rə-ˌland\ Historical region, north-central Namibia. Occupied by the Herero and Khoisan people, who subjugated the original Bergdama people there, it extends between the Namib and Kalahari deserts and from Ovamboland to Great Namaqualand, centring on Windhoek. The grassland region was suited both to the nomadic hunting and pastoral life of its original inhabitants and to the cattle breeding of the Europeans who, in the early 20th century, displaced the indigenous peoples and confiscated their herds.

Damascus \də-'mas-kəs\ *Arabic* **Dimashq** \di-'mäshk\ City (pop., 2004: 1,614,500), capital of Syria. Located at an oasis at the base of the Anti-Lebanon Mountains, it has been an important population centre since antiquity. Believed to be the world's oldest continuously inhabited city, it has evidence of occupation from the 4th millennium BC. The first written reference to it is found in Egyptian tablets of the 15th century BC, and biblical sources refer to it as the capital of the Aramaeans. It changed hands repeatedly over the centuries, belonging to Assyria in the 8th century BC, then Babylon, Persia, Greece, and Rome. It remained under the control of Rome and its successor state, the Byzantine Empire, until it fell to the Arabs in AD 635. Damascus flourished as the capital of the Umayyad dynasty, and the remains of their Great Mosque still stand. Taken by the Ottoman Empire in 1516, it remained under Ottoman rule until 1918; it was occupied by France in 1920 and became part of independent Syria in 1946. Today the city is a flourishing trading centre, with many educational and scientific institutions. The old city centre was designated a UNESCO World Heritage site in 1979.

Damascus Document *or* **Zadokite Fragments** Document associated with the ancient Jewish community at Qumrān. The group had fled to the desert during Antiochus IV Epiphanes's persecutions (175–164/163 BC). The document must predate the revolt of AD 66–70, which forced the community to disband. It is known from fragments found in caves at Qumrān as well as from 10th–12th-century manuscripts. The first section calls for fidelity to God's covenant and observance of the Sabbath and also introduces the sect's leader, the Teacher of Righteousness. The second contains statutes dealing with vows, community assemblies, and admission and instruction of new members. See also Dead Sea Scrolls.

d'Amboise \dän-'bwäz**, Jacques** *orig.* **Jacques Joseph Ahearn** (b. July 28, 1934, Dedham, Mass., U.S.) U.S. dancer and choreographer. After studying at the School of American Ballet, he made his debut at age 12. He joined the New York City Ballet at age 15 and from the 1950s to the 1970s created leading roles in ballets such as *Western Symphony* (1954), *Stars and Stripes* (1958), and *Who Cares?* (1970). D'Amboise was admired for his athletic interpretations of both character and classical roles. He also performed in films. He later founded and directed the National Dance Institute, a nonprofit group dedicated to dance instruction in public schools.

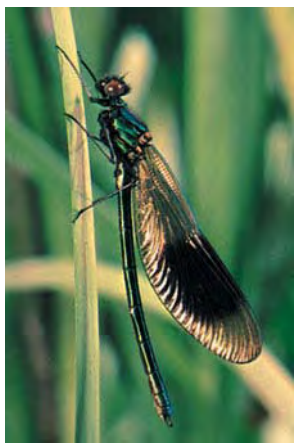
Dames, Paix des See Treaty of Cambrai

Damião \dä-mē-'au̯n**, Frei** *orig.* **Pio Gianotti** (b. Nov. 5, 1898, Italy—d. May 31, 1997, Recife, Pernambuco *estado* ["state"], Braz.) Italian-born Brazilian friar. He became a Capuchin friar at age 16 and later studied in Rome. In 1931 he was sent to Brazil, where he spent the rest of his life traveling in the poverty-stricken northeastern region. He soon developed a reputation as a miracle worker whose touch or prayers could relieve pain and heal disease. Doctrinally conservative, he was at odds with the region's left-wing priests, who supported liberation theology. After his death the bishop of Petrolina began the process of seeking Frei Damião's beatification.

Damien \'dā-mē-ən**, Father** *orig.* **Joseph de Veuster** (b. Jan. 3, 1849, Tremelo, Belg.—d. April 15, 1889, Molokai, Hawaii) Belgian priest. After training at the College of Braine-le-Comte, he joined the Society of the Sacred Hearts of Jesus and Mary in 1858. He went as a missionary to the Sandwich (Hawaiian) Islands in 1863 and was ordained there in 1864. In 1873 he volunteered to take charge of the leper colony on Molokai Island. There he served as both physician and priest, dramatically improving living conditions and building two orphanages. He contracted leprosy himself in 1884 but refused to leave his post, and he died at Molokai five years later.

Damocles \'dam-ə-ˌklēz\ (fl. 4th century BC) Member of the court of Dionysius I the Elder at Syracuse in Sicily. Legend holds that when Damocles spoke in extravagant terms of Dionysius's happiness, the sovereign responded by inviting Damocles to a banquet and seating him beneath a sword suspended by a thread, thereby demonstrating the precarious fortunes of people who hold power.

Damodar \'dä-mō-ˌdär\ **River** River, northeastern India. It rises, with its many tributaries, in the Chota Nagpur plateau of Jharkhand and flows east 368 miles (592 km) through West Bengal to join the Hugli River southwest of Kolkata (Calcutta). Its valley includes India's most important coal- and mica-mining fields and is an area of active industrial development.



Dampier, William (b. August 1651, East Coker, Somerset, Eng.—d. March 1715, London) English buccaneer and explorer. In his early years he engaged in piracy, chiefly along the western coast of South America

© 2006 Encyclopædia Britannica, Inc.

and in the Pacific. In 1697 he published a popular book, *A New Voyage Round the World*. In 1699–1701 he explored the coasts of Australia, New Guinea, and New Britain for the British Admiralty. He was court-martialed for his cruelty but later led a privateering expedition to the South Seas (1703–07). He was a keen observer of natural phenomena; one of his ship's logs contains the earliest known European description of a typhoon.

damping In physics, the restraint of vibratory motion, such as mechanical oscillations, NOISE, and alternating ELECTRIC CURRENTS, by dissipating ENERGY. Unless a child keeps pumping a swing, the back-and-forth motion decreases; damping by the air's friction opposes the motion and removes energy from the system. Viscous damping is caused by such energy losses as occur in liquid lubrication between moving parts or in a liquid forced through a small opening by a piston, as in automobile shock absorbers. Hysteresis damping involves energy loss within the moving structure itself. Other types of damping include electrical RESISTANCE, RADIATION, and magnetic damping.

damselfly Any of numerous predaceous insects of the suborder Zygoptera (order Odonata) having eyes that project to each side. When at rest, the damselfly holds its narrow, membranous, net-veined wings vertically rather than horizontally, unlike DRAGONFLIES. Damselflies are more delicate and weak-flying than dragonflies but are similar in having male copulatory organs at the front part of the abdomen. They commonly fly in tandem during mating.

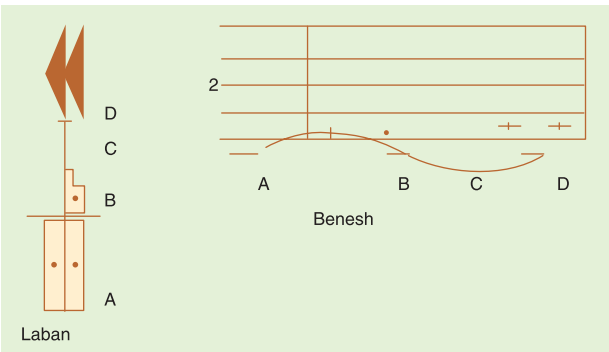
Male jewelwing damselfly (*Calopteryx splendens*).
G.I. BERNARD—OXFORD SCIENTIFIC FILMS LTD.

Damu \'dä-ˌmü\ In MESOPOTAMIAN RELIGION, a Sumerian vegetation god and city god of Girsu on the Euphrates River. He was especially associated with the flowing of sap in the spring. His name means "the child," and his cult centred on the lamentation and search for him. Damu's cult influenced and later blended with that of Dumuzi the Shepherd, a Sumerian deity of the grassland people. Damu was also the name of a goddess of healing.

Dana, Charles A(nderson) (b. Aug. 8, 1819, Hinsdale, N.H., U.S.—d. Oct. 17, 1897, Glen Cove, N.Y.) U.S. journalist. Dana lived at the utopian BROOK FARM community for five years in the 1840s before becoming an editor for HORACE GREELEY's *New York Tribune*, where he actively promoted the antislavery cause. He became a national figure as editor and part owner of the *New York Sun* (1868–97), which under his control was much admired and imitated. With George Ripley, he edited the *New American Cyclopaedia* (1857–63). He also edited a highly successful verse anthology and wrote books such as *The Art of Newspaper Making* (1895).

Dana, James D(wight) (b. Feb. 12, 1813, Utica, N.Y., U.S.—d. April 14, 1895, New Haven, Conn.) U.S. geologist, mineralogist, and naturalist. He graduated from Yale University in 1833. He joined a U.S. exploring expedition to the South Seas (1838–42), acting as a geologist and zoologist. His contributions to the *American Journal of Science* stimulated U.S. geologic inquiry. His research into the formation of the Earth's continents and oceans led him to believe in the progressive evolution of the Earth's physical features over time. By the end of his life he also came to accept the evolution of living things, as articulated by CHARLES DARWIN. During his lifetime, and largely under his leadership, U.S. geology grew from a collection and classification of unrelated facts into a mature science.

Dana \'dā-nə**, Richard Henry** (b. Aug. 1, 1815, Cambridge, Mass., U.S.—d. Jan. 6, 1882, Rome, Italy) U.S. writer and lawyer. Dana left Harvard College because of weakened eyesight and shipped out as a common sailor; after regaining his health, he returned and became a lawyer. He is remembered for his autobiographical *Two Years Before the Mast* (1840), which revealed the abuses endured by sailors. *The Seaman's Friend* (1841) became the authoritative guide to seamen's legal rights and duties. He also produced a scholarly edition of Henry Wheaton's *Elements of International Law* (1866), provided free legal aid to fugitive slaves, and served as U.S. attorney for Massachusetts.



Richard Henry Dana
COURTESY OF THE LIBRARY OF CONGRESS, WASHINGTON, D.C.

Danaë \'da-nə-ˌē\ In Greek legend, the daughter of Acrisius, king of Argos. After an oracle warned her father that she would bear a son by whom he would be slain, he confined Danaë in a tower. ZEUS visited her in the form of a shower of gold, and she gave birth to PERSEUS. Mother and child were then placed in a wooden box and cast into the sea, and they drifted ashore on the island of Seriphus. Perseus grew up there, and when the island's king, Polydectes, desired Danaë, he sent the young hero off in pursuit of the MEDUSA. Perseus later rescued his mother and took her to Argos.

dance Form of expression that uses bodily movements that are rhythmic, patterned (or sometimes improvised), and usually accompanied by music. One of the oldest art forms, dance is found in every culture and is performed for purposes ranging from the ceremonial, liturgical, and magical to the theatrical, social, and simply aesthetic. In Europe, tribal dances often evolved into FOLK DANCES, which became stylized in the social dances of the 16th-century European courts. BALLET developed from the court dances and became refined by innovations in CHOREOGRAPHY and technique. In the 20th century, MODERN DANCE introduced a new mode of expressive movement. See also ALLEMANDE; BALLROOM DANCE; COUNTRY DANCE; COURANTE; GAVOTTE; GIGUE; HULA; JITTERBUG; LÄNDLER; MAZURKA; MERENGUE; MINUET; MORRIS DANCE; PAVANE; POLKA; POLONAISE; QUADRILLE; SAMBA; SARABANDE; SQUARE DANCE; SWORD DANCE; TANGO; TAP DANCE; WALTZ.

dance notation Written recording of dance movements. The earliest notation, in the late 15th century, consisted of letter-symbols. Several attempts were made in later centuries to describe dance steps, but no unified system combined both rhythm and steps until the 1920s, when RUDOLF LABAN devised his system of Labanotation. In the 1950s, the competing system of Benesh notation, or "choreology," devised by Rudolf and Joan Benesh, came into use.

Comparison of the Laban and Benesh systems. (A) Stand with the feet together. (B) Step forward on the right foot (count 1). (C) Spring into the air. (D) Land to the left, feet together, knees bent (count 2).

dance of death *or* **danse macabre** \'dä^{n}s-mä-'kä-br^{ə}\ *or* **skeleton dance** Medieval allegorical concept of the all-conquering and equalizing power of death, expressed in the drama, poetry, music, and visual arts of western Europe, mainly in the late Middle Ages. It is a literary or pictorial representation of a procession or dance of both living and dead figures, the living arranged in order of their rank, from pope and emperor to child, clerk, and hermit, and the dead leading them to the grave. It was given impetus by the BLACK DEATH and the HUNDRED YEARS' WAR. Though depictions declined after the 16th century, the theme was revived in literature and music of the 19th–20th centuries.

dandelion Any of the weedy perennial herbaceous plants that make up the genus *Taraxacum*, in the COMPOSITE FAMILY, native to Eurasia but widespread in much of temperate North America. The most familiar species, *T. officinale*, has a rosette of leaves at the base of the plant; a deep taproot; a smooth, hollow stem; and a solitary yellow flower head composed only of ray flowers (no disk flowers). The fruit is a ball-shaped cluster of many small, tufted, one-seeded fruits. The young leaves are edible; the roots can be used as a coffee substitute.

Dandie Dinmont terrier Breed of TERRIER developed in the border country of England and Scotland. First noted as a distinct breed c. 1700, it was later named after a character in Sir Walter SCOTT's *Guy Mannering* (1815). It has a long, softly curved body, short legs, and a large, domed head crowned by a silky topknot. Its crisp-textured coat, a combination of hard and soft hairs, may be pepper- or mustard-coloured. It stands 8–11 in. (20–28 cm) high and weighs 18–24 lb (8–11 kg).

Dandolo \'dän-dō-lō**, Enrico** (b. 1107?, Venice—d. 1205, Constantinople) Doge of the Republic of VENICE (1192–1205). After a career as a Venetian diplomat, he was elected doge at age 85. He swore the "ducal promise," spelling out the duties of his office, and instituted reforms, revising the penal code and publishing the first Venetian civil code. He also revised the coinage and sought to promote trade with the East. In 1199 he fought a victorious war against the Pisans. He was prominent in the Fourth CRUSADE, offering ships and supplies in return for payment (see Treaty of VENICE). When the Crusaders were unable to pay, they agreed to help recover ZARA for Venice and helped place Alexius IV on the Byzantine throne, an action that led to the conquest of Constantinople. As a leader of the expedition, Dandolo took the title "Lord of the Fourth Part and a Half of the Empire of Romania," which equaled the territory of the Byzantine Empire given to the Venetians.

dandruff Skin disorder of the scalp, a mild form of DERMATITIS. It affects most people at some time, when the scalp, which normally sheds its dead outer skin cells continuously, starts to shed them intermittently, causing a scaly buildup before shedding and noticeable flakes of skin when shedding occurs. Dandruff is not contagious and often goes away spontaneously; special shampoos can control it.

Danegeld \'dān-ˌgeld\ Tax levied in Anglo-Saxon England to buy off Danish invaders during the reign of ETHELRED II (978–1016). The term continued to be used to refer to taxes collected by the Anglo-Norman kings in the 11th and 12th century.

Danelaw \'dān-ˌlȯ\ NE region of Anglo-Saxon England. Colonized by invading Danish armies in the late 9th century AD, it was so named because the form of customary law practiced in the local courts was of Danish origin. Danish place-names still mark the region.

Daniel One of the PROPHETS of the Hebrew scriptures, the central figure in the book of Daniel. The book is a composite work, written partly in Hebrew and partly in Aramaic. The first six chapters tell of Daniel and his adventures in BABYLON, including the stories of Daniel's delivery from the lion's den, the Jews in the fiery furnace, and the writing on the wall at BELSHAZZAR's feast. The rest of the book offers apocalyptic visions of the end of history and the last judgment. Though it contains references to rulers of the 6th century BC, the book is thought to have been written in the 2nd century BC during the persecutions of the Jews under ANTIOCHUS IV EPIPHANES. Daniel's upright character made him a model for a persecuted community.

Daniel Romanovich \rə-'män-ə-ˌvich\ *known as* **Daniel of Galicia** (b. 1201—d. 1264) Ruler of GALICIA and VOLHYNIA, one of the most powerful princes in east central Europe. He inherited the two principalities at age 4, but pretenders to the succession kept him from ruling. He finally gained control over Volhynia in 1221 and Galicia in 1238. Daniel enriched his realm, but MONGOL invasions (1240–41) forced him to acknowledge the rule of the khan. He led a rebellion against the Mongols (1256) and succeeded briefly in driving them out of Volhynia, but another Mongol force subdued the principality in 1260.

Daniels, Josephus (b. May 18, 1862, Washington, N.C., U.S.—d. Jan. 15, 1948, Raleigh, N.C.) U.S. editor, administrator, and diplomat. He published a newspaper in Raleigh, N.C. (1885–1933), and became influential in the Democratic Party. In the 1912 presidential election he worked for the nomination of WOODROW WILSON; he later served as U.S. secretary of the navy (1913–21). As ambassador to Mexico (1933–44), Daniels improved relations between Mexico and the U.S. and became Pres. FRANKLIN D. ROOSEVELT's most trusted adviser on Mexican issues.

Danilevsky \də-nyi-'lyef-skē**, Nikolay (Yakovlevich)** (b. Dec. 10, 1822, Obertse, Russia—d. Nov. 19, 1865, Tiflis, Russian Georgia) Russian naturalist and historical philosopher. He was the first to propound the philosophy of history as a series of distinct civilizations. In his *Russia and Europe* (1869), he contended that Russia and the Slavs should be indifferent to the West and concentrate on the development of political absolutism, their own special cultural heritage.

Danilova \də-'nē-lə-və**, Alexandra (Dionisyevna)** (b. Nov. 20, 1903, Peterhof, Russia—d. July 13, 1997, New York, N.Y., U.S.) Russian-born U.S. ballet dancer and teacher. She attended the Imperial Ballet School in St. Petersburg and became a soloist at the MARIINSKY THEATRE. In 1924 she joined the BALLETS RUSSES. From 1938 to 1952 she danced with the BALLET RUSSE DE MONTE CARLO, touring worldwide as its prima ballerina. She created leading roles in *The Triumph of Neptune*, *Gaîté Parisienne*, *Swan Lake*, and *Coppélia*. After retiring in 1957 she became a full-time faculty member at the School of American Ballet (1964–89). She was instrumental in bringing classical and modern Russian repertoires to the U.S.

Alexandra Danilova in *Swan Lake*.
THE BETTMANN ARCHIVE

Danish language Official language of Denmark, belonging to the Scandinavian (North) branch of the GERMANIC LANGUAGES. It began to separate from the other Scandinavian languages c. AD 1000. Modern Danish is the Scandinavian language that has undergone the greatest amount of change from Old Scandinavian. A spelling reform in 1948 eliminated the capitalization of nouns and introduced the letter *å* for *aa*, thereby making the spelling more similar to that of Norwegian and Swedish. Evidence of Denmark's political influence can be seen in the stamp of the Danish language on the NORWEGIAN, SWEDISH, and ICELANDIC languages. It is taught in the schools of the Faroe Islands, of Iceland, and of Greenland.

D'Annunzio \dän-'nünt-sē-ō**, Gabriele** (b. March 12, 1863, Pescara, Italy—d. March 1, 1938, Gardone Riviera, on Lake Garda) Italian writer and military hero. He was a journalist before turning to poetry and fiction. His prodigious output includes *The Child of Pleasure* (1898), introducing the first of his many passionate Nietzschean-Superman heroes; *The Triumph of Death* (1894), his best-known novel; *Alcyone* (1904), considered his greatest poetic work; and the powerful play *The Daughter of Jorio* (1904). His works are marked by egocentrism, fluent and melodious style, and an overriding emphasis on sensual gratification. He urged Italy's entry into World War I, in which he distinguished himself militarily. In 1919 he set himself up as dictator of the port city Fiume in defiance of the Treaty of Versailles and effectively secured it for Italy; he was forced to step down in 1920. He later became an ardent fascist. His eloquence, daring, political leadership, extravagant spending, and scandalous affairs (especially with ELEONORA DUSE) made him one of the most striking personalities of his day.

danse macabre See DANCE OF DEATH

Dante (Alighieri) \'dän-tā-ˌa-lə-'gyer-ē\ (b. c. May 21–June 20, 1265, Florence—d. Sept. 13/14, 1321, Ravenna) Italian poet. Dante was of noble ancestry, and his life was shaped by the conflict between papal and imperial partisans (the GUELPHS AND GHIBELLINES). When an opposing political faction within the Guelphs (Dante's party) gained ascendancy, he was exiled (1302) from Florence, to which he never returned. His life was given direction by his spiritual love for Beatrice Portinari (d. 1290), to whom he dedicated most of his poetry. His great friendship with GUIDO CAVALCANTI shaped his later career as well. *La Vita Nuova* (1293?) celebrates Beatrice in verse. In his difficult years of exile, he wrote the verse collection *The Banquet* (c. 1304–07); *De vulgari eloquentia* (1304–07; "Concerning Vernacular Eloquence"), the first theoretical discussion of the Italian literary

© 2006 Encyclopædia Britannica, Inc.

language; and *On Monarchy* (1313?), a major Latin treatise on medieval political philosophy. He is best known for the monumental epic poem *The Divine Comedy* (written c. 1310–14; originally titled simply *Commedia*), a profoundly Christian vision of human temporal and eternal destiny. It is an allegory of universal human destiny in the form of a pilgrim's journey through hell and purgatory, guided by the Roman poet VIRGIL, then to Paradise, guided by Beatrice. By writing it in Italian rather than Latin, Dante almost singlehandedly made Italian a literary language, and he stands as one of the towering figures of European literature.

Danton \dä^{n}-'tō^{n}**, Georges (-Jacques)** (b. Oct. 26, 1759, Arcis-sur-Aube, France—d. April 5, 1794, Paris) French revolutionary leader. A lawyer in Paris before the FRENCH REVOLUTION, he cofounded the CORDELIERS CLUB (1790) and frequently made impassioned speeches before both it and the JACOBIN CLUB. He was elected minister of justice in 1792, and he became a member of the first COMMITTEE OF PUBLIC SAFETY in April 1793. Effectively the head of government for three months, he pursued a policy of compromise and negotiation. He was not reelected to the Committee when its term expired in July, and he became leader of the moderate Indulgents, which had risen from the Cordeliers. His moderation and opposition to the REIGN OF TERROR led to his own death at the guillotine.

Danube \'dan-ˌyüb\ **River** *German* **Donau** \'dō-ˌnaù\ *Slovak* **Dunaj** \dü-'nī\ *Serbo-Croatian and Bulgarian* **Dunav** \'dü-näv\ *Romanian* **Dunarea** \'dü-nər-ˌyä\ *Ukrainian* **Dunay** \dü-'nī\ River, central Europe. The second longest European river (after the VOLGA), it rises in Germany's BLACK FOREST and flows about 1,770 mi (2,850 km) to the Black Sea, passing along or through Germany, Austria, Slovakia, Hungary, Croatia, Serbia and Montenegro, Bulgaria, Romania, Ukraine, and Moldova. Its many tributaries include the DRAVA, TISZA, and SAVA rivers. It has been an important highway between central and eastern Europe from antiquity. The lower Danube is a major avenue for freight transport, and the upper Danube is an important source of hydroelectricity. A regulatory body that consists of its riparian nations was established in 1948 to oversee its use. A major hydroelectric and navigation complex was built in the 1970s at Iron Gate Gorge in Romania. A canal linking Kelheim on the Danube and Bamberg on the MAIN RIVER, allowing traffic to flow between the North and Black seas, was completed in 1992.

The confluence of the Sava (foreground) and Danube rivers from the Kalemegdan fortress, Belgrade, Serbia and Montenegro.
JEAN S. BULDAIN/BERG & ASSOC.

Danube school Tradition of German landscape painting and etching that developed in the Danube River valley between Regensburg and Vienna in the early 16th century. The most important artists associated with the movement were ALBRECHT ALTDORFER and LUCAS CRANACH THE ELDER; others included Wolf Huber (1485–1553) and Jörg Breu the Elder (1475/76–1537). They were among the pioneers in depicting landscape for its own sake, often in highly subjective, expressive fashion.

Danzig See GDAŃSK

dao \'daù\ *or* **tao** In Chinese philosophy, a fundamental concept signifying the correct or divine way. In CONFUCIANISM, *dao* signifies a morally correct path of behaviour. In DAOISM the concept is more encompassing and includes the visible process of nature, by which all things change, as well as the principle underlying this process. This principle, known as Absolute Dao, can be only imperfectly understood by the practitioner but is the guiding principle in life. Daoists view life and death as stages of Absolute Dao and advocate a way of life that brings one closer to conformity with essential nature.

Daodejing \'daù-'də-'jiŋ\ *or* **Tao-te ching** Classic text of Chinese philosophy. Written between the 6th and 3rd centuries BC, it was once called the *Laozi* after its traditional author LAOZI, though its true authorship is still unresolved. The *Daodejing* presents a way of life intended to restore harmony and tranquillity to a kingdom racked by disorder. It promotes a course of nonaction, understood as restraint from any unnatural action rather than complete passivity, thereby allowing the DAO to resolve things naturally. It was designed as a handbook for rulers, who should rule by inaction, imposing no restrictions or prohibitions on their subjects. The *Daodejing* has had a tremendous influence on all later schools of Chinese philosophy and religion and has been the subject of hundreds of commentaries.

Daoism *or* **Taoism** \'daù-ˌiz-əm\ Major Chinese religio-philosophical tradition. Though the concept of DAO was employed by all Chinese schools of thought, Daoism arose out of the promotion of dao as the social ideal. LAOZI is traditionally regarded as the founder of Daoism and the author of its classic text, the *DAODEJING* . Other Daoist classics include the *ZHUANGZI* (4th–3rd century BC;) and the *LIEZI*. In Daoism, dao is the force or principle about which nothing can be predicated, but that latently contains the forms, entities, and forces of all phenomena. This natural wisdom should not be interfered with; DE, or superior virtue, is acquired through action so entirely in accordance with the natural order that its author leaves no trace of himself in his work. The tradition holds that all beings and things are fundamentally one. Daoism's focus on nature and the natural order complements the societal focus of CONFUCIANISM, and its synthesis with BUDDHISM is the basis of ZEN. See also YIN-YANG.

Daphne \'daf-nē\ In GREEK MYTHOLOGY, the personification of the laurel tree. The beautiful daughter of a river god, Daphne lived a pastoral existence and rejected every lover. When APOLLO pursued her, she prayed to GAEA or to her father to save her, whereupon she was transformed into a laurel. Apollo took its leaves to weave garlands that were thenceforth awarded to prize-winning poets. Daphne's other pursuer was Leucippus, who was killed because of Apollo's jealousy.

Daphnephoria \ˌdaf-nē-'fōr-ē-ə\ In GREEK RELIGION, a festival held every ninth year at Thebes in Boeotia in honor of Apollo Ismenius or Apollo Chalazius. It consisted of a procession and the dedication of a bronze tripod in APOLLO's temple. The festival was said to have originated in a vision of the Theban general Polematas, who was promised victory over the Aeolians and Pelasgians if the Daphnephoria was instituted.

DAR See DAUGHTERS OF THE AMERICAN REVOLUTION

Dar es Salaam \ˌdär-ˌes-sä-'läm\ Largest city (pop., 1995 est.: 1,747,000), capital, and major port of Tanzania. Founded in 1862 by the sultan of ZANZIBAR, it came under the German East Africa Co. in 1887. It served as the capital of GERMAN EAST AFRICA (1891–1916), of Tanganyika (1961–64), and subsequently of Tanzania. It is an industrial centre, and its harbour is the major outlet for Tanzania's agricultural and mineral exports. It is the site of the University of Dar es Salaam (1961).

Darby, Abraham (b. 1678?, near Dudley, Worcestershire, Eng.—d. March 8, 1717, Madeley Court, Worcestershire) British ironmaster. In 1709 Darby's Bristol Iron Co. became the first to successfully smelt IRON ore with COKE (see SMELTING). He demonstrated the superiority of coke in cost and efficiency by building much larger furnaces than were possible with charcoal as fuel. The quality of his iron made it possible to manufacture thin castings that rivaled brass for pots and other hollowware. Iron from his establishment was used for the cylinders of THOMAS NEWCOMEN's engines, for a cast-iron bridge, and for the first locomotive with a high-pressure boiler. See also DUD DUDLEY.

D'Arcy, William Knox (b. Oct. 11, 1849, Newton Abbot, Devonshire, Eng.—d. May 1, 1917, Stanmore, Middlesex) British businessman. After earning a fortune as a gold miner in Australia, D'Arcy secured a 60-year oil-mining concession in Iran in 1901. The concession, obtained with British government assistance, covered an area of 500,000 sq mi (1.3 million sq km). An oil strike on these lands led to the formation of the Anglo-Persian Oil Co. in 1909. See also BP PLC.

© 2006 Encyclopædia Britannica, Inc.

Dardanelles \ˌdär-dᵊn-ˈelz\ *ancient* **Hellespont** \ˈhe-lə-ˌspänt\ Narrow strait between the peninsula of Gallipoli in Europe and the mainland of Turkey in Asia. Some 38 mi (61 km) long and 0.75–4 mi (1–6 km) wide, it links the Aegean Sea with the Sea of Marmara. Strategically important from antiquity, the Dardanelles was defended by Troy from its position on the Asian side. In 480 BC the Persian Xerxes I crossed the strait to invade Greece; Alexander the Great also crossed it in 334 BC on his expedition against Persia. Held by the Roman Republic and Empire and the Byzantine Empire and later by the Ottoman Empire, it is of great strategic and economic importance as the gateway from the Black Sea to Istanbul and the Mediterranean Sea.

Dardanelles Campaign *or* **Gallipoli** \gə-ˈli-pə-lē\ **Campaign** (1915–16) Unsuccessful British-led operation against Turkey in World War I, intended to invade the Dardanelles strait, conquer the Gallipoli peninsula, and occupy Constantinople (Istanbul). In response to a Russian appeal to relieve pressure against its troops on the Caucasus front, Britain agreed to a naval action against Turkey at the Dardanelles. When bombardment alone failed, British and Australian and New Zealand (ANZAC) troops landed on the Gallipoli peninsula in April 1915, where they met strong resistance from Turkish forces under Mustafa Kemal Atatürk. After six months of standoff, the campaign was halted and Allied troops were skillfully withdrawn under difficult conditions. Allied casualties numbered about 250,000. The failed campaign gave the impression that the Allies were militarily inept, prompting the resignation of Winston Churchill, the chief promoter of the venture, as first lord of the admiralty.

Dare, Virginia (b. Aug. 18, 1587, Roanoke Island, Va.) First child born to English parents in America. Her parents were among the 120 settlers who landed at Roanoke Island, Va., in 1587. Her grandfather, John White, was the colony's governor; he left to collect supplies in England nine days after her birth. A relief expedition that finally reached the colony in 1590 found only the word *croatoan* carved on a post; the infant Virginia had vanished along with all the other colonists.

Darfur \där-ˈfür\ Historical region and former province, western Sudan. It was an independent kingdom from c. 2500 BC. Its first traditional rulers, the Daju, probably traded with ancient Egypt; they were succeeded by the Tunjur. Darfur's Christian period (c. 900–1200) was ended by the advance of Islam with the empire of Kanem-Bornu. In the 1870s Darfur came under Egyptian rule, and in 1916 it became a province of Sudan.

Darién \ˌdar-ē-ˈen\ Traditional region, eastern Panama. Extending into northwestern Colombia, it forms the link between Central America and South America. A hot, humid area of tropical rainforests, it has always been sparsely populated. The first European settlement in South America, Santa María de la Antigua del Darién, was attempted there in 1510. From this failing colony Vasco Núñez de Balboa made his famous march to the Pacific Ocean in 1513.

Darío \dä-ˈrē-ō**, Rubén** *pseudonym of* **Félix Rubén García Sarmiento** (b. Jan. 18, 1867, Metapa, Nic.—d. Feb. 6, 1916, León) Nicaraguan poet, journalist, and diplomat. At age 19 he began the travels in Europe and the Americas that would continue throughout his life. The diverse collection *Azul* (1888), written in an innovative simple, direct style, is his first major work. As a diplomat in Buenos Aires (from 1893), he became the centre of the new Modernismo movement. His *Profane Hymns* (1896) was influenced by the French Symbolists. As a journalist in Europe he became increasingly concerned with issues of imperialism and nationalism. *Songs of Life and Hope* (1905) represents the culmination of his technical experimentation and artistic resourcefulness. In addition to his poetry, he wrote about 100 short stories.

Darius \da-ˈrī-əs\ **I** *known as* **Darius the Great** (b. 550—d. 486 BC) King of Persia (522–486 BC). He was the son of Hystaspes, satrap of Parthia. Much of what is known of him is through his own inscriptions. He took the throne by force, killing Bardiya, a son of Cyrus the Great, calling him an impostor who had usurped power. He continued the conquests of his predecessors, subduing Thrace, Macedonia, some Aegean islands, and land stretching to the Indus valley. He failed in his great expedition against the Scythians (513) but put down the Ionian revolt (499), which had been supported by Eretria and Athens. After that he twice tried to conquer Greece, but a storm destroyed his fleet in 492 and the Athenians defeated him at the Battle of Marathon in 490. He died before a third expedition could be launched. Among the greatest of the Achaemenian dynasty, he was noted for his administrative genius and his building projects, especially those at Persepolis.

Darius I seated before two incense burners, detail of a bas-relief of the north courtyard in the Treasury at Persepolis, late 6th–early 5th century BC; in the Archaeological Museum, Tehrān
COURTESY OF THE ORIENTAL INSTITUTE, THE UNIVERSITY OF CHICAGO

Darjiling *or* **Darjeeling** City (pop., 2001: 107,197), West Bengal state, northeastern India. It was purchased in 1835 from the raja of Sikkim and was developed as a sanatorium for British troops. Located at an average elevation of 7,000 ft (2,100 m), it commands views of Mounts Kanchenjunga and Everest. Its economy is based primarily on tea, which is plantation-grown, and tourism.

dark matter Nonluminous matter not directly detectable by astronomers, hypothesized to exist because the mass of the visible matter in the universe cannot account for observed gravitational effects. Long believed to exist in large quantities, it enters into many theories of the origin of the universe and its present large-scale structure and into models of gravitation and other fundamental forces (see fundamental interaction) between particles. Numerous candidates for dark matter have been proposed over the years, but none has yet been confirmed.

Darlan \där-ˈlä^{n}**, (Jean-Louis-Xavier-) François** (b. Aug. 7, 1881, Nérac, France—d. Dec. 24, 1942, Algiers) French admiral. After graduating from the French naval school (1902), he rose through the ranks to become navy commander in chief (1939). After France's defeat by Germany in World War II, he entered Philippe Pétain's government as vice premier and foreign minister (1941–42), then became commander in chief of all Vichy France military forces. In 1942 he concluded an armistice with the Allies in Algiers, then was killed by an anti-Vichy assassin.

Darling River River, southeastern Australia. It is the longest member of the Murray-Darling river system. It rises in several headstreams in the Great Dividing Range and flows generally southwest across New South Wales for 1,702 mi (2,739 km) to join the Murray River at the Victoria border.

Darlington, Cyril Dean (b. Dec. 19, 1903, Chorley, Lancashire, Eng.—d. March 26, 1981) British biologist. A professor at the University of Oxford from 1953, he believed that chromosomes were the cellular components that passed hereditary information from generation to generation. He explained the behaviour of chromosomes during meiosis, formulating a theory of evolution in which the exchange of parts of chromosomes (crossing-over) was the central variable in determining the inherited characteristics of the next generation. His *Evolution of Man and Society* (1969) raised controversy by insisting that the intelligence of races was determined by inheritance.

Darnley, Henry Stewart, Lord (b. Dec. 7, 1545, Temple Newsom, Yorkshire, Eng.—d. Feb. 9/10, 1567, Edinburgh, Scot.) English nobleman, second husband of Mary, Queen of Scots, and father of James I. Son of Matthew Stewart, earl of Lennox (1516–71), a pretender to the Scottish throne, Henry wed his cousin Mary in 1565 despite the opposition of Elizabeth I and Scottish Protestants. It became evident, even to Mary, that superficial charm was his only positive attribute. After he played a role in the murder of Mary's secretary, David Riccio, he was himself murdered at age 21 at the instigation of James Hepburn, earl of Bothwell (1535–78), whom Mary soon married.

Darrow \ˈdar-ō**, Clarence (Seward)** (b. April 18, 1857, near Kinsman, Ohio, U.S.—d. March 13, 1938, Chicago, Ill.) U.S. lawyer and orator. He attended law school for only one year before being admitted to the Ohio bar in 1878. Darrow moved to Chicago in 1887 and immediately joined the effort to free anarchists charged with murder in the Haymarket Riot. He was appointed Chicago city corporation counsel (1890) and then became general attorney for the Chicago and North Western Railway. His defense of Eugene V. Debs on charges stemming from the Pullman Strike (1894) established Darrow's reputation as a union and

© 2006 Encyclopædia Britannica, Inc.

criminal lawyer. He represented striking Pennsylvania coal miners, drawing attention to working conditions and the use of CHILD LABOUR (1902–03); secured the acquittal of WILLIAM HAYWOOD in the assassination of Gov. Frank R. Steunenberg of Idaho (1907); and sought to defend the McNamara brothers, accused of bombing the *Los Angeles Times* building (1911). He saved Richard Loeb and Nathan Leopold from a death sentence for the murder of 14-year-old Robert Franks and won acquittal for members of an African American family who had fought a mob trying to expel them from their home in a white Detroit neighbourhood (1925–26). Perhaps his most famous case was the SCOPES TRIAL (1925), in which he defended a high school teacher who was charged with violating a Tennessee state law against teaching Darwin's theory of evolution.

darshan *or* **darsan** \'dər-shən, 'där-shən\ In Hindu worship, the beholding of an auspicious deity, person, or object. The experience is often conceived to be reciprocal and results in a blessing of the viewer. In *rathayatra*s (car festivals), images are carried through the streets to allow viewing by those who formerly would not have been allowed in the temple. Darshan may also be imparted by a GURU to his disciples, a ruler to his subjects, or a PILGRIMAGE shrine to its visitors. In Indian philosophy, darshan also refers to a philosophical system (e.g., VEDANTA).

Dart, Raymond Arthur (b. Feb. 4, 1893, Toowong, Brisbane, Queen., Austl.—d. Nov. 22, 1988, Johannesburg, S.Af.) Australian-born South African physical anthropologist and paleontologist. In 1925, when Asia was still believed to be the cradle of humankind, Dart's announcement of the discovery of the Taung skull near the Kalahari substantiated CHARLES DARWIN's prediction that such ancestral HOMININ forms would be found in Africa. Dart named the skull, establishing it as the type specimen of a new genus and species, AUSTRALOPITHECUS *africanus*. He lived to see his findings corroborated by additional discoveries that firmly established Africa as the site of human origins. Dart taught at the University of the Witwatersrand from 1923 to 1958.

darter Any of about 100 species of small, slender freshwater fishes (family Percidae), native to eastern North America. Darters live near the bottom of clear streams, darting quickly about when disturbed or when feeding on small aquatic animals such as insects and worms. They have two dorsal fins and often are brightly coloured. Most species are 2–3 in. (5–7 cm) long, but some grow to 9 in. (23 cm). Some species lay their eggs and abandon them; the males of other species establish a nest and guard the eggs until hatched. See also SNAIL DARTER.

Dartmouth \'därt-məth\ **College** Private institution of higher learning in Hanover, N.H., a traditional member of the IVY LEAGUE. It is consistently ranked as one of the best liberal arts colleges in the U.S. It was founded in 1769 by Rev. Eleazar Wheelock (1711–79) for the education of "youth of the Indian Tribes . . . English Youth and others." The original charter was approved by King GEORGE III. Women were first admitted in 1972. Besides offering a broad range of undergraduate programs, Dartmouth grants graduate and professional degrees in the arts and sciences, business, engineering, and medicine. See also DARTMOUTH COLLEGE CASE.

Dartmouth College case *formally* **Trustees of Dartmouth College v. Woodward** Case in which the U.S. Supreme Court held (1819) that the charter of DARTMOUTH COLLEGE, granted in 1769 by King George III, was a contract and as such could not be impaired by the New Hampshire legislature. State legislators had tried to alter the contract's terms regarding the continuance of the board of trustees, an effort rejected by the court. The decision was far-reaching in its application to business charters, protecting businesses and CORPORATIONS from much government regulation. Dartmouth's case was argued by DANIEL WEBSTER.

darts Indoor target game. It is played by throwing feathered darts at a circular board with numbered spaces. The board, usually made of cork, bristle, or elmwood, is divided into 20 sectors valued at points from 1 to 20. Six concentric rings, ranging from an inner bull's-eye to a narrow outermost ring, determine scoring. The official throwing distance in most countries is 7 ft 9.25 in. (2.37 m), though variations extend up to 9 ft (2.75 m). In Britain, darts is normally played in pubs.

Darwin *formerly* **Palmerston** Seaport (pop., 2001 prelim.: 69,698), capital of NORTHERN TERRITORY, Australia. Located on Port Darwin, a deep inlet of Clarence Strait in the Timor Sea, it has one of Australia's best harbours. The harbour was named in 1839 for CHARLES DARWIN. The port, settled in 1869, was known as Palmerston until 1911. Located in a largely undeveloped region, Darwin is a supply and shipping centre for northern Australia. A military base in World War II, it was bombed by the Japanese in 1942, then extensively rebuilt. A cyclone in 1974 damaged or destroyed nearly all of the city; rebuilt a second time, it is now one of Australia's most modern cities.

Darwin, Charles (Robert) (b. Feb. 12, 1809, Shrewsbury, Shropshire, Eng.—d. April 19, 1882, Downe, Kent) British naturalist. The grandson of ERASMUS DARWIN and JOSIAH WEDGWOOD, he studied medicine at the University of Edinburgh and biology at Cambridge. He was recommended as a naturalist on HMS *Beagle*, which was bound on a long scientific survey expedition to South America and the South Seas (1831–36). His zoological and geological discoveries on the voyage resulted in numerous important publications and formed the basis of his theories of evolution. Seeing competition between individuals of a single species, he recognized that within a local population the individual bird, for example, with the sharper beak might have a better chance to survive and reproduce and that if such traits were passed on to new generations, they would be predominant in future populations. He saw this NATURAL SELECTION as the mechanism by which advantageous variations were passed on to later generations and less advantageous traits gradually disappeared. He worked on his theory for more than 20 years before publishing it in his famous *On the Origin of Species by Means of Natural Selection* (1859). The book was immediately in great demand, and Darwin's intensely controversial theory was accepted quickly in most scientific circles; most opposition came from religious leaders. Though Darwin's ideas were modified by later developments in genetics and molecular biology, his work remains central to modern evolutionary theory. His many other important works included *Variation in Animals and Plants Under Domestication* (1868) and *The Descent of Man...* (1871). He was buried in Westminster Abbey. See also DARWINISM.

Darwin, Erasmus (b. Dec. 12, 1731, Elston Hall, Nottinghamshire, Eng.—d. April 18, 1802, Derby, Derbyshire) British physician, grandfather of CHARLES DARWIN and FRANCIS GALTON. A freethinker and radical, Darwin often wrote his opinions and scientific treatises in verse. In *Zoonomia; or, The Laws of Organic Life* (1794–96), he advanced a theory of evolution similar to that of LAMARCK, suggesting that species modified themselves by adapting to their environment in an intentional way. His conclusions, drawn from simple observation, were rejected by the more sophisticated 19th-century scientists, including his grandson Charles.

Erasmus Darwin, detail of an oil painting by Joseph Wright, 1770; in the National Portrait Gallery, London
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Darwinism Theory of the evolutionary mechanism proposed by CHARLES DARWIN as an explanation of organic change. It denotes Darwin's specific view of how EVOLUTION works. Darwin developed the concept that evolution is brought about by the interplay of three principles: variation (present in all forms of life), heredity (the force that transmits similar organic form from one generation to another), and the struggle for existence (which determines the variations that will be advantageous in a given environment, thus altering the species through selective reproduction). Present knowledge of the genetic basis of inheritance has contributed to scientists' understanding of the mechanisms behind Darwin's ideas, in a theory known as neo-Darwinism.

Darwin's finch *or* **Galápagos finch** Any of 14 species (in three genera) of songbirds (family Fringillidae) whose adaptations to several ecological niches in the Galápagos Islands and Cocos Island gave CHARLES DARWIN evidence for his thesis that "species are not immutable." All the species are 4–8 in. (10–20 cm) long and brownish or black, but they differ greatly in the configuration of the bill, which is suited to each species' particular feeding habit.

Dassault \dä-'sō**, Marcel** *orig.* **Marcel Bloch** (b. Jan. 22, 1892, Paris, France—d. April 18, 1986, Paris) French aircraft designer and industrialist. He designed aircraft during World War I, and in 1930 he

© 2006 Encyclopædia Britannica, Inc.

started his own company to build military and civilian airplanes. Sent to Buchenwald as a Jew during World War II, he later changed his last name (to that of his brother's byname in the Resistance) and resumed his business. His company produced Europe's first supersonic plane, the Mystère, and in 1956 began production of the Mirage warplane, which would be acquired by countries worldwide.

data compression Process of reducing the amount of data needed for storage or transmission of a given piece of information (text, graphics, video, sound, etc.), typically by use of encoding techniques. Data compression is characterized as either lossy or lossless depending on whether some data is discarded or not, respectively. Lossless compression scans the data for repetitive sequences or regions and replaces them with a single "token." For example, every occurrence of the word *the* or region with the colour red might be converted to *$*. ZIP and GIF are the most common lossless formats for text and graphics, respectively. Lossy compression is frequently used for photographs, video, and sound files where the loss of some detail is generally unnoticeable. JPEG and MPEG (see MP3) are the most common lossy formats.

data encryption Process of disguising information as "ciphertext," or data that will be unintelligible to an unauthorized person. Decryption is the process of converting ciphertext back into its original format, sometimes called plaintext (see CRYPTOGRAPHY). Computers encrypt data by applying an ALGORITHM to a block of data. A personal key known only to the message's transmitter and intended receiver is used to control the encryption. Well-designed keys are almost impregnable. A key 16 characters long selected at random from 256 ASCII characters could take far longer than the 15-billion-year age of the universe to decode, assuming the perpetrator attempted 100 million different key combinations per second. Symmetric encryption requires the same key for both encryption and decryption. Asymmetric encryption, or public-key cryptography, requires a pair of keys, one for encryption and one for decryption.

data mining Type of database analysis that attempts to discover useful patterns or relationships in a group of data. The analysis uses advanced statistical methods, such as cluster analysis, and sometimes employs ARTIFICIAL INTELLIGENCE or NEURAL NETWORK techniques. A major goal of data mining is to discover previously unknown relationships among the data, especially when the data come from different databases. Businesses can use these new relationships to develop new advertising campaigns or make predictions about how well a product will sell. Governments also use these techniques to discern illegal or embargoed activities by individuals, associations, and other governments.

data processing Manipulation of data by a COMPUTER. It includes the conversion of raw data to machine-readable form, flow of data through the CPU and memory to output devices, and formatting or transformation of output. Any use of computers to perform defined operations on data can be included under data processing. In the commercial world, data processing refers to the processing of data required to run organizations and businesses.

data structure Way in which data are stored for efficient search and retrieval. The simplest data structure is the one-dimensional (linear) array, in which stored elements are numbered with consecutive integers and contents are accessed by these numbers. Data items stored nonconsecutively in memory may be linked by pointers (memory addresses stored with items to indicate where the "next" item or items in the structure are located). Many ALGORITHMS have been developed for sorting data efficiently; these apply to structures residing in main memory and also to structures that constitute information systems and DATABASES.

data transmission Sending and receiving data via cables (e.g., telephone lines or FIBRE OPTICS) or wireless relay systems. Because ordinary telephone circuits pass signals that fall within the frequency range of voice communication (about 300–3,500 hertz), the high frequencies associated with data transmission suffer a loss of amplitude and transmission speed. Data signals must therefore be translated into a format compatible with the signals used in telephone lines. Digital computers use a MODEM to transform outgoing digital electronic data; a similar system at the receiving end translates the incoming signal back to the original electronic data. Specialized data-transmission links carry signals at frequencies higher than those used by the public telephone network. See also BROADBAND TECHNOLOGY; CABLE MODEM; DSL; ISDN; FAX; RADIO; TELETYPE; T1; WIRELESS COMMUNICATIONS.

database Collection of data or information organized for rapid search and retrieval, especially by a computer. Databases are structured to facilitate storage, retrieval, modification, and deletion of data in conjunction with various DATA-PROCESSING operations. A database consists of a file or set of files that can be broken down into records, each of which consists of one or more fields. Fields are the basic units of data storage. Users retrieve database information primarily through queries. Using keywords and sorting commands, users can rapidly search, rearrange, group, and select the field in many records to retrieve or create reports on particular aggregates of data according to the rules of the DATABASE MANAGEMENT SYSTEM being used.

database, relational See RELATIONAL DATABASE

database management system (DBMS) System for quick search and retrieval of information from a DATABASE. The DBMS determines how data are stored and retrieved. It must address problems such as security, accuracy, consistency among different records, response time, and memory requirements. These issues are most significant for database systems on computer NETWORKS. Ever-higher processing speeds are required for efficient database management. Relational DBMSs, in which data are organized into a series of tables ("relations") that are easily reorganized for accessing data in different ways, are the most widely used today.

Date Line See INTERNATIONAL DATE LINE

date palm Tree (*Phoenix dactylifera*) of the PALM family, found in the Canary Islands and northern Africa, the Middle East, Pakistan, India, and California. The trunk, strongly marked with the pruned stubs of old leaf bases, ends in a crown of long, graceful, shining, pinnate leaves. The fruit, called the date, is a usually oblong brown BERRY. Dates have long been an important food in desert regions, and are the source of syrup, alcohol, vinegar, and a strong liquor. All parts of the tree yield products of economic value, being used variously for timber, furniture, basketry, fuel, rope, and packing material. The seeds are sometimes used as stock feed. The tree is grown as an ornamental along the Mediterranean shores of Europe. Its leaves are used for the celebration of Palm Sunday (among Christians) and the Feast of Tabernacles (among Jews). Date sugar, a product of India, is obtained from the sap of a closely related species, *P. sylvestris*.

dating In geology and archaeology, the process of determining an object's or event's place within a chronological scheme. Scientists may use either relative dating, in which items are sequenced on the basis of stratigraphic clues (see STRATIGRAPHY) or a presumed evolution in form or structure, or absolute dating, in which items are assigned a date independent of context. The latter type includes POTASSIUM-ARGON and CARBON-14 dating; both are based on the measurement of radioactive decay. The record of changes in polarity of the Earth's magnetic field has provided a timescale for SEAFLOOR SPREADING and long-term marine SEDIMENTATION. DENDROCHRONOLOGY has proved useful in archaeology and climatology. See also FISSION-TRACK DATING; HELIUM DATING; LEAD-210 DATING; RUBIDIUM-STRONTIUM DATING; URANIUM-234–URANIUM-238 DATING; URANIUM-THORIUM-LEAD DATING.

Daubenton \dō-bä^{n}-'tō^{n}**, Louis-Jean-Marie** (b. May 26, 1716, Montbard, Côte d'Or, Fr.—d. Jan. 1, 1800, Paris) French naturalist. A prolific scientist, he completed many zoological descriptions and dissections and undertook productive studies in the comparative anatomy of recent and fossil animals, plant physiology, and mineralogy. He introduced Merino sheep to France.

Daubigny \dō-bēn-'yē**, Charles-François** (b. Feb. 15, 1817, Paris, Fr.—d. Feb. 19, 1878, Paris) French landscape painter of the BARBIZON SCHOOL. He was trained by his father, also a painter. He began by painting historical and religious works but soon turned to landscapes, painting rivers, beaches, and canals from a boat. His images were notable for their uncrowded composition and accurate depiction of natural light. One of the earliest proponents of painting directly from nature, he is considered the link between mid-19th-century naturalism and IMPRESSIONISM.

Daudet \dō-'de**, Alphonse** (b. May 13, 1840, Nîmes, France—d. Dec. 16, 1897, Paris) French short-story writer and novelist. Daudet wrote his first novel at age 14. Unable to finish his schooling after his parents lost all their money, he took a position in a duke's household. He later joined the army but fled the terrors of the PARIS COMMUNE of 1871. His health was long undermined by poverty and by the venereal disease that eventually cost him his life. He is remembered for his humorous, sentimental portrayals of the life and characters of southern France, inspired by his experiences at several social levels. His many works include the

© 2006 Encyclopædia Britannica, Inc.

story collection *Monday Tales* (1873), the play *L'Arlésienne* (1872), the novels *The Nabob* (1877) and *Sappho* (1884), and several volumes of memoirs. His son, Léon Daudet (1867–1942), edited with Charles Maurras the reactionary review *L'Action Française* and was a virulent satirist and polemicist on the subjects of medicine and psychology as well as public affairs.

Daughters of the American Revolution (DAR) U.S. patriotic society for direct descendants of soldiers or others who aided the cause of independence. It was organized in 1890 and chartered by Congress in 1895. Its historical division stresses the study of U.S. history and preservation of Americana. Its educational division provides scholarships and loans, helps support schools for underprivileged youth and for Americanization training, sponsors prizes, and publishes manuals. Its patriotic division publishes the *Daughters of the American Revolution Magazine* and *The National Defense News*. It was long known for its conservatism; its refusal in 1939 to let the black singer Marian Anderson perform at Washington's Constitution Hall led to her famous concert at the Lincoln Memorial.

Daumier \dōm-'yā**, Honoré (-Victorin)** (b. Feb. 20/26, 1808, Marseille, Fr.—d. Feb. 11, 1879, Valmondois) French painter, sculptor, and caricaturist. He was born into a family of artists. From age 13 he worked for a bailiff in a law court and later as a clerk in a bookstore, where he observed and analyzed the appearance and behaviour of people of different social classes. In 1829, after studying lithography, he began contributing cartoons and drawings satirizing 19th-century French politics and society to periodicals and came to enjoy a wide reputation. He produced more than 4,000 lithographs and 4,000 illustrative drawings. His paintings, drawing upon literary themes and documenting contemporary life and manners, were executed in a vigorous, sketchy style; they were rarely exhibited, and he remained unknown as a painter. In sculpture he specialized in caricature heads and figures; some 15 small clay busts occupy an important place in the history of sculpture.

dauphin \'dō-fən\ Title of the eldest son of a king of France, the heir apparent to the French crown, from 1350 to 1830. Derived from a personal name, dauphin was originally used as a title in the 12th century by French counts in Auvergne and Vienne. The title came to the French crown through the purchase of lands known as the Dauphiné in 1349 by Philip VI, who bestowed it on his grandson, the future Charles V. Dauphin came to designate the heir apparent during the reign of Charles V, who gave his son, Charles VI, the title and the Dauphiné.

Dauphiné \ˌdō-fē-'nā\ Historic region and former province, southeastern France. Occupied by Burgundians and later by Franks, it formed part of the Middle Kingdom of Lothar I after the division of the Carolingian empire in 843 and was part of the kingdom of Arles. It was sold to Philip VI of France and ultimately became an appanage of the eldest son of the French king, who assumed the title (dauphin) attached to the land. The area had a quasi-independent status until it was annexed to France in 1457. Dauphiné encompasses portions of the modern administrative *régions* of Rhône-Alpes and Province-Alpes-Côte d'Azur.

Davao \'dä-ˌvaù\ City (pop., 2000: metro. area, 1,147,116), southeastern Mindanao Island, Philippines. Located at the mouth of the Davao River on Davao Gulf, it is an international port and the leading commercial centre in the region. It developed as a Japanese colony. Razed during World War II, the rebuilt city is a blend of Spanish, American, and Moorish influences. Largely rural outside its urban core, it is one of the world's largest cities in area, covering 854 sq mi (2,212 sq km). It is the site of the University of Mindanao (1946).

Davenant \'dav-ə-nənt**, Sir William** *or* **William D'Avenant** (b. 1606, Oxford, Eng.—d. April 7, 1668, London) British poet, playwright, and theatre manager. Early works include the comedy *The Witts* (licensed 1634) and a volume of poems, *Madagascar* (1638). He was made poet laureate in 1638. Involved in intrigues during the English Civil Wars, he was imprisoned at the Tower of London, where he worked on his verse epic *Gondibert* (1651). Later he made the first attempt to revive English drama (banned under Oliver Cromwell) and brought the first opera, painted stage sets, and female actress-singer to the English public stage. After the Restoration he continued playwriting and founded a playhouse.

Davenport, John (b. April 1597, Coventry, Warwickshire, Eng.—d. c. March 15, 1670, Boston, Mass.) British-American Puritan clergyman. A vicar in London, he moved to Amsterdam in 1633 and served there as co-pastor of the English Church. In 1637 he left for America with Theophilus Eaton (c. 1590–1658) and their followers. They founded a colony at Quinnipiac (New Haven) in 1638; Davenport became pastor of the New Haven church, and Eaton was chosen governor. After failing to prevent New Haven's union with the Connecticut colony, Davenport left in 1667 to lead the First Church in Boston.

David (b. Bethlehem, Judah—d. c. 962 BC, Jerusalem) Second of the Israelite kings (r. c. 1000–c. 962 BC). David was an aide at the court of Saul until the monarch's jealousy forced him into outlawry. He became king of Israel on Saul's death. He captured Jerusalem from the Jebusites and made it his capital, defeated the Philistines, and gained control of many bordering kingdoms. He faced several revolts, including one by his third son, Absalom. He unified all Israel into one kingdom and made Jerusalem both the religious and political centre. He made the name Yahweh the supreme name for the god of Israel, who was worshiped in Jerusalem, and ruled that all other names for God were mere titles or attributes of Yahweh. Though the kingdom split under David's son and successor Solomon, religious unity endured, and the house of David symbolized the bond between God and Israel. The word messiah comes from *hameshiach*, the title of kings of the line of David.

David I (b. c. 1082—d. May 24, 1153, Carlisle, Cumberland, Eng.) King of the Scots (1124–53). The youngest of six sons of Malcolm III Canmore, he became king of Scotland on the death of his brother Alexander I. He created a rudimentary central administration, issued the first Scottish royal coinage, and admitted into Scotland an influential Norman aristocracy. David also reorganized Scottish Christianity to conform with European and English usages and founded many religious communities. He had obtained lands in central England through his marriage to the daughter of an English earl in 1113, and he won title to Northumberland from the future Henry II in 1149.

David II *known as* **David the Builder** (b. 1073—d. 1125) King of Georgia (1089–1125). Sometimes known as David III, he became coruler with his father, Giorgi II, in 1089. David defeated the Turks in the Battle of Didgori (1122) and captured Tbilisi. Under his leadership Georgia became the strongest state in Caucasia.

David II (b. March 5, 1324, Dunfermline, Fife, Scot.—d. Feb. 22, 1372, Scotland) King of the Scots from 1329. In keeping with an Anglo-Scottish peace treaty, he was married at age four to the sister of Edward III of England. His reign was marked by conflict with England and a decline in the prestige of the monarchy. He went into exile in France in 1334 after Edward III supported a rival for the throne, and he fought against Edward for the French king Philip VI. David returned to Scotland in 1341 and carried out raids against the English, who captured him in 1346. He was released in 1357 on the promise of ransom, and his offer to trade the Scottish throne for forgiveness of the ransom money was repudiated in Scotland.

David \'då-vət**, Gerard** (b. c. 1460, Oudewater, Neth.—d. Aug. 13, 1523, Bruges) Netherlandish painter. He worked mainly in Bruges, where he entered the painters' guild in 1484 and became dean in 1501. He

"Virgin and Child with Saints and Donor," panel painting by Gerard David, *c.* 1505; in the National Gallery, London

became the city's leading painter after the death of Hans Memling. Most of his works are altarpieces and other panels featuring traditional religious themes, but his best-known paintings, *The Judgment of Cambyses* and *The Flaying of Sisamnes* (1498), deal with the theme of justice; they originally hung in the town hall of Bruges. His works are among the earliest Flemish paintings to feature the Italian Renaissance iconography of putti (male child angels) and garlands.

David \dä-'vēd**, Jacques-Louis** (b. Aug. 30, 1748, Paris, France—d. Dec. 29, 1825, Brussels) French painter. At 18 he entered the Royal Academy of Painting and Sculpture. In 1775 he went to Rome and became a proponent of the Neoclassical style, but also studied the work of such 17th-century painters as Nicolas Poussin and Caravaggio. His work came to epitomize the late 18th-century Neoclassical reaction against the ornate Rococo style. Among his subjects were classical, historical, and mythological themes; he was also a great portraitist. He became the unchallenged painter of the French Revolution, and later was appointed official portraitist to Napoleon. He was also a founding member of the new Institut de France, which replaced the Royal Academy, and produced commemorative medals and other revolutionary propaganda. Among his masterpieces is *The Death of Marat* (1793), an expression of universal tragedy as well as a portrayal of a key event of the French Revolution. His influence on European art was pervasive; his pupils included Antoine-Jean Gros and J.-A.-D. Ingres.

Jacques-Louis David, self-portrait, oil painting, 1794; in the Louvre, Paris
ALINARI—ART RESOURCE/EB INC.

David, Star of *Hebrew* **Magen David** ("Shield of David"). Jewish symbol composed of two overlaid equilateral triangles that form a six-pointed star. It appears on synagogues, tombstones, and the flag of Israel. An ancient sign not much used by Jews before the Middle Ages, it was popularized by Kabbalists for protection against evil spirits. The Jewish community of Prague adopted it as an official symbol and its use became widespread in the 17th century. Though it has neither biblical nor Talmudic authority, it became a nearly universal emblem of Judaism in the 19th century. The Nazis' use of it to identify Jews invested it with the symbolism of martyrdom and heroism.

David ap Llywelyn \'dä-vith-äp-hlə-'we-lin\ (b. c. 1208—d. Feb. 25, 1246, Aber, Gynedd, Wales) Welsh prince, ruler of the state of Gwynedd in northern Wales (1240–46). His father, Llywelyn ap Iorwerth, had made Gwynedd the centre of Welsh power. David, the rightful heir, fought his half brother for power and imprisoned him in 1239. He was forced to cede part of his territory to Henry III of England (1241) and later went to war against Henry. The first Welsh ruler to declare himself prince of Wales, he fell ill and died while the war was in progress.

David of Tao \'taù\ (d. 1000) Georgian prince of the Bagratid family of Tao, a region between Georgia and Armenia. A just ruler and a friend of the church, he allied with Basil II to defeat the rebel Bardas Skleros (976–979) and was rewarded with extensive lands that made him the most important ruler in Caucasia. In 987–989 he supported Bardas Phokas against Basil but was defeated and agreed to cede his lands to Basil on his death. Despite this setback, David's heir, Bagrat III (978–1014), was able to become the first ruler of a unified Georgian kingdom.

Davidson, Bruce (b. Sept. 5, 1933, Oak Park, Ill., U.S.) U.S. photographer and filmmaker. After studying at the Yale University School of Design he worked briefly at *Life* magazine and in 1958 joined the photographers' cooperative Magnum Photos. He produced numerous outstanding photo-essays, the most important being *East 100th Street* (1970), 123 photographs shot with a large-format camera in East Harlem, New York. He also made several short films.

Davidson, Donald (b. March 6, 1917, Springfield, Mass., U.S.—d. Aug. 30, 2003, Berkeley, Calif.) U.S. philosopher. He taught at various universities before settling at the University of California at Berkeley in 1981. In a series of seminal papers, he developed strikingly original and unusually systematic positions on a wide range of traditional philosophical problems. According to his doctrine of anomalist monism, although mental events are identical to physical events (in the brain) under appropriate descriptions, there are no psychophysical laws (in the strict sense) that relate the two; it follows that reduction of the mental to the physical is impossible (see also supervenience). He argued that a formal requirement for any adequate theory of linguistic meaning is that it generate theorems that express the truth conditions of sentences in the "object language" in terms of sentences in a metalanguage. He also developed sophisticated arguments against the possibility of conceptual relativism (the view that there are mutually unintelligible "conceptual schemes") and global skepticism (the view that most if not all of one's beliefs about the world may be false).

Davidson College Private liberal arts college in Davidson, North Carolina, U.S., founded in 1837. It is affiliated with the Presbyterian church, though its approach to learning is nonsectarian. Women were first admitted in 1972.

Davies, Sir Peter Maxwell (b. Sept. 8, 1934, Manchester, Eng.) British composer. He studied in England, Italy, and the U.S. He cofounded the contemporary ensemble The Fires of London and was its musical director (1970–87); he wrote many of his works for the group. Since 1970 he has lived and composed primarily in the remote Orkney Islands. He has written many musical theatre works and has conducted orchestras worldwide. His most famous compositions are *Eight Songs for a Mad King* (1969) and *An Orkney Wedding, with Sunrise*; his other works include *Vesalii Icones* (1969), *Miss Donnithorne's Maggot* (1974), and *Ave maris stella* (1975); the operas *Taverner* (1968), *The Martyrdom of St. Magnus* (1976), and *Le Jongleur de Notre Dame* (1978); and seven symphonies.

Davies, (William) Robertson (b. Aug. 28, 1913, Thamesville, Ont., Can.—d. Dec. 2, 1995, Orangeville, Ont.) Canadian novelist and playwright. Educated at the University of Oxford, Davies for many years edited the Peterborough (Ont.) *Examiner* and taught at the University of Toronto. He is best known for three trilogies: the Deptford trilogy consists of *Fifth Business* (1970), *The Manticore* (1972), and *World of Wonders* (1975), novels examining the intersecting lives of three men from a small Canadian town; the Salterton trilogy, three comedies of manners set in a provincial university town; and the so-called Cornish trilogy—*The Rebel Angels* (1981), *What's Bred in the Bone* (1985), and *The Lyre of Orpheus* (1988). Davies's novels are notable for satirizing bourgeois provincialism and exploring the relationship between mysticism and art.

Davis, Angela (Yvonne) (b. Jan. 26, 1944, Birmingham, Ala., U.S.) U.S. political activist. She was a doctoral candidate at the University of California at San Diego, studying under Herbert Marcuse. Because of her radical political views, her position as lecturer in philosophy at UCLA was not renewed. A champion of the cause of black prisoners, she grew particularly attached to George Jackson, a member of the so-called Soledad Brothers (after Soledad Prison). After an abortive courtroom escape and kidnapping attempt in August 1970 in which four people, including Jackson's brother and the trial judge, were killed, Davis was suspected of involvement, and she became one of the Federal Bureau of Investigation's most-wanted criminals. Arrested in New York City in October, she was acquitted of charges of murder, kidnapping, and conspiracy by an all-white jury. In 1980 she ran unsuccessfully for vice president on the Communist Party ticket. In 1991 Davis became a professor at the University of California at Santa Cruz.

Davis, Benjamin O(liver), Jr. (b. Dec. 18, 1912, Washington, D.C., U.S.—d. July 4, 2002, Washington, D.C.) U.S. pilot and administrator, the first African American general in the U.S. Air Force. He graduated from West Point and in 1941 was admitted to the Army Air Corps. He organized the 99th Fighter Squadron, the first all-black air unit, and in 1943 he organized and commanded the Tuskegee Airmen. He flew 60 combat missions. In 1948 Davis helped plan the desegregation of the Air Force, and he later commanded a fighter wing in the Korean War. After retiring as lieutenant general in 1970, he was named director of civil aviation security in the U.S. Department of Transportation (1971–75). In 1998 he was awarded his fourth general's star, attaining the highest order in the U.S. military.

Davis, Bette *in full* **Ruth Elizabeth Davis** (b. April 5, 1908, Lowell, Mass, U.S.—d. Oct. 6, 1989, Neuilly-sur-Seine, France) U.S. film actress. She played small parts onstage before going to Hollywood in

© 2006 Encyclopædia Britannica, Inc.

1931. After a series of minor roles, she established her reputation with *Of Human Bondage* (1934) and *Dangerous* (1935, Academy Award). Known for her intense characterizations of strong women, she gave electrifying performances in films such as *The Petrified Forest* (1936), *Jezebel* (1938, Academy Award), *Dark Victory* (1939), *The Little Foxes* (1941), *Now, Voyager* (1942), and *All About Eve* (1950). Her later films include *What Ever Happened to Baby Jane?* (1962) and *The Whales of August* (1987).

Davis, Sir Colin (Rex) (b. Sept. 5, 1927, Weybridge, Surrey, Eng.) British conductor. Self-taught as a conductor, he first earned acclaim with a 1958 production of Mozart's opera *The Abduction from the Seraglio*. His reputation was established when he filled in for Otto Klemperer the next year. He was music director of Covent Garden (1971–86) and principal conductor of the Bavarian Radio Symphony (1983–92); he was appointed principal conductor of the London Symphony Orchestra in 1995. He has a special affinity for the music of Hector Berlioz and Jean Sibelius.

Davis, David (b. March 9, 1815, Cecil county, Md., U.S.—d. June 26, 1886, Bloomington, Ill.) U.S. jurist. He earned a law degree from Yale in 1835 and established a law practice in Bloomington the following year. He was elected to the Illinois legislature in 1844. As a state circuit-court judge (1848–62) he became a close friend of Abraham Lincoln, and he worked assiduously for Lincoln's election as president in 1860. In 1862 Lincoln appointed him to the Supreme Court of the United States (1862–77). He resigned his seat on the court to accept election to the U.S. Senate (1877–83).

Davis, Jefferson (b. June 3, 1808, Christian county, Ky., U.S.—d. Dec. 6, 1889, New Orleans, La.) U.S. political leader, president of the Confederate States of America (1861–65). He graduated from West Point and served as a lieutenant in the Wisconsin Territory and later in the Black Hawk War. In 1835 he became a planter in Mississippi. Elected to the U.S. House of Representatives (1845–46), he resigned to serve in the Mexican War, in which he distinguished himself at the Battle of Buena Vista. A national hero, he served in the U.S. Senate (1847–51) and as Pres. Franklin Pierce's secretary of war (1853–57). He returned to the Senate in 1857, where he advocated states' rights but tried to discourage secession. After Mississippi seceded in 1861, he resigned and was chosen president of the Confederacy. He conducted the South's war effort despite shortages of manpower, supplies, and money and opposition from radicals within his administration. After Gen. Robert E. Lee surrendered without Davis's approval in April 1865, Davis fled Richmond, Va., the Confederate capital, hoping to continue the fight until he could secure better terms from the North. Captured and indicted for treason, he was never tried. After two years imprisonment, he was released in poor health in 1867. He retired to Mississippi. His citizenship was restored posthumously in 1978.

Davis, Miles (Dewey) (b. May 26, 1926, Alton, Ill., U.S.—d. Sept. 28, 1991, Santa Monica, Calif.) U.S. trumpeter and bandleader. Davis grew up in East St. Louis, Mo., and began study at the Juilliard School in New York City in 1944. He worked with Charlie Parker (1946–48). His early efforts as a bandleader resulted in recordings known as *Birth of the Cool* (1949), in which a relaxed aesthetic replaced the more frenetic bebop with the "cool jazz" of the 1950s. From 1955 Davis's groups framed his spare, lyrical approach in contrast to the dense complexity of saxophonists such as John Coltrane and Wayne Shorter. His dark, brooding tone, logically paced improvisations, and frequent use of the metal mute were major influences on jazz trumpet soloists. The 1959 album *Kind of Blue* was a pioneering example of modal harmonic jazz. His music became more aggressive during the 1960s, and his use of electronic instruments by the end of the decade (*Bitches Brew,* 1969) gave rise to the jazz-rock fusion of the 1970s. Davis was one of the most original and influential jazz musicians.

Miles Davis, 1969.

Davis, Stuart (b. Dec. 7, 1894, Philadelphia, Pa., U.S.—d. June 24, 1964, New York, N.Y.) U.S. abstract painter. His father was a graphic artist who encouraged his interest in art. He studied in New York City with Robert Henri (1909–12), made drawings for the periodical *The Masses*, associated with the Ash Can school, and exhibited in the Armory Show. A visit to Paris in 1928–29 inspired his own version of Cubism; he began rearranging natural forms from everyday life into flat posterlike patterns with sharp outlines and contrasting colours—the dissonant colours and repetitive rhythms reflecting his interest in jazz—in a style that eventually led to totally abstract patterns. He is considered the outstanding U.S. artist who worked in the Cubist style.

Davis Cup Trophy awarded to the winning team of an international tennis tournament for men. It was donated in 1900 by Dwight F. Davis, himself a player in the first two matches (called ties), for a competition between teams from the U.S. and Britain. Since then, the tournament has developed into a truly international event. More than 100 nations have participated, but winners have been largely confined to the U.S, Australia, France, Britain, and Sweden.

Davis Strait Strait, northern Atlantic Ocean. Lying between southeastern Baffin Island and southwestern Greenland, it separates Baffin Bay to the north from the Labrador Sea to the south, and forms part of the Northwest Passage. About 400 mi (650 km) north to south and 200–400 mi (325–650 km) wide, it was explored in 1585 by the English navigator John Davis. Along the coast of Greenland, the Greenland Current carries relatively warm water northward, while the cold Labrador Current transports icebergs southward along Baffin Island's eastern shore.

Davos \dä-'vōs\ Commune (pop., 2000: 11,417), eastern Switzerland. It consists of two villages, Davos-Platz and Davos-Dorf, located in a valley of the Alps. First inhabited by Romansh-speaking people, it was settled in the 13th century by German speakers. It became the capital of the League of Ten Jurisdictions (or Courts) in 1436 and was ruled by Austria from 1477 to 1649. After the 1860s it became a fashionable health resort, and in the 20th century it developed into a centre for skiing and other winter sports. In the 1990s Davos became famous for hosting the World Economic Forum, an annual gathering of international politicians and financiers who represented a transnational elite.

Davout \dȧ-'vü**, Louis-Nicolas, Prince d'Eckmühl** \dek-'mül\ (b. May 10, 1770, Annoux, France—d. June 1, 1823, Paris) French general in the Napoleonic Wars. Despite his noble origins, in 1790 he led his regiment in a pro-Revolutionary revolt, and he performed with merit in the Belgian campaign of 1792–93. He accompanied Napoleon to Egypt (1798–99) and was promoted to division general. As a corps commander, he had a significant impact on the victories at Austerlitz (1805), Auerstedt (1806), Jena (1806), Eylau (1807), Eckmühl (1809), and Wagram (1809). Created a duke (1808) and prince (1809) by Napoleon, Davout served as minister of war during the Hundred Days.

Davy, Sir Humphry (b. Dec. 17, 1778, Penzance, Cornwall, Eng.—d. May 29, 1829, Geneva, Switz.) English chemist. By his early 20s his work on gases had established his reputation. His discovery of the anesthetic effect of nitrous oxide in 1799 was a major contribution to surgery. He also did early research on voltaic cells and batteries, tanning, electrolysis, and mineral analysis. In *Elements of Agricultural Chemistry* (1813) he became the first to apply chemical principles systematically to farming. He was the first to isolate potassium, sodium, barium, strontium, magnesium, and calcium; he also discovered boron and studied chlorine and iodine extensively. He analyzed many pigments and proved that diamond is a form of carbon. He was one of the greatest exponents of the scientific method. His research on mine explosions and flame and his invention of the safety lamp brought him great prestige, and in 1820 he was made president of the Royal Society of London.

daw See jackdaw

Dawenkou culture \'dä-wen-ˌkō\ *or* **Ta-wen-k'ou culture** Chinese Neolithic culture of c. 4500–2700 BC. It was characterized by the emergence of delicate wheel-made pots of various colours; ornaments of stone, jade, and bone; walled towns; and high-status burials involving ledges for displaying grave goods, coffin chambers, and the burial of animal teeth, pig heads, and pig jawbones. See also Erlitou culture; Hongshan culture; Longshan culture; Neolithic Period.

Dawes, Charles G(ates) (b. Aug. 27, 1865, Marietta, Ohio, U.S.—d. April 23, 1951, Evanston, Ill.) U.S. politician. He practiced law in Nebraska before being appointed U.S. comptroller of the currency (1897–1902). In World War I he headed supply procurement for the American Expeditionary Force in France. In 1923 he chaired the Allied Reparations

© 2006 Encyclopædia Britannica, Inc.

Commission and arranged the Dawes Plan. He served as vice president (1925–29) under Calvin Coolidge. He shared the 1925 Nobel Prize for Peace with Sir Austen Chamberlain.

Dawes General Allotment Act *or* **Dawes Severalty Act** (1887) U.S. land-distribution law proposed by Sen. Henry L. Dawes (1816–1903) of Massachusetts as a way to "civilize" and make farmers of the American Indians. Grants of 80 to 160 acres were offered to each Indian head of household, though actual ownership was withheld for 25 years to guard against sales to speculators. The unintended result was a weakened tribal structure, the inability of many nomadic Indians to adjust to an agrarian existence, and a reservation life of poverty, disease, and despondency. Under the provision that made available for public sale any "surplus" reservation land, whites had acquired two-thirds of the Indian land by 1932.

Dawes Plan (1924) Arrangement for Germany's payment of reparations to the Allies after World War I, produced by a committee of experts presided over by Charles Dawes. The total amount of reparations was not determined, but payments were to begin at 1 billion gold marks in the first year and rise to 2.5 billion by 1928. The plan, which also provided for the reorganization of the Reichsbank and for an initial foreign loan of 800 million marks to Germany, was later replaced by the more lenient Young Plan.

dawn redwood Coniferous, nonevergreen tree (*Metasequoia glyptostroboides*), the only living species of the genus *Metasequoia*, of the family Taxodiaceae, native to remote valleys of central China. Both branchlets and leaves grow out in pairs from points along the stem. The bright green, feathery leaves turn reddish brown in autumn. Though *Metasequoia* fossils are abundant, the tree was thought to be extinct until living specimens were discovered in the 1940s. Only a few thousand are known to have survived, in central China. Since these stands were discovered, seeds and cuttings have been planted throughout the world.

Dawson, George Geoffrey *orig.* **George Geoffrey Robinson** (b. Oct. 25, 1874, Skipton-in-Craven, Yorkshire, Eng.—d. Nov. 7, 1944, London) English journalist, influential editor of *The Times* of London. While in civil service in South Africa, he became editor of the *Johannesburg Star* as part of an effort to promote support for official policies. As editor of *The Times* in the years 1912–19 and 1923–41, he was associated with a group that sought to shape national policy through personal exchanges with leading statesmen; he saw himself as the "secretary-general of the Establishment." A firm believer in appeasement, he was instrumental in the policy that led to the Munich agreement of 1938.

Daxue \'dä-'shwe\ *or* **Ta hsüeh** *Chinese* **"Great Learning"** Short Chinese text generally attributed to Confucius and his disciple Zengzi. For centuries it existed only as a chapter of the *Liji* (see Five Classics); it gained renown when republished as one of the Four Books. It states that world peace is impossible unless a ruler first regulates his own country, but that no ruler can do this without first setting his own household in order, which requires personal virtue. Zhu Xi's preface explains that the text is a means to personal development, instructing each individual to cultivate benevolence, righteousness, propriety, and wisdom.

day Time required for a celestial body to turn once on its axis; especially, the period of the Earth's rotation. The sidereal day (see sidereal period) is the time required for the Earth to rotate once relative to the background of the stars (i.e., the time between two observed passages of a star over the same meridian of longitude). The apparent solar day is the time between two successive transits of the Sun over the same meridian. Because the orbital motion of the Earth makes the Sun seem to move slightly eastward each day relative to the stars, the solar day is about four minutes longer than the sidereal day. The mean solar day is the average value of the solar day, which changes slightly in length during the year as the Earth's speed in its orbit varies. See table opposite.

Day, Doris *orig.* **Doris von Kappelhoff** (b. April 3, 1924, Cincinnati, Ohio, U.S.) U.S. singer and actress. She worked as a band vocalist in the 1940s and went on to great success as a solo recording artist. She made her film debut in 1948 and starred in musicals such as *Calamity Jane* (1953), *Young at Heart* (1955), and *The Pajama Game* (1957). Playing a sunny, wholesome girl-next-door type, she embodied the idealized American woman of the 1950s. She played dramatic roles in *Love Me or Leave Me* (1955) and *The Man Who Knew Too Much* (1956) before starring in bedroom comedies such as *Pillow Talk* (1959) and *That Touch of Mink* (1962). She also hosted *The Doris Day Show* on television (1968–73).

Day, Dorothy (b. Nov. 8, 1897, New York, N.Y., U.S.—d. Nov. 29, 1980, New York City) U.S. journalist and social reformer. While a scholarship student at the University of Illinois (1914–16), she read widely among socialist authors and soon joined the Socialist Party. In 1916 she returned to New York to work for the radical journals *The Call* and *The Masses*. With the birth of her daughter (1927), she broke her ties with radicalism and converted to Roman Catholicism. After writing for the liberal Catholic journal *Commonweal*, in 1933 she and Peter Maurin (1877–1949) cofounded *The Catholic Worker*, which expressed her view of "personalism." She sought to aid the poor by establishing urban "hospitality houses" as part of the Catholic Worker movement. After Maurin's death, she continued to publish the paper and manage the hospitality houses. Although her outspoken pacifist views were criticized by Catholic conservatives, she influenced Catholic liberals such as Thomas Merton and Daniel and Philip Berrigan.

Day-Lewis, C(ecil) (b. April 27, 1904, Ballintubbert, County Leix, Ire.—d. May 22, 1972, Hadley Wood, Hertfordshire, Eng.) Irish-born British poet. Son of a clergyman, Day-Lewis studied at the University of Oxford and in the 1930s became part of a circle of left-wing poets centred on W.H. Auden, though he later turned to an individual lyricism expressed in traditional forms. His works include translations of Virgil's *Georgics* (1940), *Aeneid* (1952), and *Eclogues* (1963) and the verse collections *The Room* (1965) and *The Whispering Roots* (1970). He also wrote the autobiography *The Buried Day* (1960) and several detective novels under the pseudonym Nicholas Blake. He became poet laureate of England in 1968. He was the father of actor Daniel Day-Lewis.

Days

Day	Derivation
Sunday	from Old English translation of Latin *solis dies* ("sun's day")
Monday	from Old English translation of Latin *lunae dies* ("moon's day")
Tuesday	from Old English *tīwesdæg* ("Tyr's day")*
Wednesday	from Old English *wōdnesdæg* ("Woden's day")*
Thursday	from Old English *thursdæg* ("Thor's day")*
Friday	from Old English *frīgedæg* ("Frigg's day")*
Saturday	from Old English translation of Latin *Saturni dies* ("Saturn's day")

*In translating the Latin names, the Germanic peoples sometimes substituted the names of their own gods. Thus, *Martis dies* ("Mars's day") became *tīwesdæg* ("Tyr's day"), *Mercurii dies* ("Mercury's day") became *wōdnesdæg* ("Woden's day"), and *Veneris dies* ("Venus's day") became *frīgedæg* ("Frigg's day").

Months

Month	Derivation
January (31 days)	from the Roman republican calendar month Januarius, named for Janus, god of beginnings
February (28, 29 in leap year)	from the Roman month Februarius, named for Februa, the festival of purification held on the 15th
March (31)	from the Roman month Martius, named for Mars
April (30)	from the Roman month Aprilis, perhaps derived from the Greek Aphrodite (the month being sacred to her Roman equivalent, Venus), or from Latin *aperire,* "to open," for the unfolding of buds and blossoms
May (31)	from the Roman month Maius, probably named for the goddess Maia
June (30)	from the Roman month Junius, probably named for Juno
July (31)	from the Roman month Julius (formerly Quintilis), named for Julius Caesar in 44 BC
August (31)	from the Roman month Augustus (formerly Sextilis), named for Augustus in 8 BC
September (30)	seventh month of the early Roman republican calendar, from Latin *septem,* "seven"
October (31)	eighth month of the republican calendar, from Latin *octo,* "eight"
November (30)	ninth month of the republican calendar, from Latin *novem,* "nine"
December (31)	tenth month of the republican calendar, from Latin *decem,* "ten"

© 2006 Encyclopædia Britannica, Inc.

Dayak \'dī-ˌak\ Any member of a non-Muslim indigenous people of the southern and western interior of the island of Borneo. Dayak is a generic term that has no precise ethnic or tribal significance but distinguishes the indigenous people from the largely MALAY population of the coastal areas. Most Dayaks are riverine people who live in small longhouse communities. Children live with their parents until marriage, and boys, who usually seek brides outside their own village, go to live in their wife's community. Their subsistence economies rest on the shifting cultivation of hill rice, supplemented by fishing and hunting. They number more than two million.

Dayan \dī-'än**, Moshe** (b. May 20, 1915, Deganya, Palestine—d. Oct. 16, 1981, Tel Aviv–Yafo, Israel) Israeli soldier and statesman. Born of Russian parents in Israel's first kibbutz, he became a guerrilla fighter against Arab raiders during the period of the British mandate. Although jailed briefly by the British for his involvement with the HAGANA organization, he lost an eye fighting alongside British forces in Syria during World War II (1939–45). He was a commander in the Israeli army during the first Arab-Israel war (1948–49). He was army chief of staff during the SUEZ CRISIS (1956) and later agriculture minister (1959–64). He was appointed defense minister just before the SIX-DAY WAR (1967), and the Israeli victory brought him widespread adulation; he served until 1974. He joined the LIKUD party government as foreign minister when it came into power in 1977 and helped broker the 1978 CAMP DAVID ACCORDS.

Dayananda Sarasvati \də-'yä-nən-də-ˌsə-rəs-'və-tē\ *orig.* **Mula Sankara** (b. 1824, Tankara, Gujarat, India—d. Oct. 30, 1883, Ajmer, Rajputana) Hindu ascetic and social reformer. A Brahman, he rejected what he considered idol worship at age 14 after seeing mice swarm over an image of SHIVA, attracted by offerings placed before it. His religious quest led him to Yoga, and, to escape an arranged marriage, he joined the ascetic Sarasvati order. He spent 15 years traveling in search of religious truth, and in 1863 he began preaching his vision of reinstating a purified Vedic religion. He debated orthodox Hindu scholars and Christian missionaries and in 1875 founded ARYA SAMAJ. He opposed child marriage and the ban on remarriage by widows, and he opened Vedic study to all castes.

daylight saving time System for uniformly advancing clocks, especially in summer, so as to extend daylight hours during conventional waking time. In the Northern Hemisphere, clocks are usually set ahead one hour in late March or in April and are set back one hour in late September or in October. In the U.S. and Canada, daylight saving time begins on the first Sunday in April and ends on the last Sunday in October.

daylily *or* **day lily** Any plant of the genus *Hemerocallis*, in the LILY FAMILY, consisting of about 15 species of PERENNIAL herbaceous plants distributed from central Europe to eastern Asia. Members have long-stalked clusters of funnel- or bell-shaped flowers that range in colour from yellow to red and are each short-lived (hence "day" lily). Daylilies have fleshy roots and narrow, sword-shaped leaves that are grouped at the base of the plant. The fruit is a CAPSULE. Some species are cultivated as ornamentals or for their edible flowers and buds.

Dayr al-Baḥrī *or* **Deir al-Baḥrī** \'dār-el-'bä-rē\ Temple site, Egypt. Located on the western bank of the Nile River near the remains of THEBES and opposite the ruins of KARNAK, it encompasses the remains of three temples associated with three different Egyptian rulers: the funerary temple of King Mentuhotep II (built c. 1970 BC); a temple built by THUTMOSE III (c. 1435 BC); and the terraced temple of Queen HATSHEPSUT (built c. 1470 BC), much of which has been restored.

Dayton City (pop., 2000: 166,179), southwestern Ohio, U.S. Settled on the Miami River in 1796 by a group of Revolutionary War veterans, it developed as a river port shipping agricultural produce. The 1829 opening of the Miami and Erie Canal between Dayton and CINCINNATI and the 1851 arrival of the railroad stimulated its industrial growth. It was home to WILBUR AND ORVILLE WRIGHT and is also their place of burial. The city is a market and distribution centre. It is the site of Wright-Patterson Air Force Base (established 1946) and the Air Force Institute of Technology (1947). Home to several colleges and universities, it also has an art institute and a symphony orchestra.

Daytona Beach Coastal city (pop., 2000: 64,112), northeastern Florida, U.S. Located south of JACKSONVILLE, it was founded by Mathias Day in 1870 and incorporated in 1876. In 1926 the cities of Seabreeze, Daytona, and Daytona Beach were incorporated as Daytona Beach. The Ormond-Daytona beach of hard, white sand has been used for automobile speed trials since 1903. The city is known for the Daytona International Speedway.

Dazai \dä-'zī**, Osamu** *orig.* **Shuji Tsushima** (b. June 19, 1909, Kanagi, Aomori prefecture, Japan—d. June 13, 1948, Tokyo) Japanese novelist. At the end of World War II he emerged as the literary voice of his time, capturing the period of postwar confusion when traditional values were discredited. The son of a wealthy landowner and politician, he often used his background as material in his fiction. *Tsugaru* (1944) is perhaps his best novel. His postwar works—*The Setting Sun* (1947), *Villon's Wife* (1947), and *No Longer Human* (1948)—were increasingly despairing in tone, reflecting the crisis that led to his suicide at age 38.

DC See DIRECT CURRENT

DDT *in full* **dichlorodiphenyltrichloroethane** Synthetic INSECTICIDE belonging to the family of organic HALOGENS. In 1939 its toxicity to a wide variety of insects was discovered (by Paul Hermann Müller, who was awarded a Nobel Prize for his work) and effectively used against many disease vectors. By the 1960s, many species of insects had developed populations resistant to DDT; meanwhile, this highly stable compound was accumulating along the FOOD CHAIN and having toxic effects on various birds and fishes. During the 1960s it and similar chemicals were found to have severely reduced the populations of certain birds, including the bald eagle.

de *or* **te** \'de\ *Chinese* **"virtue"** In DAOISM, the potentiality of *DAO* that is present in all things; in CONFUCIANISM, the virtue of internal goodness and propriety. In both systems it is regarded as the active principle of *dao*, and it is thus the life or moral principle. In the DAODEJING, *de* is described as the unconscious functioning of the physical self, which can live harmoniously with nature. Personal *de* is thought to flourish when one abandons ambition and the spirit of contention for a life of naturalness, leading to an awareness of the underlying unity that permeates the universe.

De Beers Consolidated Mines World's largest producer and distributor of diamonds. Diamonds were first discovered in southern Africa in the mid 1860s on the de Beer farm. The urban centre that resulted is now known as KIMBERLEY. Two diamond mines dug there (no longer in operation) were at one time the world's most productive. CECIL RHODES bought a claim to the De Beers mine in 1871, and eventually bought claims to most of southern Africa's diamond mines. To keep prices high and demand steady, he formed the London Diamond Syndicate in the 1890s as a means of limiting the supply of diamonds reaching the market. Renamed the Central Selling Organization (CSO), it came to control nearly 80% of the world diamond trade by the late 1980s. Dwindling demand caused the CSO to be replaced by the Diamond Trading Company (DTC) in 2000. It was among the first companies in South Africa to sponsor drug treatments for its workers infected with HIV. De Beers also has interests in synthetic diamonds, minerals and ores, and in mining production and processing equipment. Through its large market share and its willingness to work with competitors, De Beers has continued to influence the price and availability of diamonds worldwide, prompting accusations that it has engaged in unfair trading practices. A controlling interest in the company is held by Anglo American PLC.

de Colmar \di-'kōl-ˌmär**, Charles Xavier Thomas** (b. 1785, Colmar, Fr.—d. 1870, Paris) French mathematician. In 1820, while serving in the French army, he built his first arithmometer, which could perform basic addition, subtraction, multiplication, and division. The first mechanical calculator to gain widespread use, it became a commercial success and was still being used up to World War I.

De Forest, Lee (b. Aug. 26, 1873, Council Bluffs, Iowa, U.S.—d. June 30, 1961, Hollywood, Calif.) U.S. inventor. He had invented many gadgets by age 13, including a working silverplating apparatus. After earning a Ph.D. from Yale University, he founded the De Forest Wireless Telegraph Co. (1902) and the De Forest Radio Telephone Co. (1907). In 1907 he patented the AUDION vacuum tube detector, which allowed more sensitive reception of radio signals such as his live broadcast of a performance by ENRICO CARUSO (1910). He developed a sound-on-film optical-recording system called Phonofilm and demonstrated it in theatres (1923–27). A poor businessman who was twice defrauded by business partners, he eventually sold his patents at low prices to such firms as American Telephone & Telegraph Co., which profited highly from their commercial

© 2006 Encyclopædia Britannica, Inc.

development. Though embittered, he was widely honoured as the father of radio and the grandfather of television.

De Gasperi \dā-gäs-'pā-rē**, Alcide** (b. April 3, 1881, Pieve Tesino, near Trento, Tyrol, Austria-Hungary—d. Aug. 19, 1954, Sella di Valsugana, Italy) Italian prime minister (1945–53). He served in the Austrian parliament (1911–19) and sought the annexation of his native region of Tyrol to Italy. He later served in the Italian parliament (1921–27) as one of the founders of the Italian Popular Party. After 16 months' imprisonment as an antifascist, he became a Vatican librarian in 1929. In World War II he was active in the Resistance, and after the fall of the fascist regime he became leader of the newly formed Christian Democratic Party. As prime minister (1945–53), he enacted a new constitution, instituted land reform, and oversaw Italy's postwar economic reconstruction. Under his leadership Italy joined NATO, and he helped organize the Council of Europe and the European Coal and Steel Community.

de Gaulle, Charles (-André-Marie-Joseph) (b. Nov. 22, 1890, Lille, France—d. Nov. 9, 1970, Colombey-les-Deux-Églises) French soldier, statesman, and architect of France's Fifth Republic. He joined the army in 1913 and fought with distinction in World War I. He was promoted to the staff of the supreme war council in 1925. In 1940 he was promoted to brigadier general and served briefly as undersecretary of state for defense under Paul Reynaud. After the fall of France to the Germans, he left for England and started the Free French movement. Devoted to France and dedicated to its liberation, he moved to Algiers in 1943 and became president of the French Committee of National Liberation, at first jointly with Henri-Honoré Giraud. After the liberation of Paris, he returned and headed two provisional governments, then resigned in 1946. He opposed the Fourth Republic, and in 1947 he formed the Rally of the French People (RPF), but severed his connections with it in 1953. He retired from public life and wrote his memoirs. When an insurrection in Algeria threatened to bring civil war to France, he returned to power in 1958, as prime minister with powers to reform the constitution. That same year he was elected president of the new Fifth Republic, which ensured a strong presidency. He ended the Algerian War and transformed France's African territories into 12 independent states. He withdrew France from NATO, and his policy of neutrality during the Vietnam War was seen by many as anti-Americanism. He began a policy of détente with Iron Curtain countries and traveled widely to form a bond with French-speaking countries. After the civil unrest of May 1968 by students and workers, he was defeated in a referendum on constitutional amendments and resigned in 1969.

De Grey River \də-'grā\ River, northwestern Western Australia. It rises as the Oakover River in the Robertson Range and flows north. Midway in its course, it turns northwest to join the Nullagine River and becomes the De Grey, continuing 118 mi (190 km) to the Indian Ocean. In 1888 the rich Pilbara goldfield attracted many settlers to the river's valley. The river supports pastureland for the grazing of sheep and cattle.

De Havilland, Sir Geoffrey (b. July 27, 1882, Haslemere, Surrey, Eng.—d. May 21, 1965, Watford, Hertfordshire) British aircraft designer and manufacturer. In 1910 he built and flew an airplane with a 50-horsepower engine. He formed his own company in 1920 and built the commercially successful two-seater Moth. In World War II the twin-engined Mosquito was the company's most successful product. After the war he pioneered the manufacture of jet-propelled airplanes with his Comet passenger jet and Vampire and Venom jet fighters.

de Havilland \də-'ha-və-lənd**, Olivia (Mary)** (b. July 1, 1916, Tokyo, Japan) U.S. film actress. Born to British parents, she was raised in California. She made her film debut in 1935 and played the delicate heroine opposite Errol Flynn in swashbucklers such as *Captain Blood* (1935) and *The Adventures of Robin Hood* (1938). She revealed dramatic depth in *Gone with the Wind* (1939), *To Each His Own* (1946, Academy Award), *The Snake Pit* (1948), and *The Heiress* (1949, Academy Award). Her victory in a landmark lawsuit against Warner Brothers (1945) limited actors' contracts to seven years, including suspension periods. She moved to Paris in 1955 and made only rare film appearances thereafter.

de Klerk \də-'klerk**, F(rederik) W(illem)** (b. March 18, 1936, Johannesburg, S.Af.) President of South Africa (1989–94). He brought the apartheid system to an end and negotiated a transition to majority rule. Replacing P.W. Botha as leader of the National Party and president, de Klerk quickly moved to release all important political prisoners, including Nelson Mandela, and to lift the ban on the African National Congress. He and Mandela jointly received the 1993 Nobel Peace Prize. Following the country's first universal suffrage elections in 1994, Mandela became president and de Klerk was appointed second deputy president. He retired from politics in 1997.

de Kooning, Willem (b. April 24, 1904, Rotterdam, Neth.—d. March 19, 1997, East Hampton, N.Y., U.S.) Dutch-born U.S. painter. He studied art in Rotterdam and entered the U.S. as a stowaway in 1926. Settling in Hoboken, N.J., he supported himself as a house painter before moving to New York City, where he came under the influence of Arshile Gorky. He supported himself by working for the WPA Federal Art Project. In the 1930s and '40s his work was both figurative and abstract; the two tendencies eventually fused in images that combined biomorphic and geometric shapes. In the 1940s he became one of the leading exponents of Abstract Expressionism and particularly of action painting. Among his best-known works is a series of deliberately vulgar images of women done with roughly applied pigment and raw colours (e.g., *Woman I*, 1950–52; *Woman and Bicycle*, 1953). In 1963 he moved to East Hampton; in his later years he produced clay sculpture that was cast into bronze.

de la Mare, Walter (John) (b. April 25, 1873, Charlton, Kent, Eng.—d. June 22, 1956, Twickenham, Middlesex) British poet and novelist. De la Mare was of French Huguenot descent. He was educated in London and worked for the Standard Oil Co. (1890–1908) before turning to writing, initially under the pseudonym Walter Ramal. He wrote for both adults and children. His collection *Come Hither* (1923) was especially highly praised. *Memoirs of a Midget* (1921) was his best-known novel. His *Collected Stories for Children* appeared in 1947.

de la Renta, Oscar (b. July 22, 1932, Santo Domingo, Dom.Rep.) Dominican-born U.S. fashion designer. After studies in Santo Domingo and Madrid, he became staff designer for Cristobal Balenciaga in Madrid. He moved to New York City in 1962 and started his own company to produce women's ready-to-wear fashions. In 1973 he founded Oscar de la Renta Couture and expanded into household linens, menswear, and perfumes. In the 1970s he introduced the ethnic look with "Gypsy" and Russian themes; more recently he has produced romantic evening clothes in taffeta, chiffon, velvet, brocade, and fur. From 1993 to 2002 he designed couture for the house of Pierre Balmain.

de la Roche \də-lä-'rōsh**, Mazo** (b. Jan. 15, 1879, Newmarket, Ont., Can.—d. July 12, 1961, Toronto) Canadian author. She is best known for a series of novels centred on the Whiteoak family of Jalna, an estate in her native Ontario. These sagas of the family's history, more popular in the U.S. and Europe than in Canada, were the basis of a film, *Jalna* (1935), and a play, *Whiteoaks* (1936). She also wrote children's stories, travel books, drama, and an autobiography.

De La Warr \'de-lə-ˌwar**, Thomas West, 12th Baron** *or* **Baron Delaware** (b. July 9, 1577—d. June 7, 1618, at sea off the coast of Virginia or New England) English founder of Virginia. After serving under the earl of Essex in the Netherlands and Ireland, he became a member of the Virginia Company and was appointed governor of the colony in 1610. He and 150 settlers arrived at Jamestown as another group was abandoning it. He established two forts at the mouth of the James River and rebuilt Jamestown. Delaware Bay, the Delaware River, and the state of Delaware were named for him.

De Laurentiis \dā-laù-'ren-tēs,\ *English* \ˌdē-lòr-'en-shəs**, Dino** (b. Aug. 8, 1919, Torre Annunziata, Italy) Italian-U.S. film producer. He produced his first film at age 20 and scored his first hit with *Bitter Rice* (1948). He formed a joint production company with Carlo Ponti and produced films such as Federico Fellini's *La strada* (1954, Academy Award) and *The Nights of Cabiria* (1956, Academy Award). In the early 1960s he built a studio, Dinocittà, where he made several epics; their lack of success forced him to sell the studio in the early 1970s. He then moved to the U.S., where he produced films such as *Serpico* (1973), *Ragtime* (1981), and *Hannibal* (2001).

De Leon, Daniel (b. Dec. 14, 1852, Curaçao, Netherlands Antilles—d. May 11, 1914, New York, N.Y., U.S.) Dutch-born U.S. socialist. Arriving in the U.S. in 1874, he joined joined the Socialist Labor Party in 1890 and soon became one of its leaders. Finding the labour-union leadership insufficiently radical, he led a faction that seceded from the Knights of Labor in 1895, later forming the Socialist Trade and Labor Alliance (STLA). In 1905 he helped found the Industrial Workers of the World (IWW), which absorbed the STLA. In 1908 he was refused a seat at the IWW convention by extremists who rejected political activity of the sort

© 2006 Encyclopædia Britannica, Inc.

he advocated and who favoured more violent tactics. He then created the unsuccessful Workers' International Industrial Union.

de Man \də-'män**, Paul** (b. Dec. 6, 1919, Antwerp, Belg.—d. Dec. 21, 1983, New Haven, Conn., U.S.) Belgian-born U.S. literary critic. He immigrated to the U.S. in 1947, attended Harvard University, and in 1970 joined the faculty at Yale University, where he remained the rest of his life. His groundbreaking *Blindness and Insight* (1971) made Yale the American centre for deconstructive literary criticism (see DECONSTRUCTION). His other works include *Allegories of Reading* (1979), *The Rhetoric of Romanticism* (1984), and *Aesthetic Ideology* (1988). His reputation was undermined with the posthumous revelation of his wartime anti-Semitic writings for the pro-Nazi Belgian newspaper *Le Soir*.

de Mille \də-'mil**, Agnes (George)** (b. Sept. 18, 1905, New York, N.Y., U.S.—d. Oct. 7, 1993, New York City) U.S. dancer and choreographer. She graduated from UCLA, moved back to New York, and soon was touring the U.S. with her own mime-dance concerts (1929–40). In her choreographed works for Ballet Theatre (later AMERICAN BALLET THEATRE), she made innovative use of American themes, folk dances, and idioms; in *Rodeo* (1942) she used TAP DANCE for the first time in a ballet. She choreographed many Broadway musicals, including *Oklahoma!* (1943), *Carousel* (1945), *Brigadoon* (1947), and *Paint Your Wagon* (1951), and she wrote several books on dance and an autobiography.

De Niro \də-'nir-ō**, Robert** (b. Aug. 17, 1943, New York, N.Y., U.S.) U.S. film actor. He made his debut in 1968 and played in minor films until his critically acclaimed performance in *Bang the Drum Slowly* (1973). He starred in *Mean Streets* (1973) and other films directed by MARTIN SCORSESE, including *Taxi Driver* (1976), *Raging Bull* (1980, Academy Award), and *GoodFellas* (1990). Noted for his intensely committed performances, he also starred in *The Godfather, Part II* (1974, Academy Award), *The Deer Hunter* (1978), *Once upon a Time in America* (1984), *Heat* (1997), and *Meet the Parents* (2000). He directed his first film, *A Bronx Tale*, in 1993.

De Quincey, Thomas (b. Aug. 15, 1785, Manchester, Lancashire, Eng.—d. Dec. 8, 1859, Edinburgh, Scot.) English essayist and critic. While a student at Oxford he first took opium to relieve the pain of facial neuralgia. He became a lifelong addict, an experience that inspired his best-known work, *Confessions of an English Opium-Eater* (1822), whose highly poetic and imaginative prose has made it an enduring masterpiece of English style. As a critic he is best known for the essay "On the Knocking at the Gate in *Macbeth*" (1823).

De Sica \də-'sē-kə**, Vittorio** (b. July 7, 1901, Sora, Italy—d. Nov. 13, 1974, Paris, France) Italian film director and actor. He joined an acting company in 1923 and soon became a matinee idol. He appeared on screen as a leading man in a series of light comedies, and he excelled in a dramatic role in ROBERTO ROSSELLINI's *General della Rovere* (1959). He directed his first film in 1940 and, working with screenwriter Cesare Zavattini, made a major contribution to the Neorealism of the postwar Italian cinema with *Shoeshine* (1946, Academy Award) and *The Bicycle Thief* (1948, Academy Award). His later films include *Umberto D.* (1952), *Two Women* (1961), *Yesterday, Today, and Tomorrow* (1963, Academy Award), and *The Garden of the Finzi-Continis* (1971, Academy Award).

De Stijl See DE STIJL

de Valera \ˌdev-ə-'ler-ə**, Eamon** *orig.* **Edward de Valera** (b. Oct. 14, 1882, New York, N.Y., U.S.—d. Aug. 29, 1975, Dublin, Ire.) Irish politician and patriot. Born in the U.S. to a Spanish father and an Irish mother, at age two he was sent to live with his mother's family in Ireland when his father died. In 1913 he joined the Irish Volunteers and in 1916 helped lead the rebels in the EASTER RISING. He was elected president of SINN FÉIN in 1918. Repudiating the treaty that formed the Irish Free State because it provided for the partition of Ireland, he supported the republican resistance in the ensuing civil war. In 1924 he founded FIANNA FÁIL, which won the 1932 elections. As prime minister (1932–48), he took the Irish Free State out of the British COMMONWEALTH and made his country a "sovereign" state, renamed Ireland, or Éire. He proclaimed Ireland neutral in World War II. After twice serving again as prime minister (1951–54, 1957–59), he became president of Ireland (1959–73).

de Valois \də-vȧl-'wä**, Dame Ninette** *orig.* **Edris Stannus** (b. June 6, 1898, Blessington, Co. Wicklow, Ire.—d. March 8, 2001, London, Eng.) Irish-born British dancer, choreographer, and founder of the precursor to the ROYAL BALLET. She appeared in revues and pantomimes from 1914 before joining the BALLETS RUSSES as a soloist in 1923. She founded the Academy of Choreographic Art in 1926 to teach movement to actors and cofounded the Camargo Society in 1930. In 1931 she founded and directed the Vic-Wells Ballet; this became the Sadler's Wells Ballet (1946–56) and later the Royal Ballet (1956), which she directed until 1963. She choreographed many ballets in the 1930s and '40s and remained active with the company until 1971.

De Voto \di-'vō-tō**, Bernard (Augustine)** (b. Jan. 11, 1897, Ogden, Utah, U.S.—d. Nov. 13, 1955, New York, N.Y.) U.S. journalist, historian, and critic. De Voto taught at Northwestern and Harvard universities, briefly edited *The Saturday Review* (1936–38), and wrote a column for *Harper's* (1935–55). Known for his works on American literature and the history of the western frontier as well as for his vigorous, outspoken style, he was one of the most widely read critics and historians of his day. Among his nonfiction works are *Mark Twain's America* (1932), *Across the Wide Missouri* (1948, Pulitzer Prize), and *The Course of Empire* (1952).

de Vries \də-'vrēs**, Hugo (Marie)** (b. Feb. 16, 1848, Haarlem, Neth.—d. May 21, 1935, near Amsterdam) Dutch botanist and geneticist. He taught at the University of Amsterdam (1878–1918), where he introduced the experimental study of organic evolution. His rediscovery in 1900 (simultaneously with CARL ERICH CORRENS and ERICH TSCHERMAK VON SEYSENEGG) of GREGOR MENDEL's principles of HEREDITY and his own theory of biological MUTATION explained concepts about the nature of variation of species that made possible the universal acceptance and active investigation of CHARLES DARWIN's theory of organic evolution. De Vries discovered and named the phenomenon known as mutation, and he also contributed to knowledge of the role of osmosis in plant physiology. See also WILLIAM BATESON.

de Wolfe, Elsie *orig.* **Ella Anderson de Wolfe** (b. Dec. 20, 1865, New York, N.Y., U.S.—d. July 12, 1950, Versailles, Fr.) U.S. interior designer. A New York City socialite, she worked as a professional actress (1890–1904) before becoming a designer. Her design principles of simplicity, airiness, and visual unity helped change the fashion of interior design away from Victorian ornamentation. She was the first female professional interior designer in the U.S. She spent much of her life in France as a noted hostess. During World War I she nursed soldiers; she received the Croix de Guerre for her relief work.

DEA See DRUG ENFORCEMENT ADMINISTRATION

Dead Sea *Arabic* **Al-Baḥr al-Mayyit** *Hebrew* **Yam Ha Melaḥ** *ancient* **Lacus Asphaltites** Landlocked salt lake between ISRAEL and JORDAN. The lowest body of water on Earth, it averages about 1,312 ft (400 m) below sea level. It is 50 mi (80 km) long and up to 11 mi (18 km) wide. Its eastern shore is Jordanian, while the southern half of its western shore is Israeli; the northern half of the western shore is within the West Bank, occupied by Israel since the SIX-DAY WAR (1967). The Dead Sea lies between JUDAEA to the west and the Transjordanian plateaus to the east; the JORDAN RIVER flows in from the north. It has been associated with biblical history since the time of Abraham.

Dead Sea Scrolls Caches of ancient, mostly Hebrew, manuscripts found at several sites on the northwestern shore of the Dead Sea (1947–56). The writings date from between the 3rd century BC and the 2nd century AD and total 800–900 manuscripts in 15,000 fragments. Many scholars believe that those deposited in 11 caves near the ruins of QUMRĀN belonged to a sectarian community whom most scholars believe were ESSENES, though other scholars suggest SADDUCEES or Zealots. The community rejected the rest of the Jewish people and saw the world as sharply divided between good and evil. They cultivated a communal life of ritual purity, called the "Union," led by a messianic "Teacher of Righteousness." The Dead Sea Scrolls as a whole represent a wider spectrum of Jewish belief and may have been the contents of libraries from Jerusalem hid-

© 2006 Encyclopædia Britannica, Inc.

den during the war of AD 66–73. They also cast new light on the emergence of Christianity and the relationship of early Christian and Jewish religious traditions. See also DAMASCUS DOCUMENT.

deafness Partial or total inability to hear. In conduction deafness, the passage of sound vibrations through the ear is interrupted. The obstacle may be earwax, a ruptured eardrum, or stapes fixation, which prevents the stapes bone from transmitting sound vibrations to the INNER EAR. In sensorineural deafness, a defect in the sensory cells of the inner ear (e.g., injury by excessive noise) or in the vestibulocochlear or eighth cranial nerves prevents the transmission of sound impulses to the auditory centre in the brain. Some deaf people are helped by HEARING AIDS or cochlear implants; others can learn to communicate with SIGN LANGUAGE and/or lip reading.

Deák \'de-ȧk**, Ferenc** (b. Oct. 17, 1803, Söjtör, Hung., Austrian Empire—d. Jan. 28/29, 1876, Budapest) Hungarian politician. He entered the Hungarian Diet in 1833, becoming a leader of the reform movement for the political emancipation of Hungary. Appointed minister of justice in 1848, he was the principal author of the reforming "April laws." In the 1860s he put forth Hungary's conditions for reconciliation with Austria in terms that led to the COMPROMISE OF 1867, establishing the dual monarchy of Austria-Hungary, and he helped to complete the legislation deriving from the Compromise.

Dean, Dizzy *orig.* **Jay Hanna Dean** (b. Jan. 16, 1911, Lucas, Ark., U.S.—d. July 17, 1974, Reno, Nev.) U.S. baseball pitcher. Dean joined the St. Louis Cardinals in 1932, and in five seasons with them led the NATIONAL LEAGUE four times in complete games and four times in strikeouts. In 1937 he teamed with his brother Paul (nicknamed "Daffy") to pitch the Cardinals to a World Series victory; he won 30 games and lost 7 that year and remains the last 30-game winner in the National League. He developed arm trouble the same year and never fully regained his form. He ended his career with the Chicago Cubs after being traded for the 1938 season. He was known for his colourful personality, which, after his retirement at age 30, served him well as a broadcaster.

Dean, James (Byron) (b. Feb. 8, 1931, Marion, Ind., U.S.—d. Sept. 30, 1955, near Paso Robles, Calif.) U.S. film actor. He played bit parts in four films before trying the Broadway stage, where his role in *The Immoralist* (1954) led to a screen test and a brilliant though brief movie career. His starring role in *East of Eden* (1955) brought him an Academy Award nomination. As a misunderstood teenager in *Rebel Without a Cause* (1955) he personified the confused and restless youth of the 1950s. He was featured as a nonconformist ranch hand in his last film, *Giant* (1956). His death at age 24 in an automobile crash caused anguish among his fans and contributed to his idolization as a cult figure.

James Dean in *Giant* (1956).

Dean, John Wesley, III (b. Oct. 14, 1938, Akron, Ohio, U.S.) U.S. lawyer and White House counsel. He received a law degree from Georgetown University in 1965. In 1970 he was appointed White House counsel by Pres. RICHARD NIXON. In 1972 Nixon asked Dean to investigate whether White House personnel were involved in the Watergate Hotel break-in (see WATERGATE SCANDAL). Dean refused to issue a proposed fictitious report denying a cover-up. When indications of White House involvement grew stronger, he began telling federal investigators what he knew. Nixon fired him in April 1973; two months later Dean testified before a Senate committee about obstruction of justice by White House officials, including the president. He spent four months in prison for his role in the Watergate cover-up. His revelations contributed to Nixon's decision to resign in 1974.

Deane, Silas (b. Dec. 24, 1737, Groton, Conn.—d. Sept. 23, 1789, at sea near Deal, Kent, Eng.) U.S. diplomat. He served as a delegate to the CONTINENTAL CONGRESS, which in 1776 secretly sent him to France to obtain financial and military assistance. The shiploads of arms he secured contributed to the American victory at the BATTLE OF SARATOGA. In 1777 he, BENJAMIN FRANKLIN, and Arthur Lee negotiated treaties of commerce and alliance with France. Lee later insinuated that Deane had embezzled money; though the allegations were never proved, they ruined Deane's reputation.

Dearborn City (pop., 2000: 97,775), southeastern Michigan, U.S. Settled in 1795, it originated as a stagecoach stop between DETROIT and CHICAGO. It was the birthplace of HENRY FORD and the headquarters of the FORD MOTOR CO. Industrial development began with the building of the Ford assembly plant in 1917 and continued with related automotive industries. It was incorporated as a city in 1927.

Dearborn, Henry (b. Feb. 23, 1751, Hampton, N.H.—d. June 6, 1829, Roxbury, Mass., U.S.) U.S. army officer and secretary of war (1801–09). He fought in the AMERICAN REVOLUTION and later was appointed marshal for the District of Maine (1789–93). He represented Massachusetts in the U.S. House of Representatives (1793–97), was secretary of war under Pres. THOMAS JEFFERSON, and ordered the establishment of Fort Dearborn at "Chikago" in 1803. In the WAR OF 1812, he commanded several failed attempts to invade Canada and was later recalled by Pres. JAMES MADISON.

death penalty See CAPITAL PUNISHMENT

Death Valley Valley, southeastern California, U.S. The lowest, hottest, driest portion of North America, it is about 140 mi (225 km) long and 5–15 mi (8–24 km) wide. The Amargosa River flows into it from the south and contains a small pool, Badwater, near which is the lowest point in North America at 282 ft (86 m) below sea level. Death Valley was formerly an obstacle to pioneer settlers (hence its name); it later was a centre of borax mining. Declared a national monument in 1933, it was made a national park in 1994; the park covers 5,269 sq mi (13,648 sq km) and extends into Nevada.

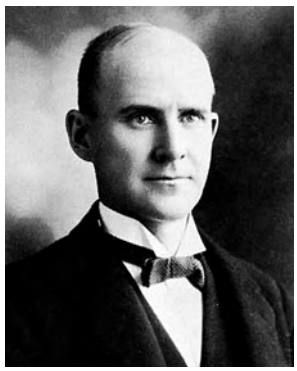
deathwatch beetle Borer insect (BEETLE species *Xestobium refuvillosum*) that tends to be small (less than 0.5 in., or 1–9 mm) and cylindrical. When disturbed, it usually pulls in its legs and plays dead. It makes a ticking or clicking sound by bumping its head or jaws against the sides of the tunnels it creates as it bores into old furniture and wood, a sound that, according to superstition, forecasts a death.

Deathwatch beetle (*Xestobium refuvillosum*)
G. E. HYDE FROM THE NATURAL HISTORY PHOTOGRAPHIC AGENCY—EB INC.

DeBakey \də-'bā-kē**, Michael (Ellis)** (b. Sept. 7, 1908, Lake Charles, La., U.S.) U.S. surgeon. He received his M.D. from Tulane University. In 1932 he devised the "roller pump," to be used in heart-lung machines. His work with the U.S. Surgeon General's office led to the development of mobile army surgical hospitals (MASH units). He also developed an efficient method of grafting frozen blood vessels to correct aortic aneurysms and pioneered the use of plastic tubing instead of grafts (1956). He was the first to perform a successful coronary artery bypass, and in 1963 he was the first to insert a mechanical device into the chest to assist the heart. He edited the *Yearbook of Surgery* (1958–70). His many awards include the Medal of Freedom.

déblé \'dyeb-lā, 'deb-lā\ Wooden female figure carved by the Senufo people of West Africa. It was used as a "rhythm pounder" in dance rituals to promote the fertility of the soil. The Poro (or Lo) male secret society held the figures by the upper arms and pounded them on the ground to keep the rhythm as they performed the fertility dance. The figures were also placed in the fields during digging contests.

Deborah (fl. 12th century BC) Prophet and heroine of the Hebrew scriptures. Her story is told in the book of Judges. With her general, Barak, she is credited with defeating the Canaanite armies led by Sisera. The Israelite victory over the Canaanites, which was aided by a thunderstorm that Israel saw as the coming of God from Mount Sinai, was celebrated in the "Song of Deborah" (Judges 5), possibly the earliest portion of the Bible.



Debré \də-'brā**, Michel (-Jean-Pierre)** (b. Jan. 15, 1912, Paris, France—d. Aug. 2, 1996, Montlouis-sur-Loire) French politician. He began his career in civil service and advanced steadily. In World War II he escaped from German imprisonment to join the Resistance, working in the

© 2006 Encyclopædia Britannica, Inc.

underground in German-occupied France. In 1945 he joined Charles de Gaulle's provisional government and later served in the senate (1948–58). He was the principal author of the constitution of the Fifth Republic and its first premier (1959–62). He served in the National Assembly (1963–68), then in various cabinet posts, including minister of defense (1969–73).

Debrecen \'de-bret-ˌsen\ City (pop., 2001: 211,034), eastern Hungary. An important city in eastern Hungary, it has long been a market centre and a religious, political, and cultural arena. Chartered in the 14th century, it became prominent during and after the Turkish occupation. Hungary's short-lived independence from the Habsburgs was proclaimed there in 1849; the city later reverted to Austrian control. During World War II it was briefly the seat of the interim Hungarian government. The Great Reformed Church and Lajos Kossuth University (1912) are located there.

Debs, Eugene V(ictor) (b. Nov. 5, 1855, Terre Haute, Ind., U.S.—d. Oct. 20, 1926, Elmhurst, Ill.) U.S. labour organizer. Debs left home at age 14 to work in the railroad shops. As a locomotive fireman, he became an early advocate of industrial unionism, and he became president of the American Railway Union in 1893. His involvement in the Pullman Strike led to a six-month prison term in 1895. In 1898 he helped found the U.S. Socialist Party; he would run as its presidential candidate five times (1900–20). In 1905 he helped found the Industrial Workers of the World. Debs was charged with sedition in 1918 after denouncing the 1917 Espionage Act; he conducted his last presidential campaign from prison, winning 915,000 votes before being released by presidential order in 1921.

Eugene V. Debs.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

debt Something owed. Anyone having borrowed money or goods from another owes a debt and is under obligation to return the goods or repay the money, usually with interest. For governments, the need to borrow in order to finance a deficit budget has led to the development of various forms of national debt. See also bankruptcy; debtor and creditor; usury.

debtor and creditor Respectively, a person who owes a debt and a person to whom the debt is owed. Usually the debtor has received something from the creditor, in return for which the debtor has promised to make repayment at a later time. If the debtor fails to repay by the deadline, a formal collection process may commence. It is sometimes possible to attach the debtor's property, wages, or bank account as a means of forcing payment. Imprisonment of the debtor is a practice no longer followed. See also garnishment, lien.

Debussy \ˌde-byü-'sē**, (Achille-) Claude** (b. Aug. 22, 1862, Saint-Germain-en-Laye, France—d. March 25, 1918, Paris) French composer. Born into near poverty, he showed an early gift for the piano. He entered the Paris Conservatoire in 1873, and soon thereafter he was employed as pianist by Nadezhda von Meck, Pyotr Tchaikovsky's patroness. Influenced by the Symbolist poets and Impressionist painters, he was early inclined toward a compositional style of great originality, shunning the strictures of traditional counterpoint and harmony to achieve new effects of great subtlety. Regarded as the founder of musical Impressionism, he used unusual voice leading and timbral colours to evoke pictorial images and moods, especially of languor and hedonism. His significance in weakening the hold of traditional tonal harmony equals that of Franz Liszt, Richard Wagner, and Arnold Schoenberg. Given his effect on such composers as Maurice Ravel, Igor Stravinsky, Béla Bartók, Alban Berg, Anton Webern, and Pierre Boulez, he can be seen as the most influential French composer of the last three centuries. His works include the opera *Pelléas et Mélisande* (1902), the orchestral works *Prelude to The Afternoon of a Faun* (1894) and *La Mer* (1905), and the piano *Préludes* (1910, 1913).

Claude Debussy, painting by Marcel Baschet, 1884; in the Versailles Museum.
GIRAUDON/ART RESOURCE, NEW YORK

Debye \də-'bī**, Peter** *orig.* **Petrus Josephus Wilhelmus Debije** (b. March 24, 1884, Maastricht, Neth.—d. Nov. 2, 1966, Ithaca, N.Y., U.S.) Dutch-born U.S. physical chemist. His first important research, on electric dipole moments, advanced knowledge of the arrangement of atoms in molecules and of the distances between atoms. He showed that X-ray crystallography worked on powders, obviating the difficult first step of preparing good crystals. In 1923 he and Erich Hückel extended Svante Arrhenius's theory of the dissociation of salts in solution, proving that ionization is complete. He also investigated light scattering in gases. He won the Nobel Prize in 1936.

Decadents Group of poets of the end of the 19th century, including some French Symbolists (see Symbolist movement), notably Stéphane Mallarmé and Paul Verlaine, and the later generation of England's Aesthetic movement (see Aestheticism), notably Arthur Symons and Oscar Wilde. Many nonpoets, including the novelist Joris-Karl Huysmans and the artist Aubrey Beardsley, are also often associated with the Decadents. The Decadents emphasized art for art's sake (see Walter Pater), seeing it as autonomous and opposed to nature and to the materialistic preoccupations of industrialized society, and therefore stressed the bizarre, incongruous, and artificial in both their work and their lives.

Decansky, Stefan See Stefan Decansky

decapod Any of more than 8,000 species (order Decapoda) of crustaceans having five pairs of legs attached to the thorax. The shrimps and shrimplike species, which can be as small as 0.5 in. (12 mm) long, have a slender body with a long abdomen, a well-developed fantail, and, often, long, slender legs. The crabs and crablike species, whose claw span can measure 13 ft (4 m), have a flattened body and, frequently, stout short legs and a reduced tail fan. Decapods are primarily marine and are most abundant in shallow tropical waters, but they are commercially valuable throughout the world. Some species (e.g., hermit and fiddler crabs) are adapted to terrestrial environments. See also crab; crayfish; lobster; shrimp.

Decapolis \di-'ka-pə-lis\ League of 10 ancient Greek cities, including Damascus, in eastern Palestine. It was formed after the Roman conquest in 63 BC for mutual protection against their Semitic neighbors. The name also denotes the roughly contiguous territory formed by these cities, all but one of which lay east of the Jordan River. Subject to the Roman governor of Syria, the league survived until the 2nd century AD.

DeCarava, Roy (b. Dec. 9, 1919, New York, N.Y., U.S.) U.S. photographer. He took up photography in the late 1940s. In 1952 he was awarded a Guggenheim Fellowship in support of his project to photograph the people of his native Harlem. Many of these photos were compiled in the book *The Sweet Flypaper of Life* (1955), with text written by the poet Langston Hughes. DeCarava's interest in education led him to found A Photographer's Gallery—which sought to educate the public about photography—in 1955 and an association of African American photographers in 1963. He is perhaps best known for his portraits of jazz musicians.

decathlon Composite athletic contest that consists of 10 different track-and-field competitions: the 100-, 400-, and 1,500-m runs, the 110-m high hurdles, the javelin and discus throws, shot put, pole vault, high jump, and long jump. Introduced as a three-day event at the 1912 Olympic Games, it later became a two-day event. Competitors are scored according to a table established by the International Amateur Athletic Federation. Decathletes are often regarded as the finest all-around athletes in the world.

Decatur \di-'kā-tər\ City (pop., 2000: 81,860), central Illinois, U.S. Situated on the Sangamon River east of Springfield, it was founded in 1829. In 1860 it was the site of Abraham Lincoln's first endorsement by a party convention for the presidential nomination. It is a commercial centre for the surrounding agricultural region. Industries include the processing of corn and soybeans and the manufacture of tractors and other vehicles.

Decatur \di-'kā-tər**, Stephen** (b. Jan. 5, 1779, Sinepuxent, Md., U.S.—d. March 22, 1820, Bladensburg, Md.) U.S. naval officer. He

© 2006 Encyclopædia Britannica, Inc.

entered the navy in 1798. In the Tripolitan War, he led a daring expedition into the harbour of Tripoli to burn a captured U.S. ship. In the War of 1812 he commanded the USS *United States* and captured the British ship *Macedonian*. In 1815 he commanded a squadron in the Mediterranean that forced a peace with the Barbary states on U.S. terms. At a banquet on his return he gave a toast that included the words "Our country, right or wrong." In the same year he was made a navy commissioner, an office he held until he was killed in a duel.

Deccan Peninsula of India south of the Narmada River. It is marked by the tableland between the Western and Eastern Ghats ranges. Its average elevation is about 2,000 ft (600 m). Its principal rivers, the Godavari, Krishna, and Kaveri (Cauvery), flow from the Western Ghats eastward to the Bay of Bengal. Its early inhabitants were a Dravidian-speaking population not reached by the 2nd-millennium-BC Aryan invasion. Ruled by Mauryan (4th–2nd centuries BC) and Gupta (4th–6th centuries AD) dynasties, it became an independent Muslim kingdom in 1347. Later split up into five Muslim sultanates, the Deccan was largely conquered by the Mughal dynasty in the 17th century. In the 18th century it was the scene of rivalry between the British and French and subsequently of the British struggle against the Maratha confederacy. It remained under British control until India gained independence in 1947.

Decembrist revolt (December 1825) Unsuccessful uprising by Russian revolutionaries. Following the death of Alexander I, a group of liberal members of the upper classes and military officers staged a rebellion in an effort to prevent the accession of Nicholas I. The poorly organized revolt was easily suppressed. Afterwards 289 Decembrists were tried; five were executed, 31 imprisoned, and the rest banished to Siberia. Their martyrdom inspired later generations of Russian dissidents.

decibel (dB) Unit for measuring the relative intensities of sounds or the relative amounts of acoustic or electric power. Because it requires about a tenfold increase in power for a sound to register twice as loud to the human ear, a logarithmic scale is useful for comparing sound intensity. Thus, the threshold of human hearing (absolute silence) is assigned the value of 0 dB and each increase of 10 dB corresponds to a tenfold increase in intensity and a doubling in loudness. The "threshold of pain" for intensity varies from 120 to 130 dB among different individuals. A related unit is the bel = 10 dB.

Nonlinear (Decibel) and Linear (Intensity) Scales

Decibels	Intensity*	Type of sound
130	10	artillery fire at close proximity (threshold of pain)
120	1	amplified rock music; near jet engine
110	10^{-1}	loud orchestral music, in audience
100	10^{-2}	electric saw
90	10^{-3}	bus or truck interior
80	10^{-4}	automobile interior
70	10^{-5}	average street noise; loud telephone bell
60	10^{-6}	normal conversation; business office
50	10^{-7}	restaurant; private office
40	10^{-8}	quiet room in home
30	10^{-9}	quiet lecture hall; bedroom
20	10^{-10}	radio, television, or recording studio
10	10^{-11}	soundproof room
0	10^{-12}	absolute silence (threshold of hearing)

*In watts per square meter.

deciduous tree Broad-leaved tree that sheds all its leaves during one season. Deciduous forests are found in three middle-latitude regions with a temperate climate characterized by a winter season and year-round precipitation: eastern North America, western Eurasia, and northeastern Asia. They also extend into more arid regions along stream banks and around bodies of water. Oaks, beeches, birches, chestnuts, aspens, elms, maples, and basswoods (or lindens) are the dominant trees in mid-latitude deciduous forests. Other plants that shed their leaves seasonally may also be called deciduous. See also conifer, evergreen.

decision theory In statistics and related subfields of philosophy, the theory and method of formulating and solving general decision problems. Such a problem is specified by a set of possible states of the environment or possible initial conditions; a set of available experiments and a set of possible outcomes for each experiment, giving information about the state of affairs preparatory to making a decision; a set of available acts depending on the experiments made and their consequences; and a set of possible consequences of the acts, in which each possible act assigns to each possible initial state some particular consequence. The problem is dealt with by assessing probabilities of consequences conditional on different choices of experiments and acts and by assigning a utility function to the set of consequences according to some scheme of value or preference of the decision maker. An optimal solution consists of an optimal decision function, which assigns to each possible experiment an optimal act that maximizes the utility, or value, and a choice of an optimal experiment. See also cost-benefit analysis, game theory.

Decius \'dē-shəs**, Gaius Messius Quintus Trajanus** (b. c. 201, Budalia, Pannonia Inferior—d. June 251, Abrittus, Moesia) Roman emperor (249–251). Of uncertain origins, he served as senator, consul, and provincial military commander before taking the throne from Philip the Arabian. He resisted the Gothic invasion of Moesia and instituted the first organized persecution of Christians throughout the empire (250), which only served to strengthen the Christian cause. He ended the persecutions in 251, shortly before he was defeated and killed by the Goths.

Declaration of Independence (July 4, 1776) Document approved by the Continental Congress that announced the separation of 13 North American British colonies from Britain. The armed conflict during the American Revolution gradually convinced the colonists that separation from Britain was essential. Several colonies instructed their delegates to the Continental Congress to vote for independence. On June 7, Richard Henry Lee of Virginia offered a resolution for independence. The congress appointed Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston to draft a declaration. Jefferson was persuaded to write the draft, which was presented with few changes on June 28. It began with a declaration of individual rights and then listed the acts of tyranny by George III that formed the justification for seeking independence. After debate and changes to accommodate regional interests, including deletion of a condemnation of slavery, it was approved on July 4 as "The Unanimous Declaration of the Thirteen United States of America." It was signed by Congress president John Hancock, printed, and read aloud to a crowd assembled outside, then engrossed (written in script) on parchment and signed by the 56 delegates.

Declaration of the Rights of Man and of the Citizen Manifesto adopted by France's National Assembly in 1789, which contained the principles that inspired the French Revolution. One of the basic charters of human liberties, it served as the preamble to the Constitution of 1791. Its basic principle was that "all men are born free and equal in rights," specified as the rights of liberty, private property, the inviolability of the person, and resistance to oppression. It also established the principle of equality before the law and the freedoms of religion and speech. The Declaration represented a repudiation of the pre-Revolutionary monarchical regime.

Declaratory Act (1766) Declaration by the British Parliament that accompanied repeal of the Stamp Act. It stated that Parliament's authority was the same in America as in Britain and asserted Parliament's authority to make laws binding on the American colonies.

declaratory judgment In law, a judgment merely declaring a right or establishing the legal status or interpretation of a law or instrument. It is binding but is distinguished from other judgments or court opinions in that it includes no executive element (an order that something be done); instead it simply declares or defines rights to be observed or wrongs to be eschewed by litigants, or expresses the court's view on a contested question of law.

decolonization Process by which colonies become independent of the colonizing country. Decolonization was gradual and peaceful for some British colonies largely settled by expatriates but violent for others, where native rebellions were energized by nationalism. After World War II, European countries generally lacked the wealth and political support necessary to suppress faraway revolts; they also faced opposition from the new superpowers, the U.S. and the Soviet Union, both of which had taken positions against colonialism. Korea was freed in 1945 by Japan's defeat in the war. The U.S. relinquished the Philippines in 1946. Britain left India in 1947, Palestine in 1948, and Egypt in 1956; it withdrew from Africa in the 1950s and '60s, from various island protectorates in the 1970s and '80s, and from Hong Kong in 1997. The French left Vietnam in 1954 and

© 2006 Encyclopædia Britannica, Inc.

gave up its North African colonies by 1962. Portugal gave up its African colonies in the 1970s; Macau was returned to the Chinese in 1999.

decompression chamber See HYPERBARIC CHAMBER

decompression sickness *also called* **the bends** *or* **caisson disease** Harmful effects of rapid change from a higher- to a lower-pressure environment. Small amounts of the gases in air are dissolved in body tissues. When pilots of unpressurized aircraft go to high altitudes or when divers breathing compressed air return to the surface, external pressure on the body decreases and the gases come out of solution. Rising slowly allows the gases to enter the bloodstream and be taken to the lungs and exhaled; with a quicker ascent, the gases (mostly nitrogen) form bubbles in the tissues. In the nervous system, they can cause paralysis, convulsions, motor and sensory problems, and psychological changes; in the joints, severe pain and restricted mobility (the bends); in the respiratory system, coughing and difficulty breathing. Severe cases include SHOCK. Recompression in a HYPERBARIC CHAMBER followed by gradual decompression cannot always reverse tissue damage.

deconstruction Method of philosophical and literary analysis, derived mainly from the work of JACQUES DERRIDA, that questions the fundamental conceptual distinctions, or "oppositions," in Western philosophy through a close examination of the language and logic of philosophical and literary texts. Such oppositions are characteristically "binary" and "hierarchical," involving a pair of terms in which one member of the pair is assumed to be primary or fundamental, the other secondary or derivative; examples include nature/culture, speech/writing, and mind/body. To "deconstruct" an opposition is to explore the tensions and contradictions between the hierarchical ordering assumed in the text and other aspects of the text's meaning, especially its figurative or performative aspects. The deconstruction "displaces" the opposition by showing that neither term is primary; the opposition is a product, or "construction," of the text rather than something given independently of it. The speech/writing opposition, according to which speech is "present" to the speaker or author and writing "absent," is a manifestation of what Derrida calls the "logocentrism" of Western culture—i.e., the general assumption that there is a realm of "truth" existing prior to and independent of its representation by linguistic signs. In polemical discussions about intellectual trends of the late 20th century, *deconstruction* was sometimes used pejoratively to suggest nihilism and frivolous skepticism. In popular usage the term has come to mean a critical dismantling of tradition and traditional modes of thought. See also POSTMODERNISM; POSTSTRUCTURALISM.

Decoration Day See MEMORIAL DAY

decorative arts Arts concerned with the design and decoration of objects that are utilitarian rather than purely aesthetic, including CERAMICS, glassware, BASKETRY, JEWELRY, METALWORK, FURNITURE, and TEXTILES. The separation of the decorative arts from the fine arts is a modern distinction.

deduction In LOGIC, a type of inference or argument that purports to be valid, where a valid argument is one whose conclusion must be true if its premises are true (see VALIDITY). Deduction is thus distinguished from INDUCTION, where there is no such presumption. Valid deductive arguments may have false premises, as demonstrated by the example: "All men are mortal; Cleopatra is a man; therefore, Cleopatra is mortal." Invalid deductive arguments sometimes embody formal fallacies (i.e., errors of reasoning based on the structure of the propositions in the argument); an example is "affirming the consequent": "If A then B; B; therefore, A" (see FALLACY; FORMAL AND INFORMAL).

deed See ESCROW

Deep Blue Computer chess-playing system designed by IBM. In 1996 Deep Blue made history by defeating GARRY KASPAROV in one of their six games—the first time a computer had won a game against a world champion under tournament conditions. In the 1997 rematch, it won the deciding sixth game in only 19 moves; its 3.5–2.5 victory (it won two games and had three draws) marked the first time a current world champion had lost a match to a computer under tournament conditions. In its final configuration, the IBM RS6000/SP computer used 256 processors working in tandem, with an ability to evaluate 200 million chess positions per second.

deep-sea trench *or* **oceanic trench** Any long, narrow, steep-sided depression in the ocean bottom in which maximum oceanic depths (24,000–36,000 ft, or 7,000–11,000 m) occur. The deepest known depression of this kind is the MARIANA TRENCH. Most trenches occur at SUBDUCTION ZONES, where one tectonic plate is thrust under another.

deep-sea vent Hydrothermal (hot-water) vent formed on the ocean floor when seawater circulates through hot volcanic rocks, often located where new oceanic crust is being formed. Vents also occur on submarine volcanoes. In either case, the hot solution emerging into cold seawater precipitates mineral deposits that are rich in iron, copper, zinc, and other metals. Outflow of these heated waters probably accounts for 20% of the Earth's heat loss. Exotic biological communities are now known to exist around the vents; these ecosystems are totally independent of energy from the Sun, depending not on photosynthesis but rather on chemosynthesis by sulfur-fixing bacteria.

deer Any of the RUMINANTS in the family Cervidae, which have two large and two small hooves on each foot and antlers on the males of most species and on the females of some species. Deer live mainly in forests but may be found in deserts, tundra, and swamps and on high mountainsides. They are native to Europe, Asia, North America, South America, and northern Africa and have been introduced widely elsewhere. Females are usually called does, and males bucks. Deer range in shoulder height from the 12-in. (30-cm) pudu (genus *Pudu*) to the 6.5-ft (2-m) MOOSE. They typically have a compact body, short tail, and long, slender ears. They shed their antlers each year, and new ones grow in. The general form of the antler varies among species. Deer feed on grass, twigs, bark, and shoots. They are hunted for their meat, hides, and antlers. See also CARIBOU, ELK, MULE DEER, MUNTJAC, RED DEER, ROE DEER, WHITE-TAILED DEER.

Rival European red deer stags (*Cervus elaphus*) fighting for possession of a hind in the rutting season.
STEFAN MEYERS GDT/ARDEA LONDON

deer mouse *or* **white-footed mouse** Any of about 60 species (genus *Peromyscus*, family Cricetidae) of small, delicate RODENTS that are active at night and are found in habitats from Alaska to South America. They often outnumber all other mammals in an area. Deer mice are 3–6.5 in. (8–17 cm) long (excluding the long tail) and have large eyes, soft fur, and relatively large ears. Colours range from white to brown or blackish, with white underparts and feet. They eat plant and animal matter and nest in burrows or trees. Clean, easily cared for, and prolific, they are often used as laboratory animals.

Deere, John (b. Feb. 7, 1804, Rutland, Vt., U.S.—d. May 17, 1886, Moline, Ill.) U.S. inventor and manufacturer of agricultural implements. He was apprenticed to a blacksmith and later set up his own smithy and moved to Illinois. There he found, through the frequent repairs he had to make, that wood and cast-iron plows, used in the eastern U.S. from the 1820s, were unsuited to the heavy, sticky prairie soils. By 1838 he had sold three steel plows of his own design; by 1846 he had sold about 1,000, and by 1857 10,000. In 1868 Deere & Co. was incorporated, and it went on to become the largest U.S. manufacturer of farm machinery.

defamation In law, issuance of false statements about a person that injure his reputation or that deter others from associating with him. Libel and slander are the legal subcategories of defamation. Libel is defama-

© 2006 Encyclopædia Britannica, Inc.

tion in print, pictures, or any other visual symbols. A libel plaintiff must generally establish that the alleged libel refers to him or her specifically, that it was published to others (third parties), and that some injury occurred as a result. The U.S. Supreme Court has ruled that public persons (e.g., celebrities or politicians) alleging libel may recover damages only if they prove that the statement in question was made with "actual malice"—i.e., with knowledge that it was false or with reckless disregard for the truth (*New York Times* v. *Sullivan*, 1964). Slander is defamation by oral communication. An action for slander may be brought without alleging and proving special injury if the statement has a plainly harmful character, as by imputing to the plaintiff criminal guilt, serious sexual misconduct, or a characteristic negatively affecting his business or profession. The defense in defamation cases often takes the form of seeking to establish the truth of the statements in question.

defecation \ˌdef-ə-ˈkā-shən\ *or* **bowel movement** Elimination of FECES from the digestive tract. PERISTALSIS moves feces through the COLON to the RECTUM, where they stimulate the urge to defecate. The rectum shortens, pushing the feces into the ANAL CANAL, where internal and external sphincters allow them to be passed or retained. Chest, abdominal, and pelvic muscles are used to pass them. Long delay of defecation causes constipation and hardened feces. See also DIARRHEA, INCONTINENCE.

defense economics Field of national economic management concerned with peacetime and wartime military expenditures. It arose in response to the greater scale and sophistication of warfare in the 20th century. Most nations seek to avoid the vast financial and human costs of war—which include the lost earnings of those killed or injured, lifetime medical care needed for those permanently incapacitated, and losses to the economy caused by diverting resources from investments in future economic capacity—by maintaining a level of military preparedness sufficient to deter aggressors. Peacetime defense economics focuses on issues of allocation of resources between the military and civilian sectors, the relative size and character of the various armed forces, and the choice and design of their weapons.

defense mechanism In psychoanalytic theory, an often unconscious mental process (such as REPRESSION) that makes possible compromise solutions to personal problems or CONFLICTS. The compromise generally involves concealing from oneself internal drives or feelings that threaten to lower self-esteem or provoke ANXIETY. The term was first used by SIGMUND FREUD in 1894. The major defense mechanisms are repression, the process by which unacceptable desires or impulses are excluded from consciousness; reaction formation, a mental or emotional response that represents the opposite of what one really feels; projection, the attribution of one's own ideas, feelings, or attitudes (especially blame, guilt, or sense of responsibility) to others; REGRESSION, reversion to an earlier mental or behavioral level; denial, the refusal to accept the existence of a painful fact; rationalization, the substitution of rational and creditable motives for the true (but threatening) ones; and SUBLIMATION, the diversion of an instinctual desire or impulse from its primitive form to a more socially or culturally acceptable form. See also EGO; NEUROSIS; PSYCHOANALYSIS.

deficit financing In government, the practice of spending more money than is received as revenue, the difference being made up by borrowing or minting new funds. The term usually refers to a conscious attempt to stimulate the economy by lowering tax rates or increasing government expenditures. Critics of deficit financing regularly denounce it as an example of shortsighted government policy. Advocates argue that it can be used successfully in response to a RECESSION or DEPRESSION, proposing that the ideal of an annually balanced budget should give way to that of a budget balanced over the span of a BUSINESS CYCLE. See also JOHN MAYNARD KEYNES; NATIONAL DEBT.

definition In philosophy, the specification of the meaning of an expression relative to a language. Definitions may be classified as lexical, ostensive, and stipulative. Lexical definition specifies the meaning of an expression by stating it in terms of other expressions whose meaning is assumed to be known (e.g., a ewe is a female sheep). Ostensive definition specifies the meaning of an expression by pointing to examples of things to which the expression applies (e.g., green is the color of grass, limes, lily pads, and emeralds). Stipulative definition assigns a new meaning to an expression (or a meaning to a new expression); the expression defined (definiendum) may either be a new expression that is being introduced into the language for the first time, or an expression that is already current.

deflation Contraction in the volume of available money or CREDIT that results in a general decline in prices. A less extreme condition is known as disinflation. Attempts are sometimes made to bring on deflation (through raising interest rates and tightening the MONEY SUPPLY) in order to combat INFLATION and slow the economy. Deflation is characteristic of DEPRESSIONS and RECESSIONS.

Defoe \di-ˈfō**, Daniel** *orig.* **Daniel Foe** (b. 1660, London, Eng.—d. April 24, 1731, London) British novelist, pamphleteer, and journalist. A well-educated London merchant, he became an acute economic theorist and began to write eloquent, witty, often audacious tracts on public affairs. A satire he published resulted in his being imprisoned in 1703, and his business collapsed. He traveled as a government secret agent while continuing to write prolifically. In 1704–13 he wrote practically singlehandedly the periodical *Review*, a serious and forceful paper that influenced later essay periodicals such as *The* SPECTATOR. His *Tour Through the Whole Island of Great Britain*, 3 vol. (1724–26), followed several trips to Scotland. Late in life he turned to fiction. He achieved literary immortality with the novel *Robinson Crusoe* (1719), which drew partly on memoirs of voyagers and castaways. He is also remembered for the vivid, picaresque *Moll Flanders* (1722); the nonfictional *Journal of the Plague Year* (1722), on the GREAT PLAGUE in London in 1664–65; and *Roxana* (1724), a prototype of the modern novel.

Daniel Defoe, engraving by M. Van der Gucht, after a portrait by J. Taverner, first half of the 18th century.
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

defoliant Chemical dust or spray applied to plants to cause their leaves to drop off prematurely. Defoliants sometimes are applied to CROP plants such as COTTON to facilitate harvesting. They have also been used in warfare to eliminate enemy food crops and potential areas of concealment (as in the VIETNAM WAR). See also AGENT ORANGE.

deforestation Process of clearing forests. Rates of deforestation are particularly high in the tropics, where the poor quality of the soil has led to the practice of routine clear-cutting to make new soil available for agricultural use. Deforestation can lead to EROSION, drought, loss of biodiversity through extinction of plant and animal species, and increased atmospheric carbon dioxide. Many nations have undertaken afforestation or reforestation projects to reverse the effects of deforestation, or to increase available timber. See also GREENHOUSE EFFECT.

deformation and flow Alteration in size or shape of a body under the influence of mechanical forces. Flow is a change in deformation that continues as long as the force is applied. Gases and liquids normally flow relatively freely, while solids deform when subjected to forces. Most solids initially deform elastically (see ELASTICITY), though rigid material such as metals, concrete, or rocks can sustain large forces while undergoing little deformation. If enough force is applied, even these materials will reach their elastic limit, at which point brittle substances fracture while ductile materials (see DUCTILITY) rearrange their internal structure, the result being plastic deformation (see PLASTICITY).

Degas \də-ˈgä**, (Hilaire-Germain-) Edgar** (b. July 19, 1834, Paris, France—d. Sept. 27, 1917, Paris) French painter, graphic artist, and sculptor. The son of a wealthy banker, he entered the École des Beaux-Arts in 1855. He spent much time in Italy studying and copying the Old Masters and became a skilled draftsman, producing history paintings and portraits. In the 1860s he was introduced to IMPRESSIONISM by ÉDOUARD MANET and gave up his academic aspirations, turning for his subject matter to the fast-moving city life of Paris, particularly the ballet, theatre, circus, racetrack, and cafés. Influenced by Japanese prints and the new medium of photography, he used displaced figure groupings and unfamiliar perspective to create figure groups seen informally and in movement, similar in effect to snapshots. His fascination with the ballet and the racetrack sprang from his interest in picturing people absorbed in the practiced movements of their occupations. He often worked in pastel, his favourite medium, producing series of women, bathers, ballerinas, and horse races. From c.

1880 he modeled wax figures, which were cast in bronze after his death. He was the first of the Impressionists to achieve recognition.

degree, academic Title conferred by a COLLEGE or UNIVERSITY to indicate completion of a course of study or extent of academic achievement. In medieval Europe there were only two degrees: master (a scholar of arts and grammar) and doctor (a scholar of philosophy, theology, medicine, or law). The baccalaureate, or bachelor's degree, was originally simply a stage toward mastership. In contemporary France the *baccalauréat* is conferred on the completion of secondary education, the *licence* on completion of a three- to four-year program of university study, the *maîtrise* on the passing of advanced examinations, and the *doctorat* on completion of several years of advanced academic studies. Other contemporary degrees include the Bachelor of Arts (B.A. or A.B.) or Bachelor of Science (B.S.) degree, typically awarded after a four-year program of college study; the Master of Arts (M.A.) or Master of Science (M.S.) degree, earned after a year or two of additional study; and the Doctor of Philosophy (Ph.D.), earned after several years of post-baccalaureate study and research. In the mid-20th century the Associate of Arts degree (A.A.) began to be awarded by U.S. JUNIOR COLLEGES. Common professional degrees are the Doctor of Jurisprudence (J.D.) and the Doctor of Medicine (M.D.). Honorary degrees are granted without regard to academic achievement.

dehydration Method of FOOD PRESERVATION in which moisture (primarily water) is removed. Dehydration inhibits the growth of microorganisms and often reduces the bulk of food. It is an ancient practice, used by prehistoric peoples in sun-drying seeds, by North American Indians in sun-drying meat strips, and by the Japanese in drying fish and rice. It was used to prepare troop rations in World War II, and in recent decades campers and relief agencies have discovered its advantages. Commercial dehydration equipment includes tunnel dryers, kilns, and vacuum dryers. A combination of dehydration and freezing is used in the process of freeze-drying, whereby solid food remains frozen while its liquid escapes as vapour. The dairy industry is one of the largest producers of dehydrated foods, including whole milk, skim milk, and eggs.

dehydration Loss of water, almost always along with SALT, from the body, caused by restricted water intake or excessive water loss. Early symptoms of water deprivation are thirst, decreased saliva, and impaired swallowing. (When more ELECTROLYTES than water are lost, osmosis pulls water into cells, and there is no thirst.) Later, tissues shrink, including the skin and eyes. Mild fever rises as PLASMA volume and cardiac output decrease, and PERSPIRATION decreases or stops, greatly reducing heat loss. URINE output falls, and the KIDNEYS cannot filter wastes from the blood. Irreversible SHOCK can occur at this point. The cause of dehydration is treated first; then water and electrolytes must be given in the correct proportions.

Deinarchus See DINARCHUS

Deinonychus \dī-'nä-ni-kəs\ Genus of clawed THEROPOD dinosaurs that flourished in western North America during the Early CRETACEOUS PERIOD (144–99 million years ago). *Deinonychus* walked and ran on two legs, yet its killing devices, large sickle-like talons 5 in. (13 cm) long on the second toe of each foot, required it to stand on one foot while slashing at its prey with the other. Its long, outstretched tail was enclosed in bundles of bony rods that grew out of the tail vertebrae, making it very rigid. About 8–13 ft (2.4–4 m) long and weighing 100–150 lbs (45–68 kg), it had a large brain and was evidently a fast, agile predator.

Deir el-Bahri See DAYR AL-BAḤRĪ

Deira \'dā-rə\ Anglo-Saxon kingdom, Britain. Located in the eastern part of modern YORKSHIRE, it stretched from the River HUMBER to the River TEES. Its first recorded king, Aelle, reigned from AD 560. By the last quarter of the 7th century it had been united with its neighbour BERNICIA to form the kingdom of NORTHUMBRIA.

Deirdre \'dir-drə, 'dar-drā\ In medieval Irish literature, the heroine of *The Fate of the Sons of Usnech*, the great love story (written in the 8th or 9th century) of the ULSTER CYCLE. A Druid foretold at Deirdre's birth that many men would die on her account, and she was raised in seclusion. A woman of great beauty, she rejected the advances of King Conor (see CONCHOBAR), married Noísi, one of the sons of Usnech, and fled with him to Scotland. Lured back to Ireland, Noísi and his brothers were murdered, and Deirdre killed herself to avoid marrying Conor. In the 20th century the story was dramatized by WILLIAM BUTLER YEATS and JOHN MILLINGTON SYNGE.

Deism Belief in God based on reason rather than revelation or the teaching of any specific religion. A form of natural religion, Deism originated in England in the early 17th century as a rejection of orthodox Christianity. Deists asserted that reason could find evidence of God in nature and that God had created the world and then left it to operate under the natural laws he had devised. The philosopher Edward Herbert (1583–1648) developed this view in *On Truth* (1624). By the late 18th century Deism was the dominant religious attitude among Europe's educated classes; it was accepted by many upper-class Americans of the same era, including the first three U.S. presidents.

Delacour \ˌdel-ə-'kür**, Jean Theodore** (b. Sept. 26, 1890, Paris, Fr.—d. Nov. 5, 1985, Los Angeles, Calif., U.S.) French-born U.S. aviculturist. After his boyhood collection of more than 1,300 live birds was destroyed during World War I, he made expeditions worldwide and assembled a huge new collection at the Château de Clères in Normandy. He bred pheasants in captivity, discovered and named many new bird and mammal species, founded the magazine *L'Oiseau* (1920), and wrote the standard work *The Birds of French Indochina* (1931). When the Germans again destroyed his aviary, he emigrated to the U.S., but he later reestablished his aviary and zoo at Clères.

Delacroix \ˌde-lə-'krwä**, (Ferdinand-) Eugène (-Victor)** (b. April 26, 1798, Charenton-Saint-Maurice, France—d. Aug. 13, 1863, Paris) French painter. As a young man he was strongly influenced by the ROMANTICISM of the painter THÉODORE GÉRICAULT and the Polish-born composer and pianist FRÉDÉRIC CHOPIN. In 1822 he exhibited the painting *Dante and Virgil in Hell*, a landmark in the development of French 19th-century Romanticism. In his subsequent choice of subjects, Delacroix often showed an affinity with LORD BYRON and other Romantic poets of his time. His work was characterized by an uninhibited expression of energy and movement, a fascination with violence, destruction, and the more tragic aspects of life, and a sensuous use of colour. After his success at the Paris Salon, he was commissioned to decorate government buildings; he became one of the most distinguished monumental mural painters in the history of French art. He explored the new medium of lithography and in 1827 executed 17 lithographs for an edition of *Faust*. In 1830 he painted *Liberty Leading the People* to commemorate the July Revolution that brought LOUIS-PHILIPPE to the French throne. His use of colour influenced the development of IMPRESSIONISM.

Liberty Leading the People, oil on canvas by Eugène Delacroix, 1830; in the Louvre, Paris.
GIRAUDON/ART RESOURCE, NEW YORK CITY

Delagoa Bay \ˌdel-ə-'gō-ə\ Bay, southeastern coast of Mozambique. Some 19 mi (31 km) long and 16 mi (26 km) wide, with Inhaca Island, a tourist resort, at its mouth, it also is the site of MAPUTO, the nation's capital. First explored by the Portuguese in 1544, it was important as an outlet for ivory and slaves, a way station for Indian Ocean trade, and a route to the South African diamond mines and goldfields. Ownership was

contested by the Portuguese, Dutch, English, and Boers until it was awarded by arbitration to Portugal in 1875.

DeLancey, James (b. Nov. 27, 1703, New York, N.Y.—d. July 30, 1760, New York City) American administrator and jurist. He was sent to Cambridge and later studied law in London. Returning to New York, he became a member of the governor's council in 1729 and a judge of the colony's supreme court in 1731. As chief justice (1733), he presided at the libel trial of John Peter Zenger. He opposed the royal governor, George Clinton, and used his influence in England to obtain Clinton's recall in 1753. He later served as lieutenant governor (1753–55, 1757–60).

Delano, Jane A(rminda) (b. March 12, 1862, Montour Falls, N.Y., U.S.—d. April 15, 1919, Savenay, Fr.) U.S. nurse and educator. She became superintendant of nurses in Jacksonville, Fla., where she used mosquito netting to prevent the spread of yellow fever even before the mosquito was known to carry it. In Bisbee, Ariz., she established a hospital for miners with scarlet fever. She oversaw the enlistment of over 20,000 U.S. nurses for overseas duty during World War I.

Delany, Martin R(obison) (b. May 6, 1812, Charles Town, Virginia, U.S.—d. Jan. 24, 1885, Xenia, Ohio) U.S. abolitionist and physician. After working in Pittsburgh, Pa., as a doctor's assistant, he founded a newspaper, *Mystery*, in the 1840s to publicize the grievances of blacks; he later copublished the *North Star* (1846–49) with Frederick Douglass. One of the first blacks admitted to Harvard Medical School (1850–51), he later practiced in Pittsburgh. He developed a strong interest in foreign colonization by black Americans and went to Africa to investigate sites. He moved to Canada in 1856 and returned early in the American Civil War to recruit for the 54th Massachusetts Volunteers, for which he also served as surgeon. He was made a major, the first black to receive a regular army commission. He later served in the Freedmen's Bureau.

Delany, Samuel R(ay) (b. April 1, 1942, New York, N.Y., U.S.) U.S. science-fiction novelist and critic. Born into a distinguished African American family, he attended the City College of New York and published his first novel in 1962. His highly imaginative works, which garnered wide critical admiration, address racial and social issues, sexuality, heroic quests, and the nature of language. *Dhalgren* (1975), his most controversial novel, tells of a young bisexual man searching for identity in a large, decaying city. Other works include the novels *Babel-17* (1966, Nebula Award), *The Einstein Intersection* (1967, Nebula Award), and *Stars in My Pocket Like Grains of Sand* (1984), and scripts for film, radio, and Wonder Woman comic books. Among his nonfiction works are *Longer Views: Extended Essays* (1996) and *Shorter Views: Queer Thoughts and the Politics of the Paraliterary* (1999).

Delaunay \də-lō-'nā**, Robert** (b. April 12, 1885, Paris, Fr.—d. Oct. 25, 1941, Montpellier) French painter. He spent his early career as a part-time designer of stage scenery and came under the influence of Neo-Impressionism, Fauvism, and Cubism. In 1909–11 his colour experiments culminated in a series of paintings of the Eiffel Tower, which combined fragmented Cubist forms with dynamic movement and vibrant colour. The introduction of bright colour to Cubism—a style that came to be known as Orphism—distinguished his work from that of the more orthodox Cubist painters and influenced the artists of Der Blaue Reiter. With his wife, the Ukrainian-born painter and textile designer Sonia Terk Delaunay (1885–1979), he painted abstract mural decorations for the 1937 Paris Exposition.

Eiffel Tower, an oil painting on canvas by Robert Delaunay from 1910–11, is on display at the Kunstmuseum, Basel, Switzerland. The painting was one of Delaunay's contributions to the art movement called cubism.

DEPOSITED BY EMANUEL HOFFMANN-FOUNDATION IN KUNSTMUSEUM BASEL, SWITZERLAND; PHOTOGRAPH, HANS HINZ

Delaware State (pop., 2000: 783,600), middle Atlantic region, U.S. It lies on the Atlantic Ocean and is bordered by Pennsylvania, New Jersey, and Maryland. Covering 2,026 sq mi (5,247 sq km), its capital is Dover. Originally inhabited by Algonquian tribes, Delaware's first permanent white settlement was by Swedes at Fort Christina, now Wilmington, in 1638. In 1655 New Sweden was taken by the Dutch of New Amsterdam and in 1664 by the English. Delaware was thereafter a part of New York until 1682, when it was ceded to William Penn. It was governed by Pennsylvania until 1776, although it was granted its own assembly in 1704. The first state to ratify the U.S. Constitution in 1787, it is the nation's second smallest state but one of its most densely populated. Chemical manufacturing is the major industry, followed by food processing. Delaware's most important transportation artery is the Chesapeake and Delaware Canal, deepened for ocean shipping, which shortens the water route between Philadelphia and Baltimore.

Delaware *or* **Lenape** \le-'nä-pā\ Confederation of North American Indians living mostly in Oklahoma, U.S. Thousands more live in Wisconsin and Kansas, U.S., and in Ontario, Can. They speak a language of the Algonquian family. They once occupied the Atlantic seaboard from southern Delaware to western Long Island, especially the Delaware River valley, for which the confederation was named. To other Algonquian divisions, the Lenape were the "grandfathers," believed to be the original tribe from which all others sprang, and they were highly respected. They depended primarily on agriculture but also hunted and fished. They were grouped in three clans based on maternal descent; these were in turn divided into lineages, whose members lived together in a longhouse. They were governed by a council of lineage sachems (chiefs), who directed the public affairs of the community; the eldest woman of the lineage appointed the sachem. The Delaware were the Indians most friendly to William Penn; they were rewarded by the infamous Walking Purchase, a treaty that deprived them of their own lands and forced them to settle on lands assigned to the Iroquois. After 1690 they drifted westward. They sided with the French in the French and Indian War (1754–63) and helped defeat the British general Edward Braddock. In 1867 most of the remaining Delaware were removed to Oklahoma. Some 8,300 people claimed sole Delaware descent in the 2000 U.S. census.

Delaware Bay Inlet of the Atlantic Ocean. Forming part of the New Jersey-Delaware state border, it extends southeast for 52 mi (84 km) from the junction of the Delaware River with Alloway Creek to its entrance between Cape May and Cape Henlopen. Bordered by marshy lowlands, the bay is an important link in the Atlantic Intracoastal Waterway.

Delaware River River in Pennsylvania, Delaware, New Jersey, and New York, U.S. Formed by the junction of its eastern and western branches in southern New York, it flows about 405 mi (650 km) to empty into the Atlantic Ocean at Delaware Bay. Navigable to Trenton, N.J., it is spanned by the Commodore Barry Bridge, completed in 1974.

Delbrück \'del-ˌbrʊk**, Max** (b. Sept. 4, 1906, Berlin, Ger.—d. March 9, 1981, Pasadena, Calif., U.S.) German-born U.S. biologist. He received his Ph.D. from the University of Göttingen in 1930, and in 1937 he immigrated to the U.S., where he joined the California Institute of Technology faculty. In 1939 he discovered a one-step process for growing bacteriophages that would induce a phage, after an hour of inactivity, to multiply to produce several hundred thousands of progeny. In 1946 he and A.D. Hershey independently discovered that the genetic material of different kinds of viruses can combine to create new types of viruses, a process previously believed to be limited to higher, sexually reproducing forms of life. In 1969 he shared a Nobel Prize with Hershey and their colleague Salvador Luria.

Delcassé \del-kȧ-'sā**, Théophile** (b. March 1, 1852, Pamiers, France—d. Feb. 22, 1923, Nice) French politician. A journalist, he was elected to the Chamber of Deputies in 1885 and served in cabinet posts from 1893. As foreign minister in six successive governments (1898–1905), he reached agreement with the British that led to the Entente Cordiale. Considered the principal architect of the new system of European alliances formed before World War I, he also paved the way for the Anglo-Russian agreement of 1907. He later served as minister of the marine (1911–13) and again as foreign minister (1914–15).

Deledda \dā-'lād-dä**, Grazia** (b. Sept. 27, 1871, Nuoro, Sardinia, Italy—d. Aug. 15, 1936, Rome) Italian novelist. She wrote her first stories, influenced by the *verismo* ("realism") school, at age 17. In her approximately 40 novels, including *After the Divorce* (1902), *Elias Portolu* (1903), and *Ashes* (1904), the ancient ways of her native Sardinia often conflict with modern mores. Her later novel *The Mother* (1920) and the posthumously published autobiographical novel *Cosima* (1937) were widely admired. She received the Nobel Prize for Literature in 1926.

© 2006 Encyclopædia Britannica, Inc.

Deleuze \də-'lœz\, **Gilles** (b. Jan. 18, 1925, Paris, France—d. Nov. 4, 1995, Paris) French antirationalist philosopher and literary critic. He began his study of philosophy at the Sorbonne in 1944 and was appointed to the faculty there in 1957; he later taught at the University of Lyons and the University of Paris VIII (Vincennes). His first major publications, *David Hume* (1952) and *Nietzsche and Philosophy* (1962), were historical studies of thinkers who emphasized the limited powers of human reason. In *Difference and Repetition* (1968), he argued against the devaluation of "difference" in Western metaphysics and tried to show that difference inheres in repetition itself. A central theme of his work during this period was the "Eleatic-Platonic bias" of Western metaphysics—i.e., its preference for unity over multiplicity ("the one" over "the many") and for sameness over difference. According to Deleuze, this bias falsifies the nature of experience, which consists of multiplicities rather than unities. In *Anti-Oedipus* (1972), the first volume of a two-volume work (*Capitalism and Schizophrenia*), Deleuze and the radical psychoanalyst Félix Guattari (1930–92) attacked traditional psychoanalysis for suppressing human desire in the service of normalization and control. The second volume, *A Thousand Plateaus* (1980), condemned all rationalist metaphysics as "state philosophy." Depressed by chronic illness, Deleuze committed suicide.

Delft City (pop., 2001 est.: 96,180), southwestern Netherlands. Founded in 1075 and chartered in 1246, it was a trade centre in the 16th–17th centuries and was famous for its DELFTWARE pottery. It was the birthplace of jurist HUGO GROTIUS (1583) and painter JAN VERMEER (1632). Landmarks include a Gothic church, a Renaissance-style town hall, and a 17th-century armory. Principal manufactures include ceramics.

delftware *or* **delft** Tin-glazed EARTHENWARE, with blue-and-white or polychrome decoration, first made in the early 17th century at Delft, Holland. Dutch potters later introduced the art of tin glazing to England along with the name, which now applies to wares manufactured in the Netherlands and England. It is distinguished from FAIENCE (made in France, Germany, Spain, and Scandinavia) and MAJOLICA (made in Italy).

Delhi \'de-lē\ National capital territory (pop., 2001: 13,850,507), north-central INDIA. Bordered by the states of UTTAR PRADESH and HARYANA, it has an area of 573 sq mi (1,483 sq km) and comprises the cities of Delhi (popularly known as Old Delhi) and NEW DELHI (India's capital) and adjacent rural areas. Delhi was the capital of a Muslim dynasty from 1206 until it was laid waste by TIMUR in 1398. It again was made the capital by the Mughal BĀBUR in 1526. Although the Mughal capital was relocated to AGRA, Delhi was beautified by SHAH JAHĀN beginning in 1638. Pillaged by NĀDIR SHAH in 1739, it surrendered to the Marathas in 1771 before being taken by the British in 1803. Delhi was a centre of the INDIAN MUTINY in 1857. It replaced Calcutta (now KOLKATA) as the capital of British India in 1912, at which time construction began on the section of the city that became New Delhi. The capital was moved to New Delhi in 1931, and it became the capital of independent India in 1947. The area's economy and population centre mainly in Old Delhi, while government is concentrated in New Delhi. The government is the chief employer. The territory is also the transportation hub for north-central India.

Delhi sultanate Principal Muslim sultanate in northern India during the 13th to the 16th centuries. Its creation owed much to the campaigns of Muḥammad of Ghūr and his lieutenant Quṭb al-Dīn Aybak between 1175 and 1206. During the reign of Sultan Iltutmish (1211–36), a permanent capital was established at Delhi and political ties with Ghūr were severed. From 1290 to 1320, under the Khaljī dynasty, the sultanate was an imperial power. Its power was shattered by TIMUR's invasion (1398–99), but it somewhat recovered under the Lodī (Afghan) dynasty (1451–1526). It fell again to BĀBUR (1526), was reestablished briefly, then finally was subsumed into AKBAR's Mughal Empire in 1556.

Delian League \'dē-lē-ən\ Confederacy of ancient Greek states led by Athens and based on the island of DELOS. Founded in 478 BC to combat Persia, its members included Aegean states and islands; Athens supplied commanders and assessed tributes of ships or money. It achieved a major victory in 467–466 when its fleet drove out Persian garrisons on the southern Anatolian coast. After 454 its leaders moved the treasury to Athens for safekeeping, used it to rebuild the city's temples, and treated the league as the Athenian empire. Most league members sided with Athens in the PELOPONNESIAN WAR, which diverted the league from its Persian campaign. After defeating Athens in battle in 405, Sparta disbanded the league in 404. Fear of Sparta helped revive the league in the early 4th century, but it weakened as Sparta declined and was crushed by PHILIP II at the Battle of CHAERONEA (338).

Delibes \də-'lēb\, **(Clément Philibert) Léo** (b. Feb. 21, 1836, Saint-Germain-du-Val, France—d. Jan. 16, 1891, Paris) French composer. He studied at the Paris Conservatoire and worked as a church organist and as accompanist and chorus master at the Paris Opéra. Though he composed almost 30 operas, operettas, and ballets, as well as many choral pieces, he is remembered today for three works: the ballets *Coppélia* (1870) and *Sylvia* (1876) and the opera *Lakmé* (1883).

DeLillo \de-'lil-ō\, **Don** (b. Nov. 20, 1936, New York, N.Y., U.S.) U.S. novelist. Born to immigrant parents, DeLillo worked in advertising before beginning to write seriously. His postmodernist works portray the unrest and alienation of an America cosseted by material excess and stupefied by empty mass culture and politics. *Ratner's Star* (1976) attracted attention with its baroque comic sense and verbal facility. His vision later turned darker and his characters more willful in their destructiveness and ignorance, as in *Players* (1977) and *White Noise* (1985). *Libra* (1988) portrays LEE HARVEY OSWALD, *Underworld* (1997) portrays 1950s America, and *The Body Artist* (2001) centres on a woman who has to deal with the fact of her husband's suicide.

delinquency Criminal behaviour carried out by a juvenile. Young males make up the bulk of the delinquent population (about 80% in the U.S.) in all countries in which the behaviour is reported. Theories regarding delinquency's causes focus on the social and economic characteristics of the offender's family, the values communicated by the parents, and the nature of youth and criminal subcultures, including gangs. In general, both "push" and "pull" factors are involved. Most delinquents apparently do not continue criminal behaviour into their adult lives but rather adjust to societal standards. The most common punishment for delinquent offenders is probation, whereby the delinquent is given a suspended sentence and in return must live by a prescribed set of rules under the supervision of a probation officer. See also CRIMINOLOGY; PENOLOGY.

delirium Condition of disorientation, confused thinking, and rapid alternation between mental states. The patient is restless, cannot concentrate, and undergoes emotional changes (e.g., anxiety, apathy, euphoria), sometimes with hallucinations. Delirium usually results from a disorder affecting the brain such as central nervous system infection, head trauma, or mental disorder. In severe cases of withdrawal from alcohol, DELIRIUM TREMENS results not from the excessive alcohol consumption alone but from exhaustion, malnutrition (particularly lack of THIAMINE), and DEHYDRATION.

delirium tremens \di-'lir-ē-əm-'trē-menz\ **(DTs)** DELIRIUM seen in severe cases of alcohol withdrawal (see ALCOHOLISM) complicated by exhaustion, lack of food, and dehydration, usually preceded by physical deterioration due to vomiting and restlessness. The whole body trembles, sometimes with seizures, disorientation, and hallucinations. Delirium tremens lasts 3–10 days, with a reported death rate of up to 20%. Hallucinations may develop independently of delirium tremens and may last days to weeks.

Delius \'dē-lē-əs\, **Frederick (Theodore Albert)** (b. Jan. 29, 1862, Bradford, Yorkshire, Eng.—d. June 10, 1934, Grez-sur-Loing, France) British-born French composer. Born to German parents in England, he studied music in Leipzig and elsewhere, and in 1887 EDVARD GRIEG convinced his parents to let him pursue a musical career. He moved to France, eventually settling in a village near Paris. After World War I he gradually succumbed to paralysis and blindness, the consequence of syphilis. His works, influenced by CLAUDE DEBUSSY, include the operas *A Village Romeo and Juliet* (1901) and *Fennimore and Gerda* (1910); the tone poems *Brigg Fair* (1907) and *On Hearing the First Cuckoo in Spring* (1912); and the choral works *Appalachia* (1903) and *A Mass of Life* (1908).

delivery See PARTURITION

Della Robbia family \ˌdāl-lä-'rȯb-yə\ Family of Italian artists active in Florence. The first works of Luca (di Simone di Marco) Della Robbia (1399/1400–1482) were reliefs sculptured in marble, most notably those for the Cantoria (singing-gallery) of Florence Cathedral (1432–37). He is remembered mainly for his development of glazed terra-cotta as a medium for sculpture; his major terra-cotta works include roundels of the Apostles (c. 1444) in FILIPPO BRUNELLESCHI's Pazzi Chapel in Santa Croce. In time the Della Robbia studio became a potters' workshop-industry, famous especially for its renderings of the Madonna and Child in white enamel on a

© 2006 Encyclopædia Britannica, Inc.

blue ground. Andrea (di Marco) Della Robbia (1435–1525), Luca's nephew, assumed control of the workshop c. 1470. Trained as a marble sculptor, his best-known works are ten roundels of infants on the facade of Florence's Foundling Hospital (c. 1487). Giovanni Della Robbia (1469–1529), the most distinguished of Andrea's sons, took control of the family workshop after his father's death. His early works, notably a lavabo in Santa Maria Novella (1497) and medallions in the Loggia of San Paolo (1493–95), were collaborations with his father.

dell'Abbate, Niccolo See Niccolo dell'ABBATE

Delmarva Peninsula Peninsula, eastern U.S. Extending between CHESAPEAKE and DELAWARE bays, it is about 180 mi (290 km) long and up to 70 mi (110 km) wide. Encompassing parts of the states of Delaware, Maryland, and Virginia—hence its name—it includes Maryland's Eastern Shore. Fishing and tourism are economically important to the area.

Delors \də-'lȯr**, Jacques (Lucien Jean)** (b. July 20, 1925, Paris, Fr.) French statesman. In 1962 he left his position in banking for a series of government positions, including minister of economics and finance. As president of the European Commission (EC) from 1985 to 1995, he pushed through reforms and persuaded the member states to agree to the creation of a single market in 1993, the first step toward full economic and political integration in the EUROPEAN UNION. When his term expired, he was considered a leading contender for the French presidency, but he declined to run.

Delos \'dē-ˌläs\ *Greek* **Dhílos** \'thē-ˌlȯs\ Island, Greece. One of the smallest of the CYCLADES, it was an ancient centre of religious, political, and commercial life in the Aegean. It was the legendary birthplace of APOLLO and ARTEMIS. The DELIAN LEAGUE was established there in 478 BC, following the PERSIAN WARS. Made a free port by Rome in 166 BC, Delos was a flourishing commercial post and slave market. Sacked in 88 BC during the Mithradatic Wars, it gradually declined and was abandoned. Its impressive ruins have been extensively excavated.

Delphi \'del-ˌfī\ Site of the ancient temple and ORACLE of APOLLO in Greece. Located on the slopes of Mount PARNASSUS, it was the centre of the world in ancient Greek religion. According to legend, the oracle was originally sacred to GAEA, and Apollo acquired it by slaying her child, the serpent Python. From 582 BC Delphi was the site of the PYTHIAN GAMES. The oracle was consulted not only on private matters but also on affairs of state, such as the founding of new colonies.

delphinium See LARKSPUR

delta Low-lying plain composed of stream-borne sediments deposited by a river at its mouth. Deltas have been important to humankind since prehistoric times. Sands, silts, and clays deposited by floodwaters were extremely productive agriculturally; and major civilizations flourished in the deltaic plains of the Nile and Tigris-Euphrates rivers. In recent years geologists have discovered that much of the world's petroleum resources are found in ancient deltaic rocks. Deltas vary widely in size, structure, composition, and origin, though many are triangular (the shape of the Greek letter delta).

dema deity \'dā-mə\ Any of several mythical ancestral beings of the Marind-Anim people of southern New Guinea. In their mythology, the killing of a divine ancestor (a dema deity) brings about the transition from the ancestral world to the human one. In Ceramese mythology, for example, the goddess Hainuwele grows from a coconut blossom and is dismembered by dema men; when the pieces of her body are buried, they become new plant species, especially tubers, the chief food of the Ceramese. Such myths offer explanations for the origin of agriculture as well as for human sexuality and death.

deme \'dēm\ *Greek* **demos** In ancient Greece, a country district or village, as distinct from a POLIS. In the democratic reforms (508–507 BC) promoted by CLEISTHENES, the demes of Attica (the area around Athens) gained a voice in local and state government. The Attic demes had their own police powers, cults, and officials. Males aged 18 years became registered members of the deme. Members decided deme matters and kept property records for taxation. Each deme sent representatives to the Athenian BOULE in proportion to its size. The term continued to be applied to local districts in Hellenistic and Roman times.

dementia \di-'men-shə\ Chronic, usually progressive deterioration of intellectual functions. Most common in the elderly, it usually begins with short-term-memory loss once thought a normal result of aging but now known to result from ALZHEIMER DISEASE. Other common causes are Pick disease and vascular disease. Dementia also occurs in HUNTINGTON CHOREA, paresis (see PARALYSIS), and some types of ENCEPHALITIS. Treatable causes include hypothyroidism (see THYROID GLAND), other metabolic diseases, and some malignant tumours. Treatment may arrest dementia's progress but usually does not reverse it.

Demerara \ˌde-mə-'rar-ə\ **River** River, eastern Guyana. Rising in the forests of central Guyana, it flows north for 215 mi (346 km) to the Atlantic Ocean at GEORGETOWN. Oceangoing steamers ascend 65 mi (105 km) to Linden to take on bauxite; smaller ships reach Malali, 25 mi (40 km) farther upstream, beyond which lie numerous rapids.

Demeter \di-'mē-tər\ In Greek religion, a consort of ZEUS and the goddess of agricuture, especially grain. Though rarely mentioned by HOMER and not an Olympian deity, she is probably an ancient goddess. She is best remembered for her role in the story of PERSEPHONE, in which her lack of attention to the harvest causes a famine. In addition to appearing as a goddess of agriculture, Demeter was sometimes worshiped as a divinity of the Underworld and as a goddess of health, birth, and marriage.

Demeter of Cnidus, sculpture, mid-4th century BC; in the British Museum.

Demetrius I Poliorcetes \də-'mē-trē-əs...ˌpä-lē-ˌȯr-'sē-tēz\ (b. 336 BC, Macedonia—d. 283, Cilicia) King of Macedonia (294–288). As a young general he fought to rebuild the empire of his father, ANTIGONUS I MONOPHTHALMUS. Under his father's command, he initially failed in his assaults on Egypt and Nabataea, but he later freed Athens from Macedonia (307) and defeated PTOLEMY I SOTER (306), restoring some of his father's domain. He fought alongside his father at the Battle of IPSUS (301), where Antigonus was killed, and later retook Athens (294). He became king of Macedonia as Demetrius I Poliorcetes ("the Besieger") after killing Alexander V (r. 297–294). Driven out in 288, he surrendered to SELEUCUS I NICATOR in 285.

DeMille \də-'mil**, Cecil B(lount)** (b. Aug. 12, 1881, Ashfield, Mass., U.S.—d. Jan. 21, 1959, Hollywood, Calif.) U.S. film director and producer. In 1913 he joined Jesse Lasky (1880–1958) and SAMUEL GOLDWYN to form the forerunner of PARAMOUNT COMMUNICATIONS. Their first venture, *The Squaw Man* (1914), was the first full-length feature film produced in Hollywood, and it established DeMille as a director. He made numerous comedies before creating biblical spectacles such as *The Ten Commandments* (1923, remade 1956) and *The King of Kings* (1927). He was known for his flamboyance and his taste for huge casts and extravagant sets. Among his 70 other films are *Samson and Delilah* (1949) and *The Greatest Show on Earth* (1952, Academy Award for best picture). He also hosted the popular weekly *Lux Radio Theatre* (1936–45).

Deming, W(illiam) Edwards (b. Oct. 14, 1900, Sioux City, Iowa, U.S.—d. Dec. 20, 1993, Washington, D.C.) U.S. statistician, educator, and advocate of quality-control methods in industrial production. He received his Ph.D. in mathematical physics from Yale University, and he subsequently taught at New York University for 46 years. From the 1930s he employed statistical analysis to achieve better industrial quality control. In 1950 he was invited to Japan to teach executives and engineers. His ideas, which centred on tallying product defects, analyzing and addressing their causes, and recording the effects of the changes on subsequent quality, were eagerly adopted there and eventually helped Japanese products dominate the market in much of the world. In 1951 Japan instituted the Deming Prize, awarded to corporations that win a rigorous quality control competition. Deming's ideas were taken up by U.S. corporations in the 1980s, particularly under the rubric of TOTAL QUALITY MANAGEMENT.

Demiurge \'de-mē-ərj\ Subordinate god who shapes and arranges the physical world. In his dialogue *Timaeus*, PLATO identified the Demiurge as the force that fashioned the world from the preexisting materials of chaos. In GNOSTICISM of the early Christian era, the Demiurge is regarded as an

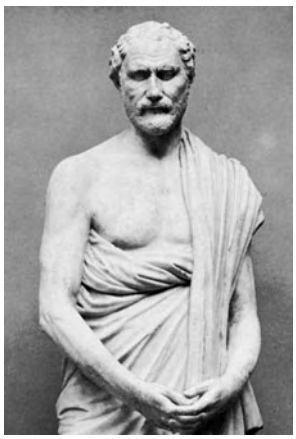
© 2006 Encyclopædia Britannica, Inc.

inferior deity who had created the imperfect, material world and who belonged to the forces of evil opposing the supreme God of goodness.

democracy Form of government in which supreme power is vested in the people and exercised by them directly or indirectly through a system of representation usually involving periodic free elections. In a direct democracy, the public participates in government directly (as in some ancient Greek CITY-STATES, some New England TOWN MEETINGS, and some CANTONS in modern Switzerland). Most democracies today are representative. The concept of representative democracy arose largely from ideas and institutions that developed during the European Middle Ages and the Enlightenment and in the American and French Revolutions. Democracy has come to imply universal suffrage, competition for office, freedom of speech and the press, and the rule of law. See also REPUBLIC.

Democratic Party One of the two major political parties in the U.S., historically the party of labour, minorities, and progressive reformers. In the 1790s a group of THOMAS JEFFERSON's supporters called themselves "Democratic Republicans" or "Jeffersonian Republicans" to demonstrate their belief in the principle of popular government and their opposition to monarchism. The party adopted its present name in the 1830s, during the presidency of ANDREW JACKSON. Democrats won nearly every presidential election in the years 1836–60, but the issue of slavery split the party. The Southern Democrats called for the protection of slavery in the new territories, whereas the Northern Democrats, led by STEPHEN A. DOUGLAS, advocated allowing each territory to decide by POPULAR SOVEREIGNTY whether to accept slavery within its borders. As a result, in 1860 the new antislavery Republican Party won its first national victory under ABRAHAM LINCOLN. From 1861 to 1913 the only Democratic president was GROVER CLEVELAND; in these years the party was basically conservative and agrarian-oriented, and its members were opposed to protective tariffs. It returned to power under WOODROW WILSON, instituting greater federal regulation of banking and industry, but the Republicans' frank embrace of big business drew voters amid the prosperity of the 1920s. Democrats became dominant again in 1932, electing FRANKLIN D. ROOSEVELT. A coalition of urban workers, small farmers, liberals, and others sustained Democrats in office until 1953, and the party regained the presidency with the election of JOHN F. KENNEDY in 1960. In the 1970s and '80s the Democrats held the presidency only during the single term of JIMMY CARTER (1976–81) but retained majority control of the House of Representatives. They regained the presidency in 1992 with the election of BILL CLINTON but lost control of both the House and the Senate in 1994. In the presidential election of 2000, Clinton's vice president, AL GORE, was defeated by Republican GEORGE W. BUSH. In 2004 the party's presidential nominee, John Kerry, was defeated by Bush, and the Democrats lost seats in both houses of Congress. The modern Democratic Party generally supports a strong federal government with powers to regulate business and industry in the public interest; federally financed social services and benefits for the poor, the unemployed, the aged, and other groups; and the protection of civil rights.

Democratic Republic of the Congo See Democratic Republic of the CONGO



Democrats of the Left (DS) *formerly (1921–91)* **Italian Communist Party** *(1991–98)* **Democratic Party of the Left** Major Italian political party. Founded as the Partito Comunista Italiano (PCI) in 1921 by dissidents of the ITALIAN SOCIALIST PARTY's left wing, it was outlawed with other political parties by BENITO MUSSOLINI's fascist government in 1926 and went underground. It participated in the Italian Resistance in World War II. After the war it joined in coalition governments and was consistently successful at the polls. In 1956, after the crimes of JOSEPH STALIN were revealed, PALMIRO TOGLIATTI tried to dissociate the PCI from the Soviet Union. ENRICO BERLINGUER, as party leader from 1972 to 1984, became the leading proponent of EUROCOMMUNISM. In order to consolidate left-wing forces and broaden its base, the party changed its name to Democratic Party of the Left in 1991; it became one of Italy's largest political parties and western Europe's largest communist party. In 1998 it renamed itself Democrats of the Left.

Democritus \di-'mä-krə-təs\ (b. c. 460—d. c. 370 BC) Greek philosopher. Though only a few fragments of his work survive, he was apparently the first to describe invisible "atoms" as the basis of all matter. His atoms—indestructible, indivisible, incompressible, uniform, and differing only in size, shape, and motion—anticipated with surprising accuracy those discovered by 20th-century scientists. For his amusement at human foibles, he has been called "the Laughing Philosopher." See also ATOMISM.

demography \di-'mä-grə-fē\ Statistical study of human populations, especially with reference to size and density, distribution, and vital statistics. Contemporary demographic concerns include the global birth rates, the interplay between population and economic development, the effects of BIRTH CONTROL, urban congestion, illegal immigration, and labour force statistics. The basis for most demographic research lies in population CENSUSES and the registration of vital statistics.

demon *or* **daemon** \'dē-mən\ In religions worldwide, any of various evil spirits that mediate between the supernatural and human realms. The term comes from the Greek word *daimon*, a divine or semidivine power that determined a person's fate. ZOROASTRIANISM had a hierarchy of demons, which were in constant battle with AHURA MAZDA. In Judaism it was believed that demons inhabited desert wastes, ruins, and graves and inflicted physical and spiritual disorders on humankind. Christianity placed Satan or Beelzebub at the head of the ranks of demons, and Islam designated IBLIS or Satan as the leader of a host of evil jinn. Hinduism has many demons, called *asuras*, who oppose the DEVAS (gods). In Buddhism demons are seen as tempters who prevent the achievement of nirvana.

Demosthenes \di-'mäs-thə-ˌnēz\ (b. 384 BC, Athens—d. Oct. 12, 322, Calauria, Argolis) Athenian statesman known as the greatest orator of ancient Greece. According to PLUTARCH, he was a stutterer in his youth and improved his speech by placing pebbles in his mouth and practicing before a mirror. His talents were recognized early, and powerful clients engaged him as a speechwriter. Throughout his life he espoused democratic principles. He roused Athens against PHILIP II by his great "Philippics," and later against Philip's son ALEXANDER THE GREAT. In so doing he incurred the enmity of AESCHINES, who argued that Philip's intentions were peaceable; Demosthenes succeeded in having Aeschines ostracized (330), but he was himself later forced into exile (324). Recalled after Alexander's death (323), he fled Alexander's successor and committed suicide.

Dempsey, Jack *orig.* **William Harrison Dempsey** (b. June 24, 1895, Manassa, Colo., U.S.—d. May 31, 1983, New York, N.Y.) U.S. boxer. Dempsey started fighting in 1914 under the name Kid Blackie. After compiling an impressive number of first-round knockouts, in 1919 he was matched against world heavyweight champion Jess Willard. Dempsey defeated Willard in three rounds. He then held the heavyweight title until his defeat by GENE TUNNEY in 1926 in a 10-round decision. In the next year's rematch, in the famous "Long Count" bout, Dempsey would not go to a neutral corner after knocking Tunney down; this delayed the start of the count against Tunney and gave him extra time to recover and win the fight. Nicknamed the "Manassa Mauler," Dempsey was known as a ferocious fighter who kept continuously on the offensive. He fought exhibition matches in the 1930s before retiring in 1940; he later became a successful restaurateur. In 84 fights he compiled a record of 62 wins, 51 by knockout.

demurrer \di-'mər-ər\ In law, a plea in response to an allegation that admits its truth but also asserts that it is not sufficient as a cause of action. In the U.S., demurrers are no longer used in federal procedure (having been replaced by motions to dismiss or motions for more definite statement) but are still used in some states. A general demurrer challenges the sufficiency of the substance of an allegation, whereas a special demurrer challenges the structure or form of an allegation.

Demuth \də-'müth**, Charles** (b. Nov. 8, 1883, Lancaster, Pa., U.S.—d. Oct. 23, 1935, Lancaster) U.S. painter. He studied in Philadelphia and later in Europe. On his return he became an important channel for the transmission of modern European movements into American art. Best known as an exponent of Precisionism, he excelled at watercolour and executed an outstanding series of flowers, circuses, and café scenes. Later he incorporated advertisements and billboard lettering into hard-edged, abstract cityscapes. Among his well-known works are his so-called "poster portraits" such as *I Saw the Figure 5 in Gold* (1928), a symbolic portrait of the poet William Carlos Williams.

"I Saw the Figure 5 in Gold," oil on composition board by Charles Demuth, 1928; in the Metropolitan Museum of Art, New York City

Denali See Mount McKinley

Denali \də-'nä-lē\ **National Park** Preserve, southern central Alaska, U.S. Established in 1980, it comprises the former Mount McKinley National Park (1917) and Denali National Monument (1978). Highlights of the park include Mount McKinley, the large glaciers of the Alaska Range, and abundant wildlife. The park's total area is 5,000,000 acres (2,025,000 hectares).

denaturation \dē-ˌnā-chə-'rā-shən\ Biochemical process modifying a protein's natural configuration. It involves breaking many weak (hydrogen and hydrophobic) bonds (see bonding) that maintain the protein's highly ordered structure. This usually results in loss of biological activity (e.g., loss of an enzyme's ability to catalyze reactions). Denaturation can be brought about by heating; treatment with alkalis, acids, urea, or detergents; or even vigorous shaking of the protein solution. It can be reversed in some cases (e.g., serum albumin, hemoglobin), if conditions favourable to the protein are restored, but not in others. The term is also used to describe the process of rendering ethanol unfit to drink.

Dench, Dame Judi(th Olivia) (b. Dec. 9, 1934, York, Yorkshire, Eng.) British actress. She made her stage debut in 1957 as Ophelia in *Hamlet*, and Shakespearean works became her specialty. She also performed in musical roles, starring in the London premiere of *Cabaret* in 1968. Among her many other notable credits were the 1981–84 TV series *A Fine Romance* and the films *84 Charing Cross Road* (1986), *Mrs. Brown* (1997)—in which she starred as Queen Victoria—and *Shakespeare in Love* (1998, Academy Award).

dendrochronology \ˌden-drō-krə-'nä-lə-jē\ Method of scientific dating based on the analysis of tree rings. Because the width of annular rings varies with climatic conditions, laboratory analysis of timber core samples allows scientists to reconstruct the conditions that existed when a tree's rings developed. By taking thousands of samples from different sites and different strata within a particular region, researchers can build a comprehensive historical sequence that becomes a part of the scientific record. Such master chronologies are used by archaeologists, climatologists, and others.

Deneuve \də-'nœv**, Catherine** *orig.* **Catherine Dorléac** (b. Oct. 22, 1942, Paris, France) French film actress. She appeared in films from age 13 and won fame with her role in *The Umbrellas of Cherbourg* (1964). Her cool blond beauty and skillful portrayals in Roman Polanski's *Repulsion* (1965) and Luis Buñuel's *Belle de jour* (1967) and *Tristana* (1970) made her an international star. Her numerous other films include *The Last Metro* (1980) and *Indochine* (1992).

Deng Xiaoping \'dəŋ-'shaù-'piŋ\ *or* **Teng Hsiao-p'ing** (b. Aug. 22, 1904, Guang'an, Sichuan province, China—d. Feb. 19, 1997, Beijing) Chinese communist leader, China's most powerful figure from the late 1970s until his death. In the 1950s he became a vice-premier of the People's Republic of China and general secretary of the Chinese Communist Party (CCP). He fell from favour during the Cultural Revolution but was rehabilitated in 1973 under the sponsorship of Zhou Enlai. Though seen as a likely successor to Zhou as premier, Deng was again ousted, this time by the Gang of Four, when Zhou died in 1976. However, Mao Zedong died later that year, and in the ensuing power struggle the Gang of Four was arrested; Deng was rehabilitated for a second time. His protégés Zhao Ziyang and Hu Yaobang became premier and CCP general secretary, respectively. Both embraced Deng's wide-reaching reform program, which abandoned many orthodox communist doctrines and introduced free-enterprise elements into the economy. Hu died in April 1989, and Zhao was dismissed from the government after the Tiananmen Square incident in June. Deng gradually relinquished his official posts but continued to guide China behind the scenes until his death.

dengue \'deŋ-gē\ *or* **breakbone fever** *or* **dandy fever** Infectious, disabling mosquito-borne fever. Other symptoms include extreme joint pain and stiffness, intense pain behind the eyes, a return of fever after brief pause, and a characteristic rash. Dengue is caused by a virus carried by mosquitoes of the genus *Aedes*, usually *A. aegypti*, which also carries yellow fever. There are four strains of virus; infection with one type does not confer immunity to the remaining three. Treatment focuses on relieving symptoms. Patients should be isolated during the first three days, when mosquitoes can pick up the disease from them. Prevention relies on mosquito control.

Dengyo Daishi See Saicho

Denikin \dyi-'nyē-kyin**, Anton (Ivanovich)** (b. Dec. 16, 1872, near Warsaw, Pol., Russian Empire—d. Aug. 8, 1947, Ann Arbor, Mich., U.S.) Russian general. A professional in the imperial Russian army, he was a lieutenant-general in World War I. After the Russian Revolution of 1917, he and Lavr Kornilov were arrested for conspiring to overthrow the provisional government. They fled south to the Don River region and assumed command of the anti-Bolshevik ("White") forces in the Russian Civil War. In 1919 Denikin launched a major offensive toward Moscow, but his forces were defeated by the Red Army at Orel. Forced to retreat, he turned over his command to Pyotr Wrangel (1920), then fled Russia and later settled in France.

denim Durable twill-woven fabric with coloured (usually blue) warp (lengthwise) and white filling (crosswise) threads, also sometimes woven in coloured stripes. The name originated in the French *serge de Nîmes*. Denim is usually all-cotton, though it is sometimes made of a cotton-synthetic mixture. Decades of use in the clothing industry, especially in the manufacture of overalls and trousers worn for heavy labour, have demonstrated denim's durability, a quality that, along with its comfort, made denim jeans extremely popular for leisure wear in the late 20th century.

Denis, Ruth Saint See Ruth Saint Denis

Denis \də-'nē,\ *English* \'de-nəs**, Saint** *or* **Saint Denys** (d. 258?, Paris; Western feast day October 9; Eastern feast day October 3) Patron saint of France and traditionally the first bishop of Paris. Probably born in Rome, he was, according to the 6th-century historian and bishop Gregory of Tours, one of seven bishops sent to convert the people of Gaul during the reign of Decius. Little is known of his life; he is believed to have been martyred during the persecutions of the emperor Valerian. A 9th-century legend says that he was beheaded on Montmartre and that his decapitated body carried his head to the area northeast of Paris where the Benedictine abbey of St. Denis was founded.

denitrifying bacteria \ˌdē-'nī-trə-ˌfī-iŋ\ Soil microorganisms whose action results in the conversion of nitrates in soil to free atmospheric nitrogen, thus exhausting soil fertility and reducing agricultural productivity. Without denitrification, earth's nitrogen supply would eventually accumulate in the oceans, since nitrates are highly soluble and are continuously leached from the soil into nearby bodies of water. See also nitrifying bacteria.

Denmark *officially* **Kingdom of Denmark** Country, north-central Europe. Area: 16,640 sq mi (43,098 sq km). Its territory includes Greenland and the Faroe Islands, which are self-governing dependencies. Population (2005 est.): 5,416,000. Capital: Copenhagen. The majority of the population is Danish. Language: Danish (official). Religions: Christian-

© 2006 Encyclopædia Britannica, Inc.

ity (predominantly Evangelical Lutheran [official]); also Islam. Currency: Danish krone. Lying between the North and Baltic seas, Denmark occupies the JUTLAND peninsula and an archipelago to its east. The two largest islands, Zealand (SJÆLLAND) and FUNEN (Fyn), together make up about one-fourth of the country's total land area. With a 4,500-mi (7,300-km) coastline, Denmark has a generally temperate and often wet climate. It has a mixed economy based on services and manufacturing. It boasts one of the world's oldest and most comprehensive social welfare systems, and its standard of living is among the highest in the world. Denmark is a constitutional monarchy. Its chief of state is the Danish monarch, and the head of government is the prime minister. Denmark may have been inhabited as early as about 100,000 BC. About 500 AD the first foreign mentions of Danes as a tribe appeared. During the VIKING period the Danes expanded their territory, and by the 11th century the united Danish kingdom included parts of what are now Sweden, England, and Norway. Scandinavia was united under Danish rule from 1397 until 1523, when Sweden became independent; a series of debilitating wars with Sweden in the 17th century resulted in the Treaty of Copenhagen (1660), which established the modern Scandinavian frontiers. Denmark gained and lost various other territories, including Norway, in the 19th and 20th centuries; it went through three constitutions between 1849 and 1915 and was occupied by Nazi Germany in 1940–45. A founding member of NATO (1949), Denmark adopted its current constitution in 1953. It became a member of the EUROPEAN ECONOMIC COMMUNITY in 1973 but modified its membership during the 1990s in response to some Danes' concerns regarding environmental protection and social welfare. In the early 21st century, Denmark's handling of immigrants, though a small statistical minority, raised great debate.

Dennison, Aaron Lufkin (b. March 6, 1812, Freeport, Mass., U.S.—d. Jan. 9, 1895, Birmingham, Eng.) U.S. WATCH manufacturer. After studying the methods used at the SPRINGFIELD ARMORY, he mastered the technical difficulties of machine production of small parts, set up a factory in Waltham, Mass., in 1850, and began to produce the first inexpensive factory-made watches with INTERCHANGEABLE PARTS. His introduction of machinery into the manufacture of paper boxes and other paper products resulted in the founding of the Dennison Manufacturing Co. He is regarded as the father of American watchmaking.

density MASS of a unit volume of a material substance. It is calculated by dividing an object's mass by its volume. In the INTERNATIONAL SYSTEM OF UNITS, and depending on the units of measurement used, density can be expressed in grams per cubic centimetre (g/cm^3) or kilograms per cubic metre (kg/m^3). The expression "particle density" refers to the number of particles per unit volume, not to the density of a single particle. See also SPECIFIC GRAVITY.

density current Any current in either a liquid or a gas that is kept in motion by the force of gravity acting on small differences in density. A density difference can exist between two fluids or between different parts of the same fluid. Density currents flow along ocean and lake bottoms, because the water entering is colder, saltier, or contains more suspended sediment and thus is denser than the surrounding water. Density currents are a factor in WATER POLLUTION, as the industrial discharge of large amounts of polluted or heated water can generate density currents that affect neighbouring human or animal communities.

density function In statistics, a FUNCTION whose INTEGRAL is calculated to find probabilities associated with a continuous RANDOM VARIABLE (see CONTINUITY, PROBABILITY THEORY). Its graph is a curve above the horizontal axis that defines a total area, between itself and the axis, of 1. The percentage of this area included between any two values coincides with the probability that the outcome of an observation described by the density function falls between those values. Every random variable is associated with a density function (e.g., a variable with a NORMAL DISTRIBUTION is described by a bell curve).

dentistry Profession concerned with the teeth and MOUTH. It includes repair or removal of decayed teeth, straightening and adjustment of teeth for proper occlusion, and design, manufacture, and fitting of false teeth and other prosthetic devices. X-RAYS are used to show conditions not visible on examination. Using local anesthesia, CARIES in teeth are drilled to remove diseased areas and filled with various materials. Decay that reaches a TOOTH's root risks infection of the nerve and requires root-canal surgery. Teeth that must be extracted are replaced by crowns for single teeth and full or partial dentures or implants for more. Dentists also educate patients on oral hygiene, examine and clean teeth, and apply fluoride compounds for decay resistance.

D'Entrecasteaux \ˌdȯn-trə-'kas-tō\ **Islands** Island group, Papua New Guinea. Located in the South Pacific Ocean, the group includes Normanby, Fergusson, and Goodenough islands and many islets, atolls, and reefs. Most are volcanic, precipitous, and forested. They have a combined land area of 1,213 sq mi (3,142 sq km). They were named by the French navigator Bruni d'Entrecasteaux in 1793. The chief settlement is Dobu, located on an islet between Normanby and Fergusson.

Denver City (pop., 2000: 554,636), capital of Colorado, U.S. On the SOUTH PLATTE RIVER just east of the ROCKY MOUNTAINS, its elevation of 5,280 ft (1,609 m) gives it the nickname "Mile High City." An early stopping place for Indians and trappers, it was settled in 1858 as St. Charles, abruptly renamed Denver City (the "city" was eventually dropped), and combined with the rival town of Auraria in 1860, becoming the territorial capital as Denver City in 1867. The 1870s and '80s saw a silver boom that ended in 1893, but new gold discoveries helped prevent a major decline. Modern Denver, a transportation, industrial, and commercial hub, has one of the nation's largest livestock markets. It is a major centre for winter sports, with many ski areas in the vicinity. The Denver branch of the U.S. Mint (opened 1906) produces about 50% of U.S. coinage and is the nation's second largest gold depository.

deontic logic \dē-'än-tik\ Branch of MODAL LOGIC that studies the permitted, the obligatory, and the forbidden, which are characterized as deontic modalities (Greek, *deontos*: "of that which is binding"). It seeks to systematize the abstract, purely conceptual relations between propositions in this sphere, such as the following: If an act is obligatory, then its performance must be permitted and its omission forbidden. In given circumstances, every act is such that either it or its omission is permitted. Modal logic leaves to substantive disciplines such as ETHICS and LAW the concrete questions of what specific acts or states of affairs are to be forbidden, permitted, or the like.

deontological ethics Ethical theories that maintain that the moral rightness or wrongness of an action depends on its intrinsic qualities, and not (as in CONSEQUENTIALISM) on the nature of its consequences. Deontological ethics holds that at least some acts are morally wrong in themselves (e.g., lying, breaking a promise, punishing the innocent, murder). It often finds expression in slogans such as "Duty for duty's sake." Deontological theories are often formulated in such a way that the rightness of an action consists in its conformity to a moral rule or command, such as

© 2006 Encyclopædia Britannica, Inc.

"Do not bear false witness." The most important exponent of deontological ethics is Immanuel Kant. See also categorical imperative.

Depardieu \də-pär-'dyœ**, Gérard** (b. Dec. 27, 1948, Chateauroux, France) French film actor. He made his film debut in 1965 and played minor parts until his performance in *Going Places* (1974) brought him a major role in Bernardo Bertolucci's *1900* (1976). He became French cinema's top male star in the 1980s and also made films elsewhere in Europe and in the U.S. Noted for a screen image that combined sensitivity with masculine strength, he delivered compelling performances in *The Last Metro* (1980), *The Return of Martin Guerre* (1981), *Jean de Florette* (1986), *Manon of the Spring* (1986), *Cyrano de Bergerac* (1990), and *Tous les matins du monde* (1992).

department store Retail establishment that sells a wide variety of goods. These usually include ready-to-wear apparel and accessories, yard goods and household textiles, housewares, furniture, electrical appliances, and accessories. In addition to departments (supervised by managers and buyers) for the various categories of goods, there are departmental divisions to handle, for example, merchandising, advertising, service, accounting, and financial strategy. The Bon Marché in Paris, which began as a small shop in the early 19th century, is often considered the first department store. The first U.S. department store chains— J.C. Penney and Sears, Roebuck and Co.—date to the 1920s. See also Harrods.

dependency In international relations, a weak state dominated by or under the jurisdiction of a more powerful state but not formally annexed by it. Examples include American Samoa (U.S.) and Greenland (Denmark). The dominant state may control certain of its affairs, such as defense, foreign relations, and internal security, and allow it autonomy in domestic affairs such as education, health, and infrastructural development. In the 1960s and '70s the term referred to an approach to understanding third-world development that emphasized the constraints imposed by the global political and economic order.

depletion allowance In tax law, the deductions from gross income allowed investors in exhaustible commodities (such as minerals, oil, or gas) for the depletion of the deposits. The depletion allowance is intended as an incentive to stimulate investment in this high-risk industry, though critics argue that mineral deposits are valuable enough to justify high levels of investment even without tax incentives. See also depreciation.

deposit account Either of two basic bank deposit accounts. The demand deposit is payable on demand (see check). Theoretically, the time deposit is payable only after a fixed interval of time; in practice, withdrawals from most small time-deposit accounts are paid on demand.

depreciation Accounting charge for the decline in value of an asset spread over its economic life. Depreciation includes deterioration from use, age, and exposure to the elements, as well as decline in value caused by obsolescence, loss of usefulness, and the availability of newer and more efficient means of serving the same purpose. It does not include sudden losses caused by fire, accident, or disaster. Depreciation is often used in assessing the value of property (e.g., buildings, machinery) or other assets of limited life (e.g., a leasehold or copyright) for tax purposes. See also depletion allowance; investment credit.

depression In economics, a major downswing in the business cycle characterized by sharply reduced industrial production, widespread unemployment, a serious decline or cessation of growth in construction, and great reductions in international trade and capital movements. Unlike recessions, which may be limited to a single country, severe depressions such as the Great Depression encompass many nations. See also deflation; inflation.

depression Neurotic or psychotic disorder marked by sadness, inactivity, difficulty in thinking and concentration, a significant increase or decrease in appetite and time spent sleeping, feelings of dejection and hopelessness, and sometimes suicidal tendencies. Probably the most common psychiatric complaint, depression has been described by physicians from at least the time of Hippocrates, who called it melancholia. Its course is extremely variable from person to person; it may be fleeting or permanent, mild or severe. Depression is more common in women than in men. The rates of incidence increase with age in men, while the peak for women is between the ages of 35 and 45. Its causes can be both psychosocial (e.g., the loss of a loved one) and biochemical (chiefly, reduced quantities of the monoamines norepinephrine and serotonin). Treatment is usually a combination of psychotherapy and drug therapy (see antidepressant). A person who experiences alternating states of depression and extreme elation is said to suffer from bipolar disorder.

Depression of 1929 See Great Depression

Depretis \dā-'pre-tēs**, Agostino** (b. Jan. 13, 1813, Mezzana Corti, Kingdom of Italy—d. July 29, 1887, Stradella, Italy) Italian politician. In 1848 he was elected to the first Piedmontese parliament and was reelected thereafter until his death. After Italy was unified, he served in several cabinet posts (1862–67). He became premier in 1876 and was the dominant force in Italian politics until 1887. Among his notable achievements were the signing of the Triple Alliance and his government policy of *trasformismo*, bringing together members of different parties in the same cabinet.

depth charge *or* **depth bomb** Weapon used by ships or aircraft to attack submerged submarines. Developed by the British in World War I for use against German submarines, it consisted of a canister filled with explosives and dropped off the stern of a ship near a submerged submarine. It rarely exploded close enough to sink the submarine, but its shock waves loosened the submarine's joints and damaged its instruments, forcing it to the surface, where naval gunfire could finish it off. Modern depth charges can be fired as far as 2,000 yards (1,800 m) from a ship's deck or launched from aircraft. Atomic depth charges have a nuclear warhead and a vastly increased killing radius.

Derain \də-'raü**, André** (b. June 10, 1880, Chatou, Fr.—d. Sept. 8, 1954, Garches) French painter, graphic artist, and designer. After studying in Paris at the Académie Carrière and Académie Julian, he developed his early style in association with his friends Maurice de Vlaminck and Henri Matisse; the three were the principal exponents of Fauvism. Their landscapes and figure studies featured brilliant colours, broken brushstrokes, and impulsive lines. By the 1920s, however, Derain had turned to the Neoclassical style (see Classicism and Neoclassicism). He produced numerous book illustrations and designs for stage sets, notably for Sergey Diaghilev's Ballets Russes.

Derby One of the classic English horse races (established 1780), run in June over a 1½-mi (2,400 m) course at Epsom Downs, Surrey. Many other horse races have been named for the Derby (e.g., the Kentucky Derby), and the term itself has come to signify a race or contest of any type.

Derby \'där-bē**, Edward (George Geoffrey Smith) Stanley, 14th earl of** (b. March 29, 1799, Knowsley Park, Lancashire, Eng.—d. Oct. 23, 1869, London) English statesman. Having entered Parliament as a Whig in 1820, he later joined the Conservatives and became leader of the Conservative Party (1846–68) and prime minister (1852, 1858, and 1866–68). Legislation adopted during his tenure included the removal of Jewish discrimination in Parliament membership, the transfer of India's administration from the East India Company to the crown, and the Reform Bill of 1867. He is remembered as one of England's greatest parliamentary orators.

Derbyshire \'där-bē-ˌshir\ *or* **Derby** \'där-bē\ Administrative (pop., 2001: 734,581), geographic, and historic county, central England. The landscape varies from the moorlands of the north to the Trent lowlands in the south. Industry ranges from tourism in the High Peak district to mining and engineering in the eastern and southern coalfields. Apart from gaining the rural district of Tintwistle from Cheshire, the traditional county was unaltered by the administrative reorganization in 1974; its county seat is Matlock.

derivative In mathematics, a fundamental concept of differential calculus representing the instantaneous rate of change of a function. The first derivative of a function is a function whose values can be interpreted as slopes of tangent lines to the graph of the original function at a given point. The derivative of a derivative (known as the second derivative) describes the rate of change of the rate of change, and can be thought of physically as acceleration. The process of finding a derivative is called differentiation.

derivative, partial See partial derivative

derivatives In finance, contracts whose value is derived from another asset, which can include stocks, bonds, currencies, interest rates, commodities, and related indexes. Purchasers of derivatives are essentially wagering on the future performance of that asset. Derivatives include such widely accepted products as futures and options. Concern over the risky nature of derivatives grew after some well-publicized corporate losses in 1994 involving Procter & Gamble, Metallgesellschaft AG of Germany, and

© 2006 Encyclopædia Britannica, Inc.

Orange County, Calif. Anxiety intensified after the collapse in 1995 of the London-based merchant bank Barings PLC (now part of the Dutch ING Group NV). Securities regulators from 16 countries then agreed on measures to improve control of derivatives.

dermatitis *or* **eczema** \ig-'zē-mə, 'eg-zə-mə\ INFLAMMATION of the SKIN, usually itchy, with redness, swelling, and blistering. Causes and patterns vary. Contact dermatitis appears at the site of contact with an irritating substance or allergen. Atopic dermatitis, with patches of dry skin, occurs in infants, children, and young adults with genetic hypersensitivities (atopy). Stasis dermatitis affects the ankles and lower legs because of chronic poor blood flow in the veins. Seborrheic dermatitis appears as scaly skin, most often on the scalp (DANDRUFF) and areas rich in SEBACEOUS GLANDS. Neurodermatitis is apparently caused by repeated scratching of an itchy skin area.

dermatology Medical specialty dealing with diseases of the SKIN. Its scientific basis was established in the mid-19th century by Ferdinand von Hebra (1816–1880), whose approach was based on microscopic examination of skin lesions. Starting in the 1930s, an emphasis on biochemistry and physiology led to more sophisticated and effective treatments. Dermatology deals with fungal diseases, skin cancers, PSORIASIS, and life-threatening skin diseases such as pemphigus, SCLERODERMA, and LUPUS ERYTHEMATOSUS.

dermestid \dər-'mes-təd\ **(beetle)** Any member of about 700 species (family Dermestidae) of widely distributed BEETLES that are household pests. Usually brown or black, some are brightly coloured or patterned, and they vary in shape from elongated to oval. Dermestids range from 0.05 to 0.5 in. (1 to 12 mm) long and are covered with hairs or scales that easily flake off. The wormlike larvae feed on furs, skins, feathers, horn, and hair; some feed on cheese and dried meats or on carpets, rugs, furniture, and clothing. Two are museum pests that have destroyed collections of stuffed animals; museums and collectors must either have pestproof display shelves or continuously apply pesticides. The larvae of carrion-feeding species are sometimes used to clean the soft tissue attached to animal skeletons.

Dermot Macmurrough \'dər-mət-mək-'mər-ō\ *or* **Diarmaid Macmurchada** \'dir-mid-mək-'mùr-ķə-də\ (d. May 1, 1171) Irish king of Leinster (1126–71). He faced a number of rivals in claiming the throne of his father, Enna, and he asserted his authority by killing or blinding 17 rebel chieftains (1141). He abducted another Irish king's wife in 1153, beginning a bitter feud in which he was driven from Ireland (1166). He returned with the backing of Anglo-Norman lords (including the earl of Pembroke), and in 1170 they captured Dublin. Pembroke married Dermot's daughter and became ruler of Leinster after his death. Dermot's appeal for Norman help in settling an internal dispute thus proved instrumental in the Norman conquest of Ireland.

Déroulède \dā-rü-'led**, Paul** (b. Sept. 2, 1846, Paris, France—d. Jan. 30, 1914, Nice) French politician and poet. An ardent nationalist and advocate of revenge against Germany, he helped found the revanchist Ligue des Patriotes (League of Patriots), supported GEORGES BOULANGER, and campaigned against ALFRED DREYFUS. After trying to overthrow the government in 1899, he was exiled in 1900 but allowed to return in 1905. His patriotic poems include the collection *Chants du soldat* (1872).

Derrida \de-rē-'dä**, Jacques** (b. July 15, 1930, El Biar, Alg.—d. Oct. 8, 2004, Paris, France) Algerian-born French philosopher. Derrida taught principally at the École Normale Supérieure in Paris (1964–84). His critique of Western philosophy encompasses literature, linguistics, and psychoanalysis. His thought is based on his disapproval of the search for an ultimate metaphysical certainty or source of meaning that has characterized most of Western philosophy. Instead, he offers DECONSTRUCTION, which is in part a way of reading philosophic texts intended to make explicit the underlying metaphysical suppositions and assumptions through a close analysis of the language that attempts to convey them. His works on deconstructive theory and method include *Speech and Phenomena* (1967), *Writing and Difference* (1967), and *Of Grammatology* (1967). Among his other works are *Psyche: Invention of the Other* (1987) and *Resistances of Psychoanalysis* (1996).

Derry See LONDONDERRY (DISTRICT); LONDONDERRY (TOWN)

Dershowitz, Alan (Morton) (b. Sept. 1, 1938, Brooklyn, N.Y., U.S.) U.S. lawyer. He graduated from Yale Law School and clerked for Justice ARTHUR GOLDBERG before being appointed to the faculty of Harvard Law School at age 25. Known as a civil liberties lawyer, he appeared for the defense in many highly publicized criminal cases, including those of Claus von Bulow and O.J. SIMPSON. His journal articles and widely syndicated newspaper columns were published in collections such as *The Abuse Excuse* (1994); his other books include *Reasonable Doubts* (1966) and *The Best Defense* (1982).

dervish In Islam, a member of a Sufi fraternity. These mystics stressed emotional aspects of devotion through ecstatic trances, dancing, and whirling. Dervishes can be either resident in the community or lay members; wandering or mendicant dervishes are called fakirs and are often regarded as holy men who possess miraculous powers. Though viewed as unorthodox and extreme by most Muslims, the movement has endured to the present. See also SUFISM.

Derwent \'dər-wənt\ **River** River, Tasmania, Australia. Rising in Lake ST. CLAIR, it flows 113 mi (182 km) southeast to enter Storm Bay through a 3.5-mi- (5.5-km-) wide estuary. Its major upper-course tributaries have been extensively developed for hydropower. The city of HOBART is situated on the estuary, 12 mi (19 km) from the river's mouth. This stretch of the river forms an excellent deepwater port and is spanned by the Tasman Bridge.

Derwent Water Lake, Cumbria, England. Located in the LAKE DISTRICT, it is about 3 mi (5 km) long and 0.5–1.25 mi (0.8–2 km) wide, with a maximum depth of 72 ft (22 m). The River Derwent enters its southern end and leaves the lake's northern end near the market town of Keswick. Several sites on its shores are National Trust property and are frequented by tourists. Lords Island, one of several in the lake, was once the residence of the earls of Derwentwater.

Des Moines \di-'mȯin\ City (pop., 2000: 198,682), capital of Iowa, U.S. Located at the juncture of the Raccoon and DES MOINES rivers, Fort Des Moines was established in 1843 to protect the rights of the Sauk and Fox Indians. The area was opened to white settlers in 1845. East Des Moines developed and by 1856 had amalgamated with Fort Des Moines to form the present city, which became the capital in 1857. The state's largest city, it is a communications hub and a major manufacturing, governmental, and publishing centre (especially for farm journals). It is the site of Drake University (1881).

Des Moines River River, southwestern Minnesota into Iowa, U.S. Rising near PIPESTONE, it flows 525 mi (845 km) southeast to join the Mississippi River near Keokuk, Iowa. Above Humboldt, Iowa, it is known as the West Fork. From the late 1830s until the end of the AMERICAN CIVIL WAR, it was the main commercial artery for central Iowa. It was early utilized for power, and, although none survive, 80 grain mills were built (1840–90) along its banks.

Des Plaines \des-'plānz\ **River** River, northeastern Illinois, U.S. Rising in southeastern Wisconsin, it flows south into Illinois past CHICAGO, to join the Kankakee River after a course of 150 mi (241 km). In 1900 Chicago completed a drainage canal from the southern branch of the CHICAGO RIVER to the Des Plaines. It is part of the Illinois Waterway (1933), which allows modern barge traffic to pass between the GREAT LAKES and the MISSISSIPPI RIVER.

Desai \'dā-ˌsī, de-'sī**, Anita** *orig.* **Anita Mazumdar** (b. June 24, 1937, Mussoorie, India) Indian novelist and author of children's books. Considered India's premier imagist writer, she excels in evoking character and mood through visual images. Her works include *Fire on the Mountain* (1977), *Clear Light of Day* (1980), *Baumgartner's Bombay* (1988), *Journey to Ithaca* (1995), and the story collection *Diamond Dust* (2000).

Desai \de-'sī**, Morarji (Ranchhodji)** (b. Feb. 29, 1896, Bhadeli, Gujarat, India—d. April 10, 1995, Bombay) Prime minister of India (1977–79). The son of a village teacher, he joined the provincial civil service of Bombay (now Mumbai) in 1918. He joined MOHANDAS K. GANDHI's struggle in 1930 and spent almost 10 years in British jails in the 1930s and '40s. In 1969 he became chairman of the opposition to INDIRA GANDHI; he was detained in solitary confinement (1975–77) for his political activities. When elections were held in 1977, he became prime minister; by 1979, however, his coalition had unraveled, and he resigned.

desalination *or* **desalting** Removal of dissolved salts from SEAWATER and from the salty waters of inland seas, highly mineralized GROUNDWATERS, and municipal wastewaters. Desalination makes such otherwise unusable waters fit for human consumption, irrigation, industrial applications, and other purposes. DISTILLATION is the most widely used desalination process; freezing and thawing, electrodialysis, and reverse osmosis are

© 2006 Encyclopædia Britannica, Inc.

also used. All are energy-intensive and therefore expensive. Currently, more than 2 billion gallons (8 million cu m) of fresh water are produced each day by several thousand desalination plants throughout the world, the largest plants being in the Arabian Peninsula.

Descartes \dā-'kärt**, René** (b. March 31, 1596, La Haye, Touraine, France—d. Feb. 11, 1650, Stockholm, Swed.) French mathematician, scientist, and philosopher, considered the father of modern philosophy. Educated at a Jesuit college, he joined the military in 1618 and traveled widely for the next 10 years. In 1628 he settled in Holland, where he would remain until 1649. Descartes's ambition was to introduce into philosophy the rigour and clarity of mathematics. In his *Meditations on First Philosophy* (1641), he undertook the methodical doubt of all knowledge about which it is possible to be deceived, including knowledge based on authority, the senses, and reason, in order to arrive at something about which he can be absolutely certain; using this point as a foundation, he then sought to construct new and more secure justifications of his belief in the existence and immortality of the soul, the existence of God, and the reality of an external world. This indubitable point is expressed in the dictum *Cogito ergo sum* ("I think, therefore I am"). His metaphysical DUALISM distinguished radically between mind, the essence of which is thinking, and matter, the essence of which is extension in three dimensions. Though his metaphysics is rationalistic (see RATIONALISM), his physics and physiology are empiricistic (see EMPIRICISM) and mechanistic (see MECHANISM). In mathematics, he founded ANALYTIC GEOMETRY and reformed algebraic notation.

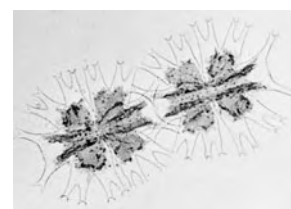
descent System of acknowledged social parentage whereby a person may claim KINSHIP ties with another. Descent systems vary widely. The practical importance of descent comes from its use as a means for individuals to assert rights, duties, privileges, or status. Descent has special influence when rights to succession, INHERITANCE, or residence follow kinship lines. One method of limiting the recognition of kinship is to emphasize the relationship through one parent only. Such unilineal kinship systems are of two main types—patrilineal systems, in which the relationships through the father are emphasized; and matrilineal systems, in which maternal relationships are stressed. These systems differ radically from cognatic systems, in which everyone has similar obligations to, and expectations from, both paternal and maternal kin. The cognatic system is somewhat vague and tends to characterize the more industrialized countries, in which individual rights and duties are increasingly defined institutionally or legally.

desensitization *or* **hyposensitization** Treatment to eliminate allergic reactions (see ALLERGY) by injecting increasing strengths of purified extracts of the substance that causes the reaction. This creates special ANTIBODIES (blocking antibodies) in the patient's serum that combine with the allergen, blocking its reaction with allergic antibodies. Desensitization can also be required when a penicillin-sensitive person needs to be treated with PENICILLIN. See also ANAPHYLAXIS, ANTIGEN.

desert Large, extremely dry area of land with fairly sparse vegetation. It is one of the Earth's major types of ecosystems. Areas with a mean annual precipitation of 10 in. (250 mm) or less are generally considered deserts. They include the high-latitude circumpolar areas as well as the more familiar hot, arid regions of the low and mid-latitudes. Desert terrain may consist of rugged mountains, high plateaus, or plains; many occupy broad mountain-rimmed basins. Surface materials include bare bedrock, plains of gravel and boulders, and vast tracts of shifting sand. Wind-blown sands, commonly thought to be typical of deserts, make up only about 2% of North American deserts, 10% of the Sahara, and 30% of the Arabian desert.

Agave shawii growing in a desert in North America.
© ROBERT AND LINDA MITCHELL

desert varnish *or* **patina** Thin, dark red to black mineral coating (generally iron and manganese oxides and silica) deposited on pebbles and rocks on the surface of desert regions. As dew and soil moisture brought to the surface by capillary action evaporate, their dissolved minerals are deposited on the surface. Wind abrasion removes the softer salts and polishes the surface to a glossy finish. Both high evaporation rates and sufficient precipitation are necessary for desert varnish to form.



desertification Spread of a desert environment into arid or semiarid regions, caused by climatic changes, human influence, or both. Climatic factors include periods of temporary but severe drought and long-term climatic changes toward dryness. Human factors include artificial climatic alteration, as through the removal of vegetation (which can lead to unnaturally high EROSION), excessive cultivation, and the exhaustion of water supplies. Desertification drains an arid or semiarid land of its life-supporting capabilities. It is characterized by a declining GROUNDWATER table, salt accumulation in topsoil and water, a decrease in surface water, increasing erosion, and the disappearance of native vegetation.

Desiderio da Settignano \dā-sē-'der-yō-dä-ˌsät-tēn-'yä-nō\ (b. c. 1430, Settignano, republic of Florence—d. January 1464, Florence) Italian sculptor. Born into a family of stonemasons, he entered the Stone and Wood Carvers' Guild of Florence in 1453. He based his style on DONATELLO's work of the 1430s, and his skill as a marble cutter established him as a master of bas-relief. His delicate, sensitive, original technique was best expressed in portrait busts of women and children. His most important public work was the tomb of Carlo Marsuppini in the church of Santa Croce; the tomb's rich architectural detail makes it one of the most outstanding of all Florentine wall monuments.

designer drug Synthetic version of a controlled narcotic substance. Designer drugs usually are synthesized for the first time in an attempt to create a chemical whose molecular structure differs only slightly from that of some well-known controlled substance but whose effects are essentially the same. Because of the difference in molecular structure, the designer drug, unlike the controlled substance, ordinarily will not be specifically listed as illicit by law-enforcement organizations. Many designer drugs are manufactured in clandestine laboratories, often by amateurs; for this reason they are sometimes more dangerous than the drugs they are intended to replace. One of the best-known is MDMA (3,4-methylenedioxymethamphetamine), a variation of methamphetamine, popularly called ECSTASY. Nonnarcotic synthetic chemical compounds designed to interact with specific proteins and enzymes in order to combat disease also have been called designer drugs.

desktop publishing (DTP) Use of a personal computer to perform publishing tasks. DTP allows an individual to combine text, numerical data, and graphic elements in a document that can be output on a printer or a phototypesetter. A typical DTP system includes a personal computer, a high-resolution printer, and input devices such as an optical SCANNER. Text and graphic elements are commonly created or manipulated with several separate software programs and then combined with a page-makeup program. Powerful DTP programs offer full-featured graphics capabilities.

desmid \'dez-məd\ Any of a group of one-celled, microscopic green ALGAE characterized by great variation in cell shape. Typically the cell is divided symmetrically into semicells connected at a central point. Desmids are found worldwide, usually in acid bogs or lakes. Since most species have a limited range, the presence of specific desmids is helpful in characterizing water samples.

Desmid (*Micrasterias*), highly magnified
WINTON PATNODE—PHOTO RESEARCHERS

Desmond Ancient territorial division, Ireland. From the 11th to the

© 2006 Encyclopædia Britannica, Inc.

17th century, the name was often used for two quite distinct areas. Gaelic Desmond extended over part of modern Counties Kerry and Cork; Anglo-Norman Desmond extended over northern Kerry, most of the modern county of Limerick, southwestern Tipperary, eastern and southern County Cork, and eastern Waterford.

Desmoulins \dā-mü-'la^{n}**, (Lucie-Simplice-) Camille (-Benoist)** (b. March 2, 1760, Guise, France—d. April 5, 1794, Paris) French journalist influential in the French Revolution. Though a stammer had impeded him as a lawyer, he suddenly emerged as an inspiring orator when the Revolution began, inciting the storming of the Bastille. In his pamphlets and newspapers he campaigned for the deposition of the king and the establishment of a republic. Elected to the National Convention, he joined other MONTAGNARDS in a struggle against the GIRONDINS. Later he and GEORGES DANTON became leaders of a moderate faction, the Indulgents. After attacking the Committee of Public Safety's REIGN OF TERROR, he was guillotined along with other Dantonists.

Dessalines \ˌdā-sə-'lēn**, Jean-Jacques** (b. c. 1758, West Africa—d. Oct. 17, 1806, Jacmel, Haiti) Emperor of Haiti who drove out the French in 1804. He was a slave of a black master in Saint-Domingue (Haiti) in 1791 when he joined a slave rebellion. He became a lieutenant of TOUSSAINT-LOUVERTURE but submitted to the French expedition that deposed Toussaint in 1802. NAPOLEON's decision to reintroduce slavery led Dessalines and others to rebel, and with British help they expelled the French. In 1804 Dessalines proclaimed the island independent under its Arawakan name, Haiti, and proclaimed himself emperor the following year. He made it illegal for whites to own property and killed thousands; he also discriminated against mulattoes. He was killed during a mulatto revolt.

destroyer Fast naval vessel used to protect other ships. The term was first applied to vessels built in the 1890s to protect BATTLESHIPS from TORPEDO boats. By World War I destroyers were often sent ahead of the battle fleet to scout for the enemy, beat back its destroyers with CANNON fire, and then launch torpedoes against its battleships and CRUISERS. When the SUBMARINE became the main torpedo-launching vessel, destroyers armed with DEPTH CHARGES protected convoys and battle fleets against submarine attack. In World War II, with the addition of RADAR and ANTIAIRCRAFT guns, its escort role included air defense. Modern destroyers are run by a crew of about 300 and equipped with surface-to-air missiles, antiship missiles, and one or two big guns. Many carry submarine-hunting helicopters, and some carry CRUISE MISSILES.

detached retina Separation of most layers of the RETINA of the eye from the choroid, the pigmented middle layer of the eyeball. With age, small tears can develop in the retina, and the vitreous humour inside the eyeball leaks through, separating the retina from the choroid. The disease retrolental fibroplasia or accidents can also cause retinal detachment. It usually develops slowly, without pain. Floating black spots and flashes of light appear in the affected eye, and vision becomes increasingly blurred. Without prompt treatment, it causes permanent blindness. Draining the fluid behind the retina and applying heat, a laser beam, or extreme cold causes scarring that seals the tears and prevents the retina from detaching again.

detective story Type of popular literature dealing with the step-by-step investigation and solution of a crime, usually murder. The first detective story was EDGAR ALLAN POE's "The Murders in the Rue Morgue" (1841). The genre soon expanded to novel length. Sherlock Holmes, the first fictional detective to become a household name, first appeared in Arthur CONAN DOYLE's *A Study in Scarlet* (1887). The 1930s was the golden age of the detective novel, exemplified by the books of DASHIELL HAMMETT. The introduction of mass-produced paperback books in the late 1930s made detective stories readily accessible to a wide public, and well-known fictional detectives were created by G.K. CHESTERTON, AGATHA CHRISTIE, DOROTHY SAYERS, RAYMOND CHANDLER, MICKEY SPILLANE, and GEORGES SIMENON. Among present-day mystery writers P.D. James and Dick Francis rank high.

détente \dā-'tänt\ Period of the easing of COLD WAR tensions between the U.S. and the Soviet Union from 1967 to 1979. The era was a time of increased trade and cooperation with the Soviet Union and the signing of the SALT treaties. Relations cooled again with the Soviet invasion of Afghanistan.

detergent Any of various surfactants (substances that reduce SURFACE TENSION) used to dislodge dirt from soiled surfaces and retain it in suspension, allowing it to be rinsed away. The term usually refers to synthetic substances and excludes SOAPS. The characteristic features of a molecule of any detergent are a hydrophilic (water-attracting) end and a hydrophobic (oil-attracting) end. In ionic detergents, the hydrophilic property is conferred by the ionized part of the molecule. In nonionic detergents, hydrophilicity is based on the presence of multiple hydroxyl groups or other hydrophilic groups. Besides those used in water to clean dishes and laundry, detergents that function in other SOLVENTS are used in lubricating oils, gasolines, and dry-cleaning solvents to prevent or remove unwanted deposits. They are also used as emulsifying agents (see EMULSION).

determinant In LINEAR ALGEBRA, a numerical value associated with a MATRIX having the same number of rows as columns. It is particularly useful in solving SYSTEMS OF (LINEAR) EQUATIONS and in the study of VECTORS. For a two-by-two matrix, the determinant is the product of the upper left and lower right terms minus the product of the lower left and upper right terms. Determinants of larger matrices involve more complicated arithmetic combinations of the terms and are usually solved using a calculator or computer.

determinism In philosophy, the doctrine that all events, including human decisions, are completely determined by previously existing causes. The traditional FREE WILL PROBLEM arises from the question, Is moral responsibility consistent with the truth of determinism? Among those who believe it is not consistent, some, maintaining the truth of determinism, have concluded that no one is morally responsible for what he does (and therefore that punishment for criminal actions is unjustified); others, maintaining the reality of moral responsibility, have concluded that determinism is false. Those who believe that moral responsibility is consistent with determinism are known as compatibilists (see COMPATIBILISM). PIERRE-SIMON LAPLACE is responsible for the classical formulation of determinism in the 18th century. For Laplace, the present state of the universe is the effect of its previous state and the cause of the state that follows it. If a mind, at any given moment, could know all the laws and all the forces operating in nature and the respective positions and momenta of all its components, it could thereby know with certainty the future and the past of every entity.

deterrence Military strategy whereby one power uses the threat of reprisal to preclude an attack from an adversary. The term largely refers to the basic strategy of the nuclear powers and the major alliance systems. The premise is that each nuclear power maintains a high level of instant and overwhelming destructive capability against any aggressor. It relies on two basic conditions: the ability to retaliate after a surprise attack must be perceived as credible, and retaliation must be perceived as a possibility, if not a certainty.

Detroit City (pop., 2000: 951,270), largest in Michigan, U.S. Located on the DETROIT RIVER and founded by the French in 1701, it became a trading centre for the GREAT LAKES region. It surrendered to the British during the FRENCH AND INDIAN WAR, then came under U.S. control in 1796. The capital of Michigan from 1805 to 1847, it grew as one of the country's shipping and flour-milling centres. In the 20th century it became the automobile capital of the world with the help of HENRY FORD. The city's industrial growth attracted migrants, at first Europeans and later Southern blacks, who by 1990 made up three-fourths of the population. The decline in the area's automotive industry brought economic hardship in the late 20th century. Wayne State University (1868) is the city's oldest college.

Detroit River River, southeastern Michigan, U.S. Forming part of the boundary between Michigan and Ontario, Can., it connects Lake ST. CLAIR with Lake ERIE. It flows south for 32 mi (51 km) past DETROIT and WINDSOR, Ont., where a bridge and tunnel connect the two cities. The largest islands in the river are Belle Isle (a city park of Detroit) and Grosse Ile (a residential area with an airport), both in Michigan, and Fighting Island in Ontario. The river is heavily used by both pleasure craft and GREAT LAKES shipping.

deus ex machina \'dā-əs-ˌeks-'ma-ki-nə, 'dā-əs-ˌeks-mə-'shē-nə\ Stage device in Greek and Roman drama in which a god appeared in the sky by means of a crane (Greek, *mechane*) to resolve the plot of a play. Plays by SOPHOCLES and particularly EURIPIDES sometimes require the device. The term now denotes something that appears suddenly and unexpectedly and provides an artificial solution to an apparently insoluble difficulty.

deuterium \dü-'tir-ē-əm\ *or* **heavy hydrogen** ISOTOPE of HYDROGEN, chemical symbol ^{2}H or D, atomic number 1 (but atomic weight approxi-

© 2006 Encyclopædia Britannica, Inc.

mately 2). HAROLD C. UREY won a Nobel Prize for its discovery and isolation. Its nucleus contains one PROTON and one NEUTRON. A stable substance found in naturally occurring hydrogen compounds to the extent of about 0.015%, deuterium can be purified by DISTILLATION of hydrogen or by ELECTROLYSIS OF WATER. It enters into all the same chemical reactions as ordinary hydrogen; it forms D_2 and HD, analogous to molecular hydrogen (H_2), and D_2O (HEAVY WATER), analogous to ordinary water (H_2O). NUCLEAR FUSION of deuterium atoms or of deuterium and TRITIUM at high temperatures releases enormous amounts of ENERGY. Such reactions have been used in NUCLEAR WEAPONS and experimental power reactors. Deuterium is useful as a tracer in research into reaction mechanisms and biochemical pathways.

deuterium oxide See HEAVY WATER

Deuteronomic Reform \ˌdü-tə-rə-ˈnä-mik\ Religious reformation in JUDAH during the reign of King JOSIAH (c. 640–609 BC). As Assyria's hold on Israel weakened, Josiah waged a campaign against foreign cults and had their altars and idols removed from the Temple. He called for a return to the observance of Mosaic Law, based on the book of the Law discovered in the Temple of JERUSALEM (c. 622 BC), believed to be the same book as the law code in the Book of Deuteronomy. Rural sanctuaries and fertility cults were destroyed and the worship of Yahweh (the God of Israel) was centralized at Jerusalem.

deva \ˈdā-və, ˈdē-və\ (Sanskrit: "divine") In the VEDIC RELIGION of India, one of many divine powers, roughly divided into sky, air, and earth divinities. During the Vedic period, the gods were divided into two classes, the devas and the *asura*s. In India the *deva*s gradually came to be more powerful, and the *asura*s came to be thought of as DEMONS. In the monotheistic systems that emerged by the late Vedic period, the *deva*s were subordinate to one supreme being.

devaluation Reduction in the exchange value of a country's monetary unit in terms of gold, silver, or foreign CURRENCY. By decreasing the price of the home country's exports abroad and increasing the price of imports in the home country, devaluation encourages the home country's export sales and discourages expenditures on imports, thus improving its BALANCE OF PAYMENTS.

devaraja \ˌdā-və-ˈrä-jä\ In ancient Cambodia, the cult of the "god-king," established early in the 9th century by Jayavarman II (c. 770–850), founder of the Khmer empire. The cult taught that the king was a manifestation of the god Shiva. For centuries it provided Khmer kings with the religious basis of their royal authority.

development, biological Gradual changes in size, shape, and function during an organism's life that translate its genetic potentials (GENOTYPE) into functioning mature systems (PHENOTYPE). It includes growth but not repetitive chemical changes (METABOLISM) or changes over more than one lifetime (EVOLUTION). DNA directs the development of a fertilized egg so that cells become specialized structures that carry out specific functions. In humans, development progresses through the EMBRYO and FETUS stages before birth and continues during childhood. Other mammals follow a similar course. Amphibians and insects go through distinctive stages that are quite different. In plants, the basic pattern is determined by the arrangement of lateral buds around a central growing stem. Different rates of growth of the plant's component elements then determine its shape and that of various parts. In both animals and plants, growth is greatly influenced by HORMONES; factors within individual cells probably also play a role.

development bank National or regional financial institution designed to provide medium- and long-term capital for productive investment. Such investment is usually accompanied by technical assistance. Some development banks are government-owned and -operated, while others are private. Many have been established under the auspices of the WORLD BANK. Among the largest are the Inter-American Development Bank, the Asian Development Bank, and the African Development Bank.

developmental psychology Branch of PSYCHOLOGY concerned with changes in cognitive, motivational, psychophysiological, and social functioning that occur throughout the human life span. In the late 19th and early 20th centuries, developmental psychologists were concerned primarily with CHILD PSYCHOLOGY. In the 1950s they became interested in the relationship between child rearing and adult personality, as well as in examining adolescence in its own right. By the late 20th century they had become interested in all aspects of PSYCHOLOGICAL DEVELOPMENT and change over the entire life span.

Devi \ˈdā-vē\ Term used to designate a goddess in HINDUISM. It is sometimes used as an honorific title for women, and it may also refer to local female divinities throughout India. In the 5th–6th century, Hindu texts first began to identify Devi as the Great Goddess and the embodiment of matter, energy, and illusion. She is represented in a variety of aspects, both good and evil, including the beautiful but menacing DURGA, the destructive KALI, and the sexually powerful Shakti (see SHAKTI).

devil Spirit or power of evil. Though sometimes used to refer to DEMONS, the term more often designates the prince of evil spirits. In the BIBLE the Devil is known as Satan, Beelzebub, and LUCIFER. In JUDAISM, Satan emerges as subservient to God and as an adversary and accuser of Job and other humans. In postbiblical traditions he emerges as the tempter of humankind and is responsible for all the sins in the Bible. Christian theology holds that his main task is to tempt humans to reject the way of life and redemption in favour of SIN and death. In the Qur'ān the Devil is frequently associated with IBLĪS; he tempts the unfaithful but not the true believer. In HINDUISM there is no principal devil, although there are a variety of demons or devilish beings. BUDDHISTS also recognize the existence of many demons, and MARA, the BUDDHA's opponent and tempter, is sometimes identified as a specific devil.

devil ray See MANTA RAY

Devils Island *French* **Île du Diable** \ˌēl-düē-ˈdyäblᵊ\ Rocky islet off the Atlantic coast of FRENCH GUIANA. The smallest of the three Îles du Salut, it is a narrow strip of land 3,900 ft (1,200 m) long and 1,320 ft (400 m) wide. Part of a penal settlement since 1852, it housed the convicts' leper colony until the islands were made a maximum-security area. It shared the notoriety for cruelty of the mainland French Guiana penal colony. Spies and political prisoners, including ALFRED DREYFUS, were held there. The island's use as a penal colony was phased out by the early 1950s.

Devils Tower National Monument National preserve, northeastern Wyoming, U.S. The first U.S. national monument, it was established in 1906 near the Belle Fourche River. It includes 1,347 acres (545 hectares) and features a natural rock tower, the remnant of a volcanic intrusion now exposed by erosion. The tower has a flat top and is 865 ft (264 m) high.

Devolution, War of (1667–68) Conflict between France and Spain over possession of the SPANISH NETHERLANDS. LOUIS XIV began the war on the pretext that the custom of devolution, whereby daughters of a first marriage were preferred to sons of subsequent marriages regarding property inheritance, should apply to sovereign territories also. That would mean that his wife, Marie-Thérèse (1638–1683), should succeed her father, PHILIP IV, in the Spanish Netherlands. The French army advanced into Flanders in May 1667 and easily secured its objectives. A peace was reached at Aix-la-Chapelle, whereby France gave up Franche-Comté but retained conquered towns in Flanders.

Devon \ˈde-vən\ Administrative (pop., 2001: 704,499), geographic, and historic county, southwestern England. It lies between CORNWALL, DORSET, and SOMERSET, and it has coasts on the BRISTOL CHANNEL and ENGLISH CHANNEL. EXETER is its long-established county seat. Its area includes the moorlands of Dartmoor, inhabited from prehistoric times and now a popular tourist area. Livestock-based agriculture is the main industry; Devonshire clotted cream is still produced.

Devonian \di-ˈvō-nē-ən\ **Period** Interval of geologic time from 417 to 354 million years ago; it was the fourth period of the PALEOZOIC ERA. During the Devonian, a giant continent was situated in the Southern Hemisphere (see GONDWANA), and other landmasses were located in the equatorial regions. Siberia was separated from Europe by a broad ocean, and North America and Europe were joined. Many types of primitive marine and freshwater fish appeared and proliferated, and the period is sometimes referred to as the Age of Fishes. Ferns and primitive GYMNOSPERMS diversified and created the first forests.

Devrient, Wilhelmine Schröder- See Wilhelmine SCHRÖDER-DEVRIENT

Devrient \dəv-rē-ˈaⁿ, dev-ˈrēnt\ **family** German theatrical family. Ludwig Devrient (1784–1832) was the greatest actor of the Romantic period in Germany. At the Dessau court theatre he developed his talent for character parts. After his Berlin debut in *The Robbers* (1814), he played Falstaff, Shylock, King Lear, and Richard III to great acclaim. His eldest

© 2006 Encyclopædia Britannica, Inc.

nephew, Karl August Devrient (1797–1872), acted in Dresden, Karlsruhe, and principally Hannover (1839–72), where he was popular in plays by Shakespeare, Goethe, and Schiller. Karl's brother Eduard (1801–77) began his career as an opera singer, then worked as an actor and stage director in Dresden (1844–52) and Karlsruhe (1852–70), where he directed German classics and made new translations of Shakespeare's plays. Karl's other brother, Emil (1803–72), made his stage debut in 1821 and acted with the Dresden court theatre (1831–68); his greatest successes were as Hamlet and as Goethe's Tasso. Eduard's son Otto (1838–94) acted in various companies, then became a director in Karlsruhe and other German cities. In Weimar he produced his own version of Goethe's *Faust* (1876); he also wrote several tragedies. Karl's son Max (1857–1929) made his debut in Dresden in 1878 and in 1882 joined the famed Vienna Burgtheater.

dew Deposit of water droplets formed at night by the condensation of water vapour from the air onto the surfaces of exposed objects. Dew forms on clear nights, when exposed surfaces lose heat by radiation and are thus usually colder than the air. The cold surface cools the air in its vicinity, and, if the air is humid enough, it may cool below its dew point, the temperature at which water vapour condenses out of the air onto the surface. See also FROST.

Dewar \'d(y)ü-ər**, Sir James** (b. Sept. 20, 1842, Kincardine-on-Forth, Scot.—d. March 27, 1923, London, Eng.) British chemist and physicist. In 1891 he built a machine for producing liquid oxygen in quantity. His Dewar flask for storing liquefied gases—a double-walled flask has insulating vacuum between the inner and outer walls—became essential in low-temperature scientific work; its principle is used in the Thermos bottle. Dewar was the first to liquefy and solidify hydrogen, and his 1905 discovery that cooled charcoal can help create high vacuums was useful in atomic physics.

dewberry Any BLACKBERRY (genus *Rubus*) that is so lacking in woody fibre in the stems that it trails along the ground. In the eastern and southern U.S., several trailing native species of *Rubus*, especially *R. flagellaris*, *R. baileyanus*, *R. hispidus*, *R. enslenii*, and *R. trivialis*, produce excellent fruits. Some varieties, especially Lucretia, are cultivated.

Dewey, George (b. Dec. 26, 1837, Montpelier, Vt., U.S.—d. Jan. 16, 1917, Washington, D.C.) U.S. naval commander. He graduated from the U.S. Naval Academy in 1858 and served with Union naval forces in the AMERICAN CIVIL WAR. In 1897 he commanded the U.S. Asiatic Squadron. In the SPANISH-AMERICAN WAR he sailed from Hong Kong to the Philippines to defeat the Spanish fleet at the BATTLE OF MANILA BAY (1898); he opened fire with the command, "You may fire when you are ready, Gridley." His victory, with no loss of U.S. ships, led to U.S. acquisition of the Philippines. In 1899 Congress created for him the rank of admiral of the navy.

George Dewey
BROWN BROTHERS

Dewey, John (b. Oct. 20, 1859, Burlington, Vt., U.S.—d. June 1, 1952, New York, N.Y.) U.S. philosopher and educator who was one of the founders of PRAGMATISM, a pioneer in functional psychology, and a leader of the Progressive movement in U.S. education. He received a Ph.D. (1884) from Johns Hopkins University and taught 10 years at the University of Michigan before moving to the University of Chicago. Influenced by G. STANLEY HALL and WILLIAM JAMES, he developed an instrumentalist theory of knowledge that conceived of ideas as tools for the solution of problems encountered in the environment. Believing the experimental methods of modern science provided the most promising approach to social and ethical problems, he applied this view to studies of democracy and liberalism. He asserted that democracy provided citizens with the opportunity for maximum experimentation and personal growth. His writings on education, notably *The School and Society* (1899) and *The Child and the Curriculum* (1902), emphasized the interests of the child and the use of the classroom to cultivate the interplay between thought and experience. At Chicago he created laboratory schools to test his theories. His work in psychology focused on the total organism in its efforts to adjust to the environment. In 1904 Dewey joined the Columbia University faculty. In 1925 he published his magnum opus, *Experience and Nature*.

Dewey, Melvil(le Louis Kossuth) (b. Dec. 10, 1851, Adams Center, N.Y., U.S.—d. Dec. 26, 1931, Lake Placid, Fla.) U.S. librarian. He graduated from Amherst College in 1874, whereupon he became acting librarian there. In 1876 he published *A Classification and Subject Index for Cataloguing and Arranging the Books and Pamphlets of a Library*, in which he outlined the DEWEY DECIMAL CLASSIFICATION system. He was one of the founders of the American Library Association and of *Library Journal* (both 1876). He set up the School of Library Economy, the first U.S. institution for training librarians. He also reorganized the N.Y. State Library (1889–1906) and established the system of traveling libraries and picture collections. A cofounder of the Spelling Reform Assn., he respelled his own name.

Dewey, Thomas E(dmund) (b. March 24, 1902, Owosso, Mich., U.S.—d. March 16, 1971, Bal Harbour, Fla.) U.S. attorney and politician. He became an assistant U.S. attorney in New York in 1931 and was elected district attorney in 1937. His successful prosecution of organized-crime figures won him three terms as governor of New York (1943–55), during which he pursued policies of political and fiscal moderation. He received the Republican presidential nomination in 1944 but was soundly defeated by FRANKLIN D. ROOSEVELT; nominated again in 1948, he was widely predicted to defeat the incumbent, HARRY S. TRUMAN, but Truman retained the vote of farmers and labour to prevail. Dewey retired from politics in 1955 but continued to advise Republican administrations.

Dewey Decimal Classification *or* **Dewey Decimal System** System for organizing the contents of a library based on the division of all knowledge into 10 groups. Each group is assigned 100 numbers. Subdivisions eventually extend into decimal numbers; for example, the history of England is placed at 942, the history of the Stuart period at 942.06, and the history of the English Commonwealth at 942.063. The system was first formulated in 1873 by MELVIL DEWEY. Many libraries add a book number created from the Cutter, or Cutter-Sanborn, Tables, which further specify author and genre. The LIBRARY OF CONGRESS CLASSIFICATION has largely replaced the Dewey system.

dextrose See GLUCOSE

Dezhnev \'dezh-nyif**, Cape** *Russian* **Mys Deshneva** \'mȯs-dezh-'nyȯ-və\ Cape, extreme eastern Russia. It is the easternmost point of the Chukchi Peninsula and of the entire Eurasian landmass. It is separated from Cape Prince of Wales in Alaska by the Bering Strait (see BERING SEA).

Dga'l-dan *or* **Galdan** \'gäl-'dän\ (b. 1644?, Central Asia—d. May 3, 1697, East Turkistan) Leader of the Dzungar tribes of MONGOLS, who built an empire that reached from Tibet in the southwest to the borders of Russia in the northeast. As a younger son of a powerful chief, Dga'l-dan was sent to Tibet, where he was trained as a Buddhist LAMA. His older brother's death gave Dga'l-dan the opportunity to exercise political power; he avenged the death and went on to conquer eastern Turkistan (modern Sichuan, China) and Outer Mongolia. He led his armies toward Beijing but was defeated by the KANGXI EMPEROR, who personally led some 80,000 troops armed with Western artillery.

Dge-lugs-pa *or* **Gelukpa** \'gā-lük-bä\ Yellow Hat sect of TIBETAN BUDDHISM, the chief religion in Tibet since the 17th century. It was founded in the 14th century by Tsong-kha-pa (1357–1419). His reforms included strict monastic discipline, celibacy, and improved education for monks. The head of the chief monastery at Lhasa first received the title of DALAI LAMA from ALTAN Khan in 1578. With his aid the Dge-lugs-pa triumphed over the Karma-pa, or Red Hat, sect. The Dge-lugs-pa ruled Tibet until the Chinese Communist takeover (1950); the sect continues to exist, but many of its members, including the Dalai Lama, remain in exile.

Dhaka *or* **Dacca** \'da-kə, 'dä-kə\ City (pop., 2001 prelim.: city, 5,644,235; metro. area, 10,403,597), capital of BANGLADESH. It can be traced to the 1st millennium AD, but it did not rise to prominence until the 17th century, when it served as the MUGHAL capital of BENGAL province. It came under British control in 1765 and was the capital of Eastern Bengal and ASSAM province (1905–12). The capital of East Bengal province in 1947 and of East Pakistan in 1956, it suffered heavy damage during Bangladesh's war of independence in 1971. Together with its port, Dhaka is

© 2006 Encyclopædia Britannica, Inc.

the country's leading industrial centre. Its historic buildings include temples, churches, and more than 700 mosques, some of which date to the 15th century.

Bayt ul-Mukarram mosque and shopping mall, Dhaka, Bangladesh.
FREDERIC OHRINGER—NANCY PALMER AGENCY/EB INC.

Dhar \'där\ Town (pop., 2001 prelim.: 75,472), western Madhya Pradesh state, central India. On the northern slopes of the Vindhya Range, it commands one of the gaps leading to the Narmada River valley. An ancient town, it was famous as the capital of the Rajputs (9th–14th centuries). It was conquered by the Muslims in the 14th century, was under Mughal dominion, and fell to the Marathas in 1730. Long a centre of culture and learning, its fine historic sites include the Pillar Mosque (1405), built out of the remains of Jaina temples.

dharma In Hinduism, the religious and moral law governing individual and group conduct. It is treated in the dharmasutras, the oldest collection of Hindu laws, and in the compilations of law and custom called the dharmashastras. In Buddhism, dharma is the universal truth common to all individuals at all times, and it is regarded as one of the primary sources of Buddhist doctrine and practice. In Jainism, dharma signifies moral virtue as well as the eternal life force.

Dhiban See Dibon

Dhofar Liberation Front See Popular Front for the Liberation of Oman

dhow \'daù\ One- or two-masted Arab sailing vessel, usually with lateen rigging (slanting, triangular sails), common on the Red Sea and the Indian Ocean. On the larger types, called baggalas and booms, the mainsail is considerably bigger than the mizzensail. Bows are sharp, with a forward and upward thrust, and the sterns of the larger dhows may be windowed and decorated.

Di Prima \di-'prē-mə**, Diane** (b. Aug. 6, 1934, New York, N.Y., U.S.) U.S. poet. Di Prima settled in Greenwich Village and became one of the few women to attain prominence in the Beat movement. In 1961 she cofounded *Floating Bear*, a monthly featuring notable Beat writers. Her collections include *Earthsong* (1968), *The Book of Hours* (1970), and *Pieces of a Song* (1990). She also founded two publishing houses that specialized in young poets. In 2001 she published *Recollections of My Life as a Woman: The New York Years*.

diabase *or* **dolerite** Fine- to medium-grained, dark gray to black intrusive igneous rock. Diabase is one of the dark rocks known commercially as "black granite." It is extremely hard and tough and is commonly quarried for crushed stone, under the name "trap." Chemically and mineralogically, diabase closely resembles the volcanic rock basalt, but it is generally somewhat coarser grained.

diabetes insipidus \ˌdī-ə-'bē-tēz-in-'si-pə-dəs\ Endocrine disorder causing extreme thirst and excessive production of very dilute urine, apparently due to lack of antidiuretic hormone (vasopressin), which regulates the kidney's water conservation and urine production) or failure of the kidney tubules to respond to it. Injections of synthetic vasopressin are effective if the hormone is lacking but not if the response is absent. Disorders of the hypothalamus are one cause of diabetes insipidus.

diabetes mellitus \'mel-ət-əs\ Disorder of insufficient production of or reduced sensitivity to insulin. Insulin, synthesized in the islets of Langerhans (see Langerhans, islets of), is necessary to metabolize glucose. In diabetes, blood sugar levels increase (hyperglycemia). Excess sugar is excreted in the urine (glycosuria). Symptoms include increased urine output, thirst, weight loss, and weakness. Type 1, or insulin-dependent diabetes mellitus (IDDM), an autoimmune disease in which no insulin is produced, must be treated by insulin injections. Type 2, or non-insulin-dependent diabetes mellitus (NIDDM), in which tissues do not respond to insulin, is linked to heredity and obesity and may be controlled by diet; it accounts for 90% of all cases, many of which go undiagnosed for years. Untreated diabetes leads to accumulation of ketones in the blood, followed by acidosis (high blood acid content) with nausea and vomiting and then coma. Careful attention to content and timing of meals, with periodic checking of blood sugar, may manage diabetes. If not, injected or oral insulin is necessary. Complications, including heart disease, diabetic retinopathy (a leading cause of blindness), kidney disease, and nerve disorders, especially in the legs and feet, account for most deaths. Degree of blood-sugar control does not always correlate with progression of complications. Gestational diabetes may occur as a complication of pregnancy.

diagenesis Sum of all processes, chiefly chemical, that produce changes in a sediment after its deposition but before its final lithification. Usually, not all the minerals in a sediment are in chemical equilibrium, so changes in interstitial water composition or in temperature or in both will lead to chemical alteration of one or more of the minerals present. Diagenesis is considered a relatively low-pressure, low-temperature alteration process that involves such processes as cementation, reworking, replacement, crystallization, and leaching.

Diaghilev \dē-'ä-gə-ˌlef**, Sergey (Pavlovich)** (b. March 31, 1872, Novgorod province, Russia—d. Aug. 19, 1929, Venice, Italy) Russian impresario, founder-director of the Ballets Russes. After studying law at the University of St. Petersburg (1890–96), he cofounded and edited (1899–1904) the avant-garde magazine *Mir Iskusstva* ("World of Art"). He then left Russia for Paris to present productions of Russian ballet and opera, to wide acclaim. In 1909 he established the Ballets Russes, in which he achieved a stunning synthesis of dance, art, and music by bringing together superb choreographers, dancers, composers, and artists and set designers. He led the company until his death.

Sergey Diaghilev, c. 1916.
DANCE COLLECTION, THE NEW YORK PUBLIC LIBRARY AT LINCOLN CENTER, ASTER, LENOX AND TILDEN FOUNDATIONS

diagnosis Identification of a disease or disorder. Diagnosis requires a medical history (including family history), a physical examination, and usually tests and diagnostic procedures (e.g., blood analysis, diagnostic imaging). A list of possible causes—the differential diagnosis—is developed and then narrowed down by further tests that eliminate or support specific possibilities.

diagnostic imaging *or* **medical imaging** Use of electromagnetic radiation to produce images of internal body structures for diagnosis. X-rays have been used since 1895. Denser tissues, such as bones, absorb more X-rays and show as lighter areas on X-ray film. A contrast medium can be used to highlight soft tissues in still X-ray pictures or can be followed on X-ray motion-picture films as it moves through the body or part of the body to record body processes. In computed axial tomography, X-rays are focused on specific tissue planes, and a series of such parallel "slices" of the body are processed by computer to produce a 3-D image. The risks of X-ray exposure are reduced by more precise techniques using lower doses and by use of other imaging techniques. See also angiocardiography; angiography; magnetic resonance imaging; nuclear medicine; positron emission tomography; ultrasound.

dial gauge Any of a number of deviation-type gauges that indicate the amount by which an object being gauged deviates from the standard. This deviation is usually shown in units of measurement, but some gauges show only whether the deviation is within a certain range. They include dial indicators, in which movement of a gauging spindle deflects a pointer on a graduated dial; wiggler indicators, used by machinists to centre or align work in machine tools; comparators, or visual gauges; and air gauges, used to gauge holes of various types.

dialect Variety of a language spoken by a group of people and having features of vocabulary, grammar, and/or pronunciation that distinguish it from other varieties of the same language. Dialects usually develop as a result of geographic, social, political, or economic barriers between groups of people who speak the same language. When dialects diverge to the point that they are mutually incomprehensible, they become languages

© 2006 Encyclopædia Britannica, Inc.

in their own right. This was the case with Latin, various dialects of which evolved into the different Romance languages. See also koine.

dialectical materialism Philosophical approach expressed through the writings of Karl Marx and Friedrich Engels, and later by Georgy Plekhanov, Vladimir Ilich Lenin, and Joseph Stalin, the official philosophy of communism. Its central tenet, borrowed from Hegelianism, is that all historical growth, change, and development results from the struggle of opposites. (In philosophical terms, a thesis is opposed by its antithesis, which results in a synthesis.) Specifically, it is the class struggle—the struggle between the capitalist and landowning classes, on the one hand, and the proletariat and peasantry, on the other—that creates the dynamic of history. The laws of historical dialectics are seen to be so powerful that individual leaders are of little historical consequence. Originally conceived as operating primarily in the social, economic, and political realm, the principle was extended in the 20th century to the scientific realm as well, with major effects on Soviet science. Marx and Engels stated their philosophical views mainly in the course of polemics and brief historical studies; there is no systematic exposition of dialectical materialism.

dialysis \dī-'a-lə-səs\ In chemistry, separation of suspended colloidal (see colloid) particles from dissolved ions or small molecules via their unequal rates of diffusion through pores of semipermeable membranes (e.g., parchment, collodion, cellophane). A slow process, dialysis may be accelerated by heating or by applying an electric field if the particles are charged.

dialysis \dī-'a-lə-səs\ *or* **hemodialysis** \ˌhē-mō-dī-'a-lə-səs\ Process of removing blood from a patient with kidney failure, purifying it with a hemodialyzer (artificial kidney), and returning it to the bloodstream. Many substances (including urea and inorganic salts) in the blood pass through a porous membrane in the machine into a sterile solution; particles such as blood cells and proteins are too large to pass. This process controls the acid-base balance of the blood and its content of water and dissolved materials.

diamagnetism Kind of magnetism characteristic of materials that line up at right angles to a nonuniform magnetic field and that partly expel from their interior the magnetic field in which they are placed. In most materials, the magnetic fields of the electrons balance each other and add up to zero. However, when placed in an external magnetic field, the interaction of this field with the electrons induces an internal field in the opposite direction. The substance can then be weakly repelled by magnetic poles. Examples of diamagnetic substances include bismuth, antimony, sodium chloride, gold, and mercury.

diamond Mineral composed of pure carbon, the hardest naturally occurring substance known and a valuable gemstone. Diamonds are formed deep in the Earth by tremendous pressures and temperatures over long periods of time. In the crystal structure of diamond, each carbon atom is linked to four other, equidistant, carbon atoms. This tight crystal structure results in properties that are very different from those of graphite, the other common form of pure carbon. Diamonds vary from colourless to black and may be transparent, translucent, or opaque. Most gem diamonds are transparent and colourless or nearly so. Colourless or pale blue stones are most valued, but most gem diamonds are tinged with yellow. Because of their extreme hardness, diamonds have important industrial applications. Most industrial diamonds are gray or brown and are translucent or opaque. In the symbolism of gemstones, the diamond represents steadfast love and is the birthstone for April.

diamond cutting Branch of lapidary art involving the five basic steps in fashioning a diamond: marking, cleaving, sawing, girdling, and faceting. The most popular style is the brilliant cut, a round stone with 58 facets; a round diamond with only 18 facets is known as a single cut. Any other style is known as a fancy cut. See also gemstone.

Diamond Sutra *in full* **Diamond-Cutter Perfection of Wisdom Sutra** Wisdom text of Mahayana Buddhism. It was composed c. ad 300 and translated into Chinese c. ad 400. The best known of the wisdom texts contained in the Prajnaparamita, it is written in the form of a dialogue between the Buddha Gautama and a questioning disciple. The work emphasizes the transitory nature of the material world and suggests that spiritual fulfillment can be attained only by transcending ephemeral phenomena and abandoning rationalism.

Dian, Lake *Chinese* **Dian Chi** \'dyen-'chē\ *or* **Tien Ch'ih** Lake, central Yunnan province, southern China. It is about 25 mi (40 km) long and 8 mi (13 km) wide. The area was settled by sedentary agricultural peoples as early as the 2nd century bc. It was the centre of the independent state of Dian (Tien), which became tributary to the Han dynasty after 109 bc.

Diana Roman goddess of nature, animals, and the hunt. As a fertility deity, she was invoked for aid in conception and childbirth. She was virtually indistinguishable from the Greek goddess Artemis. In her cult in Rome she was considered the protector of the lower classes, especially slaves.

Diana, princess of Wales *orig.* **Lady Diana Frances Spencer** (b. July 1, 1961, Sandringham, Norfolk, Eng.—d. Aug. 31, 1997, Paris, France) Consort (1981–96) of Charles, prince of Wales. Daughter of Viscount Althorp (later Earl Spencer), she was a kindergarten teacher at the time of her engagement to Charles, whom she married on July 29, 1981, in a globally televised ceremony. They had two sons, Princes William (1982) and Henry (1984). Her beauty and unprecedented popularity as a member of the royal family attracted intense press attention, and she became one of the most photographed women in the world. The marriage gradually broke down; Charles and Diana separated in 1992 and were divorced in 1996. She remained highly visible and continued her activities on behalf of numerous charities. In 1997 she was killed in a car crash in Paris, along with her companion, Emad Mohamed (Dodi) al-Fayed (1955–97), and their driver. Her death brought on a massive public outpouring of grief.

Diane de France \dyän-də-'frä^{n}s**, duchess de Montmorency and Angoulême** (b. 1538, Paris, France—d. Jan. 11, 1619, Paris) Natural daughter (legitimated 1547) of King Henry II of France. In 1559 she was married to François de Montmorency (1530–79). She was known for her culture, intelligence, and beauty as well as for the influence she wielded during the reigns of Henry III and Henry IV.

Diane de Poitiers \dē-'än-də-pwä-'tyā**, duchess de Valentinois** (b. Sept. 3, 1499—d. April 22, 1566, Anet, France) Mistress of King Henry II of France. Diane came to the French court as a lady-in-waiting, where Henry, 20 years her junior, fell violently in love with her. After the death of her husband, Diane became Henry's mistress from c. 1536. Throughout his reign (1547–59) she held court as queen of France in all but name, while the real queen, Catherine de Médicis, was forced to live in comparative obscurity. Beautiful and cultivated, Diane was a patron of poets and artists.

Dianetics See Church of Scientology

dianthus See pink family

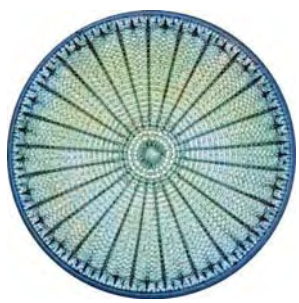
diaphragm \'dī-ə-ˌfram\ Dome-shaped muscular and membranous structure between the thoracic and abdominal cavities. The principal muscle used in respiration, it is also important in coughing, vomiting, excretion, and other expulsive functions. Spasms of the diaphragm produce hiccups. The aorta passes behind the diaphragm; the inferior vena cava and esophagus pass through it. Protrusion of part of the stomach above the diaphragm is called a hiatal hernia.

Diarmaid Macmurchada See Dermot Macmurrough

diarrhea \ˌdī-ə-'rē-ə\ Abnormally fast passage of waste material through the large intestine, resulting in frequent defecation with loose feces and sometimes cramps. Causes range widely and can include cholera, dysentery, highly seasoned foods or high alcohol intake, poisons (including food poisoning), drug side effects, and Graves' disease. Mild cases of diarrhea are treated with bismuth subsalicylate (trade name Pepto-Bismol); extreme cases are treated with fluid and electrolyte replacement while the underlying disease passes. Traveler's diarrhea affects up to half of people who travel to developing countries. Its prevention includes taking bismuth subsalicylate tablets, drinking only bottled or canned beverages, and eating only peeled fruits, canned products, and restaurant food that is well-cooked. Severe cases require antibiotics. In cases of severe malnutrition, diarrhea is potentially lethal, and it is responsible for hundreds of thousands of deaths annually in underdeveloped countries.

diary *or* **journal** Record of events, transactions, or observations kept daily or at frequent intervals; especially a daily record of personal activities, reflections, or feelings. Written primarily for the writer's use alone, the personal diary usually offers a frankness not found in writing done for publication. The diary form, which began to flower in the late Renaissance, is important as a record of social and political history. The most famous diary in English is that of Samuel Pepys. Other notable journals include those of John Evelyn, Jonathan Swift, Fanny Burney, James Boswell, André Gide, and Virginia Woolf.

© 2006 Encyclopædia Britannica, Inc.



Dias \'dē-əsh**, Bartolomeu** *or* **Bartholomew Diaz** \'dē-äs\ (b. c. 1450—d. May 29, 1500, at sea, near Cape of Good Hope) Portuguese navigator and explorer. Given command of an expedition to ascertain the southern limit of Africa, he set sail in 1487. He sailed farther south than previous explorers and became the first European to round the Cape of Good Hope (1488). His voyage opened the sea route to Asia via the Atlantic and Indian oceans. He later commanded a ship in an expedition under Pedro Álvares Cabral, in which he participated in the discovery of Brazil; he was lost at sea when they reached the Cape.

Diaspora \dī-'as-pə-rə, dē-'as-pə-rə\ *Hebrew* **Galut ("Exile")** *Greek* **"Dispersion"** The dispersion of Jews among the Gentiles after the Babylonian Exile (586 BC), or the aggregate of Jews outside Palestine or present-day Israel. The term also carries religious, philosophical, political, and eschatological connotations, inasmuch as the Jews perceive a special relationship between the land of Israel and themselves. Interpretations of this relationship range from the messianic hope of traditional Judaism for the eventual "ingathering of the exiles" to the view of Reform Judaism that the dispersal of the Jews was providentially arranged by God to foster monotheism throughout the world. Historically, Diaspora Jews outnumbered the Jews in Palestine even before the destruction of Jerusalem in AD 70. Thereafter, the chief centres of Judaism shifted from country to country (e.g., Babylonia, Persia, Spain, France, Germany, Poland, Russia, and the U.S.), and Jewish communities gradually adopted distinctive languages, rituals, and cultures, some submerging themselves in non-Jewish environments more completely than others. While some lived in peace, others became victims of violent anti-Semitism. While the vast majority of Orthodox Jews have supported Zionism, some Orthodox Jews go so far as to oppose the modern State of Israel on the grounds that it is a godless and secular state defying God's will to send his messiah at the time he has preordained.

diastrophism \dī-'as-trə-ˌfi-zəm\ *or* **tectonism** Large-scale deformation of the Earth's crust by natural processes, which leads to the formation of continents and ocean basins, mountain systems and rift valleys, and other features by mechanisms such as lithospheric plate movement (see plate tectonics), volcanic loading, or folding. The study of diastrophism, or tectonic processes, is the central unifying principle in modern geology and geophysics.

diathermy \'dī-ə-ˌthər-mē\ Use of high-frequency electric current for deep heating of tissues in physical therapy. Shortwave, ultrasound, and microwave diathermy heat tissues at different depths for different purposes. Low heat warms tissue to ease muscle pain. Higher degrees of diathermy destroy tissue; this is useful in surgery, particularly on the eye or nerves, to coagulate, limit bleeding, and seal off traumatized tissues.

diatom \'dī-ə-ˌtäm\ Any member of the algal division or phylum Bacillariophyta (about 16,000 species), tiny planktonic (see plankton), unicellular or colonial algae found floating in all the waters of the earth. The intricate and delicate markings of the silicified cell wall are useful in testing the resolving power of microscope lenses. The beautiful symmetry and design of diatoms justify their title "jewels of the sea." Among the most important and prolific sea organisms, diatoms serve directly or indirectly as food for many animals. Diatomaceous earth, composed of fossil diatoms, is used in filters, insulation, abrasives, paints, and varnishes, and as an insecticide.

Diatom (highly magnified)
ERIC GRAVE—PHOTO RESEARCHERS

diatomaceous earth *or* **kieselguhr** \'kē-zəl-ˌgür\ Light-coloured, porous, and friable sedimentary rock composed of the frustrules (silicate cell walls) of diatoms. It is used in industrial filtration applications; as a filler or extender in paper, paint, brick, tile, ceramics, linoleum, plastic, soap, detergent, and other products; in insulation for boilers, blast furnaces, and other high-temperature devices; as a sound insulator; and as a carrier for herbicides and fungicides. The oldest and best-known commercial use is as a very mild abrasive in metal polishes and toothpaste. Large deposits occur in California, Nevada, Washington, and Oregon; other sources are Denmark, France, Russia, and Algeria.

Díaz \'dē-ˌäs**, Porfirio** (b. Sept. 15, 1830, Oaxaca, Mex.—d. July 2, 1915, Paris, Fr.) Soldier and president of Mexico (1877–80, 1884–1911). After training for the priesthood, he pursued a military career instead. When peace was restored to Mexico under Benito Juárez, Díaz resigned his command, but he soon became dissatisfied with the government. After leading two revolts, he was elected president in 1877. He succeeded in bolstering the export economy through foreign investment, while leading in the spirit of a caudillo, suppressing opposition, rigging elections, and using patronage to win the cooperation of various groups. The Mexican Revolution was launched in 1910 to end his dictatorship and reverse his policies. See also Francisco Madero, La Reforma.

Porfirio Díaz.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Dibdin, Charles (baptized March 4, 1745, Southampton, Hampshire, Eng.—d. July 25, 1814, London) British composer, novelist, and actor. A cathedral chorister, Dibdin began working for a music publisher at age 15 and began his stage career in 1762. His first operetta was *The Shepherd's Artifice* (1764). By 1778, when he became exclusive composer for Covent Garden, he had produced eight operas, including *The Padlock* (1768), *The Waterman* (1774), and *The Quaker* (1775). He later produced his ballad opera *Liberty Hall*. He was author, singer, and accompanist for his celebrated one-man "table entertainments"; most of his popular sea songs were written for these. In all, he wrote about 100 stage works and 1,400 songs. He was one of the most popular British composers of the 18th century.

Dibon \'dī-ˌbän\ *modern* **Dhībān** \thē-'ban\ Ancient city of Palestine. The capital of Moab, it was located north of the Arnon River in what is now west-central Jordan. Excavations have uncovered the remains of city walls and numerous buildings; pottery found at the site dates from c. 3200 BC to the 7th century AD. One of the most important finds was the Moabite Stone, written in the Moabite alphabet, an important representation of the Phoenician script. Dating from the 9th century BC, it commemorates a victory over the Israelites. See also Moabites.

dice Set of small cubes (each called a die) marked on each face with from one to six spots and used in gambling and in various social games by being shaken and thrown down to come to rest at random on a flat surface. The combined number of the spots on the topmost surface of the tossed dice decides, according to the rules of the game being played, whether the thrower (or "shooter") wins, loses, or continues to throw. In numerous board games the thrown dice determine the player's moves. Dice, which may be traced back to prehistory, were in many cultures magical devices used for the casting of lots to divine the future. In the modern era they became associated with the playing of games of chance, including craps.

dickcissel \dik-'si-səl, 'dik-ˌsi-səl\ American passerine (*Spiza americana*, family Fringillidae) bird that eats seeds and breeds in weedy fields of the central U.S. Most dickcissels winter in northern South America, but some stray to the Atlantic coast. The male, for whose song the species is named, is a streaky brown bird 6.5 in. (16 cm) long, with a black bib on its yellow breast, resembling a miniature meadowlark.

Dickcissel (*Spiza americana*)
THASE DANIEL

Dickens, Charles (John Huffam) (b. Feb. 7, 1812, Portsmouth, Hampshire, Eng.—d. June 9, 1870, Gad's Hill, near Chatham, Kent) British novelist, generally considered the greatest of the Victorian period.

© 2006 Encyclopædia Britannica, Inc.

The defining moment of Dickens's life occurred when he was 12 years old. With his father in debtors' prison, he was withdrawn from school and forced to work in a factory. This deeply affected the sensitive boy. Though he returned to school at 13, his formal education ended at 15. As a young man, he worked as a reporter. His fiction career began with short pieces reprinted as *Sketches by "Boz"* (1836). He exhibited a great ability to spin a story in an entertaining manner and this quality, combined with the serialization of his comic novel *The Pickwick Papers* (1837), made him the most popular English author of his time. The serialization of such works as *Oliver Twist* (1838) and *The Old Curiosity Shop* (1841) followed. After a trip to America, he wrote *A Christmas Carol* (1843) in a few weeks. With *Dombey and Son* (1848), his novels began to express a heightened uneasiness about the evils of Victorian industrial society, which intensified in the semiautobiographical *David Copperfield* (1850), as well as in *Bleak House* (1853), *Little Dorrit* (1857), *Great Expectations* (1861), and others. *A Tale of Two Cities* (1859) appeared in the period when he achieved great popularity for his public readings. Dickens's works are characterized by an encyclopaedic knowledge of London, pathos, a vein of the macabre, a pervasive spirit of benevolence and geniality, inexhaustible powers of character creation, an acute ear for characteristic speech, and a highly individual and inventive prose style.

Dickey, James (Lafayette) (b. Feb. 2, 1923, Atlanta, Ga., U.S.—d. Jan. 19, 1997, Columbia, S.C.) U.S. poet, novelist, and critic. Dickey served as a pilot in World War II. His poetry—published in such volumes as *Into the Stone* (1960), *Drowning with Others* (1962), *Helmets* (1964), *Buckdancer's Choice* (1965), and *The Zodiac* (1976)—combines themes of nature mysticism, religion, and history. He became widely known with his powerful novel *Deliverance* (1970; film, 1972).

Dickinson, Emily (Elizabeth) (b. Dec. 10, 1830, Amherst, Mass., U.S.—d. May 15, 1886, Amherst) U.S. poet. Granddaughter of the cofounder of Amherst College and daughter of a respected lawyer and one-term congressman, Dickinson was educated at Amherst (Mass.) Academy and Mount Holyoke Female Seminary. She subsequently spent virtually all her life, increasingly reclusive, in her family home in Amherst. She began writing in the 1850s; by 1860 she was boldly experimenting with language and prosody, striving for vivid, exact words and epigrammatic concision while adhering to the basic quatrains and metres of the Protestant hymn. The subjects of her deceptively simple lyrics, whose depth and intensity contrast with the apparent quiet of her life, include love, death, and nature. Her numerous letters are sometimes equal in artistry to her poems. By 1870 she was dressing only in white and declining to see most visitors. Of her 1,775 poems, only seven were published during her lifetime. After posthumous publications (some rather inaccurate), her reputation and readership grew. Her complete works were published in 1955, and she has since become universally regarded as one of the greatest American poets.

Dickinson, John (b. Nov. 8, 1732, Talbot county, Md.—d. Feb. 14, 1808, Wilmington, Del., U.S.) American statesman. He represented Pennsylvania at the 1765 Stamp Act Congress and drafted the Congress's declaration of rights and grievances. He won fame in 1767–68 as the author of the *Letters from a Farmer in Pennsylvania, to the Inhabitants of the British Colonies*, which influenced opinion against the Townshend Acts. A delegate to the Continental Congress, he helped draft the Articles of Confederation. Hoping for conciliation with the British, he voted against the Declaration of Independence. As a Delaware delegate to the Constitutional Convention, he signed the U.S. Constitution and urged its adoption in a series of letters signed "Fabius." He is sometimes called the "penman of the Revolution."

dicot See cotyledon, flowering plant

dictator In the Roman republic, a temporary magistrate with extraordinary powers. Nominated in times of crisis by a consul, recommended by the Senate, and confirmed by the Comitia Curiata, the dictator's term was six months or the duration of the crisis, and he had authority over all other magistrates. By 300 BC his powers were limited; no dictators were chosen after 202. The dictatorships of Sulla and Julius Caesar were a new form with almost unlimited powers. Caesar became dictator for life just before his assassination; afterward the office was abolished.

dictatorship Form of government in which one person or an oligarchy possesses absolute power without effective constitutional checks. With constitutional democracy, it is one of the two chief forms of government in use today. Modern dictators usually use force or fraud to gain power and then keep it through intimidation, terror, suppression of civil liberties, and control of the mass media. In 20th-century Latin America, nationalist leaders often achieved power through the military and attempted either to maintain the privileged elite or to institute far-reaching social reform, depending on their class sympathies. In Europe's communist and fascist dictatorships, a charismatic leader of a mass party used an official ideology to maintain his regime, and terror and propaganda to suppress opposition. In postcolonial Africa and Asia, dictators have often retained power by establishing one-party rule after a military takeover.

dictionary Reference work that lists words, usually in alphabetical order, and gives their meanings and often other information such as pronunciations, etymologies, and variant spellings. The earliest dictionaries, such as those created by Greeks of the 1st century AD, emphasized changes that had occurred in the meanings of words over time. The close juxtaposition of languages in Europe led to the appearance, from the early Middle Ages on, of many bilingual and multilingual dictionaries. The movement to produce an English dictionary was partly prompted by a desire for wider literacy, so that common people could read Scripture, and partly by a frustration that no regularity in spelling existed in the language. The first purely English dictionary was Robert Cawdrey's *A Table Alphabetical* (1604), treating some 3,000 words. In 1746–47 Samuel Johnson undertook the most ambitious English dictionary to that time, a list of 43,500 words. Noah Webster's dictionary of Americanisms in the early 19th century sprang from a recognition of the changes and variations within language. The immense *Oxford English Dictionary* was begun in the late 19th century. Today there are various levels of dictionaries, general-purpose dictionaries being most common. Modern lexicographers (dictionary makers) describe current and past language but rarely prescribe its use.

Diderot \dēd-'rō**, Denis** (b. Oct. 5, 1713, Langres, France—d. July 31, 1784, Paris) French man of letters and philosopher. Educated by Jesuits, Diderot later received degrees from the University of Paris. From 1745 to 1772 he served as chief editor of the 35-volume *Encyclopédie*, a principal work of the Enlightenment. He composed such influential works as *Letter on the Deaf and Dumb* (1751), which studies the function of language, and *Thoughts on the Interpretation of Nature* (1754), acclaimed as the method of philosophical inquiry of the 18th century. The first great art critic, he was especially admired posthumously for his *Essay on Painting* (written 1765). His novels include *The Nun* (written 1760) and *Rameau's Nephew* (finished 1774); he also wrote plays and theoretical works on drama. See also Jean Le Rond d'Alembert.

Denis Diderot, oil painting by Louis-Michel van Loo, 1767; in the Louvre, Paris.
GIRAUDON/ART RESOURCE, NEW YORK

Didion, Joan (b. Dec. 5, 1934, Sacramento, Calif., U.S.) U.S. novelist and essayist. Her writing explores disorder and personal and social unrest. Her first novel was published in 1963; later novels include *Play It as It Lays* (1970), *A Book of Common Prayer* (1977), *Democracy* (1984), and *The Last Thing He Wanted* (1996). Her essay collections *Slouching Towards Bethlehem* (1968) and *The White Album* (1979) are perceptive, clear-eyed analyses of American culture. With her husband, John Gregory Dunne, she has written a number of screenplays, including *A Star Is Born* (1976).

Dido \'dī-dō\ In Greek legend, the founder of Carthage. She fled to North Africa after the murder of her husband and bought land from a local chieftain, Iarbas. She killed herself rather than marry him. Virgil altered the story in his *Aeneid*, in which Dido welcomes Aeneas to Carthage during his travels, becomes his lover, and kills herself when he abandons her.

Didot family \dē-'dō\ Family of French printers, publishers, and typefounders. The family had a profound influence on the history of typography. François Didot (1689–1759) went into business as a printer and bookseller in Paris in 1713. Three successive generations kept the firm

© 2006 Encyclopædia Britannica, Inc.

flourishing into the 19th century. Under François's elder son, François-Ambroise (1730–1804), the Didot point system of 72 points to the French inch became the standard unit of type measurement, as it remains today. François-Ambroise changed the standard of type design by increasing the contrast between thick and thin letters. His sons Pierre (1761–1853) and Firmin (1764–1836) took charge of the printing and typefounding, respectively. Pierre published acclaimed editions of French and Latin classics, and Firmin designed the Didot typeface. François's younger son, Pierre-François (1731–1793), and the latter's two sons were also active in the business, as were Firmin's three sons.

Didrikson, Babe See Babe Didrikson Zaharias

Didyma \'di-də-mə\ Ancient sanctuary, south of Miletus in modern Turkey. Its temple, the seat of an oracle of Apollo, was plundered by the Persians c. 494 BC and resanctified after Alexander the Great conquered Miletus in 334 BC. About 300 BC the Milesians began to build a new temple, but it was never completed; the well-preserved remains were excavated in the early 20th century.

die Tool or device for imparting a desired shape, form, or finish to a material. Examples include a perforated block through which metal or plastic is drawn or extruded, the hardened steel forms for producing the patterns on coins and medals by pressure, and the hollow molds into which metal or plastic is forced. Modern tools and dies can be traced to the work of Honoré Blanc at the Saint-Étienne armoury in France beginning in 1780. Blanc's techniques were adopted and enlarged in the U.S. by Eli Whitney and others, who used templates (tool-guiding patterns) and fixtures—the antecedents of today's tools and dies—to mass-produce firearms for the U.S. Army (see armoury practice). Today the demand for dies used in metal forming, die casting, and plastic molding is filled by tool- and die-making shops.

Die Brücke See Die Brücke

die casting Forming metal objects by injecting molten metal under pressure into dies or molds. An early and important use of the technique was in the Linotype machine (1884), but the mass-production automobile assembly line gave die casting its real impetus. Great precision is possible, and products range from tiny parts for sewing machines and automobiles to aluminum engine-block castings.

die making See tool and die making

Diebenkorn \'dē-bən-ˌkȯrn**, Richard** (b. April 22, 1922, Portland, Ore., U.S.—d. March 30, 1993, Berkeley, Calif.) U.S. painter. After studying at Stanford University, he taught at California Institute of the Arts (1947–50), and there developed an abstract style under the influence of such painters as Clyfford Still and Mark Rothko. By the mid 1950s he had achieved some commercial success but turned to an expressionistic figurative style. He produced accomplished figure drawings, still lifes, landscapes, and interiors in the Modernist tradition. Throughout his career he alternated between figuration and abstraction. His best-known works are the *Ocean Park* series, begun in the 1960s, comprising over 140 large abstract paintings that retain allusions to landscape.

Diefenbaker \'dē-fən-ˌbā-kər**, John G(eorge)** (b. Sept. 18, 1895, Grey county, Ont., Can.—d. Aug. 16, 1979, Ottawa) Prime minister of Canada (1957–63). After serving in World War I, he practiced law in Saskatchewan. He was elected to the Canadian House of Commons in 1940. He became leader of the Progressive Conservative Party in 1956 and served as prime minister from 1957 to 1963, when his party lost its majority in the House of Commons. He resigned as party leader in 1967. He was chancellor of the University of Saskatchewan from 1969 until his death.

dielectric \ˌdī-i-'lek-trik\ Insulating material or a very poor conductor of electric current. Dielectrics have no loosely bound electrons, and so no current flows through them. When they are placed in an electric field, the positive and negative charges within the dielectric are displaced minutely in opposite directions, which reduces the electric field within the dielectric. Examples of dielectrics include glass, plastics, and ceramics.

Diemen \'dē-mən**, Anthony van** (b. 1593, Culemborg, Neth.—d. April 19, 1645, Batavia, Dutch East Indies) Dutch colonial administrator who consolidated the Dutch empire in the Far East. He joined the Dutch East India Company and served in Batavia from 1618. As governor-general of the Dutch East Indian settlements (1636–45), he enabled the Dutch to gain a monopoly of the spice trade in the Moluccas, conquer cinnamon-producing areas in Ceylon (Sri Lanka), seize the key Portuguese stronghold of Malacca, and capture all of Formosa (Taiwan). By 1645 he had established the United Provinces of The Netherlands as the paramount commercial and political power in the East Indies. Van Diemen also initiated the exploring expeditions of Abel Janszoon Tasman and Frans Visscher (1642, 1644).

Dien Bien Phu \'dyen-'byen-'fü**, Battle of** (1953–54) Decisive engagement in the first of the Indochina wars (1946–54) that marked the end of French involvement in Southeast Asia. The French fought the Viet Minh (Lien Viet) for control of a small mountain outpost near Laos. The French occupied the outpost, but the Vietnamese cut all the roads into it, leaving the French to rely on air supplies. Gen. Vo Nguyen Giap then attacked the base with heavy artillery and a force of 40,000 men; the base fell to him despite heavy U.S. aid to the French.

Dieppe \'dyep, dē-'ep\ Town (pop., 1999: 34,598) and seaport, northern France, on the English Channel. French kings, realizing its strategic importance, granted it numerous privileges. In 1668 almost 10,000 of its people died during a plague, and in 1694 the town was almost completely destroyed by English and Dutch fleets. In World War II it was the site of an unsuccessful Allied commando landing (1942). Its port is one of the safest on the Channel, but its shallowness hinders modern shipping.

Dies \'dīz**, Martin, Jr.** (b. Nov. 5, 1901, Colorado, Texas, U.S.—d. Nov. 14, 1972, Lufkin, Texas) U.S. politician. He received a law degree from National University in Washington, D.C. in 1920. After practicing law in Texas, he won a seat in the U.S. House of Representatives (1931–45, 1953–59). Though originally a supporter of the New Deal, by 1937 he had turned against it. In 1938 he was named chairman of the newly created House Un-American Activities Committee; popularly known as the Dies Committee, it pursued alleged communist subversives in New Deal agencies and labour unions. Whereas conservatives applauded the exposure of supposedly disloyal government and union officials, liberals accused Dies of smearing reputations with unproved charges.

Diesel, Rudolf Christian Karl (b. March 18, 1858, Paris, France—d. Sept. 29, 1913, at sea in the English Channel) German thermal engineer. In the 1890s he invented the internal-combustion engine that bears his name, producing a series of increasingly successful models of the diesel engine that culminated in his demonstration in 1897 of a 25-horsepower, four-stroke, single vertical cylinder compression engine.

diesel engine Internal-combustion engine in which air is compressed to a temperature sufficiently high to ignite fuel injected into the cylinder, where combustion and expansion activate a piston (see piston and cylinder). It converts the chemical energy stored in the fuel into mechanical energy, which can be used to power large trucks, locomotives, ships, small electric-power generators, and some automobiles. The diesel engine differs from other internal-combustion engines (such as gasoline engines) in that it has no ignition system and so is often called a compression-ignition engine. Diesel fuel is low-grade and comparatively unrefined. Compared to other internal-combustion engines, diesel engines are more reliable, last longer, and cost less to operate, but they also produce more air pollution, noise, and vibration.

Diet Japanese national legislature. Under the Meiji Constitution, the Diet had two houses, a House of Peers and a House of Representatives, with equal powers. The Diet's role was largely negative: it could block legislation and veto budgets. It was reconstituted under the U.S.-sponsored constitution of 1947. The (upper) House of Councillors seats 247 members, and the (lower) House of Representatives has 480 members. The prime minister, who leads the majority party in the lower house, must be a member. The House of Representatives can override the House of Councillors on most issues.

dietary fibre See dietary fibre

dieting Regulating food intake to improve physical condition, especially to lose weight. Examples include diets low in fat for weight loss, low in saturated fat and cholesterol to prevent or help treat coronary heart disease, or high in carbohydrates and protein to build muscle. Weight-loss diets are based on reducing calorie intake in different proportions of fat, carbohydrate, or protein; most result in some weight loss, but often the weight is gained back within a few years. Diets must include adequate

NUTRITION and are most effective combined with exercise. Appetite suppressants may have dangerous side effects. Excessive weight loss may be a sign of ANOREXIA NERVOSA.

Dietrich \'dē-trik\, *English* \'dē-trik**, Marlene** *orig.* **Maria Magdalene Dietrich** (b. Dec. 27, 1901, Berlin, Ger.—d. May 6, 1992, Paris, France) German-U.S. film actress and singer. After joining MAX REINHARDT's theatre company in 1922, she appeared in German films and became an international star as the destructive cabaret singer Lola-Lola in JOSEF VON STERNBERG's *The Blue Angel* (1930). Sternberg took her to Hollywood, where they made many films together, including *Morocco* (1930), *Shanghai Express* (1932), and *The Scarlet Empress* (1934), which established her aura of glamorous sophistication and languid sensuality. During World War II she made over 500 appearances before Allied troops. She also starred in films such as *Destry Rides Again* (1939), *A Foreign Affair* (1948), *Witness for the Prosecution* (1957), and *Touch of Evil* (1958). She toured widely as a nightclub performer into the 1960s, singing trademark songs such as "Falling in Love Again."

Marlene Dietrich.
PICTORIAL PARADE

Dietz \'dēts**, Howard** (b. Sept. 9, 1896, New York, N.Y., U.S.—d. July 30, 1983, New York City) U.S. songwriter. He studied at Columbia University and later joined an advertising agency, where he designed the trademark roaring lion for Goldwyn Pictures (later MGM). He joined the film studio in 1919 and became director of advertising, a post he held until 1957. From 1923 he wrote lyrics in his spare time. In 1929 he met the composer Arthur Schwartz (1900–84); the duo established their reputation with *The Little Show* and went on to write such Broadway shows as *Three's a Crowd* (1930), *The Band Wagon* (1931), and *The Gay Life* (1961). Dietz wrote about 500 songs; the Dietz-Schwartz collaborations include "Something to Remember You By," "Dancing in the Dark," and "You and the Night and the Music."

Dievs \'dē-əfs\ In the pre-Christian BALTIC RELIGION, the sky god. Along with the goddess Laima, he determined the course of the world and human destiny. He was pictured as a Baltic king who lived on a farmstead in the heavens, occasionally descending to earth on horseback or in a chariot to serve as the protector of farmers and their crops. His two sons were the morning and evening stars. In modern Baltic, *dievs* refers to the Christian God.

Diez \'dēts**, Friedrich Christian** (b. March 15, 1794, Giessen, Hesse-Darmstadt—d. May 29, 1876, Bonn, Ger.) German linguist, regarded as the founder of Romance philology. He began his career as a scholar of medieval Provençal poetry and taught literature at the University of Bonn from 1823 to the end of his life. Diez applied the methodology of comparative linguistics pioneered by JACOB GRIMM and FRANZ BOPP to the ROMANCE LANGUAGES. In his *Grammar of the Romance Languages* (1836–44) and *Etymological Dictionary of the Romance Languages* (1853), he demonstrated the relationship of "Vulgar" or Spoken LATIN to Classical Latin and the evolution of Romance languages from Spoken Latin into their modern forms.

difference equation EQUATION involving differences between successive values of a FUNCTION of a discrete variable (i.e., one defined for a sequence of values that differ by the same amount, usually 1). A function of such a variable is a rule for assigning values in sequence to it. For example, $f(x + 1) = xf(x)$ is a difference equation. Methods developed for solving such equations have much in common with methods for solving linear DIFFERENTIAL EQUATIONS, which difference equations are often used to approximate.

differential In CALCULUS, an expression based on the DERIVATIVE of a FUNCTION, useful for approximating certain values of the function. The differential of an independent VARIABLE x, written Δx, is an infinitesimal change in its value. The corresponding differential of its dependent variable y is given by $\Delta y = f(x + \Delta x) - f(x)$. Because the derivative of the function $f(x)$, $f'(x)$, is equal to the RATIO $\Delta y/\Delta x$ as Δx approaches zero (see LIMIT), for small values of Δx, $\Delta y \cong f'(x)\Delta x$. This formula often enables a quick and fairly accurate approximation to be made for what otherwise would be a tedious calculation.

differential calculus Branch of mathematical ANALYSIS, devised by ISAAC NEWTON and G.W. LEIBNIZ, and concerned with the problem of finding the rate of change of a FUNCTION with respect to the variable on which it depends. Thus it involves calculating DERIVATIVES and using them to solve problems involving nonconstant rates of change. Typical applications include finding MAXIMUM and MINIMUM values of functions in order to solve practical problems in OPTIMIZATION.

differential equation Mathematical statement that contains one or more DERIVATIVES. It states a relationship involving the rates of change of continuously changing quantities modeled by functions. Differential equations are very common in physics, engineering, and all fields involving quantitative study of change. They are used whenever a rate of change is known but the process giving rise to it is not. The solution of a differential equation is generally a FUNCTION whose derivatives satisfy the equation. Differential equations are classified into several broad categories. The most important are ORDINARY DIFFERENTIAL EQUATIONS (ODEs), in which change depends on a single variable, and PARTIAL DIFFERENTIAL EQUATIONS (PDEs), in which change depends on several variables. See also DIFFERENTIATION.

differential gear In automotive mechanics, a GEAR arrangement that transmits power from the engine to a pair of driving WHEELS, dividing the force equally between them but permitting them to follow paths of different lengths, as when turning a corner or traversing an uneven road. On a straight road the wheels rotate at the same speed; when turning a corner the outside wheel has farther to go and would turn faster than the inner wheel if unrestrained. The automobile differential was invented in 1827; originally used on steam-driven vehicles, it was well known when internal-combustion engines finally appeared.

differential geometry Field of mathematics in which methods of CALCULUS are applied to the local geometry of curves and surfaces (i.e., to a small portion of a surface or curve around a point). A simple example is finding the TANGENT LINE on a two-dimensional curve at a given point. Similar operations may be extended to calculate the CURVATURE and LENGTH OF A CURVE and to analogous properties of surfaces in any number of dimensions.

differential operator In mathematics, any combination of DERIVATIVES applied to a FUNCTION. It takes the form of a POLYNOMIAL of derivatives, such as $D^2_{xx} - D^2_{xy} \cdot D^2_{yx}$, where D^2 is a second derivative and the subscripts indicate PARTIAL DERIVATIVES. Special differential operators include the GRADIENT, DIVERGENCE, CURL, and Laplace operator (see LAPLACE'S EQUATION). Differential operators provide a generalized way to look at DIFFERENTIATION as a whole, as well as a framework for discussion of the theory of DIFFERENTIAL EQUATIONS.

differentiation Mathematical process of finding the DERIVATIVE of a FUNCTION. Defined abstractly as a process involving LIMITS, in practice it may be done using algebraic manipulations that rely on three basic formulas and four rules of operation. The formulas are: (1) the derivative of x^n is nx^{n-1}, (2) the derivative of sin x is cos x, and (3) the derivative of the exponential function e^x is itself. The rules are: (1) $(af + bg)' = af' + bg'$, (2) $(fg)' = fg' + gf'$, (3) $(f/g)' = (gf' - fg')/g^2$, and (4) $(f(g))' = f'(g)g'$, where a and b are constants, f and g are functions, and a prime ($'$) indicates the derivative. The last formula is called the chain rule. The derivation and exploration of these formulas and rules is the subject of DIFFERENTIAL CALCULUS. See also INTEGRATION.

diffraction Spreading of WAVES around obstacles. It occurs with water waves, sound, electromagnetic waves (see ELECTROMAGNETIC RADIATION), and small moving particles such as ATOMS, NEUTRONS, and ELECTRONS, which show wavelike properties. When a beam of light falls on the edge of an object, it is bent slightly by the contact and causes a blur at the edge of the shadow of the object. Waves of long WAVELENGTH are diffracted more than those of short wavelength.

diffusion Process by which there is a net flow of matter from a region of high concentration to one of low concentration. It occurs fastest in liquids and slowest in solids. Diffusion can be observed by adding a few drops of food colouring to a glass of water. The scent from an open bottle of perfume quickly permeates a room because of random motion of the vapour molecules. A spoonful of salt placed in a bowl of water will eventually spread throughout the water.

© 2006 Encyclopædia Britannica, Inc.

digestion Process of dissolving and chemically converting food for absorption by cells. In the mouth, food is chewed, mixed with SALIVA, which begins to break down starches, and kneaded by the tongue into a ball for swallowing. PERISTALSIS propels it through the esophagus and the rest of the alimentary canal. In the stomach, food mixes with ACID and ENZYMES, which further break it down. The mixture, called CHYME, enters the duodenum, the first part of the small intestine. BILE from the liver breaks up FAT globules. Enzymes from the pancreas and intestinal glands act on specific molecules, breaking CARBOHYDRATES down into simple SUGARS, PROTEINS into AMINO ACIDS, and fats into GLYCEROL and FATTY ACIDS. These products are absorbed by the bloodstream. Indigestible substances, such as FIBRE, pass into the large intestine, where water and IONS are reabsorbed and FECES held for EXCRETION. See illustration opposite.

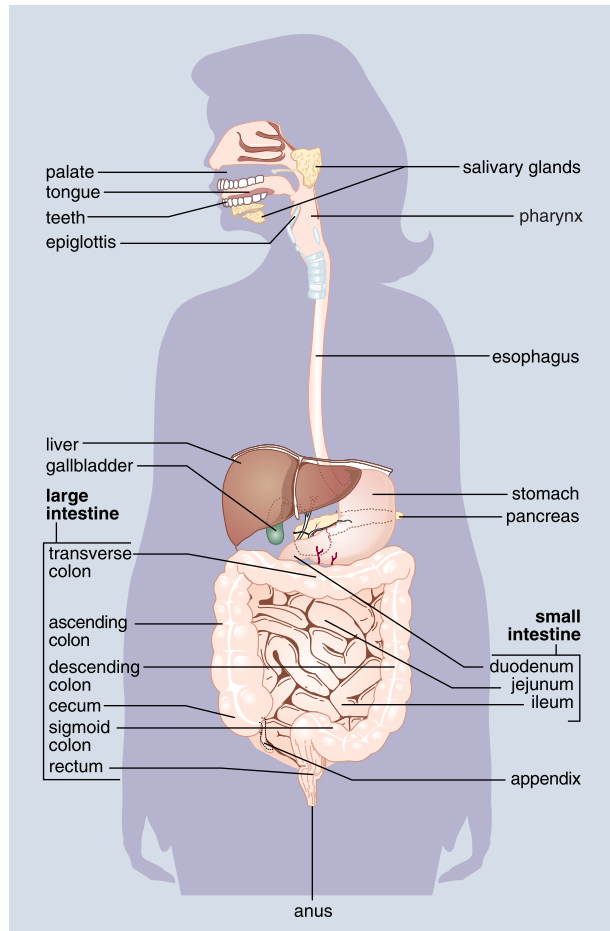
digestive tract See ALIMENTARY CANAL

digital camera CAMERA that captures images electronically rather than on film. The image is captured by an array of CHARGE-COUPLED DEVICES (CCDs), stored in the camera's RANDOM ACCESS MEMORY or a special diskette, and transferred to a computer for modification, long-term storage, or printing out. Since the technology produces a graphics file, the image can be readily edited using suitable software. Models designed and priced for the mass consumer market—as opposed to costly models designed for photojournalism and industrial photography—first became available in 1996. They appeal particularly to users who want to send pictures over the Internet or to crop, combine, enhance, or otherwise modify their photographs.

digital certificate Electronic credit card intended for on-line business transactions and authentications on the Internet. Digital certificates are issued by certification authorities (e.g., VeriSign). They typically contain identification information about the holder, including the person's public key (used for encrypting and decrypting messages), along with the authority's digital signature, so that the recipient can verify with the authority that the certificate is authentic. Web sites may also have digital certificates, to enable a person intending to buy its products to confirm that it is an authenticated e-commerce site.

digital computer COMPUTER capable of solving problems by processing information expressed in discrete form. By manipulating combinations of binary digits (see BINARY CODE), it can perform mathematical calculations, organize and analyze data, control industrial and other processes, and simulate dynamic systems such as global weather patterns. See also ANALOG COMPUTER.

Digital Subscriber Line See DSL



digital-to-analog conversion (DAC) Process by which digital signals (which have a binary state) are converted to analog signals (which theoretically have an infinite number of states). For example, a modem converts computer digital data to analog audio-frequency signals that can be transmitted over telephone lines.

digital video disk See DVD

digitalis \ˌdi-jə-ˈta-ləs\ Drug derived from leaves of the common FOXGLOVE and used as a drug that strengthens HEART muscle contraction. It was first prescribed in the 18th century. Its active principles belong to a class of STEROIDS called cardiac GLYCOSIDES. Their dosage must be carefully monitored because the lethal dose may be only three times the effective dose. Digitoxin and digoxin are among the most commonly prescribed forms of digitalis.

diglossia \dī-ˈglȯs-ē-ə\ Coexistence of two varieties of the same language in a speech community, with each variety being more or less standardized and occupying a distinct sociolinguistic niche. Typically, one variety is more formal or prestigious while the other is more suited to informal conversation or is taken as a mark of lower social status or less education. Classic diglossic situations can be found in ARABIC-speaking communities, where Modern Standard Arabic coexists with dozens of regional Arabic dialects, and among speakers of DRAVIDIAN LANGUAGES such as TAMIL, where different words for basic concepts such as "house" or "water" are chosen depending on the speaker's caste or religion.

Dijon \dē-ˈzhōⁿ\ City (pop., 2004 est.: 149,000), east-central France. The site has been occupied from pre-Roman times. It became the capital of the duchy of BURGUNDY in 1015 and prospered under the VALOIS dynasty (1364–1477). LOUIS XI annexed the city in the late 15th century. Its historic buildings include a 13th-century church and 14th-century town hall (the former palace of the dukes of Burgundy). Its university was founded in 1722. A market and tourist centre, it is still known for its food products (e.g., mustard, vinegar, and gingerbread).

Major organs of the human digestive system. Food taken in by the mouth is guided by the tongue as it is sheared and ground by the teeth. The bolus of chewed food is moistened and lubricated with saliva secreted by the salivary glands. Enzymes in the saliva begin the breakdown of starches. The epiglottis, a flap of tissue, prevents food from the pharynx from entering the larynx during swallowing. Muscles in the esophagus wall contract in waves to move the food to the stomach. Gastric juices secreted by the stomach contain a mixture of substances (including enzymes and hydrochloric acid) that break down the food into a semiliquid mass called chyme. The chyme passes into the small intestine, where food molecules are broken down into sugars, amino acids, and fatty acids. These useful substances are absorbed into the bloodstream as the food passes through the duodenum, jejunum, and ileum. The pancreas secretes digestive enzymes into the duodenum. The liver secretes bile salts that make insoluble fats entering the small intestine water-soluble and vulnerable to enzymatic action. Excess bile salts are stored in the gallbladder. The large intestine (colon) serves to remove water and electrolytes from the digested chyme and to compact and store undigestible material, called feces. Fecal matter is moved by muscular contractions into the rectum and expelled from the anus.

dik-dik Any of four species of delicate African ANTELOPE (genus *Madoqua*), named for the sound it makes when alarmed. It stands 12–16 in. (30–40 cm) high at the shoulder and weighs 7–11 lbs (3–5 kg). It has an elongated snout and a soft coat that is gray or brownish above, white below. The hair on the crown forms an upright tuft and may partially conceal the short, ringed horns of the male. Dik-diks live in dry areas of dense brush in southern and eastern Africa, and feed chiefly on acacia and other shrubs. See photograph on opposite page.

© 2006 Encyclopædia Britannica, Inc.

dike Bank, usually of earth, constructed to control or confine water. Dikes were purely defensive at first but later became a means to acquire polders (tracts of land reclaimed from a body of water through the construction of offshore dikes roughly parallel to the shoreline). After a dike is built, the polder is drained by pumping out the water. Where the land surface is above low-tide level, tide gates discharge water into the sea at low tide and automatically close to prevent reentry of seawater at high tide. To reclaim lands that are below low-tide level, the water must be pumped over the dikes. The most notable example of polder construction is the system adjacent to Holland's IJsselmeer (Zuider Zee) barrier dam. If The Netherlands were to lose the protection of its dikes, its most densely populated portion would be inundated by the sea and rivers.

dilemma tale *or* **judgment tale** Typical African form of short story. Its ending is open to conjecture or is morally ambiguous, allowing the audience to comment or speculate on the correct solution to the problem posed, whether a conflict of loyalty, the need to choose a just response to a difficult situation, or the laying of blame when several parties seem equally guilty. Dilemma tales function both as instruction and entertainment and help establish social norms.

Dili City (pop., 1999 est: 65,000), capital of East Timor. It lies on the northern coast of Timor Island on Ombai Strait. Dili has been the capital, chief port, and commercial centre of the eastern half of Timor since it was settled by the Portuguese about 1520. During World War II it was occupied by Japan. East Timor was under Portuguese rule until 1975, after which it was designated a province of Indonesia. Dili suffered major damage by Indonesian military "militias" after East Timor voted for independence in 1999. The city became the capital of newly sovereign East Timor in 2002.

Dilke \'dilk**, Sir Charles Wentworth, 2nd Baronet** (b. Sept. 4, 1843, London, Eng.—d. Jan. 26, 1911, London) British politician. He was elected to Parliament in 1868, first as an extremist then as a moderate. In 1882 he became a member of William E. Gladstone's cabinet and was seen as a future prime minister. He was ruined at the height of his career when he was cited as a corespondent in a sensational divorce suit in 1886. Dilke denied the woman's story, and the accumulated evidence showed that much of it was a fabrication. He returned to the House of Commons (1892–1911), where he promoted progressive labor legislation and gained a reputation as a military expert.

dill Fennel-like annual or biennial herb (*Anethum graveolens*) of the parsley family or its dried ripe fruit (seeds) and leafy tops, which are used to season foods. Native to Mediterranean countries and southeastern Europe, dill is now widely cultivated in Europe, India, and North America. The entire plant is aromatic. Particularly in eastern Europe and Scandinavia, the small stems and immature umbels are used for flavouring foods. Dill has a warm, slightly sharp flavour.

Dillinger \'dil-ən-jər**, John (Herbert)** (b. June 28, 1902, or June 22, 1903, Indianapolis, Ind., U.S.—d. July 22, 1934, Chicago, Ill.) U.S. bank robber. Arrested in 1924 in the foiled holdup of a grocer in Mooresville, Ind., he spent the next several years in Indiana state prisons, where he learned the craft of bank robbery from tough professionals. After his parole in 1933, he and one to four confederates committed five bank robberies in Indiana and Ohio in a period of four months. Again captured and imprisoned, he escaped with the help of other convicts whose own escape he had earlier financed and plotted. He and his gang then robbed banks in Indiana and Wisconsin and fled south to Florida and then to Tucson, Ariz., where they were discovered and arrested by local police. In 1934 he used a fake wooden pistol to effect yet another escape from an Indiana prison. His end came in an ambush set by the Federal Bureau of Investigation, Indiana police, and Dillinger's friend Anna Sage, a brothel madam. The well-publicized "lady in red" drew Dillinger to the Biograph Theatre in Chicago, where, on emerging, he was shot to death.

Dik-dik (*Madoqua*)
JACK CANNON—OSTMAN AGENCY

Dilthey \'dil-ˌtī**, Wilhelm** (b. Nov. 19, 1833, Biebrich, Nassau, Ger.—d. Oct. 1, 1911, Seis am Schlern, South Tirol, Austria-Hungary) German philosopher of history. Opposed to contemporary efforts to transform the methodology of the humanities and the social sciences on the model of natural science, Dilthey tried to establish these fields as interpretive sciences in their own right. Their subject matter, according to him, is the human mind, not as it is enjoyed in immediate experience nor as it is analyzed in psychological theory, but as it manifests or "objectifies" itself in languages and literatures, actions, and institutions. Dilthey emphasized that the essence of human beings cannot be grasped by introspection but only from a knowledge of all of history; this understanding, however, can never be final because history itself never is. His major work is *Introduction to Human Science* (1883); two influential essays are "Ideas Concerning a Descriptive and Analytical Psychology" (1894) and "The Structure of the Historical World in the Human Sciences" (1910).

DiMaggio \də-'mä-zhē-ˌō, di-'ma-jē-ˌō**, Joe** *orig.* **Joseph Paul DiMaggio** (b. Nov. 25, 1914, Martinez, Calif., U.S.—d. March 8, 1999, Hollywood, Fla.) U.S. baseball star. DiMaggio joined the New York Yankees in 1936 and stayed with them until his retirement in 1951. Regarded as one of the greatest of all centre fielders, he played outfield with such languid grace that some inattentive fans thought he was lazy. Known as "Joltin' Joe" or "the Yankee Clipper," he achieved a career batting average of .325. In 1941 he accomplished one of the most remarkable of all major league records with his feat of hitting safely in 56 consecutive games. DiMaggio helped the Yankees win 10 American League championships and 9 World Series titles. His brothers Vincent and Dominic also played in the major leagues. DiMaggio's second wife (for nine months in 1954) was Marilyn Monroe. After his retirement from baseball he served as an executive for two major-league teams and appeared in television commercials.

dimension In mathematics, a number indicating the fewest coordinates necessary to identify a point in a geometric space; more generally, a number indicating a measurement of length (see length, area, and volume). One-dimensional space can be represented by a numbered line, on which a single number identifies a point. In two-dimensional space, a coordinate system may be superimposed, requiring only two numbers to identify a point. Three numbers suffice in three-dimensional space, and so on.

dimensional analysis Technique used in the physical sciences and engineering to reduce physical properties such as acceleration, viscosity, energy, and others to their fundamental dimensions of length, mass, and time. This technique facilitates the study of interrelationships of systems (or models of systems) and their properties. Acceleration, for example, is expressed as length per unit of time squared; whether the units of length are in the English or metric system is immaterial. Dimensional analysis is often the basis of mathematical models of real situations.

dimethyl ketone See acetone

dimethyl sulfoxide (DMSO) \dī-'me-thəl-səl-'fāk-ˌsīd\ Colourless, nearly odourless liquid organic compound. It mixes in all proportions with water, ethanol, and most organic solvents and dissolves a wide variety of compounds (but not aliphatic hydrocarbons). It readily penetrates skin and other tissues and is used to carry drugs and antitoxins through the skin. It has many nonmedical uses—as a solvent, cleaner, pesticide, paint stripper, hydraulic fluid, preservative of cells at low temperatures, and metal complexing agent.

diminished responsibility *or* **diminished capacity** In law, doctrine that absolves an accused person of part of the liability for his criminal act if he suffers from such abnormality of mind as to substantially impair his responsibility in committing or being a party to an alleged violation. The doctrine provides a mitigating defense in cases in which the mental disease or defect is not of such magnitude as to exclude criminal responsibility altogether. Diminished responsibility is most frequently asserted as a defense to murder charges that require proof of a particular mental state (e.g., premeditation). If diminished responsibility is shown, negating an element of the crime with which a defendant is charged, the defendant can be convicted only of a lesser offense that does not include the element. Although diminished responsibility is recognized as a defense in Britain, most other countries recognize only mental disease or abnormality of sufficient degree to sustain a defense of insanity.

diminishing returns, law of Economic law stating that if one input used in the manufacture of a product is increased while all other inputs

© 2006 Encyclopædia Britannica, Inc.

remain fixed, a point will eventually be reached at which the input yields progressively smaller increases in output. For example, a farmer will find that a certain number of farm labourers will yield the maximum output per worker. If that number is exceeded, the output per worker will fall.

Dimitrov \di-'mē-ˌtrȯf**, Georgi (Mikhailovich)** (b. June 18, 1882, Kovachevtsi, Bulg.—d. July 2, 1949, near Moscow, Russia, U.S.S.R.) Bulgarian communist leader. He helped found the Bulgarian Communist Party in 1919. After leading a communist uprising in 1923 that provoked fierce government reprisals, he was forced to live abroad and became head of the central European section of the Comintern in Berlin (1929–33). He won worldwide fame for his defense against Nazi accusations in the Reichstag fire trial of 1933. He headed the Comintern in Moscow (1935–43), then returned to Bulgaria, where he served as prime minister (1945–49). He effected the communist consolidation of power that formed the Bulgarian People's Republic in 1946.

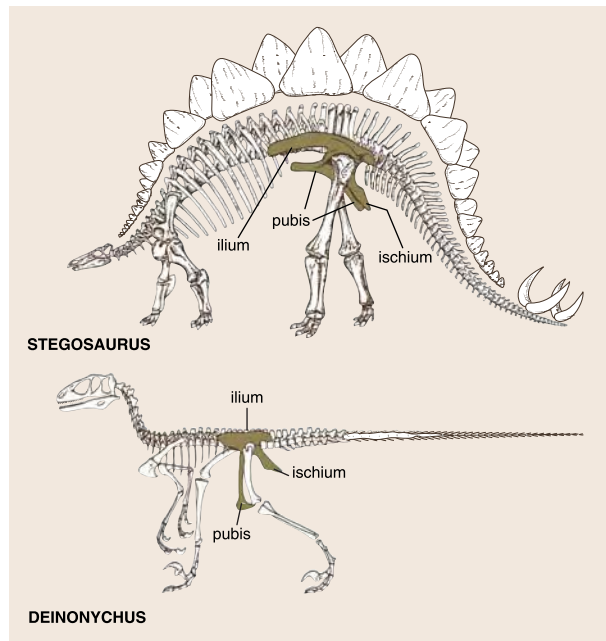
Dinarchus *or* **Deinarchus** \dī-'när-kəs\ (b. c. 360 BC—d. after 292) Professional speechwriter at Athens. He rose to fame through his speeches against Demosthenes and others accused of misusing the treasury. His work, however, reflects the decline of Attic oratory; his surviving speeches show little creativity, abuse instead of reason, and plagiarism.

d'Indy, Vincent See Vincent d'Indy

Dinesen \'dē-nə-sən**, Isak** *orig.* **Karen Christence Dinesen** *later* **Baroness Blixen-Finecke** (b. April 17, 1885, Rungsted, Den.—d. Sept. 7, 1962, Rungsted) Danish writer. Dinesen married her cousin, a baron, and they moved to Kenya; *Out of Africa* (1937; film, 1985), a memoir of her years on their coffee plantation (1914–31), reveals a deep love of Africa and its people. Her characteristic writings took the form of highly polished narratives in the Romantic tradition, set in the past and pervaded with an aura of supernaturalism; they incorporate themes of eros and dreams. Her collections include *Seven Gothic Tales* (1934) and *Winter's Tales* (1942).

Ding Ling \'diŋ-'liŋ\ *or* **Ting Ling** *orig.* **Jiang Wei** (b. 1904, Changde, Hunan province, China—d. March 4, 1986, Beijing) Chinese writer. She had written three collections, many of which contained stories centred on young, unconventional Chinese women, before publishing the proletarian-oriented *Flood* (1931), acclaimed as a model of Socialist Realism. She later expressed dissatisfaction with the government officials, for which she was censured and imprisoned during the Cultural Revolution; she was eventually reinstated in the party. Her later works include critical essays and fiction, some published in *I Myself Am a Woman* (1989).

dingo Australian wild dog (*Canis dingo*, *C. familiaris dingo*, or *C. lupus dingo*), apparently introduced from Asia 3,500–4,000 years ago. It has short, soft fur, a bushy tail, and erect, pointed ears. It is about 4 ft (1.2 m) long, including the 12-in. (30-cm) tail, and stands about 24 in. (60 cm) tall at the shoulder. Its colour varies from yellowish to reddish brown, often with white underparts, paws, and tail tip. Dingoes hunt alone or in small groups. They formerly preyed mostly on kangaroos but now feed mainly on rabbits and sometimes on livestock. They contributed, through competition for resources, to the extermination of the Tasmanian wolf and the Tasmanian devil on the Australian mainland.

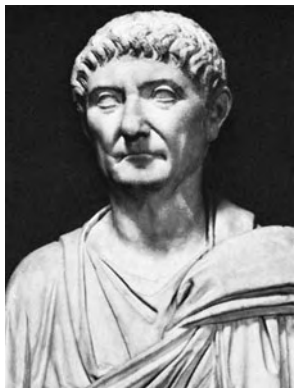


Dingo (*Canis dingo, C. familiaris dingo,* or *C. lupus dingo*).
G.R. ROBERTS

Dinka Cattle-herding people of the Nile basin in southern Sudan. They speak an eastern Sudanic language of the Nilo-Saharan family and are closely related to the Nuer. Numbering about four million, they are divided into independent groups of 1,000–30,000 persons. Leadership is provided by priest-chiefs. In recent years they have been involved in civil war. See also Nilot.

dinoflagellate \ˌdī-nō-'fla-jə-lət\ Any of numerous one-celled, aquatic organisms that have two dissimilar flagella and characteristics of both plants (algae) and animals (protozoans). Most are microscopic and marine. The group is an important component of phytoplankton in all but the colder seas, and it is an important link in the food chain. Dinoflagellates also produce part of the luminescence sometimes seen in the sea. Under favourable conditions, dinoflagellate populations may reach 60 million organisms per litre of water. Such rapid growths, called blooms, result in the red tides that discolour the sea and poison fish and other marine animals. See also Ceratium.

dinosaur Any of the extinct reptiles that were the dominant land animals during most of the Mesozoic Era (248–65 million years ago). The various species appeared at different times, and not all overlapped. The shape of the teeth reveal whether a given dinosaur was a carnivore or herbivore. Dinosaurs are classified as either ornithischians or saurischians, based on pelvic girdle structure. Most had a long tail, which they held straight out, apparently to maintain balance. Most, if not all, were egg layers. Some were probably warm-blooded. Dinosaur fossils have been found on every continent, including Antarctica. Most types of dinosaurs flourished until late in the Cretaceous Period (65 million years ago), then disappeared within the next million years. Two theories for the cause of this mass extinction, following some 140 million years of existence, are that mountain-building cycles altered habitat and changed climate or that an asteroid hit the Earth, resulting in immense dust clouds that blocked sunlight for several years. Birds are thought to be living descendants of the dinosaurs. See also carnosaur; sauropod.



Skeletons of an ornithischian dinosaur (*Stegosaurus*) and a saurischian dinosaur (*Deinonychus*). The skeleton of *Stegosaurus* shows a pelvic arrangement resembling that of birds, with a long ilium and a pubis having a short blade that extends backward into a long thin process lying below and parallel to the ischium. The pelvic girdle of *Deinonychus* shows the triangular outline formed by the ischium, pubis, and ilium characteristic of the saurischians.
© MERRIAM-WEBSTER INC.

Dinosaur National Monument National preserve, northwestern Colorado and northeastern Utah, U.S. It was set aside in 1915 to preserve rich fossil beds that include dinosaur remains. It was enlarged in 1938 and again in 1978 to its present 330 sq mi (855 sq km). It protects the canyons of the Green and Yampa rivers, which contain highly coloured geologic formations.

Dinwiddie \din-'wid-ē**, Robert** (b. 1693, Germiston, near Glasgow, Scot.—d. July 27, 1770, Clifton, Bristol, Eng.) British colonial administrator. He entered government service in 1727 and was appointed surveyor general for the southern part of America (1739–51). As lieutenant governor of Virginia, he sent George Washington in 1753 to prevent the French from controlling the western frontier, an action that helped precipitate the French and Indian War. He tried to obtain intercolonial cooperation for the war effort, an issue taken up at the Albany Congress. In 1758 he returned to England.

Diocletian \ˌdī-ə-ˈklē-shən\ *Latin* **Gaius Aurelius Valerius Diocletianus** *orig.* **Diocles** (b. AD 245, Salonae?, Dalmatia—d. 316, Salonae) Roman emperor (284–305). He was serving under the emperor Carinus (r. 283–285) when the co-emperor, Carinus's brother Numerian, was killed. Diocletian's army declared him emperor, but his domain was restricted to Asia Minor and possibly Syria. Carinus attacked Diocletian (285) but was assassinated before achieving victory, allowing Diocletian to become sole emperor. He sought to remove the military from politics and established a tetrarchy (four-ruler system) to spread his influence and combat rebellions throughout the empire. Proclaiming himself and his corulers as gods, he added the trappings of a theocracy to the reign. His fiscal, administrative, and military reorganization laid the foundation for the BYZANTINE EMPIRE in the east and briefly strengthened the fading empire in the west. In 303–304 he issued four edicts decreeing the last great persecution of Christians. He abdicated in 305.

Diocletian, detail of a bust in the Capitoline Museum, Rome.
ALINARI/ART RESOURCE, NEW YORK

Diocletian window Semicircular window divided into three lights (compartments) by two vertical mullions, with the central light usually wider than the two side lights. Its name comes from its use in the Baths of Diocletian in Rome (AD 302). It was revived in the 16th century by ANDREA PALLADIO and others in the form of a window having an arched central light flanked by narrower, square-headed apertures, known as a Palladian or Venetian window.

diode Electronic device that has two ELECTRODES (ANODE and CATHODE) and that allows current to flow in only one direction, resisting current flow in the other. An applied voltage can cause electrons to flow in only one direction, from the cathode to the anode, and then back to the cathode through an external circuit. Diodes are used especially as rectifiers—which change ALTERNATING CURRENT into DIRECT CURRENT—and to vary the amplitude of a signal in proportion to the voltage in a circuit, as in a radio or television receiver. The most familiar diodes are VACUUM TUBES and SEMICONDUCTOR diodes. Semiconductor diodes, the simplest of semiconductor devices, consist of two electrodes and a sandwich of two dissimilar semiconducting substances (a P-N JUNCTION). Such diodes form the basis for more complex semiconductor devices (including TRANSISTORS) used in computers and other electronic equipment. Semiconductor diodes include LIGHT-EMITTING DIODES and laser diodes; the latter emit LASER light, useful for telecommunications via FIBRE OPTICS and for reading COMPACT DISCS.

Diogenes of Sinope \dī-ˈäj-ə-ˌnēz...sə-ˈnō-pē\ (b. Sinope, Paphlygonia—d. c. 320 BC, probably Corinth) Greek philosopher, principal member of the CYNICS. He is credited by some with originating the Cynic way of life, but he himself acknowledged his debt to Antisthenes (c. 445–365 BC). He conveyed the Cynic philosophy by personal example rather than through any system of thought. He strove to destroy social conventions (including family life) as a way of returning to a "natural" life. To this end he lived as a vagabond pauper, sleeping in public buildings and begging for food. He also advocated shamelessness (performing harmless unconventional actions), outspokenness, and training in austerity.

Diomede \ˈdī-ə-ˌmēd\ **Islands** Two islands in the Bering Strait. Lying about 2.5 mi (4 km) apart, they are separated by the U.S.-Russian boundary, which coincides with the INTERNATIONAL DATE LINE. The larger island, Big Diomede (Russian Ratmonov), belongs to Russia and is the site of an important weather station. To the east lies Little Diomede Island, a part of Alaska.

Diomedes \ˌdī-ə-ˈmē-ˌdēz\ Greek hero in the TROJAN WAR. He was commander of 80 ships from ARGOS bringing soldiers to defeat Troy. His exploits included wounding the goddess APHRODITE, killing Rhesus and his Thracian followers, and stealing the Trojan Palladium (the sacred image of ATHENA that protected Troy). Aphrodite punished him by making his wife unfaithful to him in his absence, and after the war he returned home to find his claim to the throne of Argos disputed. He then sailed to Italy and founded the colony of Argyripa (later Arpi) in Apulia.

Dionysia See BACCHANALIA

Dionysius I *or* **Dionysius the Elder** (b. c. 430 BC—d. 367) Tyrant of SYRACUSE (405–367). He became ruler with Spartan help and retained power until his death, basing his strength on the support of his mercenary army. He held Carthaginian expansion on Sicily in check and hoped to acquire an empire in Greek Italy. Syracuse's economy depended on war, and under Dionysius great advances were made in the technology of large-scale artillery and the manufacture of munitions. His disastrous third campaign against the Carthaginians resulted in the ceding of money and territory; he died during the next Carthaginian conflict.

Dionysius of Halicarnassus (fl. c. 20 BC) Greek historian and teacher of rhetoric. Born in Halicarnassus, Caria (Asia Minor), Dionysius went to Rome in 30 BC. His history of Rome, from its origins to the First PUNIC WAR, is written from a pro-Roman standpoint but carefully researched. It is, with LIVY's, the most valuable source for early Roman history. Its 20 books began to appear in 7 BC; the last 10 have been lost.

Dionysius the Areopagite \ˌar-ē-ˈä-pə-ˌjīt, ˌar-ē-ˈä-pə-ˌgīt\ (fl. 1st century) Biblical figure, converted by St. PAUL. His conversion at Athens is mentioned in Acts 17:34, and he acquired a posthumous reputation largely through confusion with later Christians similarly named. Around AD 500, a series of influential Greek treatises uniting NEOPLATONISM and Christian theology were forged in his name; the writer, probably a Syrian monk, is now known as PSEUDO-DIONYSIUS THE AREOPAGITE.

Dionysus \ˌdī-ə-ˈnī-səs\ Greek god of vegetation and fruitfulness, known especially as the god of wine and ecstasy. His Roman equivalent was Bacchus. His worship was introduced into Greece from Asia Minor, and he became one of the most important of all the Greek gods, while his cult remained associated with that of many Asiatic deities. A son of ZEUS and (according to the standard tradition) SEMELE, he was brought up by the MAENADS, OR BACCHANTES. The first creator of wine, he traveled widely teaching the winemaking art, with a following of satyrs, sileni (see SATYR AND SILENUS), and NYMPHS. He had the gift of prophecy and was received at DELPHI along with APOLLO, though his principal oracle was at Thrace. Festivities called Dionysia or (among the Romans) BACCHANALIA were held in his honor; in their earlier years they were wild, ecstatic occasions, and they have often been the subject of artistic representation. Dionysus originally appeared as a bearded man, but later more often as a slim youth. His principal attribute was the thyrsus, a wand bound with vine leaves. The DITHYRAMB, a choral hymn in his honor, is often seen as the basis of Western drama.

Diop \ˈjȯp**, Birago Ismael** (b. Dec. 11, 1906, Dakar, French West Africa—d. Nov. 25, 1989, Dakar) Senegalese poet and recorder of traditional Wolof folktales. A veterinarian and diplomat, he was active in the NEGRITUDE movement in the 1930s. His output of lyric poetry is small but the poetry is beautifully composed. His books containing tales told to him by his family's GRIOT include *Tales of Amadou Koumba* (1947) and *Tales and Commentaries* (1963).

diopside \dī-ˈäp-ˌsīd\ Common silicate mineral in the PYROXENE family. Diopside is a calcium and magnesium silicate ($CaMgSi_2O_6$) that occurs in metamorphosed siliceous limestones and dolomites, in skarns, and in igneous rocks. It is also found in small amounts in many chondritic meteorites. Clear specimens of good green colour are sometimes cut as gems.

Dior \ˈdyȯr,\ *English* \dē-ˈȯr, ˈdē-ȯr**, Christian** (b. Jan. 21, 1905, Granville, France—d. Oct. 24, 1957, Montecatini, Italy) French fashion designer. He trained for the French diplomatic service, but in the financial crisis of the 1930s he began illustrating fashions for a weekly periodical. In 1942 he joined the house of the Parisian designer

Christian Dior, 1957.
ENCYCLOPÆDIA BRITANNICA, INC.

© 2006 Encyclopædia Britannica, Inc.

Lucien Lelong. In 1947 he introduced his revolutionary "New Look," which featured small shoulders, a natural waistline, and a voluminous skirt, a drastic change from the World War II look of padded shoulders and short skirts. In the 1950s the "sack," or "H" line, became the characteristic silhouette of his designs. He was instrumental in commercializing Parisian fashion on a worldwide scale.

diorite \'dī-ə-ˌrīt\ Medium- to coarse-grained igneous rock that commonly is composed of about two-thirds plagioclase feldspar and one-third dark-coloured minerals, such as hornblende or biotite. Diorite has about the same structural properties as granite but, perhaps because of its darker colour and more limited supply, is rarely used as an ornamental building material. It is one of the dark gray stones that is sold commercially as "black granite."

Dioscuri \ˌdī-əs-'kyůr-ī, dī-'äs-kyə-ˌrī\ *or* **Castor and Pollux** (from Greek *dioskouroi*, "sons of Zeus") Twin gods of ancient Greece and Rome. They aided shipwrecked sailors and accepted sacrifices for favorable winds. Castor was mortal and Pollux was immortal; when Castor was killed, Pollux disowned his immortality to join his brother. Zeus later changed them into the constellation GEMINI. They were believed to have aided the Romans in an important battle early in their history, and a temple in their honour was built in the Roman Forum.

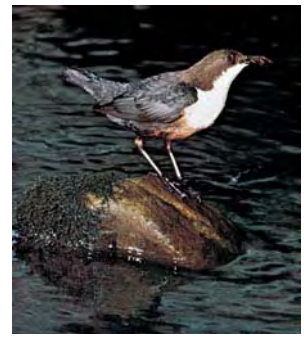
dioxin \dī-'äk-sən\ AROMATIC COMPOUND, any of a group of contaminants produced in making herbicides (e.g., AGENT ORANGE), disinfectants, and other agents. Their basic chemical structure consists of two benzene rings connected by a pair of oxygen atoms; when substituents on the rings are chlorine atoms, the molecules are particularly toxic. The best-known, usually called simply dioxin, is 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (2,3,7,8-TCDD). It is extremely stable chemically; it does not dissolve in water but dissolves in oils (and thus accumulates in body fat). The extent of its human toxicity is disputed and the subject of continuing research.

diphtheria \dif-'thir-ē-ə\ Acute infectious BACTERIAL DISEASE caused by *Corynebacterium diphtheriae*. The bacterium usually enters through the tonsils, nose, or throat and multiplies there, forming a thick membrane that adheres to the tissues and sometimes blocks the trachea, requiring emergency treatment.The bacteria produce a TOXIN that spreads to cause other symptoms, including fever, chills, sore throat, and lesions in heart muscle and peripheral nerve tissue that may cause death from heart failure and paralysis. Diphtheria is treated with an ANTITOXIN that neutralizes the toxin and produces long-term IMMUNITY. Vaccination has greatly reduced its occurrence in Europe and North America.

Diplodocus \də-'plä-də-kəs\ Genus of SAUROPOD dinosaur found as fossils in Late Jurassic rocks of North America and related to *APATOSAURUS*. *Diplodocus* and its relatives (diplodocids) were some of the longest land animals that ever lived, some approaching 100 ft (30 m). It had a long neck and extremely small brain and skull. Most diplodocids weighed about 30 tons, and some as much as 80 tons. It was formerly thought that *Diplodocus* may have spent a good deal of time in water, but fossil evidence indicates it moved freely on land, where it apparently fed on soft vegetation. It may be the most commonly displayed dinosaur.

diploidy See PLOIDY

diplomacy Art of conducting relationships for gain without conflict. It is the chief instrument of FOREIGN POLICY. Its methods include secret negotiation by accredited envoys (though political leaders also negotiate) and international agreements and laws. Its use predates recorded history. The goal of diplomacy is to further the state's interests as dictated by geography, history, and economics. Safeguarding the state's independence, security, and integrity is of prime importance; preserving the widest possible freedom of action for the state is nearly as important. Beyond that, diplomacy seeks maximum national advantage without using force and preferably without causing resentment.



diplomatic service See FOREIGN SERVICE

diplopia See DOUBLE VISION

Dipo Negoro \'dē-pō-ne-'gōr-ō**, Pangeran (Prince)** (b. c. 1785, Jogjakarta, Java—d. Jan. 8, 1855, Macassar [Ujung Pandang], Celebes) Javanese leader in the 19th-century conflict known to the West as the Java War (1825–30). He was the son of the ruler of Jogjakarta, a sultanate created in 1755 by a Dutch treaty that dismembered the once-powerful Javanese kingdom of Mataram. Dutch land reforms undercut the economic position of the Javanese aristocrats, and Dipo Negoro became the aristocrats' leader against the Dutch. The Javanese saw him as a "just prince" come to save the people, and the conflict itself was seen as a Muslim holy war against the infidels. For three years Dipo Negoro's guerrilla forces had the upper hand, but the Dutch triumphed in the end. Dipo Negoro was arrested at the peace negotiations and died in exile.

dipole See ELECTRIC DIPOLE, MAGNETIC DIPOLE

dipper *or* **water ouzel** \'ü-zəl\ Any of five songbird species in the genus *Cinclus* (family Cinclidae), noted for hunting insects by walking underwater in rushing streams. The species are widely distributed in Asia, Africa, Europe, and North and South America. Dippers are plump, stub-tailed birds, about 7 in. (18 cm) long, with a thrushlike bill and legs. They are commonly blackish brown or dull gray. They nest in a dome of moss built in a crevice, often behind a waterfall. See also OUZEL.

Eurasian dipper (*Cinclus cinclus*)
H.M. BARNFATHER—BRUCE COLEMAN INC.

dipteran \'dip-tə-rən\ Any member of the more than 85,000 species in the insect order Diptera (the two-winged, or "true," flies), characterized by the use of only one pair of wings for flight and the reduction of the second pair of wings to knobs used for balance. Dipterans live in all habitats worldwide, including the subarctic and high mountains. They range in size from about 0.05 in. (1 mm) long (MIDGES) to 3 in. (8 cm) long (ROBBER FLIES). Dipteran larvae break down and redistribute organic materials, and both adults and larvae are a significant link in numerous food chains. Many species are annoying bloodsuckers, and several (e.g., HOUSEFLY, MOSQUITO, SAND FLY, TSETSE FLY) are vectors of disease. Other species cause great damage to agricultural crops. See also BLOWFLY, CRANE FLY, FRUIT FLY, GNAT, HORSEFLY, LEAF MINER.

Dirac \di-'rak**, P(aul) A(drien) M(aurice)** (b. Aug. 8, 1902, Bristol, Gloucestershire, Eng.—d. Oct. 20, 1984, Tallahassee, Fla., U.S.) English mathematician and theoretical physicist. His first major contribution (1925–26) was a general and logically simple form of QUANTUM MECHANICS. About the same time, he developed ideas of ENRICO FERMI, which led to the FERMI-DIRAC STATISTICS. He then applied ALBERT EINSTEIN's special theory of relativity to the quantum mechanics of the electron and showed that the electron must have spin of ½. Dirac's theory also revealed new states later identified with the positron. He shared the 1933 Nobel Prize for Physics with ERWIN SCHRÖDINGER. In 1932 Dirac was appointed Lucasian Professor of Mathematics at the University of Cambridge, a chair once occupied by ISAAC NEWTON. Dirac retired from Cambridge in 1969 and held a professorship at Florida State University from 1971 until his death.

dire wolf Extinct WOLF (*Canis dirus*) that existed during the PLEISTOCENE EPOCH (1.8 million–10,000 years ago), probably the most common mammalian species found preserved in the LA BREA TAR PITS. It differed from the modern wolf in being larger and having a more massive skull, a smaller brain (and probably less intelligence), and relatively light limbs. The species was considerably widespread; skeletal remains have been found in Florida and the Mississippi valley in the U.S., as well as in the Valley of Mexico.

direct current (DC) Flow of ELECTRIC CHARGE that does not change direction. Direct current is produced by BATTERIES, FUEL CELLS, rectifiers, and GENERATORS with commutators. Direct current was supplanted by ALTERNATING CURRENT (AC) for common commercial power in the late 1880s because it was then uneconomical to transform it to the high voltages needed for long-distance transmission. Techniques developed in the 1960s overcame this obstacle, and direct current is now transmitted over very long distances, though it must ordinarily be converted to alternating current for final distribution. For some uses, such as electroplating, direct current is essential.

direct-mail marketing Method of merchandising in which the seller's offer is made through mass mailing of a circular or catalog or through a newspaper or magazine advertisement, and in which the buyer places an order by mail, telephone, or Internet. The rise of retail mail-order sell-

© 2006 Encyclopædia Britannica, Inc.

ing occurred in the late 19th century, when U.S. firms such as Sears, Roebuck and Montgomery Ward built large businesses selling goods primarily to farmers. Its use has grown steadily since the introduction of computerized mailing lists after 1960; it is now employed by tens of thousands of firms, and it reaches virtually every consumer in the U.S.

directing Art of coordinating and controlling all elements in the staging of a play or making of a film. Until the late 19th century, a theatrical director was usually the play's leading actor or the company's actor-manager. Today's stage director combines elements such as actors, decor, costumes, and lighting to shape an imaginative interpretation of the playwright's script. The director must understand the art of acting and provide guidance for the actors. The director also composes the "stage pictures," the shifting arrangements of the actors and other elements on the stage. The film director combines the theatrical director's responsibilities with the technical functions of cinematography, editing, and sound recording. See also actor-manager system; auteur theory.

Directoire style \dē-rek-'twär\ Style of dress, furniture, and ornament popular in France during the Directory, 1795–99. Dress for men mixed the ancient and contemporary: high boots, vests, open coats, top hats. Women's fashions featured dresses with long sleeves and V necklines, worn with ruffled caps. Directoire furniture and ornamentation were based on ancient Roman objects recently excavated at Pompeii.

Directory *French* **Directoire** \dē-rek-'twär\ (1795–99) Government set up during the French Revolution by the Constitution of 1795. Legislative power was placed in the Council of Five Hundred and the Council of Ancients, while executive power was placed in a five-member Directory. Though the Directors nominally inherited many of the powers of the Committee of Public Safety, they had no funds to finance their projects or courts to enforce their will. The regime was marked by administrative chaos and corruption and by the uprisings in the Vendée. It was overthrown in Napoleon's Coup of 18–19 Brumaire.

dirigible See airship

Dirksen \'dərk-sən**, Everett McKinley** (b. Jan. 4, 1896, Pekin, Ill., U.S.—d. Sept. 7, 1969, Washington, D.C.) U.S. politician. After serving in World War I, he returned to Illinois to pursue business interests. He served in the U.S. House of Representatives (1932–48), where he voted against most New Deal measures and remained an isolationist until the U.S. entered World War II. He later served in the U.S. Senate (1950–69), becoming minority leader in 1959. He was noted for his oratorical style. Though a conservative, he helped secure passage of the Nuclear Test Ban Treaty, the Civil Rights Act, and the Voting Rights Act.

dirty sandstone See graywacke

disarmament Reduction in armaments by one or more nations. Arms reductions may be imposed by a war's victors on the defeated (as happened after Germany's defeat in World War I). Bilateral disarmament agreements may apply to a specific area (such an agreement has kept the Great Lakes weapon-free since 1817). The term is most commonly used for multilateral reduction and limitation agreements, particularly in the context of nuclear weapons. See also arms control.

disc jockey (DJ) Person who plays recorded music on radio or television or at a nightclub or other live venue. Disc jockey programs became the economic base of many radio stations in the U.S. after World War II. The format generally involves one person, the disc jockey, introducing and playing phonograph records and chatting informally, usually extemporaneously, in the intervals. Because popular DJs are in a position to influence public tastes, record companies have sometimes attempted to bribe them with money and gifts, known as "payola."

Disciples of Christ Group of U.S. Protestant churches that originated in the frontier revivals of the early 19th century. Movements founded by Thomas and Alexander Campbell (1763–1854, 1788–1866) and Barton W. Stone (1772–1844) merged in 1832 and took the name Disciples of Christ. The new denomination grew rapidly. Its goal was to unite all Protestants on the basis of New Testament practices. The attempt failed, and the movement itself split into two major segments: the more conservative Churches of Christ (which rejects any innovation without New Testament precedent, including musical instruments in worship) and the Christian Church (Disciples of Christ). Other conservative congregations separated from the Christian Church (Disciples of Christ) in the 1920s; they established a separate annual gathering, the North American Christian Convention, in 1927. In 1985 the Disciples of Christ entered into an ecumenical partnership with the United Church of Christ. The common Disciples heritage is still manifest in the meetings of the World Convention of Churches of Christ, organized in 1930.

disco Style of dance music that arose in the mid-1970s, characterized by hypnotic rhythm, repetitive lyrics, and electronically produced sounds. Disco (short for *discotheque*) evolved largely from New York City underground nightclubs, in which disc jockeys would play dance records for hours without interruption, taking care to synchronize the beats so as to make a seamless change between records. Artists such as Donna Summer, Chic, and the Bee Gees had many hits in the genre, which peaked with the release of the film *Saturday Night Fever* (1977). Disco faded quickly after 1980, but its powerful influence, especially its sequenced electronic beats, still continues to affect much of pop music.

discount rate *or* **bank rate** Interest rate charged by a central bank for loans of reserve funds to commercial banks and other financial intermediaries. The discount rate is one important indicator of the condition of monetary policy in an economy. Because raising or lowering the discount rate alters the rates that commercial banks charge on loans, adjustment of the discount rate is used as a tool to combat recession and inflation.

discovery In law, pretrial procedures providing for the exchange of information between the parties involved. Discovery may be made through interrogatories, written questions sent from one side to the other in an attempt to secure important facts. It also can be made through depositions, whereby a witness is sworn and, in the presence of attorneys for both sides, is subjected to questions. (The written record of the proceedings also is called a deposition.) Other forms of discovery include an order of production and inspection, which compels the opposing party to produce relevant documents or other evidence, and requests for medical examination in cases in which a party's mental or physical condition is at issue.

discus throw Track-and-field sport of hurling for distance a disk-shaped object known as a discus. The discus is 8.6 in. (219 mm) in diameter and is thicker in the centre than at the perimeter; it must weigh at least 4.4 lbs (2 kg) for men's events, 2.2 lbs (1 kg) for women's. It is thrown by means of a whirling movement made by the athlete within a circle 8.2 ft (2.5 m) in diameter. The sport dates back to the ancient Greek Olympics.

disk, hard See hard disk

disk flower See composite family

diskette See floppy disk

dislocation Displacement of the bones of a joint. It disrupts the ligaments, muscles, and capsule (encasing membrane) holding the joint in place. The joint, painful and tender, appears misshapen and swollen, with discoloration of the overlying skin. The patient cannot use the joint and often feels a grating or grinding sensation on trying to move it. The bones must be returned to their normal position (reduction) and the joint kept immobile until healed. Recurrent and congenital dislocations usually require surgical reconstruction.

Dismal Swamp *or* **Great Dismal Swamp** Wetland region, southeastern Virginia and northeastern North Carolina, U.S. Despite much lumbering and widespread destruction by fire, the area is still heavily wooded. About 30 mi (48 km) long and 10 mi (16 km) wide, it is home to many rare birds and numerous poisonous snakes. Noted for its fishing and hunting, it is traversed by the Dismal Swamp Canal, part of the Atlantic Intracoastal Waterway.

Disney, Walt(er Elias) (b. Dec. 5, 1901, Chicago, Ill., U.S.—d. Dec. 15, 1966, Los Angeles, Calif.) U.S. animator and entertainment executive. In the 1920s he joined with his brother Roy and his friend Ub Iwerks (1901–71) to establish an animation studio. Together they created Mickey Mouse, the cheerful rodent—customarily drawn by Iwerks, with Disney providing the voice—that

Walt Disney, 1950.
ALFRED EISENSTAEDT—TIME LIFE PICTURES/GETTY IMAGES

© 2006 Encyclopædia Britannica, Inc.

starred in the first animated film with sound, *Steamboat Willie* (1928). The brothers formed Walt Disney Productions (later the Disney Co.) in 1929. Mickey Mouse's instant popularity led them to invent other characters such as Donald Duck, Pluto, and Goofy and to make several short cartoon films, including *The Three Little Pigs* (1933). Their first full-length animated film, *Snow White and the Seven Dwarfs* (1937), was followed by classics such as *Pinocchio* (1940), *Fantasia* (1940), and *Cinderella* (1950). A perfectionist, an innovator, and a skilled businessman, Walt Disney maintained tight control over the company in both creative and business aspects. He oversaw the company's expansion into live-action films, television programming, theme parks, and mass merchandising. By his death in 1966, Disney had transformed the family entertainment industry and influenced more than one generation of American children.

Disney Co. U.S. entertainment corporation. It was founded by Walt Disney and his brother Roy as Walt Disney Productions in 1929 to incorporate their cartoon animation studio. It produced short and full-length animated cartoons in the 1930s and 1940s, then expanded in the 1950s to make nature documentaries and live-action films as well as television programs. The opening of the amusement parks Disneyland (1955) and Walt Disney World (1971; see Disney World and Disneyland) strengthened the company's dominance of the family entertainment industry in the U.S. The company declined after Disney's death in 1966 but was revitalized under new management in the 1980s. As the Walt Disney Co. it expanded its production units to include Touchstone Pictures and Miramax, makers of films for more mature audiences, and revitalized its animation division, producing films such as *The Little Mermaid* (1989) and *Toy Story* (1995), the first full-length computer-animated film. The company took an active role in reviving and commercializing New York City's Times Square, including the recreation of some of its animated films, such as *The Lion King* (1994), as Broadway musicals. In 1994 it opened Celebration, a planned community in central Florida. It acquired the ABC television network in 1996 and became the world's largest media and entertainment corporation; it also operates the cable television Disney Channel. See also Michael Eisner.

Disney World and Disneyland Two theme parks built by the Walt Disney Co. (see Disney Co.), a U.S. corporation that became the best-known 20th-century purveyor of entertainment. Disneyland, an interactive, family-oriented fantasy environment that opened in Anaheim, Calif., in 1955, was Walt Disney's response to typical amusement parks, which entertained children but not their parents. The park, which has architecture that is a blend of futurism and nostalgic 19th-century reproductions, has different sections devoted to specific themes. Walt Disney World opened near Orlando, Fla., in 1971. Besides containing Epcot Center (an idealized city), Disney-MGM Studios, and the Magic Kingdom and Animal Kingdom theme parks, Disney World was the first amusement park to incorporate hotels (including two designed by Michael Graves) and sports and other recreational facilities into its master plan. In the late 20th century new Disney theme parks also opened in Paris and Tokyo.

disorderly conduct Conduct likely to lead to a disturbance of the public peace or that offends public decency. It has been held to include the use of obscene language in public, fighting in a public place, blocking public ways, and making threats. Statutes against disorderly conduct must identify the specific acts that constitute it. The offense usually carries minor penalties.

dispersion Any phenomenon associated with the propagation of individual waves at speeds that depend on their wavelengths. Wavelength determines the speeds at which waves travel through media. This variation in speed causes radiation to separate into components that have different frequencies and wavelengths. For example, when a beam of white light is sent through a glass prism, refraction causes the beam to disperse into an array of its component colours of light, producing a rainbowlike effect.

displacement activity Performance by an animal of an act inappropriate for the stimulus or stimuli that evoked it. It usually occurs when an animal is torn between two conflicting drives, such as fear and aggression. Displacement activities often consist of comfort movements (e.g., grooming, scratching).

display behaviour Ritualized activity by which an animal conveys specific information. The best-known displays are visual, but others rely on sound, smell, or touch. Agonistic (aggressive) displays make it unnecessary to chase intruders from a territory or for animals to injure each other in competition for mates. One type of defensive display deceives predators or lures them away from vulnerable young. See also birdsong; courtship behaviour.

disposable income Portion of an individual's income over which the recipient has complete discretion. To assess disposable income, it is necessary to determine total income, including not only wages and salaries, interest and dividend payments, and business profits, but also transfer income such as social-security benefits, pensions, and alimony. Obligatory payments, including personal income taxes and compulsory social-insurance contributions, must be subtracted. Disposable income may be used for consumption or saving.

Dispur \dis-'půr\ City, capital of Assam state, northeastern India. Following the administrative reorganization of the region in 1972, Dispur, a suburb of Guwahati, became the state capital.

Disraeli \diz-'rā-lē**, Benjamin, earl of Beaconsfield** (b. Dec. 21, 1804, London, Eng.—d. April 19, 1881, London) British politician and author who was twice prime minister (1868, 1874–80). Of Italian-Jewish descent, he was baptized a Christian as a child, which enabled his future career, because until 1858, practitioners of Judaism were excluded from Parliament. He first made his mark as a writer with *Vivian Grey* (1826–27); later novels included *Coningsby* (1844) and *Sybil* (1845). He was elected to Parliament as a Conservative in 1837. In 1845 he made a series of brilliant speeches against Sir Robert Peel's decision to repeal the Corn Laws, which helped him to become leader of the Conservatives. He served three stints as chancellor of the Exchequer (1852, 1858–59, 1865–68) and played a prominent role in passing the Reform Bill of 1867. He was prime minister briefly in 1868, then returned in his second ministry (1874–80) to promote social reform. An advocate of a strong foreign policy, he secured a triumph for imperial prestige with his acquisition of Suez Canal shares and won concessions for England at the Congress of Berlin. A trusted friend of Queen Victoria, he introduced a bill conferring on her the title Empress of India. After the Conservatives were defeated in 1880, he kept the party leadership and finished his political novel *Endymion* (1880).

dissociation Breaking of a chemical compound into simpler constituents as a result of added energy, as in the case of gaseous molecules dissociated by heating; also, the effect of a solvent on a dissolved polar compound (electrolyte), as in the case of an inorganic salt, such as sodium chloride, dissolved in water. All electrolytes dissociate into ions to a greater or lesser extent in polar solvents (in which the molecules are electric dipoles). The degree of dissociation can be used to determine the equilibrium constant. Dissociation is used to explain electrical conductivity and many other properties of electrolytic solutions.

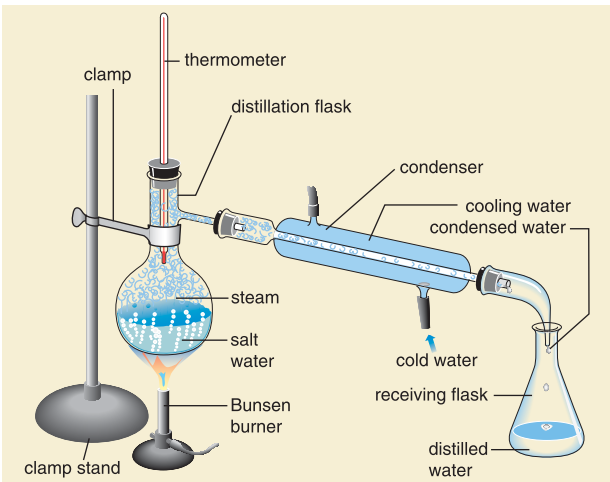
dissociative identity disorder *formerly* **multiple personality disorder** Rare condition indicated by the absence of a clear and comprehensive identity. In most cases two or more independent and distinct personality systems develop in the same individual. Each personality may alternately inhabit the person's conscious awareness to the exclusion of the others, but one is usually dominant. The various personalities typically differ from one another in outlook, temperament, and body language and might assume different first names. The condition is generally viewed as resulting from dissociative mental processes—that is, the splitting off from conscious awareness and control of thoughts, feelings, memories, and other mental components in response to situations that are painful, disturbing, or somehow unacceptable to the person experiencing them. Treatment is aimed at integrating the disparate personalities back into a single and unified personality.

dissonance See consonance and dissonance

dissonance, cognitive See cognitive dissonance

distaff Device used in hand spinning in which individual fibres are drawn out of a mass of prepared fibres held on a stick (the distaff), twisted together to form a continuous strand, and wound on a second stick (the spindle). It is most often used for making linen; wool does not require a distaff (see carding). The first stage in mechanizing spinning was to mount the spindle horizontally in bearings to rotate with a large hand-driven wheel; the distaff, carrying the mass of fibre, was held in the left hand, and the spinning wheel slowly turned with the right. The Saxon, or Saxony, wheel incorporated a bobbin on which the yarn was wound continuously; the distaff holding the raw fibre became a stationary vertical rod, and the wheel was activated by a foot treadle, freeing both the operator's

© 2006 Encyclopædia Britannica, Inc.



hands. From 17th-century England, the word *distaff* became a synonym for *maternal* as most spinning was done by women in their homes. See also DOMESTIC SYSTEM.

distance formula Algebraic expression that gives the distances between pairs of points in terms of their coordinates (see COORDINATE SYSTEM). In two- and three-dimensional EUCLIDEAN SPACE, the distance formulas for points in rectangular coordinates are based on the PYTHAGOREAN THEOREM. The distance between the points (a,b) and (c,d) is given by $\sqrt{(a-c)^2 + (b-d)^2}$. In three dimensional space, the distance between the points (a, b, c) and (d, e, f) is $\sqrt{(a-d)^2 + (b-e)^2 + (c-f)^2}$.

distemper Viral disease in two forms, canine and feline. Canine distemper is acute and highly contagious, affecting dogs, foxes, wolves, mink, raccoons, and ferrets. Most untreated cases are fatal. Infected animals are best treated with prompt injections of serum globulins; secondary infections are warded off by antibiotics. Immunity can be conferred by vaccination. Feline distemper causes a severe drop in the number of the infected cat's white blood cells. It rarely lasts more than a week, but the mortality rate is high. Vaccines offer effective immunity.

disthene See KYANITE

distillation VAPORIZATION of a LIQUID and subsequent CONDENSATION of the resultant GAS back to liquid form. It is used to separate liquids from nonvolatile solids or solutes (e.g., water from salt and other components of seawater) or to separate two or more liquids with different BOILING POINTS (e.g., alcohol from fermented beers and wines). Many variations have been devised for industrial applications. An important one is fractional distillation, in which vapour from a heated liquid mixture is contacted by a series of trays and condensed liquid as it rises through a vertical column. The most volatile fraction of the mixture emerges from the top of the column, while less volatile fractions are withdrawn at lower points. In petroleum refining, this method is very efficient for removing naphtha, kerosene, and gas oils from crude oil.

A laboratory distillation apparatus demonstrating desalination of water. In the distillation flask, salt water is boiled to produce water vapour, or steam, while the salt remains in the liquid solution. The vapour rises through the top of the flask and passes into the condenser, which consists of a glass tube within a larger tube. Cold water flows through the space between the tubes, cooling the vapour in the inner tube so that it condenses and flows into the receiving flask.

© MERRIAM-WEBSTER INC.

distilled liquor ALCOHOLIC BEVERAGE obtained by distillation from WINE or other fermented fruit juice or from various CEREAL grains that have first been brewed. The essential ingredient is usually a natural sugar or a starchy substance that may be easily converted into a sugar. The distillation process is based on the different boiling points of water (212 °F [100 °C]) and alcohol (173 °F [78.5 °C]). The alcohol vapours that arise while the fermented liquid boils are trapped and recondensed to create a liquid of much greater alcoholic strength. The resultant distillate is matured, often for several years, before it is packaged and sold. See also AQUAVIT; BRANDY; GIN; LIQUEUR; RUM; VODKA; and WHISKEY.

distribution See FREQUENCY DISTRIBUTION, NORMAL DISTRIBUTION

distributive law One of the laws relating to number operations. In symbols, it is stated: $a(b + c) = ab + ac$. The monomial factor a is distributed, or separately applied, to each term of the polynomial factor $b + c$, resulting in the product $ab + ac$. It can also be stated in words: The result of first adding several numbers and then multiplying the sum by some number is the same as first multiplying each separately by the number and then adding the products. See also ASSOCIATIVE LAW; COMMUTATIVE LAW.

District Court, U.S. See UNITED STATES DISTRICT COURT

District of Columbia Federal district of the U.S. Coextensive with the city of WASHINGTON, it is bounded by Maryland and Virginia. Originally 100 sq mi (259 sq km), the territory was authorized by Congress in 1790 and granted by Maryland and Virginia; it now occupies 68 sq mi (176 sq km). The site was chosen by Pres. GEORGE WASHINGTON and became the seat of the federal government by 1800. Part of the district (ALEXANDRIA, Va.) was retroceded to Virginia in 1847. The slave trade was prohibited in the District in 1850 and slavery was abolished in 1862. The territorial government was abolished in 1874 in favour of government by a commission appointed by the president. Residents were granted suffrage in national elections in 1961 by the 23rd Amendment to the U.S. CONSTITUTION. The mayor-council form of government was established in 1967. Originally appointees of the president, the mayor and councilors became elected officials in 1973 and received local legislative powers in 1974.

dithyramb \'dith-i-ˌram(b)\ Choric poem, chant, or hymn of ancient Greece. Dithyrambs were sung by revelers at the festival in honour of Dionysus. The form originated about the 7th century BC in extemporaneous songs of banqueters; it was a recognized literary genre by the end of the 6th century BC. Dithyrambs were composed by ARION and PINDAR, among others. By c. 450 BC the form was in decline; most dithyrambs were bombastic and turgid.

Ditters von Dittersdorf \'dit-ərs-ˌdȯrf**, Carl** *orig.* **Carl Ditters** (b. Nov. 2, 1739, Vienna, Austria—d. Oct. 24, 1799, Rothlhotta Castle, Neuhof, Bohemia) Austrian composer. A violin prodigy, he served as kapellmeister at the court of the prince-bishop of Breslau (1770–95). Though ennobled by the empress in 1773, he apparently declined the offer of the post of kapellmeister at the imperial court in Vienna. Extremely prolific, he wrote some 120 symphonies, some 40 concertos (many for violin), sacred choral works, and many chamber pieces. Most important are some 40 stage works, particularly his singspiels, including *Doctor und Apotheker* (1786) and *Die Liebe im Narrenhause* (1787).

diuretic \ˌdī-yu̇r-'e-tik\ Any drug that increases the flow of URINE from the body. Diuretics promote removal of excess water, salts, poisons, and metabolic wastes to help relieve EDEMA, KIDNEY FAILURE, or GLAUCOMA. Most types act by decreasing the amount of fluid that is reabsorbed by the kidney's NEPHRONS and passed back into the blood. Diuretics that allow the body to retain POTASSIUM are used for patients with HYPERTENSION or CONGESTIVE HEART FAILURE.

Divali *or* **Diwali** \də-'wä-lē, də-'vä-lē\ In HINDUISM, a five-day religious festival in autumn. It honors LAKSHMI, goddess of wealth, or, in Bengal, the goddess KALI. During its celebration, earthenware lamps are lit and placed on the parapets of houses and temples or set adrift on rivers and streams. The fourth day of the festival marks the start of a new year, a time of gift-giving, visiting friends, decorating homes, and wearing new clothes. Divali is celebrated by Jains and Sikhs as well.

diver See LOON

divergence In mathematics, a DIFFERENTIAL OPERATOR applied to a three-dimensional vector-valued FUNCTION. The result is a function that describes a rate of change. The divergence of a vector $\mathbf{v}$ is given by

$$\operatorname{div} \mathbf{v} = \frac{\partial \mathbf{v}_1}{\partial x} + \frac{\partial \mathbf{v}_2}{\partial y} + \frac{\partial \mathbf{v}_3}{\partial z}$$

in which $\mathbf{v}_1$, $\mathbf{v}_2$, and $\mathbf{v}_3$ are the vector components of $\mathbf{v}$, typically a velocity field of fluid flow.

diverticulum \ˌdī-vər-'ti-kyə-ləm\ Small pouch or sac formed in the wall of a major organ, usually the ESOPHAGUS, SMALL INTESTINE, or LARGE INTESTINE (the most frequent site of problems). In the large intestine, feces pushed into a pouch can make it bulge out from the colon wall, a condition known as diverticulosis, which has no symptoms. In the more seri-

© 2006 Encyclopædia Britannica, Inc.

ous condition called diverticulitis, those sacs become inflamed, causing pain and tenderness, chills, and sometimes fever. Mild cases need only bed rest and antibiotics. In severe cases, perforation or rupture of the colon wall at the diverticulum can cause PERITONITIS. Rupture may require COLOSTOMY. Meckel diverticulum, a congenital malformation of the upper intestine that causes bleeding and inflammation, may require surgical removal.

divertimento \di-ˌvər-ti-'men-tō\ Eighteenth-century CHAMBER MUSIC genre consisting of several movements, often of a light and entertaining nature, for strings, winds, or both. Though the name was applied (c. 1750–1800) to a confusingly varied range of works, it almost always referred to pieces with a single instrument to a part; this could include string quartets and even keyboard sonatas.

dividend Individual share of earnings distributed among stockholders of a corporation or company in proportion to their holdings. Usually paid in cash, dividends may also be distributed in the form of additional shares of STOCK. Preferred stockholders receive a preferential dividend, usually at a fixed rate; common stockholders get a portion of what remains after payment of the dividends on preferred stock.

dividing engine MACHINE used to mark off equal intervals accurately, usually on precision instruments. Georg Friedrich von Reichenbach (1772–1826), a German maker of astronomical instruments, designed an early dividing engine, and Jesse Ramsden (1735–1800), a British pioneer in the design of precision tools, designed dividing engines of great accuracy for both circles and straight lines and produced highly accurate SEXTANTS, theodolites (see SURVEYING), and vertical circles for astronomical observatories.

divination Practice of discerning the hidden significance of events and foretelling the future. Divination is found in all societies, ancient and modern, though methods vary. In the West, psychics claim innate ability to predict the future, and HOROSCOPES, palm reading, and TAROT cards are popular methods of divination. Other methods involve or have involved interpreting dreams, discovering OMENS in natural events, reading the entrails of animals, casting lots, and consulting ORACLES. Divination has long been viewed as the province of specially gifted persons, such as PROPHETS, SHAMANS, and magicians. See also ASTROLOGY.

Divine, Father *orig.* **George Baker** (b. 1880?, Georgia?, U.S.—d. Sept. 10, 1965, Philadelphia, Pa.) U.S. religious leader. Reportedly born on a plantation, he began preaching in 1899 in the South and later in Baltimore, Md., as "The Messenger." He settled in New York City in 1915 and adopted the name Major J. Devine (later altered to Father Divine). In 1919 he established his first communal settlement in Sayville on Long Island, and he founded the Peace Mission movement. His predominantly black following expanded rapidly in the 1930s and '40s, and his settlements, called "heavens," eventually numbered about 170. He taught his followers to renounce personal property, and the strict moral code he preached included celibacy and a ban on alcohol and tobacco. Many of his followers, called "angels," believed him to be God.

divine kingship Religio-political concept that views a ruler as an incarnation, manifestation, mediator, or agent of the sacred. In some nonliterate societies, members view their rulers or chiefs as inheritors of the community's own magical power. The ruler may exercise this power either malevolently or benevolently, but he is usually responsible for influencing the weather and the land's fertility to ensure the harvest necessary for survival. In other societies, particularly those of ancient China, the Middle East, and South America, the ruler was identified with a particular god or as a god himself; in Japan, Peru (among the Inca), Mesopotamia, and the Greco-Roman world, the ruler was regarded as the son of a god. In either case—whether the ruler embodies his own magical power or that of the community—the ruler protects the community from enemies and generally feeds and cares for his people. A third form of divine kingship, one practiced in Europe, is that of the ruler as mediator or executive agent of a god. In this form it is the institution of kingship, more than an individual ruler, that bears the mark of the sacred.

diving Sport of plunging into water, usually headfirst and often following the execution of one or more acrobatic maneuvers. It emerged as a competitive sport in the late 19th century and became part of the Olympic Games in 1904. Dives are performed from a firm platform 5 or 10 m (16.4 or 32.8 ft) above the water, or from a springboard 1 or 3 m (3.3 or 9.8 ft) above the water. In Olympic contests, only the 10-m platform and 3-m springboard are used. Contestants are required to do certain dives, as well as dives of their own choice, each rated according to its degree of difficulty. Judges score each dive, and the total score is multiplied by the degree of difficulty.

diving duck Any DUCK that obtains its food by diving to the bottom in deep water rather than by dabbling in shallows (see DABBLING DUCK). Diving ducks prefer marine environments and are popularly called either bay ducks or sea ducks. Bay ducks (tribe Aythyini, family Anatidae), including CANVASBACK, redhead, SCAUP, and allied species, are found more frequently in estuaries and tidal lagoons than on the open sea. Sea ducks (20 species in tribes Mergini and Somateriini) include the bufflehead, EIDERS, GOLDENEYE, MERGANSERS, oldsquaw, and SCOTERS; some are also or mainly found on inland waters.

division of labour Specialization in the production process. Complex jobs can usually be less expensively completed by a large number of people each performing a small number of specialized tasks than by one person attempting to complete the entire job. The idea that specialization reduces costs, and thereby the price the consumer pays, is embedded in the principle of COMPARATIVE ADVANTAGE. Division of labour is the basic principle underlying the ASSEMBLY LINE in mass production systems. See ÉMILE DURKHEIM.

divorce Dissolution of a valid MARRIAGE, usually freeing the parties to remarry. In societies in which religious authority is strong and the religion holds that marriage is indissoluble (e.g., ROMAN CATHOLICISM, HINDUISM), divorce may be difficult and rare. In the U.S. at the beginning of the 21st century there was about one divorce for every two marriages. The rate of divorce in the U.S. is greater than it is in most other Western countries, though divorce rates climbed in those countries in the last decades of the 20th century. The most common grounds for divorce are absence from the marital home, drug or alcohol addiction, adultery, cruelty, conviction of a crime, desertion, insanity, and nonsupport. See also ANNULMENT.

Diwali See DIVALI

Dix, Dorothea (Lynde) (b. April 4, 1802, Hampden, District of Maine, Mass., U.S.—d. July 17, 1887, Trenton, N.J.) U.S. social reformer on behalf of the mentally ill. She opened a school for girls in Boston in 1821, and in 1841 she began teaching Sunday school in a jail, where she was distressed to see the mentally ill imprisoned with criminals. For 18 months she toured mental institutions, and in 1843 she reported their deplorable conditions to the Massachusetts legislature. After improvements were made, she expanded her campaign to other states. Through her work, special mental hospitals were built in 15 states and in Canada.

Dix, Otto (b. Dec. 2, 1891, Untermhaus, Thuringia, Ger.—d. July 25, 1969, Singen, Baden-Württemberg, W.Ger.) German painter and printmaker. He studied at the academies of Düsseldorf and Dresden and experimented with IMPRESSIONISM and DADA before arriving at EXPRESSIONISM with a nightmarish personal vision of contemporary social reality, depicting the horrors of war and the depravities of a decadent society with great emotional effect. He was appointed professor at the Dresden Academy in 1926 and elected to the Prussian Academy in 1931. His antimilitary works aroused the wrath of the Nazi regime and he was dismissed from his academic posts in 1933. His later work was marked by religious mysticism. See also NEUE SACHLICHKEIT.

Dixiecrat *or* **States' Rights Democrat** In the U.S., member of a right-wing Democratic splinter group in the 1948 election. Organized by Southerners who objected to the Democrats' civil rights program, the Dixiecrats met in Birmingham, Ala., and nominated Gov. STROM THURMOND of South Carolina for president. He received more than one million votes in the 1948 election and won four states.

Dixieland JAZZ played by a small ensemble featuring collective and solo improvisation. The term is often ascribed especially to the New Orleans

© 2006 Encyclopædia Britannica, Inc.

pioneers of jazz, although many critics of popular music believe the term better describes the music of a later wave of white Chicago musicians including Jimmy McPartland, Bud Freeman, and Frank Teschemacher. The earliest jazz ensembles grew out of the RAGTIME and brass bands of New Orleans, incorporating elements of the BLUES. In early jazz ensembles, such as those led by KING OLIVER and JELLY ROLL MORTON, the trumpet or cornet plays the melody, with clarinet and trombone providing accompaniment. The tension created by soloists contrasts with the release of ensemble refrains. It is played with a distinctive two-beat rhythm, resulting in a joyous cacophony at fast tempos or slow, mournful dirges. Dixieland groups usually include banjo, tuba, and drums.

Dixon, Joseph (b. Jan. 18, 1799, Marblehead, Mass., U.S.—d. June 15, 1869, Jersey City, N.J.) U.S. inventor and manufacturer. Largely self-taught, Dixon began his pioneering industrial use of GRAPHITE in 1827 with the manufacture of lead pencils, stove polish, and lubricants. He discovered that graphite crucibles withstood high temperatures, and he secured patents on graphite crucibles for making steel and pottery. He established a crucible steelworks in Jersey City in 1850. He also experimented with photography and photolithography and devised a technique for printing banknotes in colour to prevent counterfeiting.

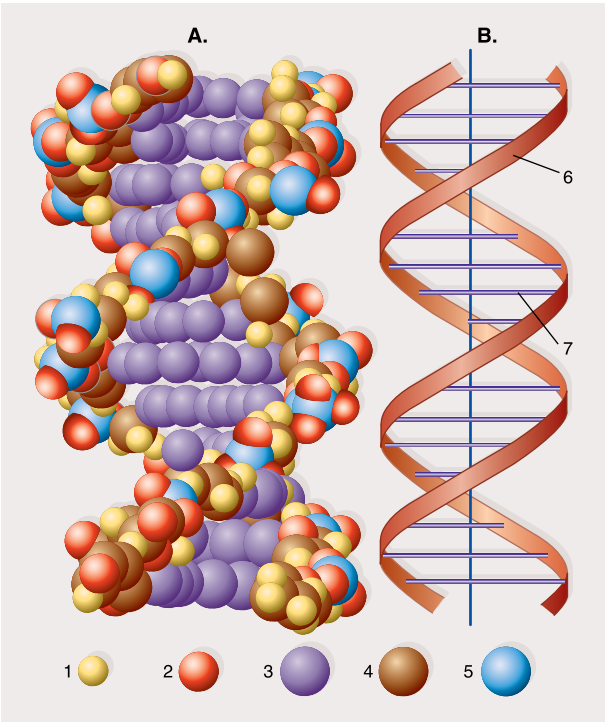
Dixon, Willie *orig.* **William James Dixon** (b. July 1, 1915, Vicksburg, Miss., U.S.—d. Jan. 29, 1992, Burbank, Calif.) U.S. musician who influenced the emergence of electric BLUES and ROCK MUSIC. In 1936 Dixon moved from his native Mississippi to Chicago, won an Illinois Golden Gloves boxing championship, and began selling his songs. He played double bass in several bands before joining Chess Records. His lively compositions, which he sold for as little as $30, included "Little Red Rooster," "You Shook Me," and "Back Door Man"; many were later recorded by MUDDY WATERS, ELVIS PRESLEY, and the ROLLING STONES. Dixon toured widely throughout the U.S. and Europe.

Djakarta See JAKARTA

Djibouti \ji-'bü-tē\ *officially* **Republic of Djibouti,** *formerly (1967–77)* **French Territory of the Afars and Issas** \ä-'fär...ē-'sä, ä-'färz...ē-'säz\ Country, eastern Africa, on the Gulf of ADEN at the entrance

to the RED SEA. Area: 8,950 sq mi (23,200 sq km). Population (2005 est.): 476,700. Capital: DJIBOUTI. Roughly half of the people are Issas and related Somali clans; Afars are about one-third; the balance includes Yemeni Arabs and Europeans, mostly French. Languages: French, Arabic (both official). Religion: Islam (predominantly Sunni). Currency: Djibouti franc. Djibouti is divided into three principal regions: the coastal plain, the volcanic plateaus in the country's south and centre, and the mountain ranges in the north, reaching 6,654 ft (2,028 m) high at Mount Moussa (Mousa). The land is primarily desert—hot, dry, and desolate; virtually none is arable. Djibouti has a developing market economy that is based almost entirely on trade and commercial services, centring on DJIBOUTI city. The country is a republic with one legislative house; its head of state and government is the president. Settled by the Arab ancestors of the Afars, it was later populated by Somali Issas. In AD 825 Islam was brought to the area by missionaries. Arabs controlled the trade in this region until the 16th century; it became a French protectorate in the 19th century. It was made a French overseas territory in 1946, assumed the name French Territory of the Afars and Issas in 1967, and gained its independence in 1977. In the late 20th century it received refugees from the Ethiopian-Somali war and from civil conflicts in Eritrea. From the 1990s the country experienced political unrest.

Djibouti City (pop., 1995 est.: 383,000), major port, and capital of Djibouti. Located on the southern shore of the Gulf of Tadjoura in the Gulf of ADEN, it was founded by the French in 1888 and made the capital of French Somaliland in 1892. Linked by rail to ADDIS ABABA in 1917, it was made a free port in 1949. The economic life of both the city and the nation depends on the city's function as a transshipment point, especially between Ethiopia and the RED SEA trade. Built on three level areas linked by jetties, the city has a mixture of ancient and modern architecture. Drought and war during the 1980s and early '90s brought many refugees to Djibouti from Somalia and Ethiopia, swelling its population.



Djilas \'ji-läs**, Milovan** (b. June 12, 1911, Podbišce, Montenegro—d. April 20, 1995, Belgrade, Serbia) Yugoslav politician and political writer. His opposition to Yugoslavia's royalist dictatorship led to a prison term (1933–36). He joined the Yugoslav Communist Party's central commit}tee in 1938 and its politburo in 1940. In World War II he played a major role in the partisan resistance to the Germans. In 1953 he became president of the Federal People's Assembly, but his criticism of the party and calls for liberalization soon led to his ouster from all political posts by TITO. He was later arrested several times after his books criticizing communism, including *The New Class* (1957), were published in the West.

Dmitry, False *or* **Pseudo-Demetrius** Any of three pretenders to the Muscovite throne who, during the Time of TROUBLES, claimed to be IVAN IV's child Dmitry Ivanovich, who had died mysteriously while still a child, possibly murdered at the order of BORIS GODUNOV. The first False Dmitry challenged Godunov's right to the throne and was proclaimed tsar in 1605. In 1606 he was murdered by Vasily Shuysky (1552–1612), who succeeded him. Rumors spread that Dmitry had survived, and a second pretender gained a large following before being killed in 1610. A third False Dmitry appeared in 1611, gaining the allegiance of the COSSACKS and the inhabitants of Pskov, but he was executed in 1612.

DNA *or* **deoxyribonucleic** \dē-'äk-si-ˌrī-bō-nyü-'klē-ik, dē-'äk-si-ˌrī-bō-nyü-'klā-ik\ **acid** One of two types of NUCLEIC ACID (the other is RNA); a complex organic compound found in all living CELLS and many VIRUSES. It is the chemical substance of GENES. Its structure, with two strands wound around each other in a double helix to resemble a twisted ladder, was first described (1953) by FRANCIS CRICK and JAMES D. WATSON. Each strand is a long chain (POLYMER) of repeating NUCLEOTIDES: ADENINE (A), GUANINE (G), CYTOSINE (C), and THYMINE (T). The two strands contain complementary information: A forms hydrogen bonds (see HYDROGEN BONDING) only with T, C only with G. When DNA is copied in the cell, the strands separate and each serves as a template for assembling a new complementary strand; this is the key to stable HEREDITY. DNA in cells is organized into dense protein-DNA complexes (see NUCLEOPROTEIN) called CHROMOSOMES. In EUKARYOTES these are in the NUCLEUS, and DNA also occurs in mitochondria and CHLOROPLASTS (if any). PROKARYOTES have a single circular chromosome in the CYTOPLASM. Some prokaryotes and a few eukaryotes have DNA outside the chromosomes in PLASMIDS. See also ROSALIND FRANKLIN; GENETIC ENGINEERING; MUTATION; MAURICE WILKINS. See illustration on following page.

DNA computing Form of computing in which DNA molecules are used instead of digital logic circuits. The biological cell is regarded as an entity that resembles a sophisticated computer. The four AMINO ACID bases that are constituents of DNA, traditionally represented by the letters A, T, C, and G, are used as operators, as the binary digits 0 and 1 are used in computers. DNA molecules are encoded to a researcher's specifications and then induced to recombine (see RECOMBINATION), resulting in trillions of

"calculations" simultaneously. The field is in its infancy and its implications are only beginning to be explored. See also QUANTUM COMPUTING.

DNA fingerprinting Method developed by the British geneticist Alec Jeffreys (born 1950) in 1984 for isolating and making images of sequences of DNA. The procedure consists of obtaining a sample of cells containing DNA (e.g., from skin, blood, or hair), extracting the DNA, and purifying it. The DNA is then cut by ENZYMES, and the resulting fragments of varying lengths undergo procedures that permit them to be analyzed. The pattern of fragments is unique for each individual. DNA fingerprinting is used to help solve crimes and determine paternity; it is also used to locate gene segments that cause genetic diseases, to map the genetic material of humans (see HUMAN GENOME PROJECT), to engineer drought-resistant plants (see GENETIC ENGINEERING), and to produce biological drugs from genetically altered cells.

Dnieper River \'nē-pər\ *Russian* **Dnepr** \də-'nyeprʲ\ *ancient* **Borysthenes.** River, eastern central Europe. One of the longest rivers in Europe, it rises west of MOSCOW and flows south through Belarus and Ukraine, emptying into the Black Sea after a course of 1,420 mi (2,285 km). More than 300 hydroelectric plants operate in the Dnieper basin, and it has several huge dams. Navigable for about 1,042 mi (1,677 km) during the 10 months of the year when it is not frozen, it is an important shipping artery for eastern Europe.

Dniester River \'nē-stər\ *Russian* **Dnestr** \də-'nyestrʲ\ *ancient* **Tyras.** River, southern central Europe. Rising on the northern side of the CARPATHIAN MTNS., it flows south and east for 840 mi (1,352 km) to the Black Sea near ODESSA. It is the second-longest river in Ukraine and the main water artery of Moldova. It is navigable for 750 mi (1,200 km).

Dnipropetrovsk \də-ˌnye-prə-pē-'trȯfsk\ *formerly (1783–1926)* **Ekaterinoslav** \i-ˌkä-ti-'rē-nə-ˌsläf\ City (pop., 2001: 3,567,600), south-central Ukraine. Located on the DNIEPER RIVER, it was founded in 1783 and named for CATHERINE the Great; it grew after the railroad arrived in the 1880s. In 1926 the Soviets gave it its current name. A railway junction and a centre of the wheat trade, it has developed into one of the largest industrial cities of Ukraine, with a huge iron and steel industry. It is the site of institutes of higher education, and its cultural amenities include several theatres.

Doberman pinscher \'dō-bər-mən-'pin-chər\ Breed of working dog developed in Apolda, Germany, by Louis Dobermann, a dog-pound keeper, in the late 19th century. This sleek, agile, powerful dog stands 24–28 in. (61–71 cm) high and weighs 60–88 lbs (27–40 kg). It has a short, smooth black, blue, fawn, or red coat, with rust markings on the head, throat, chest, tail base, and feet. Dobermans have a reputation for fearlessness, alertness, loyalty, and intelligence. They have been used in police and military work, as watchdogs, and as guide dogs for the blind.

Döblin \'dœ-ˌblēn\, **Alfred** (b. Aug. 10, 1878, Stettin, Ger.—d. June 26, 1957, Emmendingen, near Freiburg im Breisgau, W.Ger.) German novelist and essayist. He studied medicine at the Universities of Berlin and Freiburg, specializing in psychiatry. His first novel, *The Three Leaps of Wang-Lun* (1915), describes the quashing of a rebellion in China. His best-known work, *Berlin Alexanderplatz* (1929; film, 1931; adapted for television, 1980), is written in an Expressionist vein and dramatizes the miseries of working-class life in a disintegrating social order. His Jewish ancestry and socialist views compelled him to leave Germany upon the Nazi takeover, and he fled to France (1933) and then to the U.S. (1940), resettling in Paris in the early 1950s.

Dobrovský \'dȯ-brȯf-skē\, **Josef** (b. Aug. 17, 1753, Gyarmat, Hung.—d. Jan. 6, 1829, Brno, Moravia, Austrian Empire) Czech linguist. He was ordained a priest in 1786, but after 1791 noble patronage allowed him to devote himself to scholarship in Prague. His textual criticism of the Bible led him to study OLD CHURCH SLAVONIC and then the SLAVIC LANGUAGES as a group. An influential scholar of the CZECH LANGUAGE and its literature, he published such works as *History of the Bohemian Language and Literature* (1792). His grammar of Czech, *Learning System of the Bohemian Language* (1809), helped standardize literary Czech, and his grammar of Old Church Slavonic (1822) laid the foundation of comparative Slavic LINGUISTICS.

dobsonfly Any insect of the family Corydalidae with four net-veined wings, found in North and South America, Asia, Australia, and Africa. The species *Corydalus cornutus* has a wingspread of about 5 in. (13 cm), and the male has very large jaws (mandibles) of about 1 in. (2.5 cm) or more. Females lay eggs near streams. Larvae live in the streams and, with their strong biting mouthparts, are ferocious predators on other aquatic insects and small invertebrates. Sometimes called hellgrammites or toe-biters, they can inflict painful bites on humans; they are eaten by fish, especially bass, and are used as bait by fishermen.

Dobzhansky \dəb-'zhan-skē\, **Theodosius** *orig.* **Feodosy Grigorevich Dobrzhansky** (b. Jan. 25, 1900, Nemirov, Ukr., Russian Empire—d. Dec. 18, 1975, Davis, Calif., U.S.) Ukrainian-born U.S. geneticist and evolutionist. He immigrated in 1927 to the U.S., where he taught at the California Institute of Technology, Columbia University, and Rockefeller University. He laid the groundwork for a theory combining Darwinian evolution and Mendelian genetics by changing the then commonly held view that natural selection produced something close to the best of all possible results and that changes would be rare and slow and not apparent over one life span. He observed extensive genetic variability in wild populations of *Drosophila*, and he found that in a given population some genes would regularly change in abundance with the seasons of the year.

dock Any coarse weedy plant of the genus *Rumex*, in the BUCKWHEAT family, that has a long taproot and is sometimes used as a potherb. Most docks are native to Europe but naturalized throughout North America. Examples include curly dock (*R. crispus*) and bitter dock (*R. obtusifolius*). The early basal leaves of patience-dock (*R. patientia*) are sometimes used in salads. The common weed *R. acetosa* is known variously as dock, common sorrel, or garden sorrel. See also SORREL.

Doctorow \'däk-tə-ˌrō\, **E(dgar) L(aurence)** (b. Jan. 6, 1931, New York, N.Y., U.S.) U.S. novelist. Doctorow worked as an editor and has since taught at colleges and universities. His best-selling novels have often focused on the working class and the dispossessed of earlier decades in the U.S. *The Book of Daniel* (1971) concerned the Rosenberg spy case. *Ragtime* (1975; film, 1981) incorporates actual early 20th-century American figures. *Loon Lake* (1980), *World's Fair* (1985), and *Billy Bathgate*

© 2006 Encyclopædia Britannica, Inc.

(1989; film, 1991) examine the Great Depression and its aftermath. *City of God* (2000), concerns the efforts of a New York City Episcopal minister to renew his faith.

Doctors' Plot (1953) Alleged conspiracy of prominent Soviet medical specialists to murder leading government and party officials. In January 1953, the Soviet press reported that nine doctors, at least six of them Jews, had been arrested and confessed their guilt. Because of Joseph Stalin's death in March, no trial occurred. *Pravda* later announced that the charges against the doctors were false and their confessions obtained by torture. In his secret speech at the Communist Party's Twentieth Congress, Nikita Khrushchev asserted that Stalin intended to use the doctors' trial to launch a massive party purge.

Doctors Without Borders *French* **Médecins Sans Frontières** \mād-'sa^{n}-sä^{n}-frō^{n}-'tyer\ **(MSF)** World's largest independent international medical relief agency. It was established by a group of French physicians in 1971. It aids victims of armed conflict, epidemics, and natural and man-made disasters and helps others whose lack of health care is due to geographic remoteness or ethnic or political marginalization. Teams provide primary health care, perform surgery, vaccinate children, rehabilitate hospitals, operate emergency nutrition and sanitation programs, and train local medical staff. Operating independently of governments, the organization depends on volunteer health professionals (more than 2,000 annually) and private donations. It received the 1999 Nobel Peace Prize.

doctrine of the affections *German* **Affektenlehre** Aesthetic theory of music in the Baroque period. Under the influence of Classical rhetoric, late Baroque theorists and composers held that music is capable of arousing a variety of specific emotions in the listener, and that, by employing the proper musical procedure or device, the composer could produce a particular involuntary emotional response in his audience. By the end of the 17th century, individual movements were customarily organized around a single emotion, resulting in the lack of strong contrasts and the repetitive rhythms characteristic of Baroque music. Several attempts at systematic lists of the emotional effects of different scales and figures were made, but to no general agreement.

Doctrine of the Mean See Zhong yong

documentary Fact-based film that depicts actual events and persons. Documentaries can deal with scientific or educational topics, can be a form of journalism or social commentary, or can be a conduit for propaganda or personal expression. The term was first coined by Scottish-born filmmaker John Grierson to describe fact-based features such as Robert Flaherty's *Nanook of the North* (1922). Grierson's *Drifters* (1929) and Pare Lorentz's *The Plow That Broke the Plains* (1936) influenced documentary filmmaking in the 1930s. During the World War II era documentary filmmaking was a valuable propaganda tool used by all sides. Leni Riefenstahl contributed to the Nazi propaganda efforts in the 1930s; the U.S. made films such as Frank Capra's series *Why We Fight* (1942–45); and Britain released *London Can Take It* (1940). Cinéma vérité documentaries, which gained notoriety in the 1960s, emphasized a more informal and intimate relationship between camera and subject. Television became an important medium for documentary films with goals that were more journalistic (such as CBS's *Harvest of Shame* [1960]) and educational (such as Ken Burns's *Civil War* [1990]).

documentary theatre See Theatre of Fact

dodder Any of the leafless, twining, parasitic vines (see parasitism) that make up the genus *Cuscuta* (family Cuscutaceae), containing more than 150 species found throughout temperate and tropical regions. The stringlike stems may be yellow, orange, pink, or brown. Many species have been introduced with their host plants into new areas. Dodders contain no chlorophyll, instead absorbing water and food through rootlike organs called haustoria that penetrate the tissue of a host plant and may kill it. Dodder can do great damage to crops of clover, alfalfa, flax, hops, and beans. The best control is to remove the plant from fields by hand and to prevent its accidental introduction.

Dodder (*Cuscuta gronovii*)
RUSS KINNE—PHOTO RESEARCHERS

Dodge, Mary Mapes *orig.* **Mary Elizabeth Mapes** (b. Jan. 26, 1831, New York, N.Y., U.S.—d. Aug. 21, 1905, Onteora Park, N.Y.) U.S. author. She began writing children's stories when she was suddenly widowed with two small sons. Her first collection, *Irvington Stories* (1864), was followed by *Hans Brinker; or, The Silver Skates* (1865), which became a children's classic. In 1873 she was named editor of the new children's magazine *St. Nicholas*; its success stemmed from her high standards, which attracted such writers as Mark Twain, Louisa May Alcott, Robert Louis Stevenson, and Rudyard Kipling.

Dodge, William E(arl) (b. Sept. 4, 1805, Hartford, Conn., U.S.—d. Feb. 9, 1883, New York, N.Y.) U.S. mining entrepreneur. He was a dry-goods merchant in Hartford, Conn., before founding the metal dealership Phelps, Dodge & Co. with his father-in-law, Anson G. Phelps, in 1833. They soon established a prosperous metal-importing business. Dodge made numerous other investments in timberland, mills, and iron and copper mines. After purchasing the Copper Queen mine in Arizona in 1882, the company became a major U.S. mining concern. Further acquisitions and diversifications have made Phelps Dodge Corp. one of the world's largest copper producers.

dodo Extinct flightless bird (*Raphus cucullatus*) of Mauritius, first seen by Portuguese sailors about 1507. Humans and the animals they introduced had exterminated the dodo by 1681. It weighed about 50 lbs (23 kg) and had blue-gray plumage, a big head, a 9-in. (23-cm) blackish bill with a reddish hooked tip, small useless wings, stout yellow legs, and a tuft of curly feathers high on its rear end. The Réunion solitaire (*R. solitarius*), also driven to extinction, may have been a white version of the dodo. Partial museum specimens and skeletons are all that remain of the dodo.

Restoration of a dodo (*Raphus cucullatus*)
COURTESY OF THE PEABODY MUSEUM OF NATURAL HISTORY, YALE UNIVERSITY

Dodoma \dō-'dō-mä\ City (pop., 1995 est.: 189,000), Tanzania. Designated the national capital since 1974, it awaits complete transfer of official functions from Dar es Salaam, the current capital. Located in a sparsely populated agricultural region at an elevation of 3,720 ft (1,135 m), it is a market centre for the surrounding area. Industries produce wood and furniture, beverages, processed food, soap, and oil.

Dodona \dō-'dō-nə\ Sanctuary of the Greek god Zeus, located at Epirus. Mentioned by Homer, it was the site of an oracle, where messages came through the rustling of leaves or other natural sounds. There was also a large bronze gong that vibrated in the breeze.

Doe, Samuel K(anyon) (b. May 6, 1950/51, Tuzon, Liberia—d. Sept. 9/10, 1990, Monrovia) Liberian soldier and head of state (1980–90). A member of the Krahn ethnic group, Doe led a coup in 1980 that overthrew Pres. William R. Tolbert (b. 1913—d. 1980). He suspended Liberia's constitution until 1984, and in 1985 he won a presidential election widely denounced as fraudulent. His regime was considered corrupt and brutal, and his life was continually threatened by assassination attempts. In the civil war that broke out in 1989, Doe was captured and killed.

Doenitz, Karl See Karl Dönitz

Doesburg \'düs-ˌbʉrg**, Theo van** *orig.* **Christian Emil Maries Küpper** (b. Aug. 30, 1883, Utrecht, Neth.—d. March 7, 1931, Davos, Switz.) Dutch painter, decorator, and art theorist. Originally involved in theatre, in 1900 he began painting under the influence of Post-Impressionism and Fauvism. After meeting the painter Piet Mondrian in 1915, he turned to geometric abstraction. He was instrumental in founding the De Stijl group and the avant-garde periodical *De Stijl*. His advocacy of the geometric style was well received at the Bauhaus, where he taught briefly and influenced Le Corbusier, Walter Gropius, and Ludwig Mies van der Rohe. In

1926 Doesburg wrote his manifesto, "De Stijl", and in 1930 he moved to Paris and opened a studio, which became the focus of the movement.

dog Any member of the CANINE genus *Canis*, particularly the domestic species, *Canis familiaris*. Domestic dogs seem to have decended from the WOLF or a wolflike ancestor. Dogs were apparently the first animals to be domesticated, and domestication seems to have begun in various parts of the world at roughly the same time. Selective breeding by humans has resulted in myriad domestic breeds that vary widely in size (from the tiny CHIHUAHUA to the huge MASTIFF), physical form (e.g., the short-legged DACHSHUND and the flat-faced BULLDOG), coat texture and length (e.g., the sleek DOBERMAN PINSCHER and the long-haired AFGHAN HOUND), and behavioral patterns (e.g., sporting dogs, TOY DOGS, and WORKING DOGS). The American Kennel Club now recognizes almost 150 breeds; other clubs, such as the United Kennel Club, recognize many more.

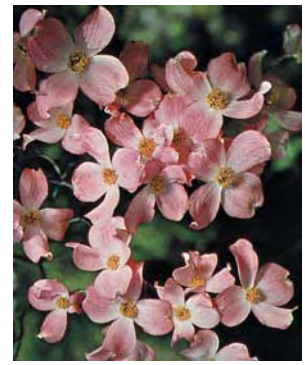
dog salmon See CHUM SALMON

Dog Star See SIRIUS

dogbane family Family Apocynaceae, of the GENTIAN order, with about 1,000 member species of trees, shrubs, woody vines, and herbaceous plants, found mostly in the tropics and subtropics. Dogbanes have milky, often poisonous juice and usually clustered, showy flowers. Garden ornamentals include PERIWINKLE, OLEANDER, yellow oleander (*Thevetia*), FRANGIPANI, Natal plum (*Carissa*), and crepe jasmine (*Tabernaemontana coronaria*). Some species are African SUCCULENTS. Arrow poisons are obtained from many dogbanes, and the poisonous ALKALOIDS of some species are used in medicines.

doge \'dōj\ (Venetian Italian: "duke") Highest official of the republic of VENICE in the 8th–18th century. The office originated when the city was nominally subject to the Byzantine empire and became permanent in the 8th century. The doge was chosen from among the ruling families of Venice and held office for life. He held extensive power, as evidenced by the rule of ENRICO DANDOLO (r. 1192–1205), though from the 12th century the aristocracy placed limits on the doge's authority. Under Francesco Foscari (r.1423–57), Venice undertook the first conquests of the Italian mainland. The last doge was deposed when NAPOLEON conquered northern Italy in 1797.

Dōgen \'dō-gen\ (b. Jan. 19, 1200, Kyōto, Japan—d. Sept. 22, 1253, Kyōto) Japanese Buddhist who introduced Sōtō ZEN to Japan from China. Orphaned at age 7, he became a monk at 13. He studied in China under the Zen master Rujing (1223–27), and he also studied with EISAI. He returned to Japan and taught Zen meditation, spending his last years at Eihei Temple, which he founded.



dogfish Any of several species of small SHARKS. The spiny dogfish (*Squalus acanthias*, family Squalidae) has a sharp spine in front of each of its two dorsal fins. It is abundant along northern Atlantic and Pacific coasts. It is gray with white spots, about 2–4 ft (60–120 cm) long, and often found in schools. It preys on fishes and invertebrates and often steals bait and damages fishing nets. It yields liver oil or is ground for fertilizer. Other well-known species are the spotted dogfishes (family Scyliorhinidae), which are sold as food, and the smooth hound or smooth dogfish (*Mustelus canis*, family Triakidae), one of the most common sharks on the U.S. Atlantic coast. See also BOWFIN.

Dogon \'dō-ˌgän\ People of the central plateau region of Mali, around Bandiagara. Their language is of uncertain affinity within the NIGER-CONGO LANGUAGES. Numbering about 450,000, the Dogon are mainly an agricultural people. Their distinctive villages are composed of elaborate mud buildings, often built on cliff faces. In addition to their characteristic architecture, the Dogon are known for their fine wood sculptures and masks, metalwork, and leatherwork.

dogsled racing Sport of racing sleds pulled by dogs over snow-covered cross-country courses. It developed from a traditional Eskimo method of transportation. Modern sleds are usually of wood (ash) construction, with leather lashings and steel- or aluminum-covered runners. Sled dogs are usually ESKIMO DOGS, SIBERIAN HUSKIES, SAMOYEDS, or ALASKAN MALAMUTES; teams typically consist of 4–10 dogs. The course is usually 12–30 mi (19–48 km) long, though some, including the IDITAROD, are considerably longer.

dogtooth violet Any of the approximately 20 species of spring-blooming plants that make up the genus *Erythronium*, in the LILY FAMILY, all native to North America except for the purple- or pink-flowered dogtooth violet of Europe (*E. dens-canis*). The nodding flowers, usually one to a plant or in small clusters, range in colour from white to purple. The two leaves, borne at the base of the plant, often are covered with white or brown spots. The common dogtooth violet of North America, *E. americanum*, has yellow flowers and brown-mottled leaves. Several species are grown as rock-garden ornamentals.

dogwood Shrubs, trees, and herbaceous plants of the genus *Cornus*, in the dogwood family (Cornaceae), found in temperate and warm temperate zones and on tropical mountains. The family is noted for its woody ornamental species native to both coasts of North America and to eastern Asia and Europe. Some members, such as the flowering dogwood (*Cornus florida*), are chiefly ornamental; the European cornelian cherry (*C. mas*), also an ornamental, has edible fruit; others yield wood for furniture. In the flowering dogwoods, flowers are small; the conspicuously expanded structures are coloured bracts that surround the cluster of true flowers.

Flowers of flowering dogwood (*Cornus florida*)
J.C. ALLEN AND SON

Doha \'dō-hə\ *Arabic* **Al-Dawḥah** \ȧd-'daù-hə\ City (pop., 1997: 264,009), capital of Qatar. Located on the east coast of the Qatar Peninsula, it contains about three-fifths of the country's population. Long a centre of pirate activity in the PERSIAN GULF, Doha was a small village when it became the capital of newly independent Qatar in 1971. The city has been thoroughly modernized. Its Government House (1969) was built on reclaimed waterfront land; its water supply is obtained by distilling seawater. The deepwater port, built in the 1970s, accommodates oceangoing vessels.

Doherty, Peter Charles (b. Oct. 15, 1940, Australia) Australian immunologist and pathologist. He earned a Ph.D. at the University of Edinburgh. With ROLF M. ZINKERNAGEL, he found that T CELLS from mice infected with a meningitis virus destroyed virus-infected cells only from the same strain of mice, and he showed that T cells must recognize two signals on an infected cell—one from the virus and one from the cell's own antigens—to destroy it. For the new understanding of general cellular immune mechanisms enabled by their research, the two men shared a 1996 Nobel Prize.

Dole, Bob *in full* **Robert Joseph Dole** (b. July 22, 1923, Russell, Kan., U.S.) U.S. politician. Seriously wounded while fighting in World War II, he recovered from near-total paralysis but permanently lost the use of his right arm and hand. He returned to Kansas, earned a law degree, and held state elective office as a Republican before serving in the U.S. House of Representatives (1961–69) and the Senate (1969–96). He was the running mate of Pres. GERALD R. FORD in 1976. In 1984 Dole became Republican Party leader in the Senate, and he twice served as majority leader (1984–86, 1994–96). After clinching his party's nomination for president in 1996, he retired from the Senate to devote himself wholly to the campaign. He was defeated in the election by Democrat BILL CLINTON. His wife, Elizabeth Hanford Dole (born 1936), ran unsuccessfully for the Republican nomination in 2000 but was elected to the U.S. Senate from North Carolina in 2002.

Dole, Sanford Ballard (b. April 23, 1844, Honolulu, Hawaiian Islands—d. June 9, 1926, Honolulu) Hawaiian politician. The son of U.S. missionaries, he served in Hawaii's legislature (1884–87) and on its supreme court (1887–93). He led the committee formed by local sugar interests that overthrew Queen LILIUOKALANI (1893) and sought annexation by the U.S.; he then served as the first president of the Republic of Hawaii (1894–1900). Though U.S. Pres. GROVER CLEVELAND demanded the queen's restoration, Dole pressed successfully for annexation (1900) and afterward served as governor of the Territory of Hawaii (1900–03). He later became a federal district judge (1903–15).

Dolin, Sir Anton *orig.* **Sydney F.P.C. Healey-Kay** (b. July 27, 1904, Slinfold, Sussex, Eng.—d. Nov. 25, 1983, Paris, Fr.) British dancer

© 2006 Encyclopædia Britannica, Inc.

and choreographer. In 1921 he joined the Ballets Russes, where he created leading roles as a soloist. In the 1930s and 1940s he helped form several ballet companies; in 1949 he and his partner Alicia Markova founded the forerunner of London's Festival Ballet, of which he was artistic director and premier dancer until 1961. He created leading roles in *Le Train bleu*, *Job*, and *Bluebeard*, choreographed works such as *Capriccioso* (1940), *The Romantic Age* (1942), and *Variations for Four* (1957), and wrote several books on dance.

doline See sinkhole

doll Small-scale figure of a human being or animal, used especially as a child's plaything. The doll is perhaps humankind's oldest toy. Some ancient dolls may have served religious or magical functions—as do voodoo (see vodun) dolls in modern times. Dolls were buried in children's graves in Egypt, Greece, and Rome and in early Christian catacombs. In Europe dolls have been commercially manufactured since about the 16th century. Doll heads were made of wood, terra-cotta, alabaster, and wax, while the bodies were made of carved wood or leather stuffed with sawdust. In about 1820 glazed porcelain (Dresden) doll heads and unglazed bisque (ceramic) heads became popular. These were supplanted in the 20th century by molded plastic. In Japan, dolls are used as traditional festival figures. In India, elaborately dressed dolls were given to child brides by both Hindus and Muslims. Today both antique and modern dolls are often collected.

Painted wooden Egyptian doll, 2000 BC.

Dollar Diplomacy U.S. foreign policy created by Pres. William H. Taft to ensure financial stability in a region in exchange for favourable treatment of U.S. commercial interests.The policy grew out of Pres. Theodore Roosevelt's peaceful intervention in the Dominican Republic, where U.S. loans had been exchanged for the right to choose the head of customs (the country's major revenue source). Taft's secretary of state, Philander Knox carried out Dollar Diplomacy in Central America (1909) and China (1910). Pres. Woodrow Wilson repudiated the policy in 1913. The term has become a disparaging reference to the manipulation of foreign affairs for economic ends.

Dollfuss \'dȯl-ˌfüs\, **Engelbert** (b. Oct. 4, 1892, Texing, Austro-Hungarian Empire—d. July 25, 1934, Vienna, Austria) Austrian politician. He rose rapidly in Austrian politics to become chancellor in 1932. Opposed to the Nazis, he welcomed Benito Mussolini as an ally, converting Austria virtually into an Italian satellite state. In 1933 he abolished the parliament and established an authoritarian regime based on conservative Roman Catholic and Italian Fascist principles. In 1934 after paramilitary groups loyal to him crushed Austria's Social Democrats, he issued a new constitution establishing a dictatorship. Germany soon incited the Austrian Nazis to civil war, and Dollfuss was assassinated in a raid on the chancellery.

Dollond \'däl-ənd\, **John and George** (respectively b. June 10, 1706, London, Eng.—d. Nov. 30, 1761, London; b. Jan. 25, 1774, London—d. May 13, 1852, London) British optical scientists. John developed an achromatic (non-colour-distorting) refracting telescope and a practical heliometer (a telescope that measures the Sun's diameter and the angles between celestial bodies). His grandson George worked most of his life for the family firm of instrument makers, inventing various precision instruments used in astronomy, geodesy, and navigation. His micrometer made of rock crystal was used by astronomers; his atmospheric recorder simultaneously measured and recorded on paper tape temperature, atmospheric pressure, wind speed and direction, evaporation, and electrical phenomena.

dolmen \'dōl-mən\ Prehistoric monument usually consisting of several large stone slabs set edgewise in the earth to support a flat stone roof, all covered by a mound of earth that in most cases has weathered away. Designed as a burial chamber, the structure is typical of the Neolithic Period in Europe. Dolmens, though found as far east as Japan, are mainly confined to western Europe and northern Africa. See also megalith; menhir.

Dolmen at Pentre Evan, Dyfed, Wales
CROWN COPYRIGHT: CADW: WELSH HISTORIC MONUMENTS

Dolmetsch \'däl-ˌmech\, **(Eugène) Arnold** (b. Feb. 24, 1858, Le Mans, France—d. Feb. 28, 1940, Haslemere, Surrey, Eng.) French-born British music scholar and performer. He moved to England after studying violin with Henri Vieuxtemps (1820–81). There he began collecting, repairing, and learning to play old instruments. He built copies of old lutes, clavichords, harpsichords, and recorders, ultimately involving his wife and children in the performance and promulgation of early music. His *Interpretation of Music of the 17th and 18th Centuries* (1915) was highly influential, and he is regarded as the father of the 20th-century early music revival.

dolomite Type of limestone, the carbonate fraction of which is dominated by the mineral dolomite, calcium magnesium carbonate $CaMg(CO_3)_2$. The carbonate mineral dolomite occurs in marbles, talc schists, and other magnesium-rich metamorphic rocks. It occurs in hydrothermal veins, in cavities in carbonate rocks, and less often in various sedimentary rocks as a cement. It is most common as a rock-forming mineral in carbonate rocks.

Dolomites \'dō-lə-ˌmīts\ *Italian* **Alpi Dolomitiche** \'äl-pē-dō-lō-'mē-tē-kē\ Mountain group, northern Italian Alps. Including a number of impressive peaks, 18 of which rise to more than 10,000 ft (3,050 m), the range and its characteristic rock are named for the 18th-century French geologist Dieudonné Dolomieu, who made the first scientific study of the region. The mountains are formed of light-colored dolomitic limestone, which erosion has carved into grotesque shapes. Popular with tourists and mountain-climbers, the area has a number of resort towns.

dolphin One of a large group of small, gregarious, streamlined whales or one of two species of oceanic sport and food fishes. Mammalian dolphins are small toothed whales, usually with a well-defined, beaklike snout. (They are sometimes called porpoises, but that name is properly reserved for a blunt-snouted whale family.) The common dolphin (*Delphinus delphis*) and the bottlenose dolphin, both of the family Delphinidae, are found widely in warm temperate seas, though some inhabit tropical rivers. Most of the 32 delphinid species are marine; gray, blackish or brown above and pale below; and about 3–13 ft (1–4 m) long. River dolphins (family Platanistidae; five species) live mainly in fresh water in South America and Asia. One of the two fish species, *Coryphaena hippuras* (family Coryphaenidae), also called mahimahi and dorado, is a popular fish of tropical and temperate waters worldwide. The pompano dolphin (*C. equiselis*) is similar. See also killer whale.

Bottle-nosed dolphins (*Tursiops truncatus*)

Domagk \'dō-ˌmäk\, **Gerhard** (b. Oct. 30, 1895, Lagow, Brandenburg, Ger.—d. April 24, 1964, Burgberg, near Königsfeld, W.Ger.) German bacteriologist and pathologist. While director of the Bayer Laboratory for Experimental Pathology and Bacteriology, Domagk noticed the antibacterial action of a dye, Prontosil red, against streptococcal infection in mice. Found to be an effective treatment in humans, Prontosil became the first sulfonamide drug. Awarded a Nobel Prize in 1939, Domagk was unable to accept it at the time because of Nazi policy. He also was active in research on tuberculosis and cancer.

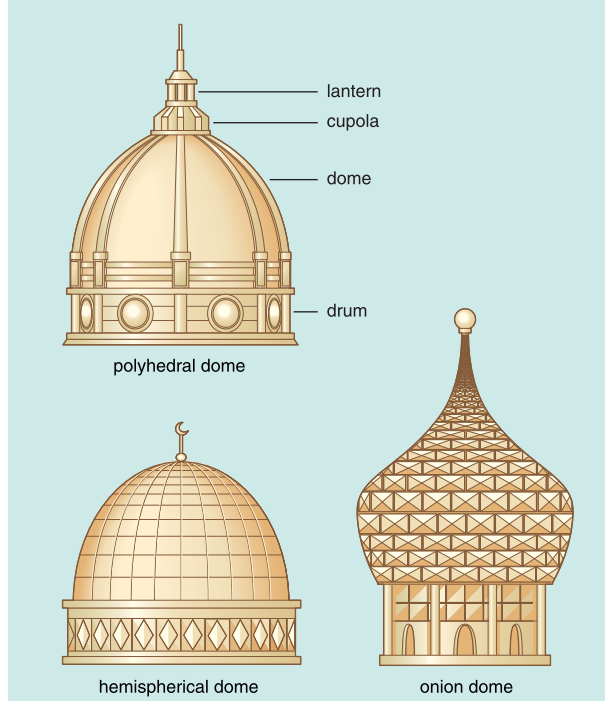
domain name Address of a computer, organization, or other entity on a TCP/IP network such as the Internet. Domain names are typically in a

© 2006 Encyclopædia Britannica, Inc.

three-level "server.organization.type" format. The top level denotes the type of organization, such as "com" (for commercial sites) or "edu" (for educational sites); the second level is the top level plus the name of the organization (e.g., "britannica.com" for Encyclopædia Britannica); and the third level identifies a specific host server at the address, such as the "www" (World Wide Web) host server for "www.britannica.com". A domain name is ultimately mapped to an IP address, but two or more domain names can be mapped to the same IP address. A domain name must be unique on the Internet, and must be assigned by a registrar accredited by the Internet Corporation for Assigned Names and Numbers (ICANN). See also URL.

Dombrowska, Maria See Maria Dąbrowska

dome In architecture, a hemispherical structure evolved from the arch, forming a ceiling or roof. Domes first appeared on round huts and tombs in the ancient Middle East, India, and the Mediterranean in forms, such as solid mounds, adaptable only to the smallest buildings. The Romans introduced the large-scale masonry hemisphere. A dome exerts thrust all around its perimeter, and the earliest monumental examples (see Pantheon) required heavy supporting walls. Byzantine architects invented a technique for raising domes on piers, making the transition from a cubic base to the hemisphere by four pendentives. Bulbous or pointed domes were widely used in Islamic architecture. The design spread to Russia, where it gained great popularity in the form of the onion dome, a pointed, domelike roof structure. The modern geodesic dome, developed by R. Buckminster Fuller, is fabricated of lightweight triangular framing that distributes stresses within the structure itself. See illustration opposite.



Dome of the Rock *or* **Mosque of Omar** Oldest existing Islamic monument. It is located on Temple Mount, previously the site of the Temple of Jerusalem. The rock over which it is built is sacred to both Muslims and Jews. In Islam, Muhammad is believed to have ascended into heaven from the site. In Judaism it is the site where Abraham prepared to sacrifice his son Isaac. Built in 685–91 as a place of pilgrimage, the octagonal building has richly decorated walls and a gold-overlaid dome mounted above a circle of piers and columns.

Domenichino \ˌdō-mā-nē-ˈkē-nō\ *orig.* **Domenico Zampieri** (b. Oct. 1581, Bologna, Papal States—d. April 6, 1641, Naples) Italian painter. He was trained in the academy of Lodovico Carracci in Bologna. In 1602 he joined the Bolognese artists in Rome working under Annibale Carracci in the decoration of the Farnese Palace. His work, done in the Baroque Classical style, is marked by lucid and balanced compositions, even and serene lighting and subdued colours, and the sober expressions and restrained gestures of its figures. He became Rome's leading painter and had a succession of major decorative commissions. He was an outstanding draftsman and portraitist; his paintings were regarded as second only to those of Raphael throughout the 17th–18th centuries and had great influence on Nicolas Poussin and Claude Lorrain.

Last Communion of Saint Jerome, oil painting by Domenichino, 1614; in the Vatican Museum.
SCALA/ART RESOURCE, NEW YORK

Domenico Veneziano \dō-ˈmā-nē-kō-və-ˌnet-sē-ˈä-nō\ (b. c. 1410, Venice, Republic of Venice—d. May 15, 1461, Florence, Republic of Florence) Italian painter. He was active mainly in Florence, where he settled c. 1439. Two signed works survive: fresco fragments of the *Virgin and Child* from a street tabernacle (1430s) and the altarpiece for the church of Santa Lucia dei Magnoli, called the *St. Lucy Altarpiece* (c. 1445), one of the outstanding Florentine early Renaissance paintings of the mid 15th century and Domenico's most successful experiment in rendering outdoor light. He used colour and texture as the basis of perspective and composition; his influence can be seen in the work of Alesso Baldovinetti.

A dome is traditionally supported primarily by a cylindrical or polygonal drum; it may be surmounted by a cupola, which may have a lantern to admit light. The classic hemispherical dome has a circular base and semicircular section; the polyhedral dome has segments resting on a polyhedral base and meeting at the top; the onion dome rests on a circular base and has an ogee section.

Domesday Book \ˈdümz-ˌdā, ˈdōmz-ˌdā\ (1086) Original record or summary of William I the Conqueror's survey of England. The most remarkable administrative feat of the Middle Ages, the survey was carried out, against popular resentment, by panels of commissioners who compiled accounts of the estates of the king and his tenants. As summarized in the Domesday Book, it now serves as the starting point for the history of most English towns and villages. Originally called "the description of England," the name Domesday Book (a reference to doomsday, when people face a final accounting of their lives) was later popularly attached to it.

domestic cat *or* **house cat** Domesticated carnivore (*Felis catus*) that retains many characteristics of the larger wild cats but differs in coat and size. Breeds are either shorthaired (e.g., Siamese) or longhaired (e.g., Persian). Domestic cats are usually white, black, yellow, or gray and sometimes have markings of a different colour. A pattern of dark stripes or swirls on a lighter background is called tabby. Males may reach lengths of 28 in. (71 cm), and females are usually about 20 in. (51 cm) long. Weights generally vary from 6 to 10 lb (2.5 to 4.5 kg), though nonpedigreed cats may weigh up to 28 lb (13 kg). The most closely related wild species are the North African wildcats (including *Felix lybica*). Valued for their mouse and rat hunting, which protected farmers' grain supplies, cats were being domesticated in ancient Egypt by 1500 BC. The Cat Fanciers' Association now recognizes about 37 breeds.

domestic service Employment of hired workers by private households for tasks including housecleaning, cooking, child care, gardening, and personal service. It also includes the performance of similar tasks for hire in public institutions and businesses, including hotels and boardinghouses. In ancient Greece and Rome domestic service was performed almost exclusively by slaves. In medieval Europe serfs provided much of the necessary labour force. Indentured servants were widely used in colonial America, as were black slaves in the pre-Civil War South. In Victorian England many middle- and upper-class households hired domestic servants; the royalty and gentry often employed huge staffs with an elaborate hierarchy. Domes-

tic service has declined in the U.S. and Europe since the early 1920s, a trend attributed to the leveling of social classes, greater job opportunities for women, and the spread of labour-saving household devices.

domestic system *or* **putting-out system** Production system widespread in 17th-century Europe in which merchant-employers "put out" materials to rural home workers, who then returned finished products to the employers for payment. The domestic system differed from the handicraft system of home production in that the workers neither bought materials nor sold products. It undermined the urban GUILDS and brought the first widespread industrial employment of women and children. The system was generally superseded by employment in FACTORIES but was retained in the 20th century in some industries, notably watchmaking in Switzerland, toy manufacturing in Germany, and many industries in India and China.

domestic tragedy Drama in which the main characters are ordinary people. This form of tragedy contrasts with Classical tragedy, in which the main characters are of royal or aristocratic rank. An early domestic tragedy, *A Warning for Faire Women* (1599), deals with the murder of a merchant by his wife. The form became popular in the mid-18th century and reached its maturity in the 19th-century bourgeois tragedies of HENRIK IBSEN. GERHART HAUPTMANN, EUGENE O'NEILL, and ARTHUR MILLER wrote important 20th-century domestic tragedies.

domestication Process of hereditary reorganization of wild animals and plants into forms more accommodating to the interests of people. In its strictest sense, it refers to the initial stage of human mastery of wild animals and plants. The fundamental distinction of domesticated animals and plants from their wild ancestors is that they are created by human labour to meet specific requirements or whims and are adapted to the conditions of continuous care people maintain for them. A variety of animals have been domesticated for food (e.g., CATTLE, CHICKENS, PIGS), clothing (e.g., SHEEP, SILKWORMS), transportation and labour (e.g., CAMELS, DONKEYS, HORSES), and pleasure (e.g., CATS, DOGS). See also BREEDING; SELECTION.

domicile Place where an individual has a fixed and permanent home for legal purposes. The term refers to the place where an organization (e.g., a corporation) is chartered or that is the organization's principal place of business. The domicile of an individual or organization determines the proper jurisdiction and venue for legal process, including taxation. For persons lacking capacity (e.g., minors), domicile is usually defined as the domicile of the guardian.

dominance In genetics, the greater influence by one of a pair of GENES (alleles) that affect the same inherited trait. If an individual pea plant that has one allele for tallness and one for shortness is the same height as an individual that has two alleles for tallness, the tallness allele is said to be completely dominant. If such an individual is shorter than an individual that has two tallness alleles but still taller than one that has two shortness alleles, the tallness allele is said to be partially or incompletely dominant and the shortness allele is said to be recessive (see RECESSIVENESS).

Domingo, Plácido (b. Jan. 21, 1941, Madrid, Spain) Spanish tenor and conductor. He moved to Mexico in 1949 with his parents, both of whom were ZARZUELA (a form of Spanish light opera) singers. He studied voice, piano, and conducting, making his debut as a baritone. After developing his tenor range, he made his U.S. debut, spent three years in Tel Aviv (singing in Hebrew), came to the New York City Opera in 1965, and debuted with the Metropolitan Opera at Lewissohn Stadium in 1966. His resonant, powerful voice, imposing physical stature, good looks, and dramatic ability made him one of the most popular tenors of the second half of the 20th century.

Dominic, Saint *orig.* **Domingo de Guzmán** (b. 1170, Caleruega, Castile—d. Aug. 6, 1221, Bologna, Romagna; canonized July 3, 1234; feast day August 8) Founder of the Order of Friars Preachers, or DOMINICANS. He joined the religious community of the cathedral of Osma c. 1196. On a visit to southern France in 1203, he encountered the Albigensian heresy (see CATHARI) and determined to fight it. He gathered a group of preachers willing to travel the roads barefoot and in poverty, and in 1206 he founded a convent of nuns converted from heresy. While designing his order devoted to preaching, Dominic may first have met St. FRANCIS OF ASSISI, who became his good friend. In 1216 he received sanction for his order from Pope HONORIUS III. He established schools of theology at his two principal houses near the Universities of Paris and Bologna.

Dominica \ˌdä-mə-'nē-kə\ *officially* **Commonwealth of Dominica** Island country, Lesser ANTILLES, Caribbean Sea. It is located between the French islands of GUADELOUPE and MARTINIQUE. Area: 290 sq mi (750

sq km). Population (2005 est.): 69,000. Capital: ROSEAU. The majority of the people are of African or mixed African and European descent. Languages: English (official), French patois. Religion: Christianity (predominantly Roman Catholic; also Protestant). Currency: Eastern Caribbean dollar. A mountainous island, Dominica is broken midway by a plain drained by the Layou River. It has a warm tropical climate with heavy rainfall. The main crop is bananas. Dominica is among the poorest of the Caribbean nations. A developing tourist trade was helped by the establishment in 1975 of Morne Trois Pitons National Park, a unique tropical mountain wilderness, but the country was ravaged by hurricanes in 1979 and 1980. With financial help from Britain, it is trying to protect its coastline. It is a republic with one legislative house; its chief of state is the president, and its head of government is the prime minister. At the time of CHRISTOPHER COLUMBUS's arrival in 1493, it was inhabited by the CARIBS. Because of its steep coastal cliffs and inaccessible mountains, it remained in the possession of the Caribs until the 18th century; it was then settled by the French and later taken by Britain in 1783. Subsequent hostilities between the settlers and the native inhabitants resulted in the Caribs' near extinction. Incorporated with the LEEWARD ISLANDS in 1833 and with the WINDWARD ISLANDS in 1940, it became a member of the West Indies Federation in 1958. Dominica became independent in 1978. See also WEST INDIES. Offshore banking, a controversial boom to the Dominican economy in the late 20th century, was discontinued early in the 21st century.

Dominican Member of the Order of Friars Preachers, a Roman Catholic preaching and teaching order founded by St. DOMINIC. It dates officially from 1216, when Pope HONORIUS III gave it his approval, though Dominic had begun to build it at least a decade earlier. In contrast with earlier orders, the Dominicans were not organized in autonomous monastic houses, but joined the order at large and could be sent to any house or

© 2006 Encyclopædia Britannica, Inc.

province on the order's business. The early teaching centers were at Bologna, Paris, Cologne, and Oxford. Dominican preachers spoke out against the Cathari, the Moors, and the Jews and were among the first missionaries under the Spanish and Portuguese explorers. Dominicans were put in charge of the Inquisition when it was founded. Perhaps their most famous member was St. Thomas Aquinas.

Dominican Republic Country in the West Indies, occupying the eastern two-thirds of the island of Hispaniola, which it shares with Haiti. Area: 18,792 sq mi (48,671 sq km). Population (2005 est.): 8,895,000. Capital:

Santo Domingo. The majority of the people are of mixed European-African ancestry; most of the rest are of European or African descent. Language: Spanish (official). Religion: Christianity (predominantly Roman Catholic; also Protestant). Currency: Dominican peso. The country is generally mountainous, with ranges and hills running from northwest to southeast. The Central Highlands reach 10,417 ft (3,175 m) at Duarte Peak, the highest point in the West Indies. The Cibao Valley in the north is noted for its fertility; the southwestern part of the country is generally dry with large stretches of desert. Traditionally dominated by sugar production, the Dominican Republic's mixed economy became increasingly diversified in the late 20th century, when the country experienced one of the world's highest economic growth rates, though widespread poverty remained despite a growing middle class. It is a republic with two legislative houses; its head of state and government is the president. The Dominican Republic was originally part of the Spanish colony of Hispaniola. In 1697 the western third of the island, which later became Haiti, was ceded to France; the remainder of the island passed to France in 1795. The eastern two-thirds of the island were returned to Spain in 1809, and the colony declared its independence in 1821. Within a matter of weeks it was overrun by Haitian troops and occupied until 1844. Since then the country has been under the rule of a succession of dictators, except for short interludes of democratic government, and the U.S. has frequently been involved in its affairs. The termination of the dictatorship of Rafael Trujillo in 1961 led to civil war in 1965 and U.S. military intervention. For the rest of the country, politics in the Dominican Republic were dominated by seven-time president Joaquín Balaguer. The country suffered from severe hurricanes in 1979 and 1998.

domino theory *or* **domino effect** Doctrine of U.S. foreign policy during the Cold War, according to which the fall of a noncommunist state to communism would precipitate the fall of other neighbouring noncommunist states. The theory was first enunciated by Pres. Harry Truman, who used it to justify sending U.S. military aid to Greece and Turkey in the late 1940s. Dwight D. Eisenhower, John F. Kennedy, and Lyndon B. Johnson invoked it to justify U.S. military involvement in Southeast Asia, especially the prosecution of the Vietnam War.

dominoes Game of several variations played with a set of flat rectangular blocks (dominoes) whose faces are divided into two equal parts that are blank or bear from one to six dots arranged as on dice faces. The usual set consists of 28 pieces. Dominoes in China may date to the 12th century AD; the Eskimos have also long played a domino-like game. There is no record of dominoes in Europe before the mid-18th century. The principle in nearly all modern dominoes games is to match one end of a piece to another that is identically or reciprocally numbered. The game may be set at 50 or 100 points.

Domitian \də-'mish-ən\ *Latin* **Caesar Domitianus Augustus** *orig.* **Titus Flavius Domitianus** (b. Oct. 24, AD 51—d. Sept. 18, 96, Rome) Roman emperor (81–96). The son of Vespasian, he succeeded his brother Titus, whom he probably had killed. His administration was ostensibly egalitarian and based on precedent, but his laws were severe. Defeats in Britain and Germany undid his successes, though increased pay for the army kept it loyal. From 89 he became crueler, imposing a reign of terror over prominent senators and confiscating his victims' property to cover imperial expenses. The group that killed him included his wife and possibly his successor, Nerva.

domovoy \də-mə-'vòi\ In Slavic mythology and folklore, a spirit-guardian of home and family. It never leaves the household to which it belongs. It favours hardworking people; when displeased with its family, it may cause trouble with farm animals or make knocking or grating noises. Its weeping, moaning, or singing are interpreted as portents of evil or good.

Dôn \'dōn\ In Welsh mythology, a mother-goddess, the counterpart of the Irish Danu. According to the Mabinogion, she was the sister of the magician-king Math and the mother of Gwydion (a master of magic and poetry) and Arianrhod, who was in turn the mother of Dylan (presumed to be a sea god) and Lleu Llaw Gyffes (probably the Welsh form of Lugus).

Don Juan Fictional character famous as a heartless womanizer but also noted for his charm and courage. In Spanish legend, Don Juan was a licentious rogue who seduced a young girl of noble family and killed her father. Coming across a stone effigy of the father in a cemetery, he invited it home to dine with him, and the ghost of the father arrived for dinner as the harbinger of Don Juan's death. The legend of Don Juan was first written down by Tirso de Molina, who gave it an original twist in his tragedy *The Seducer of Seville* (1630). The story was subsequently taken up by many other artists including W.A. Mozart, in the opera *Don Giovanni* (1787); Molière and George Bernard Shaw, in plays; and Lord Byron in his long satiric poem *Don Juan* (1819–24).

Don Pacifico Affair (1850) Conflict between Britain and Greece that originated when the home of David Pacifico (known as Don Pacifico), a British subject living in Athens, was burned down in an anti-Semitic riot. In support of his demand for compensation, Viscount Palmerston sent a naval squadron to blockade the Greek coast. Palmerston's policy drew protests from France and Russia as well as Britain's House of Lords, but he won the support of the Commons after arguing that Britain should protect its subjects from injustice wherever they might live.

Don River \'dòn\ *Tatar* **Duna** \'dü-nə\ *ancient* **Tanais.** River, southwestern Russia. Rising south of Moscow in the central Russian uplands, it flows generally south for 1,162 mi (1,870 km) to enter the Gulf of Taganrog in the Sea of Azov. In its middle course it flows into the Tsimlyansk Reservoir, which dominates the Don's lower course. Most of its basin is rich farmland and timberland. A major shipping artery, it is navigable (in the spring) as far as 990 mi (1,584 km) from the Sea of Azov.

Donaldson, Walter (b. Feb. 15, 1893, Brooklyn, N.Y., U.S.—d. July 15, 1947, Santa Monica, Calif.) U.S. songwriter. He began his career as a music publisher's pianist and later established his own music publishing company. After his first Broadway success with "My Mammy," introduced by Al Jolson in *Sinbad* (1918), he continued writing for Broadway revues for more than 25 years, producing songs such as "My Buddy," "My Blue Heaven," "Carolina in the Morning," "Yes Sir! That's My Baby," and "Makin' Whoopee." He also wrote for many films.

donatário Recipient of a *capitanía* (captaincy), which was both a territorial division and a royal land grant in Portugal's colonies. The system was introduced to Brazil in 1533 by King John III in order to consolidate

© 2006 Encyclopædia Britannica, Inc.

Portuguese power in the colony. Each *donatário* received a portion of land and was charged with recruiting and protecting settlers and promoting agriculture and commerce. At one time Brazil's viability as a colony depended on the success of the *donatários*, but by 1754 all the captaincies had been abolished.

Donatello \ˌdō-nä-ˈtel-lō,\ *English* \ˌdä-nə-ˈte-lō\ *orig.* **Donato di Niccolò** (b. c. 1386, Florence—d. Dec. 13, 1466, Florence) Italian sculptor active in Florence. He learned stone carving from the sculptors of the Florence Cathedral (c. 1400), and in 1404 joined the workshop of Lorenzo Ghiberti. He drew his inspiration from Classical and medieval sources. With his marble statues of St. Mark (1411–13) and St. George (c. 1415) for the church of Or San Michele in Florence, he revolutionized the concept of sculpture; not since antiquity had the human body been rendered with such naturalism and emotional impact. He invented his own style of bas-relief with his marble panel *St. George Killing the Dragon* (c. 1417). His bronze sculpture *David*, conceived independently of any architectural setting, was the first large-scale, freestanding nude statue of the Renaissance. In Florence he worked for the Medici family (1433–43), producing sculptural decoration for the sacristy of San Lorenzo, the Medici family church, and in Padua (1450s) for the church of Sant'Antonio. He was the greatest European sculptor of the 15th century, influencing painters as well as sculptors, and was a founder of the Renaissance style.

Equestrian statue of Gattamelata, bronze sculpture by Donatello, 1447–53; in the Piazza del Santo, Padua, Italy.
ANDERSON—ALINARI FROM ART RESOURCE/EB INC.

Donation of Constantine Document concerning the supposed grant by the emperor Constantine I (the Great) to Pope Sylvester I (314–335) and later popes of temporal power over Rome and the Western Empire. The gift was said to have been motivated by Constantine's gratitude to Sylvester for miraculously healing his leprosy and converting him to Christianity. Based on legends from the 5th century concerning Sylvester and Constantine, the Donation was probably written at Rome in the mid 8th century and was related to the coronation of Pippin III, the first Carolingian king of the Franks. Proved in the 15th century by Lorenzo Valla to be a forgery, the document was already questioned by the emperor Otto III (r. 996–1002) but was often cited in the 11th–15th centuries to support papal claims in the struggle between church and state.

Donation of Pippin (754) Promise made by the Frankish king Pippin III to win for Pope Stephen II Byzantine imperial lands in Italy conquered by the Lombards. The Donation was made in the context of the papal struggle with the Lombards, the collapse of Byzantine support for the papacy, and Pippin's elevation to the royal throne with papal support. In 756 it was written in a document that became the basis of papal rule over central Italy, which lasted until the 19th century. Pippin won territory from the Lombard king in two military campaigns (754, 756) and gave it to the papacy. The Donation was later confirmed and enlarged by Charlemagne (774).

Donatism \ˈdō-nə-ˌti-zəm, ˈdä-nə-ˌti-zəm\ Schismatic Christian movement in North Africa in the 4th century. It arose out of the debate over the status of church leaders who had cooperated with Roman officials during persecutions of Christians. The movement's leader, Donatus (died c. AD 355), denied the validity of priestly duties performed by such leaders, insisting that lapsed Christians were not in a state of grace and thus had no authority to administer the sacraments. The struggle over the Donatist heresy came to a head in 311, when Caecilian was consecrated bishop of Carthage by a lapsed bishop. The Donatists declared the election invalid, but Constantine I decided in favor of Caecilian, prompting the Donatists to break with the Roman church in 312. Despite persecution, Donatism survived in North Africa until the advent of Islam (7th century).

Donbas See Donets Basin

Donders \ˈdȯn-dərz**, Frans Cornelis** (b. May 27, 1818, Tilburg, Neth.—d. March 24, 1889, Utrecht) Dutch ophthalmologist. His study of "muscae volitantes" (spots before the eyes) resulted in Donders' law, stating that the rotation of the eye around the line of sight is involuntary. His research improved diagnosis, operative treatment, and use of eyeglasses for vision problems. He found that in farsightedness the eyeball is shortened, resulting in light rays being focused behind the retina (1858). His finding that astigmatism is caused by uneven corneal and lens surfaces (1862) created the field of scientific clinical refraction. His *On the Anomalies of Accommodation and Refraction* (1864) was the first authoritative work in the field.

Donen \ˈdō-nən**, Stanley** (b. April 13, 1924, Columbia, S.C., U.S.) U.S. film director and choreographer. He began his career in the stage chorus of *Pal Joey* (1940), where he met Gene Kelly. He and Kelly choreographed *Best Foot Forward* (1941; film, 1943) and other musicals, and the two codirected *On the Town* (1949) and the acclaimed *Singin' in the Rain* (1952). Both films showed off Donen's skill at intensifying a sense of fantasy and served to reenergize the musical film genre. He later directed and produced films such as *The Pajama Game* (1957), *Funny Face* (1957), and *Damn Yankees* (1958). He also branched into nonmusical films such as *Charade* (1963) and *Two for the Road* (1967).

Donets Basin \də-ˈnyets,\ *English* \də-ˈnets\ *or* **Donbas** \ˈdän-ˌbas\ Large mining and industrial region, southeastern Ukraine and southwestern Russia. Notable for its coal and iron reserves, the exploited area of the coalfield covers nearly 9,000 sq mi (23,300 sq km) south of the Donets River. First mined in the early 19th century, by 1913 the Donets Basin was producing 87% of Russian coal. The coalfields adjoin the rich ironfield of Krivoi Rog, where an ironworks was set up in 1872 in Donetsk; by 1913 it was making 74% of all Russian pig iron. The area today is the largest single producing area of iron and steel in Ukraine and one of the world's major heavy-industrial complexes.

Donets River River, southwestern Russia and eastern Ukraine. Rising in the Central Russian Upland, it winds south and east through Russia and Ukraine for some 650 mi (1,050 km) to join the Don River below Konstantinovsk. It flows along the northern Donets Basin industrial region, which uses it for heavy shipping and also causes severe pollution problems. A water shortage in the river and industrial area led to the construction in the 1970s of a canal connecting the Dnieper to the Donets. Six weirs make navigation possible upstream to the city of Donetsk.

Donetsk \də-ˈnyetsk\ *formerly (1924–61)* **Stalino** \ˈstä-lyi-nō\ City (pop., 2001: 1,016,000), southeastern Ukraine. In 1872 an ironworks was founded there by a Welshman, John Hughes, to produce iron rails for the growing Russian rail network. Fueled by the rich deposits of the Donets Basin, both coal mining and steelmaking developed rapidly. Extensive destruction in World War II led to postwar modernization, and subsequent growth has been rapid. Modern Donetsk is one of Ukraine's largest metallurgical centres.

Dong-nai River *or* **Donnai River** \ˈdȯŋ-ˈnī\ River, southern Vietnam. Rising in the central highlands, it flows southwest for about 300 mi (480 km), joining the Saigon River northeast of Ho Chi Minh City and combining with it and other streams to form an estuary north of the Mekong delta.

Dong Qichang \ˈdùŋ-ˈchē-ˈchäŋ\ *or* **Tung Ch'i-ch'ang** (b. 1555, Huating, Kiangsu province, China—d. 1636) Chinese painter, calligrapher, and theoretician of the late Ming period. He is noted especially for his writings on Chinese painting, which he divided into the Northern school, which taught the acquisition of truth, and the Southern school, which emphasized sudden, intuitive understanding. At the centre of the scholarly ideal of the Southern school was the art of calligraphy, which expressed the true nature of the artist without the interposition of pictorial description. Dong Qichang's own paintings stress stark forms, seemingly anomalous spatial renderings, and naive handling of ink and brush. His ideas continue to influence Chinese aesthetic theory.

Dong Son \ˈdȯŋ-ˈsȯn\ **culture** Important prehistoric culture of mainland Southeast Asia that developed in the 1st millennium BC, best known for its bronzes. Excavations at the site of Dong Son in northern Vietnam revealed bronze objects, iron, pottery, and Chinese artifacts. The Dong Son were a seafaring people who traded throughout Southeast Asia. They are credited with making the Red River delta area a great rice-growing region. Dong Son culture, transformed by Chinese and Indian influence, became the basis of the general civilization of the region. The Dong Son homeland was taken over by the Han dynasty of China in AD 43.

Dong Thap Muoi See Plain of Reeds

Dong Zhongshu \'důŋ-'jůŋ-'shü\ *or* **Tung Chung-shu** (b. c. 179 BC, Guangchuan, China—d. c. 104 BC, China) Confucian scholar. As chief minister to Wudi of the Han dynasty, he dismissed all non-Confucian scholars from government. He established Confucianism as the empire's unifying ideology (136 BC) and set up an imperial college, instrumental in the later establishment of the Chinese civil service. As a philosopher, he made the theory of the interaction between heaven and humanity his central theme. He merged the yin-yang concept with Confucianism and believed that one of the emperor's duties was to preserve the balance of yin and yang. His *Chunqiu fanlu* is one of the most important philosophical works of the Han period.

Dongan \'däŋ-gən**, Thomas, 2nd earl of Limerick** (b. 1634, Castletown, County Kildare, Ire.—d. Dec. 14, 1715, London, Eng.) British colonial governor of New York. A member of an Irish royalist family, he was exiled to France after the English Civil Wars. Recalled to England in 1677, he served as lieutenant governor of Tangiers from 1678 to 1680. As governor of New York (1682–88), he organized the colony's first representative assembly, issued a "Charter of Liberties" in 1683, and pursued a policy of cooperation with the Iroquois Confederacy against the French. He returned to England in 1691.

Dongbei See Manchuria

Donglin Academy *or* **Tung-lin Academy** \'důŋ-'lin\ Chinese academy founded during the Song dynasty and revived in 1604 by scholars and officials to protest the moral laxity and intellectual weakness undermining public life in the last years of the Ming dynasty. Its members cultivated the antiabsolutist views of Mencius and rebuked the court for failing to uphold Confucian values. The court eunuch Wei Zhongxian persecuted members and supporters of the Academy, practically wiping it out by 1627. It was rehabilitated after Wei's death.

Dongting Lake *Chinese* **Dongting Hu** \'důŋ-'tiŋ-'hü\ *or* **Tung-t'ing Hu** Large, shallow lake, northeastern Hunan province, China. Its size varies greatly from season to season. Its normal area of 1,089 sq mi (2,820 sq km) may increase up to 7,700 sq mi (20,000 sq km) in flood season. Some two-fifths of the water from the Yangtze River (Chang Jiang) flows into the lake through four channels. It also is fed by the Zi, Yuan, Xiang, and Li rivers. It discharges into the Yangtze.

Dönitz \'dœ-nits,\ *English* \'dər-nəts**, Karl** *or* **Karl Doenitz** (b. Sept. 16, 1891, Grünau-bei-Berlin, Ger.—d. Dec. 22, 1980, Aumühle, W.Ger.) German admiral. After serving as a submarine officer in World War I, he oversaw the creation of the German U-boat fleet in the 1930s, thus violating the Treaty of Versailles. As the fleet's commander, he conducted the Battle of the Atlantic in World War II, then served as commander in chief of the navy (1943–45). He succeeded Adolf Hitler as Germany's leader in the last few days of the war and executed Germany's surrender to the Allies. Convicted of war crimes at the Nürnberg trials, he served 10 years in prison.

Donizetti \ˌdō-nēd-'zā-tē,\ *English* \ˌdä-nə-'ze-tē**, (Domenico) Gaetano (Maria)** (b. Nov. 29, 1797, Bergamo, Cisalpine Republic—d. April 8, 1848, Bergamo, Lombardy, Austrian Empire) Italian opera composer. He was tutored and guided by the opera composer Simone Mayr (1763–1845). His opera *Zoraida di Granata* had a successful premiere in Rome in 1822, but it was *Anna Bolena* in 1830 that made his name internationally. Later successes included *L'Elisir d'amore* (1832), *Lucrezia Borgia* (1833), *Lucia di Lammermoor* (1835), *Roberto Devereux* (1837), *La Fille du régiment* (1840), and *Don Pasquale* (1843). Enormously prolific, he could produce an entire opera in weeks. He completed almost 70 operas, as well as more than 150 sacred works and hundreds of songs. Infected with syphilis, he suffered a severe four-year decline leading to his death. He was one of the foremost Italian opera composers of the early 19th century and a principal master of the bel canto style.

donkey *or* **burro** Descendant of the African wild ass that has been used as a beast of burden since 4000 BC. The average donkey stands about 40 in. (100 cm) high at the shoulder, but breeds range from 24 to 66 in. (61–168 cm). Coats range from white to gray or black, usually with a dark stripe from mane to tail and a crosswise stripe on the shoulders. The mane is short and upright, and the tail has long hairs only at the end. The very long ears are dark at the base and tip. Donkeys are surefooted and can carry heavy loads over rough terrain. See also mule.

Donkin, Bryan (b. March 22, 1768, Sandree, Northumberland, Eng.—d. Feb. 27, 1855, London) British inventor. Initially apprenticed to a papermaker, Donkin perfected a version of the Fourdrinier machine. He established a factory to produce and can vegetable soups and preserved meats for the Royal Navy. With a printer he developed a forerunner of the rotary press and a composition printing roller. He became a civil engineer in London, received two gold medals from the Society of Arts, and was a founder of the British Institution of Civil Engineers (1818).

Dönme *or* **Dönmeh** \dœn-'me,\ *English* \ˌdən-'mā\ Jewish-Islamic sect founded in Salonika (now Thessaloniki, Greece) in the late 17th century. Its members were followers of Shabbetai Tzevi, whom they believed to be the messiah. Arrested by Ottoman authorities in 1666, he chose conversion to Islam over death, as did his followers, who believed that his conversion was a step in the fulfillment of messianic prophecy. While accepting Islam, they secretly practiced various Jewish rites, preserved some knowledge of Hebrew, and refused to intermarry with Muslims. The community moved to Turkey in the early 20th century and gradually was assimilated, resisting Jewish attempts to return them to Judaism.

Donnai River See Dong-nai River

Donne \'dən**, John** (b. c. Jan. 24–June 19, 1572, London, Eng.—d. March 31, 1631, London) English poet. Donne was born into a Roman Catholic family. He entered the University of Oxford at age 12; he later transferred to the University of Cambridge and subsequently studied law. An adventurer in youth, he hoped for a high public appointment, but his clandestine marriage to his employer's daughter ruined his prospects. He converted to Anglicanism; ordained in 1615, he became a preacher of great power and eloquence and was installed as dean of St. Paul's Cathedral in 1621. The greatest of the English Metaphysical poets (see metaphysical poetry), he is noted for his love lyrics, religious verse and treatises, and sermons. His secular poetry, most written early in his career, is direct, intense, brilliantly witty, and daringly imaginative. Later his tone darkened with works such as the *Anniversaries* (1611–12), two long poems meditating on the decay of the world. His 19 famous *Holy Sonnets* (written 1607–13) were published posthumously. Among his prose works, many as dramatic and intimate as his poetry, the most enduring is *Devotions upon Emergent Occasions* (1624).

Donner party Group of U.S. pioneers stranded en route to California. In late 1846, 87 immigrants led by George and Jacob Donner were trapped by heavy snow in the Sierra Nevada. Fifteen of the group set out to find help. When the others' food ran out, they resorted to cannibalism of those already dead. The 47 surviving members were rescued in February 1847. Donner Lake and Donner Pass, Cal., are named for them.

Donostia–San Sebastián \ˌthō-nō-'stē-ä, sän-sā-ˌbäs-'tyän\ Seaport and city (pop., 2001: 178,377), northern Spain. The city is situated at the mouth of the Urumea River on the Bay of Biscay, near the French border. First mentioned in 1014, it was chartered by Sancho the Wise of Navarra c. 1175. The town was burned in 1813 after Anglo-Portuguese troops took it from the French during the Peninsular War. Formerly the summer residence of the Spanish royal court, it is now a fashionable seaside resort. Nearby is Mount Urgull, with the 16th-century Mota Castle at its summit. Donostia–San Sebastián is the official place-name, incorporating first the Basque name and then the Spanish.

Doolittle, Hilda *known as* **H.D.** (b. Sept. 10, 1886, Bethlehem, Pa., U.S.—d. Sept. 27, 1961, Zürich, Switz.) U.S. poet. Doolittle went to Europe in 1911 and remained there the rest of her life. One of the first Imagists (see Imagism) and deeply influenced by Ezra Pound, she wrote clear, impersonal, sensuous verse that combined classical themes with modernist techniques. Her later work was looser and more passionate, though it remained erudite and symbolic. Her collections include *Sea*

© 2006 Encyclopædia Britannica, Inc.

Garden (1916), *Hymen* (1921), and *Red Roses for Bronze* (1929). She was also acclaimed for her translations, verse drama, and prose works.

Doolittle, Jimmy *orig.* **James Harold Doolittle** (b. Dec. 14, 1896, Alameda, Calif., U.S.—d. Sept. 27, 1993, Pebble Beach, Calif.) U.S. general. He enlisted in the army in World War I and became an aviator. After the war he earned a Ph.D. in engineering and remained in the Army Air Corps as a test pilot until 1930, when he became head of aviation for Shell Oil Co. In 1932 he set a world air speed record. Returning to active duty during World War II, he led a daring raid on Tokyo (1942), for which he received the Congressional Medal of Honor. He commanded air operations on many fronts, including attacks on Germany in 1944–45. After the war he remained active in the aerospace industry. He received the Presidential Medal of Freedom in 1989.

door Movable barrier installed in the entry of a room or building to restrict access or provide visual privacy. Early doors were hides or textiles. With monumental architecture came pivoting doors of rigid, permanent materials; important chambers often had stone or bronze doors. Pompeiian doors looked much like modern wooden doors; they were constructed of stiles (vertical planks) and rails (horizontal planks) fastened together to support panels and occasionally equipped with locks and hinges. The typical Western medieval door was of vertical planks backed with horizontal or diagonal bracing. In the 20th century, a single, hollow-core panel door became most common. Other types include the revolving door, folding door, sliding door (inspired by the Japanese SHOJI), rolling door, and Dutch door (divided horizontally so that the lower or upper part can be opened separately).

Door Peninsula Peninsula, northeastern Wisconsin, U.S. Located between GREEN BAY and Lake MICHIGAN, it was named for a strait at its tip known as La Porte des Mortes ("Death's Door"). About 80 mi (130 km) long and 25 mi (40 km) wide at its base, the peninsula was visited in the 17th century by French traders and missionaries. It is now a year-round vacation area, and tourism is a major business. The whole peninsula is popularly known as Door County, though Door is but one of four counties on the peninsula.

dopamine \'dō-pə-ˌmēn\ One of the CATECHOLAMINES, widely distributed in the central NERVOUS SYSTEM. Through a series of enzymatic reactions (see ENZYME) it is formed from LEVODOPA and converted to NOREPINEPHRINE and then EPINEPHRINE. It is a central nervous system NEUROTRANSMITTER essential to control of motion; it also acts as a HORMONE. Degeneration of certain dopamine-producing brain cells results in PARKINSONISM.

dopant \'dō-pənt\ Any impurity added to a SEMICONDUCTOR to modify its electrical conductivity. The most common semiconductors, SILICON and GERMANIUM, form crystalline lattices in which each atom shares electrons with four neighbours (see BONDING). Replacing some atoms with donor atoms (e.g., PHOSPHORUS, ARSENIC) that have five bonding electrons makes extra electrons available. The semiconductor thus doped is called *n*-type (for negative, because of the additional negative charges). Doping with acceptor atoms (e.g., gallium), which have only three electrons available, creates "holes," which are positively charged. Conduction can occur by migration of holes through the crystal structure of such a semiconductor, known as *p*-type (for positive).

Doppler effect Apparent difference between the FREQUENCY at which WAVES—including light, sound, and radio waves—leave a source and that at which they reach an observer. The effect, first described by the Austrian physicist Christian Doppler (1803–1853), is caused by the relative motion of the observer and the wave source. It can be observed by listening to the blowing horn or siren of an approaching vehicle, whose pitch rises as the vehicle approaches the observer and falls as it recedes. It is used in RADAR and to calculate the speed of stars by observing the change in frequency of their light.

Dorchester Former town, now a ward of BOSTON, Mass., U.S. It extended nearly to the Rhode Island border and included Dorchester Heights, whose fortification by GEORGE WASHINGTON's artillery led the British to evacuate Boston on March 17, 1776, at the start of the AMERICAN REVOLUTION.

Dorchester *ancient* **Durnovaria** Town (pop., 1995 est.: 16,000) and county seat of DORSET, England. On the River Frome, the ancient town was a sizable Roman British centre, and many remains of the period have been found. By 1086 it was a royal borough, and a castle had been built by the 12th century; the Franciscan priory, founded before 1331, is thought to have been constructed from its ruins. The town is now a marketplace serving an extensive rural area. THOMAS HARDY was born near Dorchester, the "Casterbridge" of his Wessex novels.

Dorchester (of Dorchester), Guy Carleton, 1st Baron (b. Sept. 3, 1724, Strabane, County Tyrone, Ire.—d. Nov. 10, 1808, Stubbings, Berkshire, Eng.) Irish soldier-statesman. In 1759 he was sent to Canada, where he fought in the Battle of Quebec. He served as lieutenant governor (1766–68) and governor (1768–78) of Quebec province. His conciliatory policies toward the French Canadians led to passage of the QUEBEC ACT of 1774. He helped repel the attack on Quebec by American Revolutionary forces in 1775. He was appointed commander of British forces in North America in 1782 and then governor in chief of British North America (1786–96).

Dordogne River \dȯr-'dȯnʸ\ *ancient* **Duranius.** River, southwestern France. Rising in the MASSIF CENTRAL and flowing west for 293 mi (472 km), it unites with the GARONNE RIVER north of BORDEAUX to form the Gironde Estuary. It then flows through the spa resorts of Monts Dore in the Puy-de-Dôme. The river is a source for hydroelectric power.

Doré \dȯ-'rā**, Gustave (-Paul)** (b. Jan. 6, 1832, Strasbourg, France—d. Jan. 23, 1883, Paris) French printmaker. In 1847 he went to Paris and began producing lithographic caricatures for a weekly journal and several albums of lithographs (1847–54). He achieved fame and wide popularity with his wood-engraved book illustrations; among the finest were editions of DANTE's *Inferno* (1861) and the Bible (1866). His vivid work is characterized by images of the grotesque and bizarre. Employing over 40 block cutters, he eventually produced more than 90 illustrated books.

Doren, Carl and Mark Van See Carl and Mark VAN DOREN

Dorgon \'dȯr-ˌgän\ *Chinese* **Chengzong** *or* **Ch'eng-tsung** \'cheŋ-'dzuŋ\ (b. Nov. 7, 1612, Yenden, Manchuria—d. Dec. 31, 1650, Kharahotu) Prince of the MANCHU people, instrumental in founding the QING (MANCHU) DYNASTY in China. He joined his former enemy WU SANGUI in driving the Chinese rebel LI ZICHENG from Beijing, where Li had already unseated the last MING-DYNASTY emperor. Though some wanted to put Dorgon on the throne, he saw to it that his nephew Fu-lin was proclaimed emperor (Dorgon acted as regent); this loyalty and selflessness won him the high regard of future historians.

Doria \'dȯr-yä**, Andrea** (b. Nov. 30, 1466, Oneglia, Duchy of Milan—d. Nov. 25, 1560, Genoa) Genoese statesman, mercenary, and admiral, the foremost naval commander of his time. A member of an aristocratic family, he was orphaned at an early age and became a soldier of fortune. In 1522 he entered the service of FRANCIS I, who was fighting Emperor CHARLES V in Italy. Doria later transferred his services to Charles and in 1528 drove the French out of Genoa. He became the new ruler of Genoa and reorganized its government into an effective and stable oligarchy. He commanded several naval expeditions against the Turks and helped Charles V extend his domination over the Italian peninsula. Though greedy and authoritarian, Doria was also a fearless commander with outstanding tactical and strategic talents.

ALINARI/ART RESOURCE, NEW YORK

Dorian Any member of a major division of the ancient Greeks. Coming from the north and northwest, they conquered the PELOPONNESE c. 1100–1000 BC, overran the remnants of the MYCENAEAN and MINOAN civilizations, and ushered in a dark age that lasted almost three centuries, until the rise of the Greek city-states. They had their own dialect and were organized into three TRIBES. Patterns of settlement determined their alliances in later Greek conflicts. To Greek culture they gave the Doric ORDER of architecture, the tragic choral lyric, and a militarized aristocratic government. They assimilated into Greek societies in some cases, but in Sparta and Crete they held power and resisted cultural advancement.

dormer Window set vertically in a structure that projects from a sloping roof. It often illuminates a bedroom. In the late Gothic and early Renaissance periods, elaborate masonry dormers were designed. Dormers were used along with the mansard ROOF to defy a Parisian law limiting buildings to six stories; the seventh story was called a garret (or attic) and was made habitable by the dormer. See also GABLE.

dormouse Any of 20 RODENT species (family Gliridae) found throughout Eurasia and northern Africa. Dormice have large eyes, soft fur, rounded ears, and a hairy (sometimes bushy) tail. They live in trees, bushes, and rock walls and in nests of plant material. They eat fruit, nuts, birds' eggs, and some insects and small animals. Many species sleep for long periods, particularly in winter. The largest species, the edible dormouse (*Glis glis*), is gray and attains a maximum length of about 8 in. (20 cm), excluding the 6-in. (15-cm) tail.

Edible dormouse (*Glis glis*).
SCHUNEMANN/BAVARIA-VERLAG

Dornberger \'dȯrn-ˌber-gər\, Walter Robert (b. Sept. 6, 1895, Giessen, Ger.—d. June 27, 1980, Baden-Württemberg) German-born U.S. engineer. From 1932, with WERNHER VON BRAUN, he began to perfect the ROCKET engine. During World War II he directed construction of the V-2 rocket, the forerunner of all postwar spacecraft. In the U.S. after the war, he worked as an adviser on GUIDED MISSILES for the U.S. Air Force. In the 1950s he participated in the Air Force–NASA project Dyna-Soar, which eventually became the SPACE SHUTTLE program.

Dorr, Thomas Wilson (b. Nov. 5, 1805, Providence, R.I., U.S.—d. Dec. 27, 1854, Providence) U.S. politician. From 1834 he served in the Rhode Island legislature, where he tried to introduce constitutional reform to expand white manhood suffrage. In 1841 he organized the People's Party, which held elections and installed Dorr as governor in 1842. The existing government refused to recognize his authority, labeling the action "Dorr's Rebellion." The state had two governments until 1844, when Dorr was tried for treason; though given a life sentence, he was released in 1845.

Dorset Administrative (pop., 2001: 390,986), geographic, and historic county, southwestern England. It is located on the ENGLISH CHANNEL; its county seat is DORCHESTER. Prehistoric peoples were active in the area and left abundant monuments dating from the Neolithic Period, Bronze Age, and Iron Age, including Maiden Castle, a huge earthworks just outside Dorchester. The area subsequently became part of the West Saxon kingdom. As Wessex, it appears in the writings of THOMAS HARDY.

Dorsey, Thomas A(ndrew) (b. July 1, 1899, Villa Rica, Ga., U.S.—d. Jan. 23, 1993, Chicago, Ill.) U.S. songwriter, singer, and pianist, the "father of GOSPEL MUSIC." Born the son of a revivalist preacher, Dorsey was influenced by BLUES pianists in the Atlanta area. After moving to Chicago in 1916, he appeared under the name of "Georgia Tom," became a pianist with MA RAINEY, and composed secular "hokum" songs (those peppered with risqué double entendres). He wrote his first gospel song in 1919, and in 1932 he abandoned the blues completely and founded the Pilgrim Baptist Church in Chicago. His more than 1,000 gospel songs include "Precious Lord, Take My Hand," "Peace in the Valley," and "If We Ever Needed the Lord Before." He recorded extensively in the early 1930s. Many of his songs were introduced by MAHALIA JACKSON. He founded and directed the National Convention of Gospel Choirs and Choruses.

Dorsey, Tommy *orig.* **Thomas Dorsey** (b. Nov. 19, 1905, Shenandoah, Pa., U.S.—d. Nov. 26, 1956, Greenwich, Conn.) U.S. trombonist and band leader. Dorsey led the Dorsey Brothers Orchestra from 1934 with his brother, saxophonist and clarinetist Jimmy Dorsey (1904–57); they later separated to lead their own groups. Tommy Dorsey's band combined smooth ballad performances with up-tempo jazz arrangements featuring some of the best musicians of the period, including BUDDY RICH, FRANK SINATRA, and arranger Sy Oliver. Dorsey's trombone playing was technically impeccable, and his seamless phrasing and sweet tone were a major influence on singers and brass players alike. The Tommy Dorsey band was one of the most popular big bands of the SWING era

Dortmund \'dȯrt-ˌmůnt\ *ancient* **Throtmannia** City (pop., 2002 est.: 589,200), North Rhine–Westphalia, western Germany. First mentioned in AD 885, it became a free imperial city in 1220 and later joined the HANSEATIC LEAGUE. A prosperous trading centre in the 14th century, it declined after the THIRTY YEARS' WAR and lost its imperial rights in 1803. The development of coal and iron ore mining and the completion of the Dortmund-Ems Canal in 1899 stimulated its regrowth. The city was largely destroyed in World War II but was extensively rebuilt. It is a major transportation and industrial hub of the RUHR area.

Dorylaeum \ˌdȯr-ə-'lē-əm**, Battle of** (July 1, 1097) Battle in which a combined force of crusaders and Byzantines defeated an army of SELJUQ Turks in Anatolia. The crusaders later captured Antioch. See also CRUSADES.

Dos Passos \däs-'pa-səs**, John (Roderigo)** (b. Jan. 14, 1896, Chicago, Ill., U.S.—d. Sept. 28, 1970, Baltimore, Md.) U.S. writer. Son of a wealthy lawyer, Dos Passos attended Harvard University. His wartime service as an ambulance driver and later work as a journalist led him to see the U.S. as "two nations," one for the rich and one for the poor. His reputation as social historian, radical critic of American life, and major novelist of the postwar "lost generation" rests primarily on his powerful U.S.A. trilogy, comprising *The 42nd Parallel* (1930), *1919* (1932), and *The Big Money* (1936).

Dostoyevsky \däs-tə-'yef-skē**, Fyodor (Mikhaylovich)** (b. Nov. 11, 1821, Moscow, Russia—d. Feb. 9, 1881, St. Petersburg) Russian novelist. Dostoyevsky gave up an engineering career early in order to write. In 1849 he was arrested for belonging to a radical discussion group; sentenced to be shot, he was reprieved at the last moment and spent four years at hard labour in Siberia, where he developed epilepsy and experienced a deepening of his religious faith. Later he published and wrote for several periodicals while producing his best novels. His novels are concerned especially with faith, suffering, and the meaning of life; they are famous for their psychological depth and insight and their near-prophetic treatment of issues in philosophy and politics. His first, *Poor Folk* (1846), was followed the same year by *The Double*. *The House of the Dead* (1862) is based on his imprisonment and *The Gambler* (1866) on his own gambling addiction. Best known are the novella *Notes from the Underground* (1864) and the great novels *Crime and Punishment* (1866), *The Idiot* (1869), *The Possessed* (1872), and *The Brothers Karamazov* (1880), which focuses on the problem of evil, the nature of freedom, and the characters' craving for some kind of faith. By the end of his life, he had been acclaimed one of his country's greatest writers, and his works had a profound influence on 20th-century literature.

Dou \'dau**, Gerrit** *or* **Gerard Dou** (b. April 7, 1613, Leiden, Neth.—d. Feb. 9, 1675, Leiden) Dutch painter. From 1628 to 1631 he studied with REMBRANDT, adopting his subject matter, careful draftsmanship, and dramatic treatment of light and shadow. When Rembrandt left Leiden, Dou developed his own style, painting smooth, meticulously detailed, small-scale domestic interiors and portraits. He used the "frame within a frame" device of surrounding his figures by a window or curtain and excelled at scenes lit by candlelight. With JAN STEEN he was among the founders of the Guild of St. Luke at Leiden (1648).

Douala \dü-'ä-lä\ City (pop., 1992 est.: 1,200,000), chief port of Cameroon, on the Bight of BIAFRA. It was the capital of German Kamerun and later of French Cameroun and was taken from the Germans in 1914. Cameroon's largest city, it is one of Central Africa's major industrial centres, and its deepwater port handles most of the country's overseas trade. It is home to a variety of commercial, agricultural, and industrial schools; a museum and handicraft centre encourage the production and preservation of Cameroonian art.

double-aspect theory *or* **dual-aspect theory** Type of mind-body MONISM. According to double-aspect theory, the mental and the material are different aspects or attributes of a unitary reality, which itself is neither mental nor material. The view is derived from the metaphysics of BENEDICT DE SPINOZA, who held that mind and matter are merely two of an infinite number of "modes" of a single existing substance, which he identified with God. See also MIND-BODY PROBLEM.

© 2006 Encyclopædia Britannica, Inc.

double bass Lowest-pitched of the modern STRINGED INSTRUMENTS. It varies in size, up to 80 inches (200 cm) tall. Its shape also varies; its shoulders usually slope more than those of the violin, reflecting its status as a hybrid of the VIOL and VIOLIN families (the name comes from the double-bass viol). It emerged from these families in the late Renaissance, and it has always been less standardized in form than its cousins in the violin family. It normally has four strings; the orchestral instrument often has a lower fifth string (more often, an extension is added to the fourth string), and the jazz instrument has a higher fifth string. Its range is an octave below that of the CELLO. It is normally bowed in orchestral music and plucked in jazz. In rock bands and some jazz bands, the electric bass is used instead.

double jeopardy In law, the prosecution of a person for an offense for which he or she already has been prosecuted. In U.S. law, double jeopardy is prohibited by the 5th Amendment to the CONSTITUTION OF THE UNITED STATES, which states that no person shall "be subject for the same offense to be twice put in jeopardy of life and limb." The clause bars second prosecutions after acquittal or conviction and prohibits multiple convictions for the same offense. Thus a person cannot be guilty of both murder and manslaughter for the same homicide, nor can a person be retried for the same crime after the case has been resolved. A person can, however, be convicted of both murder and robbery if the murder arose from the robbery. The prohibition against double jeopardy is not violated when an individual is charged for behaviour stemming from an offense for which he has been charged in a different jurisdiction or in a different court (e.g., a civil court as opposed to a criminal court). See also rights of the ACCUSED; DUE PROCESS.

double refraction *or* **birefringence** Optical property in which a single ray of unpolarized light (see POLARIZATION) splits into two components traveling at different velocities and in different directions. One ray is refracted (see REFRACTION) at an angle as it travels through the medium, while the other passes through unchanged. The splitting occurs because the speed of the ray through the medium is determined by the orientation of the light compared with the CRYSTAL LATTICE of the medium. Since unpolarized light consists of waves that vibrate in all directions, some will pass through the lattice without being affected, while others will be refracted and change direction. Materials that exhibit double refraction include ICE, QUARTZ, and SUGAR.

double vision *or* **diplopia** Perception of two images of an object, usually caused by temporary or permanent eye-muscle paralysis. Normally, the brain fuses slightly different images from each eye by matching corresponding points on each RETINA. When an eye muscle is paralyzed, the image falls at a different point and the images do not correspond. Double vision may be an early symptom of BOTULISM or MYASTHENIA GRAVIS and occurs in other infections, head injuries, and nerve or muscle disorders.

Doubleday, Abner (b. June 26, 1819, Ballston Spa, N.Y., U.S.—d. Jan. 26, 1893, Mendham, N.J.) U.S. Army officer, once thought to be the inventor of BASEBALL. Doubleday served in the Mexican War and the Seminole Wars. As a major general in the American Civil War, he gave the first order to fire at Fort Sumter, and he later fought in other major battles. In 1907 a commission appointed by A.G. SPALDING concluded that Doubleday formulated the essential rules of baseball in 1839 at Cooperstown, N.Y., leading to the choice of Cooperstown as the site of the Baseball Hall of Fame. It was later proved that Doubleday was not in Cooperstown in 1839. See also ALEXANDER CARTWRIGHT.

Abner Doubleday.

Doubs River \'dü\ *ancient* **Dubis.** River, eastern France and western Switzerland. Rising in the JURA Mtns., it flows northeast to form part of the French-Swiss border. It continues east into Switzerland, makes a hairpin turn and heads back into France, finally entering the SAÔNE RIVER, after a course of about 270 mi (435 km), only 56 mi (90 km) from its source.

Dougga See THUGGA

Douglas, Aaron (b. May 26, 1899, Topeka, Kan., U.S.—d. Feb. 2, 1979, Nashville, Tenn.) U.S. painter and graphic artist. In 1925 he moved to New York City, where he joined the burgeoning arts scene in Harlem that later became known as the HARLEM RENAISSANCE. In his magazine illustrations and murals, he synthesized CUBIST forms with stylized and geometric shapes drawn from African art. Perhaps his most significant work was a series of four murals, collectively titled *Aspects of Negro Life*, for the 135th Street branch of the New York Public Library. His illustrations are widely known for their tonal gradations and ART DECO-style silhouettes. He taught at Fisk University from 1939 to 1966.

Douglas, Sir James (b. Aug. 15, 1803, Demerara, British Guiana—d. Aug. 2, 1877, Victoria, B.C., Can.) Canadian statesman, known as "the father of British Columbia." He joined the HUDSON'S BAY CO. in 1821 and became a senior member in charge of operations west of the Rocky Mountains. In 1849 he moved the company's headquarters from Oregon to Vancouver Island. He served as governor of Vancouver from 1851 to 1864. When gold was discovered on the Fraser River in 1858, he extended his authority to the mainland to preserve Britain's Pacific foothold. When Britain created the colony of British Columbia, Douglas was appointed governor (1858–64).

Douglas, Kirk *orig.* **Issur Danielovitch** *later* **Isadore Demskey** (b. Dec. 9, 1916, Amsterdam, N.Y., U.S.) U.S. film actor and producer. He had minor Broadway roles before making his film debut in *The Strange Love of Martha Ivers* (1946) and emerged as a major star in *Champion* (1949). Despite giving sensitive performances in *The Glass Menagerie* (1950) and *Paths of Glory* (1957), he became identified with the intense, forceful roles he played in films such as *The Bad and the Beautiful* (1952), *Lust for Life* (1956), *Gunfight at the O.K. Corral* (1957), and *Seven Days in May* (1964). He produced and starred in *Spartacus* (1960). He continued to appear in films into the 21st century.

Douglas, Michael (b. Sept. 25, 1944, New Brunswick, N.J., U.S.) U.S. actor and producer. The son of KIRK DOUGLAS, he made his film acting debut in 1969 and began his career as a producer with *One Flew over the Cuckoo's Nest* (1975). He produced and acted in films such as *The China Syndrome* (1979), *Romancing the Stone* (1984), *Fatal Attraction* (1987), and *Wall Street* (1987, Academy Award) and also starred in *Basic Instinct* (1992), *Traffic* (2000), and *Wonder Boys* (2000).

Douglas, Stephen A(rnold) (b. April 23, 1813, Brandon, Vt., U.S.—d. June 3, 1861, Chicago, Ill.) U.S. politician. He was elected to the U.S. House of Representatives (1843–47) and Senate (1847–61), where he strongly supported the Union and national expansion. To settle the bitter dispute over the extension of slavery to the territories, he developed the policy of POPULAR SOVEREIGNTY. He was influential in the passage of the COMPROMISE OF 1850 and the KANSAS-NEBRASKA ACT. Short and heavy-set, he was dubbed "the Little Giant" for his oratorical skill. In 1858 he engaged in a number of widely publicized debates with ABRAHAM LINCOLN in a close contest for the Senate seat in Illinois (see LINCOLN-DOUGLAS DEBATES). The Democrats nominated Douglas for president in 1860, but a splinter group of Southerners nominated JOHN C. BRECKINRIDGE, which divided the Democratic vote and gave the presidency to Lincoln. In 1861 he undertook a mission for Lincoln to gain support for the Union among the Southern border states and in the Northwest. His untimely death of typhoid was partly a result of these exertions.

Douglas, Tommy *orig.* **Thomas Clement Douglas** (b. Oct. 20, 1904, Falkirk, Stirlingshire, Scot.—d. Feb. 24, 1986, Ottawa, Ont., Can.) Scottish-born Canadian politician. His family immigrated to Winnipeg in 1919. An ordained minister, he became active in the socialist CO-OPERATIVE COMMONWEALTH FEDERATION, and he served in the Canadian Parliament (1935–44). As premier of Saskatchewan (1944–61), he led Canada's first socialist government. He established a system of state-run health care in the province, the first such system in the nation; for this he is considered the father of socialized medicine in Canada. He resigned in 1961 to become leader of the NEW DEMOCRATIC PARTY, a post he held until 1971.

Douglas, William O(rville) (b. Oct. 16, 1898, Maine, Minn., U.S.—d. Jan. 19, 1980, Washington, D.C.) U.S. jurist and public official. He attended Columbia University Law School, where he edited the law review and graduated second in his class. After learning the intricacies of financial and corporate law at a Wall Street law firm, he joined the law faculty at Yale, where he taught until 1936. He became a member of the

© 2006 Encyclopædia Britannica, Inc.

Securities and Exchange Commission (SEC) in 1936. As SEC chairman (1937–39) he engineered the reorganization of the country's stock exchanges, instituted measures for the protection of small investors, and began government regulation of the sale of securities (see security). In 1939 Pres. Franklin Roosevelt appointed him to the Supreme Court of the United States, on which he served until 1975. Although responsible for writing opinions in many complicated financial cases, he became most famous for his pronouncements on civil liberties (see civil liberty). He rejected government limitations on freedom of speech and was an outspoken defender of an unfettered press. He also strove to uphold the rights of the accused. He wrote numerous books on history, politics, foreign relations, and conservation, including *Of Men and Mountains* (1950) and *A Wilderness Bill of Rights* (1965).

Douglas fir Any of about six species of coniferous evergreen timber trees (see conifer) that make up the genus *Pseudotsuga*, in the pine family, native to western North America and eastern Asia. Long, flat, spirally arranged yellow- or blue-green needles grow directly from the branch. The North American tree commonly called Douglas fir is *P. menziesii* (sometimes *P. douglasii*). Douglas firs may grow to 250 ft (75 m) tall and 8 ft (2.4 m) in diameter. One of the best timber trees in North America, it is also a popular ornamental and Christmas tree and is used for reforestation along the Pacific Coast.

Cone of a Douglas fir (*Pseudotsuga menziesii*)
GRANT HEILMAN

Douglas-Home \'dəg-ləs-'hyüm**, Sir Alec** *orig.* **Alexander Frederick** *later* **Baron Home (of the Hirsel of Coldstream)** (b. July 2, 1903, London, Eng.—d. Oct. 9, 1995, The Hirsel, Coldstream, Berwickshire, Scot.) British statesman. A member of the House of Commons (1931–45 and 1950–51), he entered the House of Lords after inheriting the earldom of Home (1951). He served as minister of state for Scotland (1951–55), leader of the House of Lords (1957–60), and foreign secretary (1960–63) before succeeding Harold Macmillan as prime minister in 1963, relinquishing his hereditary titles. He was unable to improve the British balance-of-payments situation and antagonized Conservatives by supporting legislation against price-fixing, but gained U.S. approval as a result of his anti-Communism. After his government fell in 1964, he became Conservative opposition spokesman on foreign affairs and later again foreign secretary (1970–74). In 1974 he was created a life peer.

Douglass, Frederick *orig.* **Frederick Augustus Washington Bailey** (b. February 1818?, Tuckahoe, Md., U.S.—d. Feb. 20, 1895, Washington, D.C.) U.S. abolitionist. The son of a slave mother and a white father, he was sent to work as a house servant in Baltimore, where he learned to read. At age 16 he was returned to the plantation; later he was hired out as a ship caulker. In 1838 he fled to New York City and then to New Bedford, Mass., changing his name to elude slave hunters. His eloquence at an 1841 antislavery convention propelled him into a new career as an agent for the Massachusetts Anti-Slavery Society, in which capacity he endured frequent insults and violent personal attacks. In 1845 he wrote his autobiography, now regarded as a classic. To avoid recapture by his owner, whose name he had given in the narrative, he embarked on a speaking tour of England and Ireland (1845–47), returning with enough money to buy his freedom and to start an antislavery newspaper *North Star*, which he published until 1860 in Rochester, N.Y. In 1851 he split with the radical abolitionist William Lloyd Garrison and allied himself with moderates led by James Birney. In the American Civil War he was a consultant to Pres. Abraham Lincoln. During Reconstruction he fought for full civil rights for freedmen and supported women's rights. He served in government posts in Washington, D.C. (1877–86), and as U.S. minister to Haiti (1889–91).

Douhet \dü-'e**, Giulio** (b. May 30, 1869, Caserta, Italy—d. Feb. 15, 1930, Rome) Italian general. He served as commander of Italy's first aviation unit, the Aeronautical Battalion (1912–15). In World War I his criticism of the war's conduct led to his court-martial, imprisonment, and retirement. An investigation in 1917 justified his criticisms; his conviction was reversed, and he was appointed head of the aviation service. In books such as *The Command of the Air* (1921) he advanced his ideas on strategic air power and the importance of strategic bombing. He advocated the creation of an independent air force, reduction of land and sea forces, and unification of the armed forces. Though his ideas aroused great controversy, many were adopted by the major powers.

Doukhobors *or* **Dukhobors** \'dü-kə-ˌbȯr\ (Russian: "Spirit Wrestler") Member of a Russian peasant religious sect. Its members, most of whom originally lived in southern Russia, objected to the liturgical reforms (1652) of Patriarch Nikon and Russia's Westernization under Peter I. They had no priests or sacraments, and their egalitarian and pacifist beliefs provoked sporadic persecution from 1773 on. Leo Tolstoy won them the right to emigrate, and by 1899 7,500 had left for western Canada. In the early 20th century they clashed repeatedly with the Canadian government over noncompliance with land, tax, and education laws. The removal of Doukhobor children from their parents 1953–59 prompted legal action to obtain compensation in the late 1990s.

Douris \'dü-ris\ (fl. early 5th century bc, Greece) Greek vase painter. He was known for his work in red-figure pottery, which exhibit his fine draftsmanship and rhythmic composition. He decorated his vases with a variety of themes, including the legend of the Golden Fleece. His signature has been identified on some 40 vases; more than 200 have been attributed to him, including a cup depicting *Eos Embracing Her Dead Son Memnon*.

Douro River \'dō-ˌrü\ *Spanish* **Duero** \'dwā-rō\ *ancient* **Durius.** River in Spain and Portugal. The third-longest in the Iberian Peninsula, it rises in the Sierra de Urbión in central Spain, and crosses the Numantian Plateau. It flows generally westward for 556 mi (895 km) across Spain and northern Portugal to the Atlantic Ocean. It has extensive barge traffic in its Portuguese section, and has been harnessed for hydroelectric power.

dove Any of certain birds of the pigeon family (Columbidae). The names pigeon and dove are often used interchangeably. Though "dove" usually refers to the smaller, long-tailed members of the pigeon family, there are exceptions: the common street pigeon, generally typical for birds designated as pigeons, is frequently called the rock dove. The common names of these birds do not necessarily reflect their accurate biological relationships to one another.

Dove, Rita (Frances) (b. Aug. 28, 1952, Akron, Ohio, U.S.) U.S. writer and teacher. She studied writing at the University of Iowa and published the first of several chapbooks of her poetry in 1977. Her poems and short stories focus on the particulars of family life and personal struggle, addressing the larger dimensions of the African American experience primarily by indirection. Her poetry collections include *Museum* (1983), *Thomas and Beulah* (1986, Pulitzer Prize), *Mother Love* (1995), and *On the Bus with Rosa Parks* (1999). She was poet laureate of the U.S. from 1993 to 1995.

Dover City (pop., 2000: 32,135), capital of Delaware, U.S., on the St. Jones River. Laid out in 1717 as the site for a county courthouse and jail by order of William Penn and named for Dover, Eng., it became the capital in 1777. Its many colonial buildings include the Old State House (rebuilt 1787–92), which served as the capitol building until 1933; displayed there are King Charles II's original royal grant and Penn's deeds to Delaware (1682). The modern city is a farm trade centre and shipping point for fruits, and it has some light industries.

Dover *ancient* **Dubris Portus** Town (pop., 1995 est.: 34,000) and seaport on the Strait of Dover, Dover district, administrative and historic county of Kent, southeastern England. A pre-Roman settlement existed on the site, and in the 4th century ad it was guarded by a Saxon fort. During the 11th century it was chief of the Cinque Ports. Dover Castle, a stronghold of medieval England, was besieged by rebellious barons in 1216. The town was held by Parliamentarians in the English Civil Wars. It was a naval base in World War I and was bombed by Germans in World War II. Landmarks include the castle, a Roman lighthouse, and an ancient fortress church. Famous for the white chalk cliffs rising above it, Dover is a leading passenger port.

Dover, Strait of *French* **Pas de Calais** \ˌpäd-kä-'lā\ *ancient* **Fretum Gallicum.** Channel separating southeastern England from northwestern France. Connecting the English Channel with the North Sea, it is about 20 mi (32 km) wide at its narrowest point. Lined on the British side

© 2006 Encyclopædia Britannica, Inc.

with the famous White Cliffs, which are composed of soft chalk, it is one of the world's busiest seaways; its chief ports include Dover and Folkestone in England and Calais and Boulogne in France. It was the scene of several historic naval battles, including the repulse by the English of the Spanish Armada in 1588. Allied troops in the Dunkirk Evacuation crossed to Dover in 1940.

Dover, Treaty of (1670) Pact between Charles II of England and Louis XIV in which Charles promised to support French policy in Europe in return for a French subsidy that would free him from financial dependence on Parliament. There were actually two treaties: a secret one concerning the conversion of England to the Roman Catholic faith (which never took effect), and a formal one concerning an Anglo-French military and naval alliance designed to subjugate the United Provinces of the Netherlands.

Dow, Herbert H(enry) (b. Feb. 26, 1866, Belleville, Ont., Can.—d. Oct. 15, 1930, Rochester, Minn., U.S.) U.S. inventor and manufacturer. After attending college in Cleveland, Dow developed and patented electrolytic methods (the Dow process) for extracting bromine from brines (concentrated water solutions of salts). In 1895 he founded the Dow Chemical Co. to electrolyze brine for chlorine, used in insecticides. He was the first U.S. producer of iodine (which he also extracted from brine). He eventually was granted some 65 patents as his company became one of the world's leading chemical manufacturers.

Dow Chemical Co. Leading U.S. petrochemical company that manufactures chemicals, pharmaceuticals, consumer goods, paint, and many other products for industrial and home use. It was founded in 1897 by the chemist Herbert H. Dow, initially as a bleach plant to use wastes produced by the Midland Chemical Co. It was incorporated with Midland Chemical and the Dow Process Co. in 1900. Dow's products have included a broad range of industrial chemicals and metals, plastics and packaging materials, and bioproducts, including mustard gas, napalm, Agent Orange, silicone breast implants, aspirin, plastic wrap, and Styrofoam.

Dow Jones average Stock price average computed by Dow Jones & Co. Founded in 1882 by Charles H. Dow (1851–1902) and Edward D. Jones (1856–1920), Dow Jones & Co. commenced publication of the *Wall Street Journal* in 1889 and began computing a daily industrials average in 1897. Dow Jones publishes averages based on 20 transportation stocks, 15 utility stocks, and 30 selected industrial stocks, as well as a composite average of all three; the industrial-stocks average is universally followed by U.S. and international investors. The company also publishes several bond averages. See also NASDAQ; stock exchange.

Dowland, John (b. 1562/63, Westminster, London, Eng.—d. Jan. 21, 1626, London) English composer and lutenist. Educated at Oxford, he was refused a court position in 1594 and, believing his adoptive Catholicism had been the cause, he left for the continent. There he traveled extensively and took a position at the Danish court. In 1612, when his compositions had made him famous, he was finally appointed lutenist to the English court. He published three collections of songs, including about 90 works for solo lute and some 80 lute songs, including "Come again, sweet love does now endite," " Flow my tears," and "Weep you no more, sad fountains." His *Lachrimae* is a collection for viol-and-lute ensemble.

Down District (pop., 1999 est.: 63,800), Northern Ireland. Formerly part of County Down, it was established as a district in 1973. It fronts Strangford Lough and the Irish Sea. Extreme southern and western Down is mountainous; the dome-shaped Mourne Mountains reach an elevation of 2,789 ft (850 m). Down is a rich agricultural district; livestock raising is important. Down was settled in prehistoric times. It was where St. Patrick began his mission in Ireland (AD 432), and his well and bathhouses are preserved near the district seat, Downpatrick. In Tudor times, parts of Down were colonized by English and Scottish adventurers.

Down syndrome *or* **trisomy** \'trī-ˌsō-mē\ **21** Congenital disorder caused by an extra chromosome (trisomy) on the chromosome 21 pair. Those with the syndrome may have broad, flat faces; up-slanted eyes, sometimes with epicanthal folds (whence its former name, mongolism); mental retardation (usually moderate); heart or kidney malformations; and abnormal fingerprint patterns. Many persons with Down syndrome can live and work independently or in a sheltered environment, but they age prematurely and have a short (55-year) life expectancy. The risk of bearing a child with the disorder increases with the mother's age; it can be detected in the fetus by amniocentesis.

Downing, Andrew Jackson (b. Oct. 30, 1815, Newburgh, N.Y., U.S.—d. July 28, 1852, vicinity of Yonkers, N.Y.) U.S. horticulturist, landscape gardener, and architect. He educated himself in landscape gardening and architecture while working in his father's nursery. In 1850 he began collaborating with the British architect Calvert Vaux (1824–95); the two designed a number of estates in New York's Hudson River valley and on Long Island. Recognized as the foremost U.S. landscape designer of his day, he was commissioned in 1851 to lay out the grounds for the Capitol, the White House, and the Smithsonian Institution. His death at 36 in a steamboat accident prevented him from seeing his plans to completion. His books on architecture and landscaping became standard works, and his influence on American conceptions of the middle-class home were far-reaching.

Downpatrick Town (pop., 1991: 10,113), seat of Down district, Northern Ireland. It is on the southwestern end of Strangford Lough. Formerly a MacDunleary stronghold, it was seized in 1177 by the Anglo-Norman adventurer John de Courci and served as his headquarters until 1203. St. Patrick is reputedly buried on the grounds of its cathedral.

dowry \'daù-rē\ Money, goods, or estate that a woman brings to her husband in marriage. The dowry has a long history in Europe, South Asia, Africa, and other parts of the world. Some of its basic functions are to protect the wife against ill treatment by her husband, since a dowry can be a conditional gift; to help the husband discharge the responsibilities of marriage, since the dowry makes it possible for the young man to establish a household; to provide the wife with support in case of her husband's death; and to compensate the groom's kin for their payment of bridewealth. In Europe, the dowry served to build the power and wealth of great families and played a role in the politics of grand alliance through marriage. The giving of a dowry more or less disappeared in Europe in the 19th and 20th centuries. The practice grew, however, in South Asia. In some cases, delayed or insufficient dowry made some young wives the victims of murder by their husbands or in-laws, a practice known as "bride burning" or "dowry death."

dowsing \'daù-ziŋ\ Occult practice used for finding water, minerals, or other hidden substances. A dowser generally uses a Y-shaped piece of hazel, rowan, or willow wood (also called a dowser or a divining rod). The dowser grasps the rod by its two prongs and appears, while walking, to be receiving transmissions from beneath the earth. If the rod quivers violently or points downward, some buried substance has been located. First practiced in Europe during the Middle Ages, dowsing is most often used to find water but may also be employed to locate precious metals, buried treasure, archaeological remains, or even dead bodies.

Doyle, Arthur Conan See Sir Arthur Conan Doyle

Drâa \'drä\ **River** River, southwestern Morocco. Rising from two headstreams in the Atlas Mountains, it flows south to form much of the Algerian-Moroccan frontier before emptying into the Atlantic Ocean near Cape Drâa. Although it is Morocco's longest river (700 mi [1,100 km] in length), all but the headstreams and upper course flow intermittently.

Drabble, Margaret (b. June 5, 1939, Sheffield, Yorkshire, Eng.) British novelist. She graduated from the University of Cambridge. Her novels include *The Realms of Gold* (1975), *The Radiant Way* (1987), and *The Gates of Ivory* (1991). She has also written literary biographies (like her husband, Michael Holroyd) and other literary studies and has edited the *Oxford Companion of English Literature* (1985). A.S. Byatt is her sister.

dracaena \drə-'sē-nə\ Any of about 50–80 species of ornamental foliage plants that make up the genus *Dracaena*, in the agave family, native primarily to the Old World tropics. Most have short stalks and narrow, sword-shaped leaves; some have taller stalks and resemble trees. The small flowers are red, yellow, or green. *D. sanderiana* and *D. fragrans* are often grown as houseplants. The ornamental dragon tree (*D. draco*) of the Canary Islands bears orange fruit. Its trunk contains a red gum, called dragon's blood, that was formerly used in medicines.

Draco \'drā-kō\ *or* **Dracon** (fl. 7th century BC) Athenian lawgiver. Almost nothing is known of his life. His harsh legal code (621 BC) punished most crimes, even trivial ones, with death. Solon repealed Draco's code, retaining only the homicide statutes.

Dracula Character created by Bram Stoker in his 1897 novel of the same name. A mesmerizing, ruthless vampire, Dracula captured the public imagination, especially following Bela Lugosi's elegant and chilling portrayal of

© 2006 Encyclopædia Britannica, Inc.

Count Dracula in Tod Browning's 1931 horror film version. Stoker had named the character for the notoriously cruel Vlad III Tepes (1431–76), a ruler of Walachia, whose epithet was Dracula ("Son of the Dragon").Vlad was said to have put to death 20,000 men, women, and children by impaling them upright on stakes. The Dracula character became a stock figure in the horror repertoire, portrayed with varying degrees of sympathy and repulsion.

draft See bill of exchange

draft See conscription

Draft Riot of 1863 Four days of violence in New York City to protest the inequities of American Civil War conscription. The law permitted draftees to buy their way out of army service for $300, a sum relatively few men could afford. When the drawing of names began on July 11, mobs of Irish and other foreign-born workers surged into the streets, burning draft headquarters and other buildings, and assaulting blacks, who they had feared would take their jobs. About 100 people (mostly rioters) died.

drafting Precise graphical representation of a structure, machine, or its component parts that communicates the intent of a technical design to the fabricator (or the prospective buyer) of the product. Drawings may present the various aspects of an object's form, show the object projected in space, or explain how it is built. Drafting uses orthographic projection, in which the object is viewed along parallel lines that are perpendicular to the plane of the drawing. Orthographic drawings include top views (plans), flat front and side views (elevations), and cross-sectional views showing profile. Perspective drawing, which presents a realistic illusion of space, uses a horizon line and vanishing points to show how objects and spatial relationships might appear to the eye, including diminution of size and convergence of parallel lines. Drafting was done with precision instruments (T square or parallel rule, triangle, mechanical pens and pencils) until computerization revolutionized production methods in architectural and engineering offices.

drafting See drawing

drag Force exerted by a fluid stream on any obstacle in its path or felt by an object moving through a fluid. Its magnitude and how it may be reduced are important to designers of moving vehicles, ships, suspension bridges, cooling towers, and other structures. Drag forces are conventionally described by a drag coefficient, defined irrespective of the shape of the body. Dimensional analysis reveals that the drag coefficient depends on the Reynolds number; the precise dependence must be elucidated experimentally and can be used to predict the drag forces experienced by other bodies in other fluids at other velocities. Engineers use this principle of dynamic similarity when they apply results obtained with a model structure to predict the behaviour of other structures. See also friction; streamline.

drag racing Form of motor racing in which two contestants race side by side from a standing start over a straight quarter-mile strip of pavement. Winners go on to compete against others in their class until only one is left undefeated. There are three main classes of vehicle: (1) the Top Fuel Eliminator (called a "rail" or "slingshot"), a lightweight, long-chassied vehicle with wide rear tires that is fueled by a special mixture, such as methanol and nitromethane; (2) the "funny car," a high-performance copy of a late-model production car that uses special fuel; and (3) the standard production car, a modified version of a gasoline-powered production car. The Top Fuel class is the fastest, followed by the funny car. Drag racing is most popular in the U.S.

dragon Legendary monster usually depicted as a huge, bat-winged, fire-breathing lizard or snake with a barbed tail. The dragon symbolized evil in the ancient Middle East, and the Egyptian god Apepi was the great serpent of the world of darkness. The Greeks and Romans sometimes represented dragons as evil creatures and sometimes as beneficent powers acquainted with the secrets of the earth. In Christianity the dragon symbolized sin and paganism, and saints such as St. George were shown triumphing over it. Used as warlike emblems in many cultures, dragons were carved on the prows of Norse ships and depicted on royal ensigns in medieval England. In the Far East the dragon was a beneficent creature, wingless but regarded as a power of the air. In China it symbolized yang in the yin-yang of cosmology, and it served as the emblem of the royal family.

dragon worm See guinea worm

dragonfly Any member of the insect suborder Anisoptera (order Odonata), characterized by four large, membranous, many-veined wings, that, when at rest, are held horizontally rather than vertically (see damselfly). Dragonflies are agile and have bulging eyes that often occupy most of the head and a wingspan of about 6 in. (16 cm). The dragonfly is one of the fastest-flying and most predaceous insects; in 30 minutes it can eat its own weight in food. Dragonflies differ from most other insects by having the male copulatory organs at the front part of the abdomen rather than at the back end. Male and female often fly in tandem during sperm transfer.

Dragonfly (*Libellula forensis*).
E.S. ROSS

dragoon In late 16th-century Europe, a mounted soldier who fought as a light cavalryman on attack and as a dismounted infantryman on defense. The term derived from his weapon, a short musket called the dragoon. Dragoons were organized in companies, and their officers bore infantry titles. By the 18th century, *dragoon* referred to members of certain cavalry regiments. The term is still applied in the British Army to certain armoured reconnaissance units.

Drake, Sir Francis (b. c. 1540–43, Devonshire, Eng.—d. Jan. 28, 1596, at sea, off Puerto Bello, Pan.) English admiral, the most renowned seaman of the Elizabethan Age. Brought up by his wealthy Hawkins relatives (see John Hawkins) in Plymouth, Drake went to sea at about age 18. He gained a reputation as an outstanding navigator and became wealthy by raiding and plundering Spanish colonies. In 1577 he set sail with five ships, but ultimately only his flagship, the *Golden Hind*, made its way through the Strait of Magellan into the Pacific and up the coast of South and North America. He sailed at least as far north as what is now San Francisco, claiming the area for Elizabeth, and continued westward to the Philippines and around the Cape of Good Hope. Having circumnavigated the globe, he returned to Plymouth, Eng., in 1580 laden with treasure, the first captain ever to sail his own ship around the world. In 1581 he was knighted. Appointed vice admiral (1588), he destroyed ships and supplies destined for the Spanish Armada and delayed the Spanish attack for a year. But he is not known to have played any part in the battle that eventually occurred. In his lifetime, his reputation at home was equivocal, yet his legend grew. On his last voyage he succumbed to fever and was buried at sea.

Drake equation *or* **Green Bank equation** Equation claimed to yield the number of technically advanced civilizations capable of interstellar communication in the Milky Way Galaxy as a function of several factors conducive to evolution of intelligent life with technological capabilities. It was largely developed by Frank D. Drake (b. 1930) in 1961 at a SETI conference in Green Bank, W.Va. Of all the stars that form in the Galaxy, only some will give rise to life-supporting planets, and of those planets, only some will generate life capable of high technology and yet able to avoid technological destruction. Because the numbers for each factor are poorly known, the results generated vary from zero to millions.

Drake Passage Strait, connecting the Atlantic and Pacific oceans between Tierra del Fuego and the South Shetland Islands. Located about 100 mi (160 km) north of the Antarctic Peninsula, it is 600 mi (1,000 km) wide. In this area the climate changes from cool, humid, and subpolar to the frozen conditions of Antarctica. An important trade route in the 19th and early 20th centuries, its stormy seas and icy conditions made the rounding of Cape Horn a difficult journey.

Drakensberg \'drä-kənz-ˌberk\ *Zulu* **Kwathlamba** \'kwät-'läm-bä\ Mountain range, southern Africa. It rises to more than 11,400 ft (3,475

© 2006 Encyclopædia Britannica, Inc.

m) and extends from southwest to northeast in Lesotho and southeastern South Africa, separating the extensive high plateaus of the interior from the lower lands along the coast. It is an area of many game reserves and national parks.

Draper, Charles Stark (b. Oct. 2, 1901, Windsor, Mo., U.S.—d. July 25, 1987, Cambridge, Mass.) U.S. aeronautical engineer. He taught at MIT from 1935, where he developed a gunsight for naval anti-aircraft guns that was installed on most U.S. naval vessels in World War II. His inertial guidance system, called spatial inertial reference equipment (SPIRE), allowed planes, submarines, and ballistic missiles to travel thousands of miles to their destinations without reference to outside navigational aids, such as radio or the positions of celestial bodies. His group at the Massachusetts Institute of Technology also developed guidance systems for the Apollo program. He is memorialized in the annual Charles Stark Draper Prize for achievement in engineering.

Draper, Ruth (b. Dec. 2, 1884, New York, N.Y., U.S.—d. Dec. 30, 1956, New York City) U.S. monologist. She began her career by writing dramatic sketches about people she had observed and performing them at parties. She made her New York debut (1917) in a series of one-act pieces. Her London debut (1920) established her as a master monologist. She performed worldwide, playing on a bare stage with few props and creating characters and settings by subtle modulation of feature, gesture, and voice.

Drau River See Drava River

Drava River \'drä-və\ *German* **Drau** \'draù\ River, south-central Europe. It rises in the Carnic Alps and flows east through Austria, where it forms the Drautal, the longest longitudinal valley of the Alps. Flowing southeast, it passes through Slovenia and forms part of the Croatian-Hungarian border. The Drava is 447 mi (719 km) long and a major tributary of the Danube River. Its valley was the chief passage through which invaders penetrated the Alpine countries.

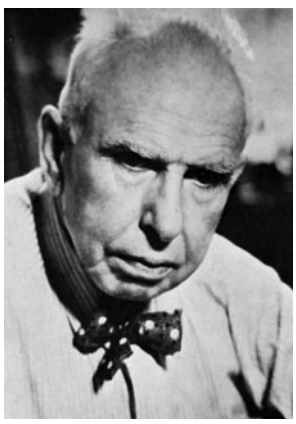
Dravidian \drə-'vi-dē-ən\ **languages** Family of 23 languages indigenous to and spoken principally in South Asia by more than 210 million people. The four major Dravidian languages of southern India—Telugu, Tamil, Kannada, and Malayalam—have independent scripts and long documented histories. They account for the overwhelming majority of all Dravidian-speakers, and they form the basis of the linguistic states of Andhra Pradesh, Tamil Nadu, Karnataka, and Kerala. All have borrowed liberally from Sanskrit. The only Dravidian language spoken entirely outside of India is Brahui, with fewer than two million speakers mainly in Pakistan and Afghanistan. Of the Dravidian languages, Tamil has the greatest geographical extension and the richest and most ancient literature, which is paralleled in India only by that of Sanskrit. The Dravidian family, with no demonstrated relationship to other language families, is assumed to have covered a much more extensive area of South Asia before the spread of Indo-Aryan and was the source of loanwords into early Indo-Aryan dialects.

drawing Art or technique of producing images on a surface, usually paper, by means of marks in graphite, ink, chalk, charcoal, or crayon. It is often a preliminary stage to work in other media. According to Giorgio Vasari, *disegno* (drawing and design) was the foundation of the three arts of painting, sculpture, and architecture. Beginning in the Italian Renaissance, debate arose regarding the role of drawing, as some saw it as an independent art form and others saw it as a preliminary stage in creating a painting or sculpture. By the 17th century, drawings had definite market value; connoisseurs specialized in collecting them, and forgers began to exploit the demand. In the 20th century, the drawing became fully autonomous as an art form, figuring significantly among the works of virtually every major artist, and the line itself was exploited both for its representational and its purely expressive qualities.

drawing *or* **drafting** In yarn manufacture, process of attenuating a loose assemblage of fibres. These fibres, called sliver, pass through a series of rollers, which straighten the individual fibres and make them more parallel. Each pair of rollers spins faster than the previous one. Drawing reduces a soft mass of fibres to a firm uniform strand of usable size. For synthetic fibres, drawing is a stretching process applied to fibres in the plastic state, increasing orientation and reducing size. In metalworking, drawing refers to the process of shaping sheet metal into complex, three-dimensional forms with metal dies. See also carding, wire drawing.

drawing frame *or* **spinning frame** Machine for drawing, twisting, and winding yarn. Invented in the 1730s by Lewis Paul and John Wyatt, the spinning machine operated by drawing cotton or wool through pairs of successively faster rollers. It was eventually superseded by R. Arkwright's water frame.

Dreadnought, HMS British battleship launched in 1906 that established the pattern of the warships that dominated the world's navies for the next 35 years. It was equipped entirely with big guns because recent improvements in naval gunnery had made preparation for short-range battle unnecessary. Powered by steam turbines instead of the steam pistons then common, it sailed at a record top speed of 21 knots. It displaced 18,000 tons (16,300 metric tons), was 526 ft (160 m) long, and carried a crew of about 800. By World War I it was nearly outclassed by faster "superdreadnoughts" carrying bigger guns. It was placed on reserve in 1919 and broken up for scrap in 1923.



dream Series of thoughts, images, or emotions occurring during sleep, particularly sleep accompanied by rapid eye movement (REM sleep). Dream reports range from the very ordinary and realistic to the fantastic and surreal. Humans have always attached great importance to dreams, which have been variously viewed as windows to the sacred, the past and the future, or the world of the dead. Dreams have provided creative solutions to intellectual and emotional problems and have offered ideas for artistic pursuits. A type of cognitive synthesis that facilitates conscious insight may occur subconsciously during dreaming. The most famous theory of the significance of dreams is the psychoanalytic model of Sigmund Freud; in Freud's view, desires that are ordinarily repressed (hidden from consciousness) because they represent forbidden impulses are given expression in dreams, though often in disguised (i.e., symbolic) form.

Dreaming, the *or* **Dream-Time** In the religion of the Australian Aborigines, the mythological time of the Creation. In the Dreaming the environment was shaped and humanized by mythic beings, many of whom took animal or human form. Some could change form at will. They took long journeys and created human life and the social order. In Aboriginal belief, these beings are eternal and continue to exist, although they may have traveled beyond the lands of the people who sing about them or may have metamorphosed into natural features such as rocky outcrops or water holes. The landscape is thus sacred to Aboriginal peoples. See also Australian religion.

Dred Scott decision *formally* **Dred Scott v. Sandford** 1857 ruling of the Supreme Court of the United States that made slavery legal in all U.S. territories. Scott was a slave whose master had taken him in 1834 from a slave state (Missouri) to a free state and a free territory, then back to Missouri. Scott sued for his freedom in Missouri in 1846, claiming his residence in a free state and a free territory made him free. The opinion of Chief Justice Roger B. Taney declared that Scott was not entitled to rights as a U.S. citizen and, in fact, had "no rights which any white man was bound to respect". Taney and six other justices struck down the Missouri Compromise as unconstitutional, maintaining that Congress had no power to prohibit slavery in the territories (see states' rights). The decision, a clear victory for the South, increased Northern antislavery sentiment, strengthened the new Republican Party, and fed the sectional strife that led to war in 1861.

Dreikaiserbund See Three Emperors' League

Dreiser \'drī-zər**, Theodore (Herman Albert)** (b. Aug. 27, 1871, Terre Haute, Ind., U.S.—d. Dec. 28, 1945, Hollywood, Calif.) U.S. novelist. Born to poor German immigrant parents, Dreiser left home at age 15 for Chicago. He worked as a journalist, and in 1894 he moved to New York, where he had a successful career as a magazine editor and publisher. His first novel, *Sister Carrie* (1900), about a young kept woman who goes unpunished for her transgressions, was denounced as scandalous. His subsequent novels would confirm his reputation as the outstanding American practitioner of naturalism. After the success of *Jennie Gerhardt* (1911), he began writ-

ing full-time, producing a trilogy consisting of *The Financier* (1912), *The Titan* (1914), and *The Stoic* (published 1947), which was followed by *The Genius* (1915) and its sequel, *The Bulwark* (published 1946). *An American Tragedy* (1925), based on a murder trial and itself the basis for the 1931 film by that name and for a 1951 film entitled *A Place in the Sun*, made him a hero among social reformers.

Dresden City (pop., 2002: 478,600), situated on the Elbe River, eastern Germany. Originally a Slavonic settlement, it was the residence of the margraves of Meissen in the early 13th century. The Dresden china industry originated there but was moved to Meissen in 1710 (see MEISSEN PORCELAIN). NAPOLEON I made Dresden a centre of military operations and won his last great battle there in 1813. Dresden was occupied by Prussia in 1866. In World War II, it was severely damaged by Allied bombing raids in 1945. Several of its historic buildings have been restored or reconstructed. It is known for its art galleries, museums, and other cultural institutions. Industries produce precision and optical instruments.

Dresden Codex *Latin* **Codex Dresdensis** One of the few pre-Columbian MAYA CODICES to survive book burnings by Spanish clergy. It contains exceptionally accurate astronomical calculations, including ECLIPSE-prediction tables and the SYNODIC PERIOD of Venus. The reputation of the Maya as astronomers is based largely on these figures.

dress Covering, or clothing and accessories, for the human body. The term encompasses garments as shirts, togas, footwear, HATS, and GLOVES; hairstyles, facial hair, and WIGS; and COSMETICS, JEWELRY, and other forms of body decoration. In cultures thoughout the world, perhaps the most obvious function of dress is to provide warmth and protection, but it can also serve religious or ritual purposes. Other basic functions of dress include identifying the wearer (by providing information about sex, age, occupation, or other characteristic) and making the wearer appear more attractive. In the West up through the modern era, dress has often functioned as a reflection of social and economic standing. See also FASHION.

dressage \drə-'säzh\ *French* **"training"** Equestrian sport involving the execution of precision movements by a trained horse in response to barely perceptible signals from its rider. Particularly important are the animal's pace and bearing in performing walks, trots, canters, and more specialized maneuvers. Training is divided into the elementary *campagne* and the advanced *haute école.* Dressage competitions have been included in the Olympic Games since 1912. Riders compete as individuals and in teams.

Dressler, Marie *orig.* **Leila Marie Koerber** (b. Nov. 9, 1868, Cobourg, Ont., Can.—d. July 28, 1934, Santa Barbara, Calif., U.S.) Canadian-U.S. actress. She began her acting career as a vaudeville comedian and made her film debut in *Tillie's Punctured Romance* (1914), in which CHARLIE CHAPLIN also appeared. After a period of obscurity, she experienced a career revival with the coming of sound films. In the 1930s she was known for her portrayals of self-sufficient, humorous old women (often costarring with WALLACE BEERY) in films such as *Min and Bill* (1931, Academy Award) and *Tugboat Annie* (1933).

Drew, Charles Richard (b. June 3, 1904, Washington, D.C., U.S.—d. April 1, 1950, near Burlington, N.C.) U.S. physician and surgeon. He received his Ph.D. from Columbia University. While researching the properties and preservation of blood plasma, he developed efficient ways to process and store plasma in blood banks. He directed the U.S. and Britain's World War II blood-plasma programs until 1942. An African American, he resigned over the segregation of the blood of blacks and whites in blood banks.

Drew, Daniel (b. July 29, 1797, Carmel, N.Y., U.S.—d. Sept. 18, 1879, New York, N.Y.) U.S. railway financier. In 1844 he founded the Wall Street brokerage firm of Drew, Robinson, and Co., which became one of the principal traders in railroad stocks in the U.S. The "Erie War" of 1866–68, in which Drew joined JAY GOULD and JAMES FISK against CORNELIUS VANDERBILT in a struggle for control of the ERIE RAILROAD CO., eventually led to his ruin, and he filed for bankruptcy in 1876.

Drew family U.S. theatrical family. Louisa Lane (later Louisa Lane Drew; 1820–97) began her stage career at age eight in Philadelphia, where her widowed mother had brought her from England. Her many successful parts included Lady Teazle, Mrs. Malaprop, and such "breeches" roles as Shakespeare's Romeo and Mark Antony. In 1850 she married the Irish comic actor John Drew (1827–62), who made his U.S. debut in 1842 and comanaged the Arch Street Theatre in Philadelphia. He toured widely, and she managed the theatre from 1861, directing the renamed Mrs. John Drew's Arch Street Theatre company with notable success until 1892. Their son John Drew, Jr. (1853–1927), made his debut (1873) with his mother's company, then joined the companies of Augustin Daly (1838–99) and Charles Frohman (1860–1915). He was noted for his roles in Shakespearean comedies, society dramas, and light comedies. Their daughter Georgiana Emma Drew (1854–93) made her acting debut with her mother's company (1872). She became the wife of the actor Maurice Barrymore and the mother of the actors Lionel, Ethel, and John Barrymore (see BARRYMORE FAMILY).

Drexel, Anthony J(oseph) (b. Sept. 13, 1826, Philadelphia, Pa., U.S.—d. June 30, 1893, Carlsbad, Bohemia) U.S. banker and philanthropist. He and his brothers inherited his father's Philadelphia banking house and built it into a successful investment-banking concern, specializing in flotation of government bonds, railroad organization, mining development, and urban real estate. In 1891 he founded the Drexel Institute of Art, Science, and Industry, now Drexel University. He was the uncle of ST. KATHERINE DREXEL.

Drexel, Saint Katharine (b. Nov. 26, 1858, Philadelphia, Pa., U.S.—d. March 3, 1955, Cornwells Heights, Pa.; canonized Oct. 1, 2000; feast day March 3) U.S. missionary. The niece of banker and philanthropist ANTHONY J. DREXEL, she inherited a vast fortune, which she used to fund her charitable enterprises, including mission schools in Minnesota, South Dakota, Wyoming, and New Mexico. In 1887 Pope LEO XIII (1878–1903) asked her to become a missionary. In 1891 she founded the Blessed Sacrament Sisters for Indians and Colored People (now Sisters of the Blessed Sacrament), a congregation of missionary nuns dedicated to the welfare of Native Americans and African Americans. She also founded several schools for minority students as well as Xavier University in New Orleans (1915). She was the second U.S.-born saint; the first was ELIZABETH ANN SETON, canonized in 1975.

Dreyer \'drī-ər**, Carl Theodor** (b. Feb. 3, 1889, Copenhagen, Den.—d. March 20, 1968, Copenhagen) Danish film director. He entered the film industry as a writer of subtitles and became a scriptwriter and editor. His first film as a director was *The President* (1919); after several others, he made his most famous silent film, *The Passion of Joan of Arc* (1928). He created a new directorial style based on extensive close-ups and the use of authentic settings. His other films include *Vampire* (1932), the celebrated *Day of Wrath* (1943), *The Word* (1955), and *Gertrud* (1964).

Dreyfus \dre-'fūs,\ *English* \'drī-fəs, 'drā-fəs**, Alfred** (b. Oct. 19, 1859, Mulhouse, France—d. July 12, 1935, Paris) French army officer, subject of the Dreyfus Affair (*l'Affaire*). Son of a Jewish textile manufacturer, he studied at the École Polytechnique, then entered the army and rose to the rank of captain (1889). He was assigned to the war ministry when, in 1894, he was accused of selling military secrets to Germany. He was convicted and sentenced to life imprisonment on Devil's Island. The legal proceedings, based on insufficient evidence, were highly irregular, but public opinion and the French press, led by its virulently anti-Semitic section, welcomed the verdict. Doubts began to grow as evidence came out suggesting that C. F. Esterhazy (1847–1923) was the true traitor. The movement for revision of Dreyfus's trial gained momentum when ÉMILE ZOLA wrote an open letter under the headline "J'Accuse," accusing the army of covering

Alfred Dreyfus, before 1894.
H. ROGER-VIOLLET

© 2006 Encyclopædia Britannica, Inc.

up its errors in making the case. After a new court-martial (1899) again found Dreyfus guilty, he was pardoned by the president of the republic in an effort to resolve the issue. In 1906 a civilian court of appeals cleared Dreyfus and reversed all previous convictions. Formally reinstated and decorated with the Legion of Honor, he later saw active service in World War I. The affair resulted in the separation of church and state in 1905.

Dreyfuss \'drā-fəs**, Henry** (b. March 2, 1904, New York, N.Y., U.S.—d. Oct. 5, 1972, South Pasadena, Calif.) U.S. industrial designer. He began designing stage sets for the Broadway theatre at age 17, and in 1929 he opened his first industrial design office. Bell Telephone Laboratories hired him to design a series of telephones in the 1930s. Among his other notable designs was the interior of the ocean liner *Independence*. A pioneer of ergonomic design, he published several books explaining his methods, including *Designing for People* (1955, 1967).

drill Large, short-tailed MONKEY (*Mandrillus leucophaeus*, family Cercopithecidae). Formerly found from Nigeria to Cameroon, it is now restricted to remote forest regions of Cameroon because of hunting and deforestation. Like the related MANDRILL, the drill is stout-bodied and has vividly coloured buttocks. The male is about 32 in. (82 cm) long and has a black face. Its lower lip is bright red, the hairs around the face and a tuft behind the ears are yellowish white, and the rest of the fur is olive-brown. An omnivore, it is mainly terrestrial, gregarious, and powerful, and it can fight ferociously if molested.

Drill (*Mandrillus leucophaeus*).
J. KOHLER/BAVARIA-VERLAG

drill Tool to make holes, usually by revolving. Drills, gimlets, and AUGERS have cutting edges that detach material to leave a hole. Drilling usually requires high speed and low TORQUE, with little material being removed during each revolution of the tool. The earliest (perhaps BRONZE AGE) drill points had sharp edges that ultimately developed into arrow shapes with two distinct cutting edges. This shape was effective and remained popular until the late 19th century, when factory-made, spiral-fluted twist drills became available at reasonable cost to displace the blacksmith-made articles. Rotating drill bits containing diamonds or other hard materials are used for drilling rock, as for tunnels or oil wells. See also DRILL PRESS.

drill In military science, the preparation of soldiers for performance of their duties through the practice of prescribed movements. It trains soldiers in battle formations, familiarizes them with their weapons, and develops a sense of teamwork and discipline. Today close-order drill is used for marching, ceremonies, and parades; combat drill is used to practice the looser routines of battle. It was introduced by the Greeks, who practiced the maneuvers of the PHALANX. Careful training of the LEGIONS was a major factor in the Roman Empire's dominance. After Rome's decline, drill largely disappeared and battles became free-for-all combats. GUSTAV II ADOLF of Sweden led in reintroducing drill techniques in early 17th-century Europe.

drill press *or* **drilling machine** MACHINE TOOL for producing holes in hard substances. The DRILL is held in a rotating spindle and is fed into the workpiece, which is usually clamped in a VISE supported on a table. The drill may be gripped in a chuck with three jaws that move radially in unison, or it may have a tapered shank that fits into a tapered hole in the spindle. Means are provided for varying the spindle speed and (on some machines) for automatically feeding the drill into the workpiece. See also BORING MACHINE.

Drina \'drē-nə\ **River** River, central Balkans, southeastern Europe. Originating with the confluence of the Tara and Piva rivers, it follows a northerly course 285 mi (459 km) to enter the SAVA RIVER. Its upper course is through canyons, while its lower course is wider. The Drina constitutes a large part of the boundary that separates Bosnia and Herzegovina from Serbia and Montenegro.

drive In psychology, an urgent need pressing for satisfaction, usually rooted in some physiological deficiency or imbalance (e.g., hunger and thirst) and impelling the organism to action. Psychologists distinguish between drives that are innate and directly related to basic physiological needs (e.g., food, air, and water) and drives that are learned (e.g., drug addiction). Among the other drives psychologists have identified are achievement, affection, affiliation, exploration, manipulation, maternity, pain avoidance, sex, and sleep.

driver Computer program that acts as an intermediary between the operating system and a device such as a disk drive, video card, printer, or keyboard. The driver must contain a detailed knowledge of the device, including its set of specialized commands. The presence of a separate driver program frees the operating system from having to understand the details of every device; instead, the operating system issues general commands to the driver, which in turn translates them into specific instructions for the device, or vice versa.

drop forging Process of shaping metal and increasing its strength. In most FORGING, an upper DIE is forced against a heated workpiece positioned on a stationary lower die. If the upper die or hammer is dropped, the process is known as drop forging. To increase the force of the blow, power is sometimes applied to augment gravity.

drop spindle See SPINDLE AND WHORL

drosophila \drō-'sä-fə-lə\ Any member of about 1,000 species in the DIPTERAN genus *Drosophila*, commonly known as FRUIT FLIES but also called vinegar flies. Some species, particularly *D. melanogaster*, are used extensively in laboratories for experiments on genetics and evolution because they are easy to raise and have a short life cycle (less than two weeks at room temperature). More data have been collected concerning the genetics of *Drosophila* than for any other animal. In the wild, its larvae live in rotting or damaged fruits or in fungi or fleshy flowers.

Droste-Hülshoff \'drō-stə-'hülz-hȯf**, Annette, Baroness von** *orig.* **Anna Elisabeth Franziska Adolphine Wilhelmine Louise Maria, Freiin von Droste zu Hülshoff** (b. Jan. 10, 1797, Schloss Hülshoff, near Münster, Westphalia—d. May 25, 1848, Meersburg, Baden) German writer. One of the great women poets of Germany, she wrote religious verse, particularly *Das geistliche Jahr* (1851; "The Spiritual Year"), but she is best known for detailed, evocative poems about her native Westphalia. Her stories are considered forerunners of the 19th-century realistic short story. Her only complete prose work, *The Jew's Beech* (1842), is a psychological study of a villager who murders a Jew.

Drottningholm Palace \'drůt-niŋ-ˌhȯlm\ Royal palace, near Stockholm, Sweden. It was designed by Nicodemus Tessin (1615–1681) and built 1662–86. It shows French Baroque influences in its plan, gardens, and interior, but it also has Italian Classical elements and is capped by a Nordic *sateri* roof. A theater attached to it was built in the 1760s and is preserved with its original sets and stage machinery as a theatrical museum. The palace was formerly the Swedish royal family's summer residence.

drought Lack or insufficiency of rain for an extended period that severely disturbs the HYDROLOGIC CYCLE in an area. Droughts involve water shortages, crop damage, streamflow reduction, and depletion of groundwater and soil moisture. They occur when evaporation and transpiration exceed precipitation for a considerable period. Drought is the most serious hazard to agriculture in nearly every part of the world. Efforts have been made to control it by seeding clouds to induce rainfall, but these experiments have had only limited success.

drug Any chemical agent that affects the function of living things. Some, including ANTIBIOTICS, STIMULANTS, TRANQUILIZERS, ANTIDEPRESSANTS, ANALGESICS, NARCOTICS, and HORMONES, have generalized effects. Others, including LAXATIVES, heart stimulants, ANTICOAGULANTS, DIURETICS, and ANTIHISTAMINES, act on specific systems. VACCINES are sometimes considered drugs. Drugs may protect against attacking organisms (by killing them, stopping them from reproducing, or blocking their effects on the host), substitute for a missing or defective substance in the body, or interrupt an abnormal process. A drug must bind with receptors in or on cells and cannot work if the receptors are absent or its configuration does not fit theirs. Drugs may be given by mouth, by injection, by inhalation, rectally, or through the skin. The oldest existing catalogue of drugs is a stone tablet from ancient Babylonia (c. 1700 BC); the modern drug era began when antibiotics were discovered in 1928. Synthetic versions of natural drugs led to design of drugs based on chemical structure. Drugs must be not only effective but safe; side effects can range from minor to dangerous (see DRUG POISONING). Many

© 2006 Encyclopædia Britannica, Inc.

illegal drugs also have medical uses (see COCAINE; HEROIN; DRUG ADDICTION). See also DRUG RESISTANCE; PHARMACOLOGY; PHARMACY.

drug addiction *or* **chemical dependency** Physical and/or psychological dependency on a psychoactive (mind-altering) substance (e.g., alcohol, NARCOTICS, NICOTINE), defined as continued use despite knowing that the substance causes harm. Physical dependency results when the body builds up a tolerance to a drug, needing increasing doses to achieve the desired effects and to prevent withdrawal symptoms. Psychological dependency may have more to do with one's psychological makeup; some people may have a genetic tendency to addiction. The most common addictions are to alcohol (see ALCOHOLISM), BARBITURATES, TRANQUILIZERS, and AMPHETAMINES, as well as to the stimulants nicotine and CAFFEINE. Initial treatment (detoxification) should be conducted with medical supervision. Individual and group psychotherapy are critical elements. ALCOHOLICS ANONYMOUS and similar support groups can increase the success rate of other efforts. The ability to admit addiction and the will to change are necessary first steps.

drug poisoning *or* **medicinal poisoning** Harmful effects of drugs, from overdose or sensitivity to regular doses. Many medicines are dangerous; the margin between dose and overdose is often narrow. A normally safe dose may be toxic in some people, over time, or in combination with certain foods, alcohol, or other drugs. Safeguards to prevent drug poisoning include testing in animals, then human volunteers, and then patients. Drugs unsafe for self-medication are available only to doctors or by prescription. Pharmacists advise the public on proper use.

drug resistance Property of a disease-causing organism that allows it to withstand drug therapy. In any population of infectious agents, some have a MUTATION that helps them resist the action of a drug. The drug then kills more of the nonresistant microbes, leaving the mutants without competition to multiply into a resistant strain. This situation is more likely if the drug is not taken properly (e.g., a course of ANTIBIOTICS not completed, anti-HIV drug doses missed) or not prescribed properly (e.g., an antibiotic given for a viral disease). Resistance factors can also be transferred between species that infect the same body. The overprescription of antibiotics in humans and the addition of antibiotics to animal feed have accelerated the evolution of resistant strains of bacteria, making it increasingly difficult to fight off certain disease-causing organisms.

Druid Member of a learned class of priests, teachers, and judges among the ancient Celtic peoples. The Druids instructed young men, oversaw sacrifices, judged quarrels, and decreed penalties; they were exempt from warfare and paid no tribute. They studied ancient verse, natural philosophy, astronomy and religious lore; their principal doctrine was belief in the immortality of the soul and the transmigration of souls. They sometimes practiced human sacrifice to cure gravely ill people or protect warriors in battle. The Druids were suppressed in Gaul by the Romans in the 1st century AD and in Britain a little later. They lost their priestly functions in Ireland after the coming of Christianity but survived as poets, historians, and judges. See also CELTIC RELIGION.

drum *or* **croaker** In biology, any of about 160 species (family Sciaenidae) of carnivorous, generally bottom-dwelling fishes. Most are marine, found along warm and tropical seashores. Most can "vocalize" by moving strong muscles attached to the air bladder, which acts as a resonating chamber, amplifying the sounds. Drums have two dorsal fins and are usually silvery. The WEAKFISHES, sea trouts, and squeteagues (genus *Cynoscion*) have a large mouth, jutting jaws, and canine teeth, but most drums have an underslung lower jaw and small teeth. The largest species, the totuava, weighs up to 225 lbs (100 kg), but other species are much smaller. Many drums are food or game fishes. See also BASS, KINGFISH.

drum Musical instrument, the sound of which is produced by the vibration of a stretched membrane. Drums are usually either cylindrical or bowl-shaped. The drum is a universal instrument and very ancient; a drum dating to 6000 BC has been found in Moravia. Drums have been important ritually in cultures worldwide. They may have a definite pitch or be unpitched; those of Africa, South and Southeast Asia (see TABLA), and the Middle East are mostly pitched, whereas Western drums are more often unpitched. Drumming has attained its highest degree of development in Africa and India. From the 13th century, the FOLK DANCE in Europe was accompanied by a single musician playing simultaneously the pipe or fife and the tabor, a small double-headed snare drum played with one stick. The side drum, or snare drum, has coiled wires or gut strings strung across the lower head, which vibrate against it when the upper head is struck. The powerful bass drum is used especially in marching bands. The pitched TIMPANI are the standard orchestral drums. Until the 17th century, drum parts in Western music were entirely improvised. The drum set used in popular music is played by a single person and normally includes a snare drum, tom-toms, a pedal-operated bass drum, and suspended and hi-hat CYMBALS.

Barrel drum from India with cord-tensioned construction, in the Metropolitan Museum of Art, New York City
COURTESY OF THE METROPOLITAN MUSEUM OF ART, NEW YORK CITY, GIFT OF ALICE E. GETTY, 1946

drupe Fruit in which the outer layer is a thin skin, the middle layer is thick and usually fleshy (though sometimes tough, as in the ALMOND, or fibrous, as in the coconut), and the inner layer (the pit) is hard and stony. Within the pit is usually one seed. In aggregate fruits such as the raspberry and blackberry (which are not true BERRIES), many small drupes are clumped together. Other representative drupes are the CHERRY, PEACH, MANGO, OLIVE, and WALNUT.

Drury Lane Theatre Oldest English theatre still in use. It was built in London by Thomas Killigrew for his acting company as the Theatre Royal (1663). It burned in 1672 and was rebuilt in 1674 with CHRISTOPHER WREN as architect. It prospered under such actor-managers as COLLEY CIBBER and later under DAVID GARRICK and RICHARD BRINSLEY SHERIDAN. An expanded "fireproof" theatre opened in 1794 and burned in 1809. Rebuilt in 1812 with over 2,000 seats, it declined in popularity from the 1840s, but it revived in the 1880s with melodramas and spectacles and was the scene of the acting triumphs of HENRY IRVING and ELLEN TERRY. More recently it has played host to many U.S. musicals.

Drusus Germanicus \'drü-səs-jər-'ma-ni-kəs**, Nero Claudius** (b. 38 BC—d. 9) Younger brother of TIBERIUS and commander of Roman forces in German territory. The reputed son of Octavian (later AUGUSTUS), he was allowed to take office five years earlier than the legal age. In 13 BC he became governor of the three GAULS, where he conducted a census and erected an altar to Augustus. In 12 he marched into Germany, reaching the Elbe three years later. During those years he was made PRAETOR in 11 and CONSUL in 9. At the Elbe he was thrown from his horse and died. His son CLAUDIUS later became emperor.

Druze \'drüz\ *or* **Druse** Relatively small Middle Eastern religious sect. It originated in Egypt in 1017 and is named for one of its founders, Muḥammad al-Darazī (d. 1019/20). Strictly monotheistic and based in ISLAM, particularly Ismāʿīlī Islam, Druze beliefs include an eclectic mixture of elements from GNOSTICISM, NEOPLATONISM, JUDAISM, and IRANIAN RELIGION. The Druze believe in the divinity of al-Ḥākim bi-Amr Allāh (985–1021?), sixth caliph of the FĀṬIMID DYNASTY of Egypt, and expect him to return someday to inaugurate a golden age. The Druze are divided hierachically into two orders—the sages, who are fully initiated in the beliefs of the religion, and the ignorant, who constitute the uninitiated lay majority. They permit no converts, either to or from their religion, and no intermarriage. Their religious system is kept secret from the outside world, and they are permitted to deny their faith if their life is in danger. In the early 21st century they numbered about one million, mostly in Syria and Lebanon.

dry cleaning System of cleaning textiles with chemical SOLVENTS instead of water. The chemicals, often halides or organohalogens (compounds that contain HALOGEN atoms bonded to carbon atoms), dissolve dirt and grease from fabrics. Carbon tetrachloride was once widely used as a dry-cleaning liquid, but its adverse health effects have cut back its use; other organic halogen compounds are now preferred, particularly tetrachloroethylene, which is much more stable and less toxic.

dry ice CARBON DIOXIDE in SOLID form. It is a dense, colourless substance, resembling compressed snow, that at normal atmospheric pressure passes directly from solid to vapour (see SUBLIMATION) at −109.3 °F (−78.5 °C).

© 2006 Encyclopædia Britannica, Inc.

Commonly available in blocks, it is used chiefly to keep foods, vaccines, and other perishable products cold during shipping or storage.

dry lake See PLAYA

dry rot Symptom of fungal disease in plants (see FUNGUS), characterized by firm spongy to leathery or hard decay of the stem (branch), trunk, root, rhizome, corm, bulb, or fruit. The fungus consumes the CELLULOSE of wood, leaving a soft skeleton that is readily reduced to powder.

Dry Tortugas \tȯr-'tü-gəz\ **National Park** National park located on the Dry Tortugas islands, southwestern Florida, U.S. The islands are situated at the entrance to the Gulf of Mexico, west of Key West, Fla. Established in 1935 as Fort Jefferson National Park, it occupies an area of about 64,700 acres (26,200 hectares). Its current name was adopted in 1992. The park's principal features are a marine exhibit and the remains of fortifications built in 1846.

dryad \'drī-əd, 'drī-ˌad\ *or* **hamadryad** In GREEK MYTHOLOGY, tree NYMPHS. Dryads were originally the spirits of oak trees (*drys*: "oak"), but the name was later applied to all tree nymphs. They were nature spirits who took the form of beautiful young women, and it was believed that they lived only as long as the trees they inhabited.

Dryden, John (b. Aug. 9, 1631, Aldwinkle, Northamptonshire, Eng.—d. May 1, 1700, London) British poet, dramatist, and literary critic. The son of a country gentleman, Dryden was educated at the University of Cambridge. His poetry celebrating the RESTORATION so pleased CHARLES II that he was named poet laureate (1668) and, two years later, royal historiographer. Even after losing the laureateship and his court patronage in 1688 with the accession of WILLIAM III, he succeeded in dominating the literary scene with his numerous works, many attuned to politics and public life. Several of his nearly 30 comedies, tragedies, and dramatic operas—including *Marriage A-la-Mode* (1672), *Aureng-Zebe* (1675), and *All for Love* (1677)—were outstandingly successful. His *Of Dramatick Poesie* (1668) was the first substantial piece of modern dramatic criticism. Turning away from drama, he became England's greatest verse satirist, producing the masterpieces *Absalom and Achitophel* (1681) and *Mac Flecknoe* (1682). He also produced extensive translations of Latin poetry, including VIRGIL's *Aeneid*.

dryopithecine \ˌdrī-ō-'pi-thə-ˌsīn\ Any member of the genus *Dryopithecus*, a group of extinct apelike animals. The species are representative of a group of generalized APES that includes the ancestors of both the modern apes and humans. Fragmentary materials found over a widespread area, including Europe, Africa, and Asia, have been attributed to other groups but were probably remains of *Dryopithecus*. Dryopithecines are found as fossils in Miocene and Pliocene deposits (23.8–1.8 million years old) and apparently originated in Africa. Several distinct forms are known, including small, medium, and large (GORILLA-sized). Dryopithecines lacked most of the specializations that distinguish modern apes from humans.

DSL *in full* **Digital Subscriber Line** Broadband digital communications connection that operates over standard copper telephone wires. It requires a DSL MODEM, which splits transmissions into two frequency bands: the lower frequencies for voice (ordinary telephone calls) and the upper band for digital data, especially for connection to the INTERNET. Data can be transferred via DSL at much higher rates than with ordinary dial-up modem service; the range of DSL signals, however, is very small. Connections can be made only within a few miles of the nearest transmitting station. DSL and "xDSL" are umbrella terms under which a variety of protocols and technologies fall. ADSL (Asymmetric DSL) is a popular type of DSL in which most of the bandwidth of the connection is devoted to downloading data from the network to the user, leaving only a small-scale connection for uploading data. In HDSL (High bit-rate DSL) and SDSL (Symmetric DSL) the data stream is symmetric; that is, the upstream and downstream rates are the same. UDSL (Unidirectional DSL), VDSL (Very high data rate DSL), and others still under development are intended to offer even greater rates of data transmission.

Du Bois \dü-'bȯis**, W(illiam) E(dward) B(urghardt)** (b. Feb. 23, 1868, Great Barrington, Mass., U.S.—d. Aug. 27, 1963, Accra, Ghana) U.S. sociologist and civil-rights leader. He received a Ph.D. from Harvard University in 1895. Two years later he accepted a professorship at Atlanta University, where he conducted empirical studies on the social situation of African Americans (1897–1910). He concluded that change could be attained only through agitation and protest, a view that clashed with that of BOOKER T. WASHINGTON. His famous book *The Souls of Black Folk* appeared in 1903. In 1905 Du Bois founded the Niagara Movement, the forerunner of the NAACP. In 1910 he left teaching to become the NAACP's director of research and editor of its magazine, *Crisis* (1910–34). He returned to Atlanta University in 1934 and devoted the next 10 years to teaching and scholarship. After a second research position with the NAACP (1944–48), he moved steadily leftward politically. In 1951 he was indicted as an unregistered agent of a foreign power (the Soviet Union); though a federal judge directed his acquittal, he was by then completely disillusioned with the U.S. In 1961 he joined the Communist Party, moved to Ghana, and renounced his U.S. citizenship.

Du Buat \dü-bü̇-'ä**, Pierre-Louis-Georges** (b. April 23, 1734, Tortisambert, France—d. Oct. 17, 1809, Vieux-Condé) French hydraulic engineer. He compiled experimental data from which he determined his basic algebraic expression for discharge from pipes and open channels. Though valid only within the range of his experimental data, this equation provided the best means at the time of predicting the performance of water-supply systems and similar works. His emphasis on achieving results that would be of practical use strongly influenced the development of experimental HYDRAULICS in the 18th–19th centuries.

du Cange, Charles du Fresne, seigneur See Charles du Fresne, seigneur du CANGE

Du Fu \'dü-'fü\ *or* **Tu Fu** (b. 712, Xiangyang, China—d. 770, Hunan) Chinese poet, often considered the greatest of all time. After a traditional Confucian education, he failed the important civil service examinations and consequently spent much of his life wandering, repeatedly attempting to gain court positions, with mixed success. His early poetry, which celebrates the natural world and bemoans the passage of time, garnered him renown. He suffered periods of extreme personal hardship, and as he matured his verse began to express profound compassion for humanity. An expert in all the poetic genres of his day, he is renowned for his superb classicism and skill in prosody, though many of the subtleties of his art do not survive translation.

du Maurier \dü-'mȯr-ē-ˌā**, Dame Daphne** (b. May 13, 1907, London, Eng.—d. April 19, 1989, Par, Cornwall) British novelist and playwright. Granddaughter of GEORGE DU MAURIER and daughter of the actor-manager Sir Gerald Du Maurier (1873–1934), she is best known for the romantic gothic suspense novel *Rebecca* (1938), one of many successful tales set on the wild coast of Cornwall. Her other novels include *Jamaica Inn* (1936), *Frenchman's Creek* (1942), and *My Cousin Rachel* (1951). Her story "The Birds," like *Jamaica Inn* and *Rebecca*, was filmed by ALFRED HITCHCOCK.

du Maurier, George (Louis Palmella Busson) (b. March 6, 1834, Paris, France.—d. Oct. 6, 1896, London, Eng.) British caricaturist and novelist. Forced to abandon painting for drawing when he was blinded in one eye, his skilled draftsmanship and engaging personality quickly established his success. His drawings for PUNCH, *Once a Week*, and *The Leisure Hour* were acute commentaries on the Victorian scene. His highly successful novel *Trilby* (1894), about an artist's model who falls under the spell of the musician Svengali, has entered popular mythology. His other novels were *Peter Ibbetson* (1891) and *The Martian* (1897). His granddaughter DAPHNE DU MAURIER was also a writer.

Du Mont, Allen B(alcom) (b. Jan. 29, 1901, Brooklyn, N.Y., N.Y., U.S.—d. Nov. 15, 1965, New York City) U.S. engineer. He became interested in television in 1928, as chief engineer at the De Forest Radio Co., and concluded that television required a purely electronic system to work. In 1931 he set up what would become Allen B. Du Mont Laboratories, where he improved the CATHODE-RAY TUBE and developed the modern oscilloscope. In 1937 he began manufacturing the first commercial television receivers. After World War II he marketed the first widely available TV receivers and set up one of the first TV broadcasting networks. He served with the National Television System Committee formulating broadcasting standards and worked with the Federal Communications Commission in allocating frequencies for TV channels.

Dual Alliance See AUSTRO-GERMAN ALLIANCE, FRANCO-RUSSIAN ALLIANCE

dual-aspect theory See DOUBLE-ASPECT THEORY

Dual Monarchy See AUSTRIA-HUNGARY

dualism In philosophy, any pair of irreducible, mutually heterogeneous principles used to analyze the nature and origins of knowledge (epistemological dualism) or to explain all of reality or some broad aspect of it

(metaphysical dualism); also, any theory that employs dualisms. Examples of epistemological dualisms are subject and object and sensation and sensibilia; examples of metaphysical dualisms are mind and matter, good and evil, and God and world. Dualism is distinguished from MONISM and PLURALISM.

Dubayy *or* **Dubai** \dü-'bī\ Constituent emirate (pop., 2001 est.: 913,000), United Arab Emirates (UAE). It is surrounded by the emirates of ABU DHABI and Al-Shariqah (Sharjah), and it has 45 mi (72 km) of coastline on the PERSIAN GULF. Occupying an area of 1,510 sq mi (3,900 sq km), it is the second most populous and second largest state of the federation. Most of its population live in or near its capital, Dubai city (pop., 1995: 669,181). Settled in 1799 by people from Abu Dhabi, Dubayy became a locally powerful state in the early 19th century, and until the 1930s it was known for its pearl exports. It has since been enriched by petroleum exports. Dubai city is now a centre for most of the banks and insurance companies of the UAE.

Dubček \'düb-ˌchek**, Alexander** (b. Nov. 27, 1921, Uhrovec, Czech.—d. Nov. 7, 1992, Prague) Czech politician. In World War II he took part in the underground resistance to Nazi occupation. After the war he rose in Communist Party ranks to become a member of the Presidium of the party's Central Committee (1962). In 1968 he forced Antonín Novotný (1904–75) to resign and replaced him as head of the Communist Party. He introduced liberal reforms in the brief period known as the PRAGUE SPRING, which ended when the Soviet Union invaded Czechoslovakia in August 1968. Demoted to lesser posts, he was expelled from the party in 1970. He returned to prominence in 1989 after the Communist Party had given up its monopoly on power, and was elected speaker of the Czech parliament.

Dubinsky, David (b. Feb. 22, 1892, Brest-Litovsk, Russian Empire—d. Sept. 17, 1982, New York, N.Y., U.S.) U.S. labour leader. The son of a baker in Russian Poland, he was sent to Siberia in 1908 for his union activities. In 1911 he escaped and immigrated to the U.S., where he renewed his union work. In 1932 he became president of the INTERNATIONAL LADIES' GARMENT WORKERS' UNION (ILGWU), a post he held until 1966. As president, he transformed the ILGWU from a small, fractious regional organization into a model international union. He also played a significant role in the merger of the American Federation of Labor and the Congress of Industrial Organizations (see AFL-CIO) in 1955.

Dublin *ancient* **Eblana** City and county borough (pop., 2002 prelim.: city, 495,101; county borough, 1,122,600), capital of Ireland. On the River LIFFEY, it was settled by Danish Vikings arriving in the area in the 9th century AD; they held it until it was taken by the Irish in the 11th century. Under English control in the 12th century, it was given a charter by HENRY II, establishing it as a seat of government. It prospered in the 18th century as a centre of the cloth trade, and its harbour dates from this period. In the 19th and 20th centuries it was the site of bloody nationalist violence, including the 1867 FENIAN MOVEMENT and the 1916 EASTER RISING. It is the country's chief port, centre of finance and commerce, and seat of culture. Its Guinness Brewery is the country's largest private employer. Educational and cultural institutions include the University of DUBLIN; the National Library and National Museum are housed on the grounds of Leinster House (1748), now the seat of the Irish parliament.

Dublin, University of *or* **Trinity College** Oldest university in Ireland, founded in 1592 by Elizabeth I and endowed by the city of Dublin. Trinity was originally intended to be the first of many constituent colleges of the university, but no others were established, and the two names became interchangeable. The full benefits of the university (degrees, fellowships, scholarships, etc.) were for many years limited to Anglicans, but in 1873 all religious requirements were eliminated. The university has faculties of arts (humanities and letters), sciences, business, economic and social studies, engineering and systems sciences, health sciences, and graduate studies. The library contains many illuminated manuscripts, including the Book of Kells.

Dublin Bay prawn See SCAMPI

Dubnow \'düb-ˌnȯf**, Simon Markovich** (b. Sept. 10, 1860, Mstislavl, Russia—d. December 1941, Riga, Latvia, U.S.S.R.) Russian Jewish historian. Largely self-educated, he gained notice as a scholar of Jewish history before the BOLSHEVIK Revolution prompted him to leave his native Russia for Germany in 1922. He emphasized the cultural autonomy of the Jewish people throughout history, rejecting assimilation but also opposing Zionism as unrealistic. His best-known works were *History of the Jews* (10 vol., 1925–30) and *History of Hasidism* (1931). He fled Nazi Germany in 1933 for Riga, Latvia, where he was eventually killed by the Germans.

Dubos \dü-'bōz**, René (Jules)** (b. Feb. 20, 1901, Saint-Brice, France—d. Feb. 20, 1982, New York, N.Y., U.S.) French-born U.S. microbiologist and environmentalist. He immigrated to the U.S. in 1924 and earned his Ph.D. from Rutgers University. His pioneering research in isolating antibacterial substances from soil microorganisms led to the discovery of major antibiotics. He researched and wrote on antibiotics, acquired immunity, tuberculosis, and the bacteria of the gastrointestinal tract. In his later years his interest shifted to the relationship of humans to the natural environment; his *So Human an Animal* (1968) won the Pulitzer Prize. See also SELMAN WAKSMAN.

Dubrovnik \'dü-ˌbrȯv-nik\ Port city (pop., 2001: 43,770), Croatia. It is situated on the southern Adriatic coast southwest of SARAJEVO. Founded in the 7th century by Roman refugees, it came under Byzantine rule after the fall of Rome. It acknowledged Venetian suzerainty (1205–1358) but remained largely independent and became a mercantile power. It was known as a centre of Slavic literature and art in the 15th–17th centuries. Subjugated by NAPOLEON I in 1808, it was passed to Austria in 1815 and to Yugoslavia in 1918. It was bombed by the Serbs (1991–92) during Croatia's struggle for independence. The old city, enclosed by medieval city walls, contains 14th-century convents and the 15th-century Rector's Palace.

Dubuffet \dǖ-bǖ-'fe**, Jean (-Philippe-Arthur)** (b. July 31, 1901, Le Havre, Fr.—d. May 12, 1985, Paris) French painter, sculptor, and printmaker. He studied painting in Paris, but in 1929 he began making a living as a wine merchant. When he returned to art full-time in the early 1940s, he became a leading artist in Paris and proponent of ART BRUT. He executed crude images incised into rough impasto surfaces made of materials such as sand, plaster, tar, gravel, and ashes bound with varnish and glue, and sculptural works made of junk materials; their unfinished appearance provoked public outrage. In the 1960s he experimented with musical composition and architectural environments, and in his later years he produced large fibreglass sculptures for public spaces.

Duby, Georges (b. Oct. 7, 1919, Paris, France—d. Dec. 3, 1996, near Aix-en-Provence) Prolific and influential French historian. After receiving a doctorate in history at the Sorbonne (University of Paris) in 1950, Duby taught at the university of Marseilles–Aix-en-Provence. In 1970 he moved to the Collège de France, where he served as professor of the history of medieval societies until 1993. The most influential of his many works was his dissertation, *La Société aux XIe et XIIe siècles dans la région mâconnaise* ("Society in the Mâconnais in the 11th and 12th Centuries"), published in 1953, which helped shape a new understanding of medieval society. He also served as director of the Société d'Edition de Programmes de Télévision, a public television production agency. He was elected to the Académie Française in 1987.

Duccio \'düt-chō\ **(di Buoninsegna)** (b. 13th century, Siena, Republic of Siena—d. c. 1318, Siena?) Italian painter. Little is known of his life, but several commission records survive, as well as two documented works, the *Rucellai Madonna* for the Florentine church of Santa Maria Novella (1285) and the famous *Maestà* altarpiece for Siena Cathedral (1308–11); both represent landmarks in the history of Italian painting. His style reflected the influence of CIMABUE and Byzantine art, though he introduced a warmth of human feeling that was comparable to that of GIOTTO in Florentine painting. He was the leading painter in Siena, one of Italy's most vital artistic centres in the Middle Ages.

Duchamp \dǖ-'shäⁿ**, Marcel** (b. July 28, 1887, Blainville, France—d. Oct. 2, 1968, Neuilly) French artist and art innovator. In 1913 he caused a sensation at the ARMORY SHOW with his painting *Nude Descending a Staircase, No. 2* (1912), which combined the principles of CUBISM and FUTURISM. His irreverence for conventional aesthetic standards then led him to devise his famous READY-MADES: in 1913 he exhibited *Bicycle Wheel*, which was simply an ordinary bicycle wheel displayed as a work of art, and in 1917 he exhibited a urinal he entitled *Fountain*. Intended as a derisive gesture against the excessive importance attached to works of art, the ready-mades ushered in an era when contemporary art became in itself a mixture of creation and criticism. In Paris in 1919 he established contact with the DADA group of artists, whose nihilistic ideas he had anticipated. During this period he exhibited a photograph of the *Mona Lisa* with a

© 2006 Encyclopædia Britannica, Inc.

moustache and goatee added, a gesture that expressed the Dadaists' scorn for the art of the past. He greatly influenced the SURREALISTS, and his attitude toward art and society led to POP ART and other modern and postmodern movements. A legend in his lifetime, he is considered one of the leading spirits of 20th-century art.

duck Any of various relatively small, short-necked, large-billed WATERFOWL (several genera in subfamily Anatinae, family Anatidae). The legs of true ducks (Anatinae) are placed rearward (as are those of SWANS), resulting in a waddling gait. Most true ducks differ from swans and true geese (see GOOSE) in that male ducks molt twice annually, females lay large clutches of smooth-shelled eggs, and both sexes have overlapping scales on the skin of the leg and exhibit some differences between sexes in plumage and in call. All true ducks except SHELDUCKS and sea ducks (see DIVING DUCK) mature in the first year and pair only for the season. They are generally divided into three groups: perching ducks, DABBLING DUCKS, and diving ducks. The whistling duck species, also called tree ducks, are not true ducks but are more closely related to geese and swans.

duck hawk See PEREGRINE FALCON

duckbill See PLATYPUS

ductility Capacity of a material to deform permanently (e.g., stretch, bend, or spread) in response to STRESS. Most common STEELS, for example, are quite ductile and hence can accommodate local stress concentrations. Brittle materials, such as glass, cannot accommodate concentrations of stress because they lack ductility, and therefore fracture easily. When a material specimen is stressed, it deforms elastically (see ELASTICITY) at first; above a certain deformation, called the elastic limit, deformation becomes permanent.

ductus arteriosus \'dək-təs-är-ˌtir-ē-'ō-səs\ Channel between the pulmonary ARTERY and the AORTA in the fetus, which bypasses the lungs to distribute oxygen received through the placenta from the mother's blood. It normally closes once the baby is born and the lungs inflate, separating the pulmonary and systemic CIRCULATIONS. Closure before birth causes circulatory problems. If the ductus stays open after birth (patent ductus arteriosus, more common in premature births), oxygenated and deoxygenated blood mix. Alone, this may not be serious; in some heart malformations it is even necessary for life.

Dudley City (pop., 1998 est.: 311,500), WEST MIDLANDS, England. It is the site of several Saxon and Norman fortifications. Coal and ironstone have been mined there since the Middle Ages. By the mid-19th century there were numerous blast furnaces, and the resultant pollution helped to give the area to the north and east the name "Black Country." Metalworking is an important industry.

Dudley, Dud (b. 1599, England?—d. 1684, England?) English ironmaster. He was an illegitimate son of Edward Sutton, the 9th Baron of Dudley, who recalled him from Oxford in 1619 to manage the family's ironworks in Staffordshire. He was the first to experiment with SMELTING IRON ore in a COAL-fired furnace. Previously, CHARCOAL had been exclusively used for smelting iron, but it was becoming increasingly costly, and unpopular, with the depletion of England's forests for fuel. Dudley patented his innovation in 1621, but the poor quality of his metal limited its sale. Dudley's work culminated in ABRAHAM DARBY's COKE-fired furnace in 1709.

Dudley, Robert See Earl of LEICESTER

due process Legal proceedings carried out fairly and in accord with established rules and principles. Due process standards are sometimes referred to as either substantive or procedural. Substantive due process refers to a requirement that laws and regulations be related to a legitimate government interest (e.g., crime prevention) and not contain provisions that result in the unfair or arbitrary treatment of an individual. The 5th Amendment to the CONSTITUTION OF THE UNITED STATES states that "no person shall…be deprived of life, liberty, or property, without due process of law." This right was extended to the states by the 14th Amendment (1868). Fundamental to procedural due process are adequate notice before the government can deprive one of life, liberty, or property, and the opportunity to be heard and defend one's rights. The boundaries of due process are not fixed and are the subject of endless judicial interpretation and decision making. See also rights of the ACCUSED; DOUBLE JEOPARDY.

duel Formal combat with weapons fought between two persons in the presence of witnesses. Intended to settle a quarrel or point of honour, it represented an alternative to the usual process of justice. The judicial duel, or trial by battle, is reported in ancient sources and was prevalent in medieval Europe. A judge could order two parties to meet in a duel to settle a matter. It was believed that through such an appeal to the "judgment of God" the righteous would emerge victorious; the loser, if still alive, was dealt with according to the law. Duels of honour were private encounters over real or imagined slights or insults. Eventually fought with pistols, duels were frequent in France and Germany in the 19th and early 20th centuries, and they were legal or encouraged by the fascist regimes in Italy and Germany. By the late 20th century they were prohibited; the last duel recorded in France occurred in 1967. The most famous duel in the U.S. was that between ALEXANDER HAMILTON and AARON BURR (1804). See also ORDEAL.

Duero River See DOURO RIVER

Dufay \dü-'fe**, Guillaume** *or* **Du Fay** (b. c. 1400—d. Nov. 27, 1474, Cambrai, Bishopric of Cambrai) Franco-Flemish composer, principal composer of the BURGUNDIAN SCHOOL. As a boy he sang in the choir of Cambrai Cathedral. Ordained a priest, he acquired a high reputation for learnedness. In 1428 he joined the papal singers in Rome, by which time his works had made him famous. He returned to Cambrai c. 1440, where he would supervise the cathedral's music for the rest of his life, apart from a period (1451–58) working for the duke of Savoy. Many musicians came to learn under him, and he enjoyed renown as the greatest living composer. His surviving works, which employ a richly harmonic texture, include some 90 chansons, 13 motets, and at least 6 complete masses, including such early cantus-firmus works as *L'Homme armé* and *Se la face ay pale.*

Dufy \dü-'fē**, Raoul** (b. June 3, 1877, Le Havre, Fr.—d. March 23, 1953, Forcalquier) French painter and designer. In 1900 he studied at the École des Beaux-Arts in Paris and experimented with IMPRESSIONISM, but by 1904 he had adopted the flat areas of bright colour typical of FAUVISM. In the early 1920s he developed a distinctive style characterized by rapid calligraphic drawing on backgrounds of bright, decorative colour; his subjects were usually recreational scenes such as horse races, parades, and concerts. He also designed textiles and made numerous book illustrations.

dugong \'dü-ˌgäŋ\ Large marine mammal (*Dugong dugon*, the sole living member of the family Dugongidae) that lives in shallow coastal waters from the Red Sea and eastern Africa to the Philippines, New Guinea, and northern Australia. It is 7–11 ft (2.2–3.4 m) long and usually weighs 500–800 lbs (230–360 kg). Its round, tapered body ends in a flipper with paired, pointed, horizontal branches. The forelimbs are rounded flippers; there are no hind limbs. The head blends into the body, and the snout is broad, square, and bristled. Dugongs live in pairs or in groups of up to six individuals. Once heavily hunted for their meat, hides, and oil, they are now protected throughout most of their range, though some populations remain in danger of extermination. See also MANATEE, SEA COW.

duiker \'dī-kər\ Any of 19 species of small, shy ANTELOPE. They live in most of Africa but are rarely seen by humans. The gray, or bush, duiker (*Sylvicapra grimmia*) has long legs and lives where there is bush or grass cover. It stands 22–26 in. (57–67 cm) tall at the shoulder. Only males have horns, which are short and straight. Forest duikers (18 species, genus *Cephalophus*) are short-legged, hunchbacked animals that live in dense brush and in forests. They stand 14–18 in. (36–46 cm) tall and vary from pale brown through reddish brown to nearly black. Both sexes have short, straight horns.

Zebra duiker (*Cephalophus zebra*).
KENNETH W. FINK FROM THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS—EB INC.

Duisburg \'dü-ēs-ˌbůrk,\ *English* \'düz-bərg\ City (pop., 2002 est.: 478,600), North Rhine–Westphalia state, western Germany. It lies at the junction of the RHINE and RUHR rivers and is connected with the North Sea ports by the Rhine-Herne Canal. Known to the Romans as Castrum Deutonis, it was mentioned in AD 740 as Diuspargum, a seat of the Frankish kings. It passed to Cleves in 1290 and, with Cleves, to BRANDENBURG in 1614. After suffering heavily in the THIRTY YEARS' WAR, it revived as the seat of a Protestant university from 1655 to 1818. With increasing industrialization after 1880, it is now one of the world's largest inland ports.

© 2006 Encyclopædia Britannica, Inc.

Dujardin \dǖ-zhär-'da^{n}**, Félix** (b. April 5, 1801, Tours, France—d. April 8, 1860, Rennes) French biologist. His studies of microscopic animal life frequently found in decaying organic materials led him in 1834 to propose a new group of one-celled animals that he called *Rhizopoda*. He named the seemingly formless life substance that oozed outward through openings in certain shells *sarcode*; later it became known as *protoplasm*. This work led him in 1835 to argue against Christian Gottfried Ehrenberg's theory that microscopic organisms have the same organs as higher animals. Dujardin also studied jellyfish, corals, and sea stars; his study of flatworms laid the foundation for the later development of the study of parasites and parasitism.

Dukas \dǖ-'käs**, Paul (-Abraham)** (b. Oct. 1, 1865, Paris, France—d. May 17, 1935, Paris) French composer. Born into a musical family, he studied at the Paris Conservatoire. His first success was the overture *Polyeucte* (1892). Perfectionism led him to destroy much of his work. His fame rests almost entirely on the tone poem *The Sorceror's Apprentice* (1897); his other surviving works include the opera *Ariane et Barbe-Bleue* (1906), the ballet *La Péri* (1912), and a symphony (1896).

duke European title of nobility, the highest rank below a prince or king except in countries having such titles as archduke or grand duke. The wife of a duke is a duchess. The Romans gave the title *dux* to high military commanders with territorial responsibilities. It was adopted by the barbarian invaders of the Roman Empire and was used in their kingdoms and also in France and Germany for rulers of very large areas. In some European countries a duke is a sovereign prince who rules an independent duchy. In Britain, where there were no ducal titles until 1337, it is a hereditary title.

Duke, James B(uchanan) (b. Dec. 23, 1856, Durham, N.C., U.S.—d. Oct. 10, 1925, New York, N.Y.) U.S. tobacco magnate and philanthropist. He and his brother Benjamin (1855–1929) entered the family tobacco business. In 1890 James became president of the American Tobacco Co., which controlled the entire U.S. tobacco industry until antitrust laws caused it, in 1911, to be broken into several companies that would become the principal U.S. cigarette makers. He oversaw the family's contributions to Trinity College in Durham, which was renamed Duke University.

Duke, Vernon *orig.* **Vladimir (Aleksandrovich) Dukelsky** (b. Oct. 10, 1903, Parfyanovka, near Pskov, Russia—d. Jan. 16, 1969, Santa Monica, Calif., U.S.) Russian-born U.S. composer. He fled Russia at age 16, settling in Constantinople. From there he visited the U.S., where George Gershwin suggested his new name and advised him not to be afraid of "going low-brow." He composed classical works in Europe, including *Zéphyr et Flore* (1925) for the Ballets Russes but returned to the U.S. in 1929. With lyricists including Edgar Harburg and Howard Dietz, he wrote music for shows (including *Walk a Little Faster*, 1932) and movies (including *Cabin in the Sky*, 1943, and *Sadie Thompson*, 1944). His songs include "April in Paris," "Taking a Chance on Love," and "Banjo Eyes."

Duke University Private university in Durham, N.C. It was created in 1924 through an endowment from James B. Duke, although the original college (Trinity) traces its roots to the mid 19th century. Duke maintained separate campuses for undergraduate men and women until the 1970s. Besides an undergraduate liberal arts college, the university includes schools of business, divinity, engineering, environmental studies, graduate studies, law, medicine (including a medical centre), and nursing.

Dukhobor See Doukhobor

Dulany \də-'lā-nē**, Daniel** (b. June 28, 1722, Annapolis, Md.—d. March 17, 1797, Baltimore, Md., U.S.) American lawyer. He was educated in England and became a lawyer after returning to Maryland. After serving in Maryland's legislative assembly (1751–54), he was appointed to the Governor's Council (1757–76) in recognition of his support for the colony's proprietary government. Though he wrote an influential pamphlet criticizing the Stamp Act (1765), he opposed revolt against British rule and remained a loyalist during the American Revolution.

Dulbecco \dəl-'be-kō**, Renato** (b. Feb. 22, 1914, Catanzaro, Italy) Italian-born U.S. virologist. He received his M.D. from the University of Turin in 1936 and immigrated to the U.S. in 1947. With Marguerite Vogt he pioneered the culturing of animal viruses and investigated how certain viruses gain control of the cells they infect. They showed that polyoma virus inserts its DNA into the DNA of the host cell and that the cell is then transformed into a cancer cell, reproducing the viral DNA along with its own and producing more cancer cells. Dulbecco suggested that human cancers could be caused by similar reproduction of foreign DNA fragments. He shared a 1975 Nobel Prize with two former students, Howard Temin (b. 1934) and David Baltimore. The last of his academic appointments in the U.S. and Britain was as president of the Salk Institute.

dulcimer *or* **hammered dulcimer** Stringed musical instrument in which the strings are beaten with small hammers rather than plucked. Its soundbox is flat and usually trapezoidal; each pair of strings produces a single note, and the pairs slope upward alternately left and right to facilitate rapid playing. The Hungarian *cimbalom* is a large dulcimer with legs and a damper pedal, much used in Roma (Gypsy) orchestras. The Appalachian dulcimer is a narrow zither with a fretted fingerboard and three to five strings, which are stopped with one hand and plucked with a plectrum held in the other.

DuLhut \dǖ-'lǖt**, Daniel Greysolon, Lord** (b. c. 1639, Saint-Germain-Laval, France—d. Feb. 25/26, 1710, Montreal) French soldier and explorer. He made two voyages to New France before 1674 and returned to Montreal in 1675. He negotiated fur-trade agreements with Indian tribes, rescued Louis Hennepin from the Sioux, assisted count de Frontenac in the campaign against Indian allies of the British, and is credited with establishing French control over the land north and west of Lake Superior. Duluth, Minn., is named for him.

Dulles \'də-ləs**, Allen W(elsh)** (b. April 7, 1893, Watertown, N.Y., U.S.—d. Jan. 29, 1969, Washington, D.C.) U.S. diplomat and administrator. He held diplomatic posts before practicing law with his brother, John Foster Dulles. In World War II he served in the Office of Strategic Services. After the war he chaired a committee to survey the U.S. intelligence system. When the Central Intelligence Agency was established in 1951, he became its deputy director. As director (1953–61), he oversaw the agency's early successes, but the U-2 Affair (1960) and the Bay of Pigs invasion (1961) led to his resignation.

Dulles, John Foster (b. Feb. 25, 1888, Washington, D.C., U.S.—d. May 24, 1959, Washington, D.C.) U.S. secretary of state (1953–59). He was counsel to the American Peace Commission at Versailles, France, and later helped oversee the payment of World War I reparations. He helped prepare the charter of the UN and was a delegate to its General Assembly (1946–49). He negotiated the complex Japanese peace treaty (1949–51). As secretary of state under Pres. Dwight D. Eisenhower, he advocated active opposition to Soviet actions and developed the Eisenhower Doctrine. His critics considered him inflexible and harsh and a practitioner of "brinkmanship" for raising international tensions and bringing the country to the brink of war; later assessments credit his firmness in checking communist expansion.

Duluth \də-'lüth\ City (pop., 2000: 86,918) and inland port, northeastern Minnesota, U.S. It is situated on Lake Superior at the mouth of the St. Louis River, opposite Superior, Wis. The combined Duluth-Superior harbour is the western terminus of the St. Lawrence Seaway. Through it are shipped iron ore, coal, grain, and oil. The site was named after Daniel DuLhut, one of the French voyageurs who visited the area in the 17th century. It was laid out in 1856 and incorporated as a city in 1870.

Duma *Russian* **Gosudarstvennaya Duma ("State Assembly")** Elected legislative body that, with the State Council, constituted the imperial Russian legislature (1906–17). It had only limited power to control spending and initiate legislation, and the four Dumas that convened (1906, 1907, 1907–12, 1912–17) rarely enjoyed the cooperation of the ministers or the emperor, who retained the right to rule by decree when the Duma was not in session. In the Soviet era, soviets were the basic unit of government. After the fall of the Soviet Union (1991), the Russian parliament (composed of the Congress of People's Deputies and the Supreme Soviet) exercised legislative responsibilities until 1993, when conflicts with Pres. Boris Yeltsin reached a crisis. Parliament's revolt was suppressed by military force, and a new constitution established a new parliament composed of a Federation Council (in which all 89 of Russia's republics and regions have equal representation) and a Duma, with 450 members, half elected through proportional representation on a party basis and half through single-member constituencies. The president may override and even dissolve the legislature under certain circumstances.

Dumas \dǖ-'mä,\ *English* \d(y)ü-'mä, 'd(y)ü-ˌmä**, Alexandre** *known as* **Dumas père** (b. July 24, 1802, Villers-Cotterêts, Aisne, France—d. Dec. 5, 1870, Puys, near Dieppe) French playwright and novelist.

© 2006 Encyclopædia Britannica, Inc.

Dumas's first success was as a writer of melodramatic plays, including *Napoléon Bonaparte* (1831) and *Antony* (1831). His immensely popular novels, set in colourful historical backgrounds, include *The Three Musketeers* (1844), a romance about four swashbuckling heroes in the age of Cardinal Richelieu, and its sequel *Twenty Years After* (1845); *The Count of Monte Cristo* (1844–45); and *The Black Tulip* (1850). His illegitimate son Alexandre Dumas (1824–95), called Dumas *fils*, is best known for his play *La Dame aux camélias* (1848), the basis of Giuseppe Verdi's opera *La Traviata* and later of several films titled *Camille*.

Dumfries \dəm-'frēs\ Town (pop., 1995 est.: 31,000) and royal burgh, administrative centre of Dumfries and Galloway council area, southwestern Scotland. In the historic county of Dumfriesshire, the town is situated on the left bank of the River Nith near the border with England. It is the main market centre for an intensive livestock-farming region. The poet Robert Burns lived there from 1791 to 1796 and is buried there; his house is now a museum.

Dummer, Jeremiah (b. 1681, Boston, Mass.—d. May 19, 1739, Plaistow, Essex, Eng.) American lawyer and colonial agent. In England in 1708 he defended Massachusetts' claim to Martha's Vineyard. As colonial agent in England for Massachusetts (1710–21) and for Connecticut (1712–30), he was a diligent advocate for the colonies. In 1715 he wrote a pamphlet defending the charter rights of the New England colonies.

Dummett, Sir Michael A(nthony) E(ardley) (b. June 27, 1925, London, Eng.) British philosopher. Dummett has done influential work in the philosophy of language, metaphysics, logic, and the philosophy of mathematics; he is also one of the foremost expositors of the work of Gottlob Frege. He is known chiefly for his defense of antirealism (see realism) and his attempt to explicate sentence meaning in terms of "assertibility conditions" rather than truth conditions. His major works include *Frege: Philosophy of Language* (1973), *Truth and Other Enigmas* (1978), *The Logical Basis of Metaphysics* (1991), and *The Seas of Language* (1993).

Dumont d'Urville \dœ̄-mō^{n}-dœ̄r-'vēl**, Jules (-Sébastien-César)** (b. May 23, 1790, Condé-sur-Noireau, France—d. May 8, 1842, near Meudon) French navigator. His exploration of the South Pacific (1826–29) resulted in extensive revision of charts of South Sea waters and redesignation of island groups into Melanesia, Micronesia, Polynesia, and Malaysia. In 1830 he conveyed the exiled king Charles X to England. He set sail for Antarctica in 1837; though unable to penetrate the pack ice, his expedition surveyed the Straits of Magellan, discovered Joinville Island and Louis Philippe Land, and sighted the Adélie coast (named for Dumont's wife) before returning in 1840.

Dumuzi-Abzu \'dü-mü-zē-'äb-ˌzü\ In Mesopotamian religion, a Sumerian fertility goddess. The city goddess of Kinirsha in the southeastern marshland region, she represented the power of new life in the marshes. Her counterpart in the central herding region was Tammuz.

Dumuzi-Amaushumgalana \'dü-mü-zē-ˌä-mä-'ü-shùm-gä-'lä-nä\ In Mesopotamian religion, a Sumerian god who represented the power of growth and new life in the date palm. He was the young bridegroom of the fertility goddess Inanna or Ishtar. Their marriage was celebrated annually as a harvest festival. He was also identified with the Sumerian god Tammuz.

Dunajec River \dü-'nä-yets\ River, southern Poland. Rising in the Tatra Mountains near the Slovakia border, it flows about 156 mi (251 km) northeast into the Vistula River. It was the scene of heavy fighting during World War I in the Austro-German offensive. In 1975 Czechoslovakia and Poland modified their border along the Dunajec to permit Poland to construct a dam for irrigation in the region southeast of Kraków.

Dunant \dœ̄-'nä^{n}**, (Jean-) Henri** (b. May 8, 1828, Geneva, Switz.—d. Oct. 30, 1910, Heiden) Swiss humanitarian. An eyewitness to the Battle of Solferino, he organized emergency aid services for the Austrian and French wounded. In 1862 he proposed the formation of voluntary relief services in all countries and proposed an international agreement covering the war wounded. In 1864 he founded the Red Cross, and the Geneva Convention came into being. He continued to promote interest in the treatment of prisoners of war, the abolition of slavery, international arbitration, disarmament, and the establishment of a Jewish homeland. In 1901 he shared with Frédéric Passy (1822–1912) the first Nobel Peace Prize.

Dunaway, (Dorothy) Faye (b. Jan. 14, 1941, Bascom, Fla., U.S.) U.S. film actress. She acted in several off-Broadway plays (1962–67) before making her film debut in *The Happening* (1967). She became an international star in *Bonnie and Clyde* (1967). In her best roles, such as those she played in *Bonnie and Clyde*, *Chinatown* (1974), and *Network* (1976, Academy Award), she gave textured performances that embodied the spirit of the films. She later starred in notable films such as *Mommie Dearest* (1981), *Barfly* (1987), and *Arizona Dreams* (1993).

Dunbar, Paul Laurence (b. June 27, 1872, Dayton, Ohio, U.S.—d. Feb. 9, 1906, Dayton) U.S. author. The son of former slaves, Dunbar became the first African American writer to try to live by his writings and one of the first to attain national prominence. He wrote for a largely white readership, using black dialect and depicting the pre-Civil War South in pastoral, idyllic tones. His verse collections include *Oak and Ivy* (1893), *Majors and Minors* (1895), and *Lyrics of Lowly Life* (1896). His poems reached a wide readership, and he gave readings in the U.S. and England. He also published four short-story collections and four novels, including *The Sport of the Gods* (1902).

Paul Laurence Dunbar, 1906.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Dunbar, William (b. 1460/65, Scotland—d. before 1530) Scottish poet. He was attached to the court of James IV. Of the more than 100 poems attributed to him, most are short occasional pieces, ranging from gross satire to hymns of religious exaltation. The longer works include the charming dream allegory "The Goldyn Targe," the nuptial song "The Thrissill and the Rois," and "The Flyting of Dunbar and Kennedie," a virtuoso piece of personal abuse directed at a rival. Dunbar was the dominant makar (courtly poet) in the golden age of Scottish poetry.

Duncan I (d. Aug. 1, 1040, near Elgin, Moray, Scot.) King of the Scots (1034–40). The grandson of King Malcolm II, his accession to the throne violated the system in which kingship alternated between two branches of the royal family. He was challenged by Macbeth, mormaer (subking) of Moray, who was the inspiration for the play by William Shakespeare and who may have had a stronger claim to the throne. Macbeth murdered Duncan in 1040, and Duncan's elder son later killed Macbeth and ruled as Malcolm III Canmore.

Duncan, David Douglas (b. Jan. 23, 1916, Kansas City, Mo., U.S.) U.S. photojournalist. After graduating from college, he became a freelance photographer. In 1946 he joined the staff of *Life* magazine and covered the Korean War (1950); his photographs depicting the life of the ordinary soldier were published in *This Is War!* (1951). Resuming his freelance life, in 1956 he met Pablo Picasso, with whom he became fast friends; Duncan later published several photographic essays on Picasso's works, including *The Private World of Pablo Picasso* (1958) and *Picasso's Picassos* (1961).

Duncan, Isadora *orig.* **Angela Duncan** (b. May 26, 1877, or May 27, 1878, San Francisco, Calif., U.S.—d. Sept. 14, 1927, Nice, Fr.) U.S. interpretive dancer. She rejected the conventions of classical ballet and based her technique on natural rhythms and movement inspired by ancient Greece, dancing barefoot in a tunic without tights. Enjoying little success in the U.S., she moved to Europe in 1898. She toured Europe, giving recitals to great acclaim throughout her life and earning notoriety for her liberated unconventionality, and she founded several dance schools. She was strangled when her long scarf became entangled in the rear wheel of the car in which she was riding. Her emphasis on "free dance" made her a precursor of modern dance, and she became an inspiration to many avant-garde artists.

Dundee \ˌdən-'dē\ City and royal borough (pop., 2001: 145,663), eastern Scotland. It constitutes the council area of Dundee City in the historic county of Angus. An important seaport, it is situated on the Firth of Tay, an inlet of the North Sea. Earliest mention of the town dates from the late 12th century, and over the next four or five centuries it was repeatedly sacked, with much bloodshed, by the English. Among surviving buildings, the City Churches, a collection of three parish churches housed under

© 2006 Encyclopædia Britannica, Inc.

one roof, are a focal point in the modern city centre. Dundee was a world centre for jute manufacturing in the 19th century. Textiles are still produced, but since World War II light engineering has become the predominant industry. The University of Dundee was founded in 1881.

dune See SAND DUNE

dung beetle Any member of one subfamily (Scarabaeinae) of SCARAB BEETLES, which shapes manure into a ball (sometimes as large as an apple) with its scooperlike head and paddle-shaped antennae. They vary from 0.2 to more than 1 in. (5–30 mm) long. In early summer it buries itself and the ball and feeds on it. Later in the season the female deposits eggs in dung balls, on which the larvae will later feed. They are usually round with short wing covers (elytra) that expose the end of the abdomen. They can eat more than their own weight in 24 hours and are considered helpful because they hasten the conversion of manure to substances usable by other organisms.

Dungannon \dən-'ga-nən\ District (pop., 2001: 47,735), Northern Ireland. Created in 1973, it extends from Lough NEAGH to the district of FERMANAGH and from the foothills of the Sperrin Mountains to the River Blackwater and the republic of Ireland. An essentially pastoral area, its early history is linked with the O'Neills, earls of TYRONE, whose chief residence was at the town of Dungannon, the district seat. The Irish Parliament's independence was first proclaimed there in 1782.

Dungeness crab \'dən-jə-nəs\ Edible CRAB (*Cancer magister*) found along the Pacific coast from Alaska to lower California, one of the coast's largest and most important commercial crabs. The male is 7–9 in. (18–23 cm) wide and 4–5 in. (10–13 cm) long. The reddish brown upper surface is lighter toward the back; the legs and undersurface are yellowish. It lives on sandy bottoms below the high-tide mark. Closely related North American species are the rock crab of the Atlantic coast, the Jonah crab in coastal waters from New England to Canada, and the red and Pacific rock crabs, both in Pacific coastal waters. All are edible, but their commercial importance varies.

Dunham, Katherine (b. June 22, 1910, Joliet, Ill., U.S.) U.S. dancer, choreographer, and anthropologist noted for her interpretation of tribal and ethnic dances. In 1931 she opened a dance school in her native Chicago. In 1940 she formed the U.S.'s first all-black dance company, for which she choreographed revues based on her anthropological research in the Caribbean; her early works included *Tropics* and *Le Jazz hot*. She later received a Ph.D. in anthropology from the University of Chicago. Many well-known black dancers were trained in her studios in Chicago and New York City. In the 1950s she toured in Europe with her company. She also choreographed Broadway stage productions, operas, and movies.

Katherine Dunham in *Tropical Revue* (1945–46).
COURTESY OF THE DANCE COLLECTION, NEW YORK PUBLIC LIBRARY, ASTOR, LENOX AND TILDEN FOUNDATIONS

dunite \'dü-ˌnīt, 'də-ˌnīt\ Yellowish green to green igneous rock composed almost entirely of olivine. Chromite and magnetite also occur in dunite, as do spinel, ilmenite, pyrrhotite, and platinum in some cases. Dunites may be a source of CHROMIUM. Places of occurrence include Dun Mtn., New Zealand (the source of its name), South Africa, and Sweden.

Dunkirk Evacuation (1940) In WORLD WAR II, the evacuation of the BRITISH EXPEDITIONARY FORCE and other Allied troops, cut off by the Germans, from the French seaport of Dunkirk (Dunkerque) to England. Naval vessels and hundreds of civilian boats were used in the evacuation, which began on May 26. When it ended on June 4, about 198,000 British and 140,000 French and Belgian troops had been saved. The operation's success was due to fighter cover by the RAF and (unintentionally) to ADOLF HITLER's order of May 24 halting the advance of German armored forces into Dunkirk.

Dunmore's War, Lord See LORD DUNMORE'S WAR

Dunne, Finley Peter (b. July 10, 1867, Chicago, Ill., U.S.—d. April 24, 1936, New York, N.Y.) U.S. journalist and humorist. A son of Irish immigrants, Dunne began contributing Irish-dialect sketches to Chicago newspapers in 1892. In these he created the character Martin Dooley, who commented on current events in a rich Irish brogue. Mr. Dooley soon became a force for clear thinking and tolerance in public affairs. Dunne wrote more than 700 dialect essays, some of which were republished in eight volumes, including *Mr. Dooley in Peace and War* and *Mr. Dooley's Philosophy*, from 1898 to 1919.

Dunnet Head Cape, northeastern Scotland. A rounded headland, it is the northernmost point of the Scottish mainland, jutting into the NORTH SEA. It is crowned by a lighthouse, 346 ft (105 m) high, built in 1831.

Duns Scotus \'dənz-'skō-təs**, John** (b. 1266, Duns, Lothian, Scot.—d. Nov. 8, 1308, Cologne) Medieval Scottish philosopher and SCHOLASTIC theologian. He studied and taught at Oxford, where he joined the FRANCISCANS, and later taught at the University of Paris, from which he was briefly exiled for supporting Pope BONIFACE VIII in his quarrel with King PHILIP IV. In 1307 he became professor of theology at Cologne, perhaps to escape charges of heresy over his defense of the doctrine of the IMMACULATE CONCEPTION, which the DOMINICANS and secular authorities opposed. His two major works are *Ordinatio* and *Quaestiones quodlibetales*, both left unfinished at his death.

Dunstable \'dən-stə-bəl**, John** (b. c. 1385, England—d. Dec. 24, 1453, London) English composer. His life and career are almost completely obscure. After his death he came to be credited with the achievements of all his English contemporaries, including Leonel Power (c. 1380–1445). He left at least 50 compositions, all for three and four voices and almost all sacred. Their full triadic harmony and frequent parallel motion in the voices represented an important innovation that influenced composers such as GUILLAUME DUFAY and Gilles Binchois (c. 1400–60), softening the austerity of 14th-century polyphony.

Dunstan of Canterbury, Saint (b. c. 909, near Glastonbury, Eng.—d. May 19, 988, Canterbury; feast day May 19) Archbishop of Canterbury. He served as a chief adviser to the kings of Wessex, beginning with Edmund I, who made him abbot of Glastonbury (c. 943). Under King Eadred he served as minister of state, working to conciliate the Danish section of the kingdom and reform the church. Dunstan was outlawed (955) under King Eadwig and went into exile in Flanders, but he was recalled by King Edgar (957) and continued his reforms, restructuring English monasticism on the continental model. He became archbishop of Canterbury in 959.

duodenum \ˌdü-ə-'dē-nəm, dü-'ä-dᵊn-əm\ First and shortest (9–11 in., or 23–28 cm) segment of the SMALL INTESTINE. It curves down and then up from the pylorus of the stomach, where CHYME enters it. Ducts from the pancreas and gallbladder bring in bicarbonate to neutralize stomach acid, pancreatic enzymes to further digestion, and bile salts to break up fats. Nutrient absorption begins in the lower duodenum, which has a mucous lining. Exposure to stomach acid makes the upper duodenum susceptible to PEPTIC ULCERS, the duodenum's most common problem. Compression of the lower duodenum between the liver, pancreas, and major blood vessels can require surgery.

Duparc \dü-'pȧrk**, (Marie-Eugène-) Henri** (b. Jan. 21, 1848, Paris, France—d. Feb. 12, 1933, Mont-de-Marsan) French song composer. He studied music with CÉSAR FRANCK while also studying law. His composing career lasted about 16 years; he stopped composing at age 36 for psychological reasons. Highly self-critical, he destroyed an incomplete opera and other works and acknowledged only 13 completed songs, including "L'Invitation au voyage," "Phidylé," "Testament," and "Extase," as his lifetime oeuvre. Almost all the songs, universally admired, were originally for voice and piano; he later orchestrated eight of them.

Dupleix \dü-'pleks,\ *English* \dü-'pleks**, Joseph-François** (b. 1697, Landrecies, France—d. Nov. 10, 1763, Paris) French colonial administrator who attempted to establish a French empire in India. His father, a director of the French EAST INDIA COMPANY, secured him an appointment in 1720 to the superior council of Pondicherry, capital of French India, and in 1742 he was named governor-general of French India. He fought the British in India during the War of the AUSTRIAN SUCCESSION (1744) and later attempted to undermine the British position in southern India. His schemes exhausted French finances, and he was recalled to France, discredited, in 1754.

DuPont Co. *in full* **E.I. du Pont de Nemours & Co.** U.S. chemical, coatings, and fibre manufacturer. The company was founded near Wilmington, Del., in 1802 by a French immigrant, Éleuthère Irénée du Pont de Nemours, son of the eminent economist Pierre-Samuel du Pont de Nemours (1739–1817). The company originally manufactured gunpowder and other explosives. It was incorporated in 1899 after nearly a century as a partnership, after which it began to diversify its product line, partly through extensive acquisitions. DuPont developed nitrocellulose plastics in 1915 and synthetic rubber in 1931 and later developed the fibres NYLON, Orlon, Dacron, KEVLAR, and Lycra, as well as Mylar film and TEFLON resin, among many other synthetics. The company was run by the Du Pont family until World War II. Today it is a highly diverse conglomerate with interests in chemicals, agriculture, electronics, and packaging.

Dupuytren \dǖ-pwʸē-traⁿ**, Guillaume** *later* **Baron Dupuytren** (b. Oct. 5, 1777, Pierre-Buffière, near Limoges, Fr.—d. Feb. 8, 1835, Paris) French surgeon and pathologist. Dupuytren was the first to excise the lower jaw and to clearly describe the pathology of congenital hip dislocation. He revised the classification of burns and devised surgery for cervical cancer and for creation of an artificial anus, among other advances. He is best known for surgical procedures to alleviate Dupuytren contracture, in which fibrosis in the palm causes permanent retraction of one or more fingers.

Dura-Europus \ˈdu̇r-ə-yu̇-ˈrō-pəs\ Ancient town on the EUPHRATES RIVER, Syria. Originally a Babylonian town, it was rebuilt as a military colony c. 300 BC under the SELEUCID DYNASTY. Annexed by the Romans in AD 165, it became a frontier fortress. Shortly after 256 it was overrun and destroyed by the SĀSĀNIAN DYNASTY. Its ruins give an unusually detailed picture of everyday life there and provide information about the fusion of Hellenistic and Semitic culture.

Durance River \dǖ-ˈräⁿs\ *ancient* **Druentia.** River, southeastern France. The principal river draining the French side of the Alps toward the Mediterranean, its origin is in the Montgenèvre region. To its confluence with the RHÔNE RIVER below AVIGNON, it is 189 mi (304 km) long. It is the site of extensive hydroelectric projects that were established after World War II.

Durand \du̇-ˈrand**, Asher B(rown)** (b. Aug. 21, 1796, Jefferson Village, N.J., U.S.—d. Sept. 17, 1886, Jefferson Village) U.S. painter, engraver, and illustrator. He had established his reputation as an engraver by 1823 with his print of JOHN TRUMBULL's *Declaration of Independence* and his portraits of prominent contemporary Americans. He later devoted himself to landscape painting, becoming a founder of the HUDSON RIVER SCHOOL and one of the earliest U.S. artists to work directly from nature. In 1826 he cofounded the National Academy of Design in New York City and served as its president (1845–61).

Durango \du̇-ˈraŋ-gō\ State (pop., 2000: 1,448,661), north-central Mexico. It covers 47,560 sq mi (123,181 sq km), and its capital is DURANGO. The western portion of the state lies within the mineral-laden Sierra Madre Occidental; semiarid plains, used for ranching, comprise the eastern portion. The Nazas River, which flows about 375 mi (600 km), is the largest in the state and is a main source of water for commercial agriculture. Along the river's lower course is the Laguna cotton district, a large state-operated cooperative that DURANGO city shares with COAHUILA state. First explored by Europeans in 1562, Durango shared the colonial history of CHIHUAHUA as a major part of Nueva Vizcaya; the two states separated in 1823.

Durango *officially* **Victoria de Durango** City (pop., 2000: 427,135), capital of DURANGO state, north-central Mexico. It lies in a fertile valley of the SIERRA MADRE, about 6,200 ft (1,890 m) above sea level. North of the city is the Cerro del Mercado, a hill of nearly pure iron ore representing one of the world's largest deposits of that mineral. First settled in 1556, Durango was the political and ecclesiastical capital of Nueva Vizcaya, which included Durango and CHIHUAHUA until 1823. The city, long known as a health resort, is an important commercial and mining centre.

Durant \du̇-ˈrant**, Will(iam James) and Ariel** *Ariel Durant orig.* **Ada Kaufman** *or* **Ida Kaufman** (respectively b. Nov. 5, 1885, North Adams, Mass., U.S.—d. Nov. 7, 1981, Los Angeles, Calif.; b. May 10, 1898, Prosurov, Russia—d. Oct. 25, 1981, Los Angeles) U.S. writers. After the great success of Will's *Story of Philosophy* (1926), they cowrote the 11-volume *The Story of Civilization* (1935–75), including *Rousseau and Revolution* (1967, Pulitzer Prize). Though involved in the writing of every volume, Ariel was not listed as coauthor until the seventh.

Durant, William C(rapo) (b. Dec. 8, 1861, Boston, Mass., U.S.—d. March 18, 1947, New York, N.Y.) U.S. industrialist, founder of GENERAL MOTORS CORP. He established a carriage company in 1886 and joined the new but failing Buick Motor Car Co. (founded by David Buick in 1902) in 1903–04, quickly reviving it. In 1908 he brought together several automotive manufacturers to form the GENERAL MOTORS Co. He lost control of the company two years later. With Louis Chevrolet (1878–1941) he founded the Chevrolet Motor Co., which acquired control of General Motors in 1915. As president of General Motors Corp. until 1920, he presided over its steady expansion.

Durante \də-ˈran-tē**, Jimmy** *orig.* **James Francis Durante** (b. Feb. 10, 1893, New York, N.Y., U.S.—d. Jan. 29, 1980, Santa Monica, Calif.) U.S. comedian. By age 16 he was playing piano in nightclubs in New York City's Bowery. In the 1920s the team of Durante, Lou Clayton, and Eddie Jackson starred in vaudeville and nightclubs; they appeared on Broadway in FLORENZ ZIEGFELD's *Show Girl* (1929). Durante made his film debut in *Roadhouse Nights* (1930) and over the next 30 years brightened many films and musicals with his gravelly voice, malapropisms, and warmhearted buffoonery. Nicknamed "Schnozzola" for his large nose, he is remembered for ending his many radio and television programs with the line "Goodnight, Mrs. Calabash, wherever you are."

Duras \dǖ-ˈräs**, Marguerite** *orig.* **Marguerite Donnadieu** (b. April 4, 1914, Gia Dinh, Cochinchina—d. March 3, 1996, Paris, France) French novelist, playwright, film director, and screenwriter. Indochina was the setting for Duras's first successful novel, *The Sea Wall* (1950). Her writing grew increasingly minimal and abstract, and she is sometimes associated with the nouveau roman ("new novel") movement. Perhaps her best-known novel is the semiautobiographical *The Lover* (1984, Prix Goncourt; film, 1992), about a French teenage girl's love affair with an older Chinese man; she revised this work as *The North China Lover* (1991). Her original screenplay for *Hiroshima mon amour* (1959) and her adaptation for film of her play *India Song* (1975) were highly acclaimed.

Durban City (pop., 1996: metro. area, 2,117,650) and chief seaport, South Africa. Located on Natal Bay of the Indian Ocean, it was the site of a European trading settlement from 1824 and was named Port Natal by the traders. Land was ceded to them by the Zulu king SHAKA, and the Old Fort (now a museum) was built. Durban was founded in 1835 on the site of Port Natal. In the 1840s the Boers clashed with the British over control of Durban. One of the world's major commercial ports, it is the headquarters of South Africa's sugar industry and a centre of diverse manufacturing. Tourism is also important, based on the city's proximity to game and nature reserves and to beaches.

Dürer \ˈdu̇r-ər,\ *English* \ˈdu̇r-ər**, Albrecht** (b. May 21, 1471, Imperial Free City of Nürnberg—d. April 6, 1528, Nürnberg) German painter and printmaker. He worked as a draftsman in his father's goldsmith workshop before being apprenticed at 15 to a painter and illustrator in his native Nürnberg. He opened his own workshop c. 1494 and began producing woodcuts and copper engravings. His extensive travel took him twice to Italy; Italian influence can be seen in such engravings as *The Four Witches* (c. 1497) and *Adam and Eve* (1504). He became known for his penetrating half-length portraits and self-portraits. In 1506, in Venice, he completed his great altarpiece *The Feast of the Rose Garlands* for the German chapel in the church of San Bartolommeo. Later important graphic works include his famous *Passion* series of copperplate engravings (1507–13) as well as his greatest engravings: *St. Jerome in His Study, Melencolia I* and *The Knight, Death, and the Devil* (1513–14). Back in Nürnberg he worked for

Emperor Maximilian I (1512–19). By 1515 he had achieved international fame. In 1518 he became a devoted follower of Martin Luther. His finest painting is the *Four Apostles* of 1526. He was the greatest Renaissance artist in northern Europe and had many pupils and imitators.

Durga In Hinduism, one of the forms of the goddess Devi or Shakti (see shakti), and the wife of Shiva. She was born fully grown, created out of flames that issued from the mouths of Brahma, Vishnu, Shiva, and other gods and embodying their collective energy (shakti). They created her to slay the buffalo-demon Mahisasura, whom they were unable to overcome. She is usually depicted riding a lion or tiger, each of her multiple arms bearing a weapon. See also Durga-puja.

Durga, Rajasthani miniature of the Mewar school, mid-17th century; in a private collection
PRAMOD CHANDRA

Durga-puja \'důr-gä-'pü-jä\ Hindu festival held annually in northeastern India in September–October in honor of the goddess Durga. Images of the goddess are made, worshiped for nine days, and then immersed in water. The celebration includes colourful processions and much public and private festivity.

Durham See shorthorn

Durham *Saxon* **Dunholme** City (pop., 2001: district, 87,725), administrative and historic county of Durham, northeastern England. It is on a peninsula in the River Wear. This natural defensive site, fortified by William I (the Conqueror) against the Scots, became a seat of the feudal prince-bishops of Durham. Medieval Durham was a place of pilgrimage, holding the remains of St. Cuthbert in its cathedral (begun in 1093). The bishops of Durham helped establish the city as an educational centre. It is the site of the Gulbenkian Museum of Oriental Art and Archaeology, part of the University of Durham.

Durham \'dər-əm\ Administrative (pop., 2001: 493,470), geographic, and historic county, northeastern England. Adjacent to the North Sea coast, it includes the city of Durham. The northern part of the county is cut by the valleys of the Rivers Wear and Tees; the Tees lowlands extend across the south. Under the Romans the region was a military outpost associated with Hadrian's Wall. Durham was later incorporated into the Saxon kingdom of Northumbria. It was unimportant economically until the 19th century, when exploitation of its coalfields, now exhausted, made it a key area of industrial growth in Britain. The area is now a centre of light industry.

Durham, John George Lambton, 1st earl of (b. April 12, 1792, London—d. July 28, 1840, Cowes, Isle of Wight, Eng.) British colonial administrator in Canada. He was a member of the British House of Commons (1813–28) and served in the cabinet of Earl Grey (1830–33). In 1838 he was appointed governor-general and lord high commissioner of Canada. He appointed a new executive council to placate the rebellious French Canadians of Lower Canada (later Quebec). Criticized in England for his action, he resigned. He later issued the Durham Report, which advocated the union of Lower Canada and Upper Canada and the expansion of self-government to preserve Canadian loyalty to Britain.

durian \'důr-ē-ən\ Tree (*Durio zibethinus*) of the bombax family (Bombacaceae) and its fruit, cultivated in Indonesia, the Philippines, Malaysia, and southern Thailand. The tree has oblong, tapering leaves and yellowish green flowers and resembles the elm in shape. The spherical fruit has a hard spiny shell and contains five oval compartments, each filled with an edible, cream-coloured, custardlike pulp, in which are embedded one to five chestnut-sized seeds, which are edible if roasted. The ripe fruits are eaten by many animals. Though the durian has a mild, sweet flavour, it also has a pungent foul odour. It is seldom exported.

Durkheim \důr-'kem**, Émile** (b. April 1858, Épinal, France—d. Nov. 15, 1917, Paris) French social scientist. He developed a vigorous methodology combining empirical research with sociological theory and is widely regarded as the founder of the French school of sociology. Durkheim was greatly influenced by philosopher Auguste Comte, and his sociological reflections, never remote from the moral philosophy he was schooled in, were first expressed in *The Division of Labor in Society* (1893) and *Suicide* (1897). In his view, ethical and social structures were endangered by technology and mechanization. The division of labour produced alienation among workers, and the increased prosperity of the late 19th century generated greed and passions that threatened the equilibrium of society. Durkheim drew attention to anomie, or social disconnectedness, and studied suicide as a decision to renounce life. Following the Dreyfus affair, he came to regard education and religion as the most potent means of reforming humanity and molding new social institutions. His *Elementary Forms of the Religious Life* (1915) is an anthropological study—centring largely on totemism—of the origins and functions of religion, which Durkheim saw as expressing the collective conscience of a society and producing social solidarity. He also wrote influential works on sociological method. He taught at the Universities of Bordeaux (1887–1902) and Paris (1902–17). See also Marcel Mauss.

Durocher \dů-'rō-shər**, Leo (Ernest)** (b. July 27, 1905, West Springfield, Mass., U.S.—d. Oct. 7, 1991, Palm Springs, Calif.) U.S. baseball player and manager. Durocher played for various teams from 1928 to 1938, distinguishing himself by his sharp fielding at shortstop. He gained notoriety as the cheeky, contentious manager of the Brooklyn Dodgers (1939–46, 1948); he was suspended from managing for the entire 1947 season for "conduct detrimental to baseball," a vague charge that was based upon Durocher's reputation for gambling and fast living. He managed the New York Giants 1948–55, left to become a commentator, returned to the game as a coach for the Los Angeles Dodgers (1961–64), and managed the Chicago Cubs (1966–72) and the Houston Astros (1972–73). He is credited with the observation "Nice guys finish last" (what he actually said was, "The nice guys over there are in seventh place").

Durrānī, Aḥmad Shah See Aḥmad Shah Durrānī

Durrell \'də-rəl**, Lawrence (George)** (b. Feb. 27, 1912, Jullundur, India—d. Nov. 7, 1990, Sommières, France) British writer. He spent most of his life in Mediterranean countries, often in diplomatic posts. He is best known for the tetralogy The Alexandria Quartet, composed of the novels *Justine* (1957), *Balthazar* (1958), *Mountolive* (1958), and *Clea* (1960), which explore the erotic lives of a group of exotic characters in Alexandria, Egypt. His poetry—including *Cities, Plains and People* (1946)—and nonfiction books about locales—including *Prospero's Cell* (1945), *Reflections on a Marine Venus* (1953), and *Bitter Lemons* (1957), describing three Greek islands—are often considered his best works.

Dürrenmatt \'dœr-ən-ˌmät**, Friedrich** (b. Jan. 5, 1921, Konolfingen, near Bern, Switz.—d. Dec. 14, 1990, Neuchâtel) Swiss playwright. His plays, showing the influence of Bertolt Brecht as well as the Theatre of the Absurd, were central to the post-1945 revival of the German theatre. In his first three plays, *All as It Is Written* (1947), *The Marriage of Mr. Mississippi* (1952), and *An Angel Comes to Babylon* (1953), he took comic liberties with historical facts to present parables about modern life. His play *The Visit* (1956) and the modern morality play *The Physicists* (1962) earned him international acclaim. After 1970 he wrote adaptations, detective novels, radio plays, and essays. His works have been translated into more than 50 languages.

Duryea \'důr-ˌyā**, Charles E(dgar) and J(ames) Frank** (respectively b. Dec. 15, 1861, Canton, Ill., U.S.—d. Sept. 28, 1938, Philadelphia, Pa.; b. Oct. 8, 1869, Washburn, Ill., U.S.—d. Feb. 15, 1967, Saybrook, Conn.) U.S. automotive inventors. Charles initially worked as a bicycle mechanic. After seeing a gasoline engine at a state fair, he designed a gasoline-powered automobile, and in 1893 he and his brother Frank constructed the first U.S. automobile, which they drove successfully on the streets of Springfield, Mass. In Chicago in 1895, Frank drove an improved model to win the first U.S. auto race. In 1896 their company manufactured the first commercially produced U.S. automobiles; 13 cars were sold before the company failed and the brothers separated. Both started new automobile manufacturing ventures; Frank later developed the Stevens-Duryea limousine, which was produced into the 1920s.

Dusan, Stefan See Stefan Dusan

Duse \'dü-zā**, Eleonora** (b. Oct. 3, 1858, near or in Vigevano, Lombardy, Austrian Empire—d. April 21, 1924, Pittsburgh, Pa., U.S.) Italian actress. Born into a family of touring actors, she appeared on stage from age four. She acted in several French plays to great acclaim from 1878 and toured with her own company in Europe and the U.S. after 1885. She fell in love with the poet Gabriele D'Annunzio in the 1890s and acted in several plays he wrote for her. Unlike her contemporary Sarah Bernhardt, she did not try to project her own personality but instead sought to lose herself in her characters. The most fluent and expressive actress of her day, she was especially noted for her roles in Henrik Ibsen's plays. She retired in 1909 but returned to the stage in 1921 and was touring the U.S. when she died.

Eleonora Duse.

Dushanbe \'dyü-ˌshäm-bə, ˌdyü-shäm-'bā\ *formerly (until 1929)* **Dyushambe** \'dyü-ˌshäm-bə, ˌdyü-shäm-'bā\ *(1929–61)* **Stalinabad** \ˌstä-lyi-nə-'bäd\ City (pop., 1998 est.: 513,000), capital of Tajikistan. It lies on the Varzob River in southwestern Tajikistan. It was built in the Soviet period on the site of three former settlements, the largest of which, Dyushambe, was a part of the khanate of Bukhara; the old city suffered severe damage during the Soviet takeover in 1920. In 1924 it became the capital of the new Tajik Autonomous S.S.R., and rapid industrial and population growth followed. An important transport junction, it accounts for much of the country's industrial output.

Dussek \'dů-sek**, Jan Ladislav** (b. Feb. 12, 1760, Čáslav, Bohemia—d. March 20, 1812, St. Germain-en-Laye, France) Bohemian (Czech) composer and pianist. He toured Europe with great success as a pianist and studied with C.P.E. Bach. He joined his father-in-law's music publishing firm in London (1792–99) but fled England to escape his creditors. He served two princely patrons and spent his last years in the household of Charles-Maurice de Talleyrand. A transitional figure between Classicism and Romanticism, he wrote some 60 violin sonatas, 15 piano concertos, and 30 admired piano sonatas, which may have influenced Ludwig van Beethoven.

Düsseldorf \'dū-səl-ˌdȯrf\ City (pop., 2002 est.: city, 570,765; metro. area, 1,315,736), capital of North Rhine–Westphalia state, western Germany. Located on the Rhine River, it is the administrative and cultural centre of the industrial Rhine-Ruhr area. Chartered in 1288 by the count of Berg, Düsseldorf passed to the Palatinate-Neuberg line in 1609. Although it suffered considerably in the Thirty Years' War and the War of the Spanish Succession, it later revived. It was transferred to Prussia in 1815 and grew rapidly with the establishment of iron and steel industries in the 1870s. Heavily damaged in World War II, its old buildings were repaired and new ones erected. It is the site of the first German skyscraper, the Wilhelm-Marx-Haus (1924). It is the birthplace of Heinrich Heine.

Dust Bowl Section of the U.S. Great Plains that extended over southeastern Colorado, southwestern Kansas, the panhandles of Texas and Oklahoma, and northeastern New Mexico. The term originated after World War I, when the area's grasslands were converted to agricultural fields. In the naturally dry climate, overcultivation added to the effect of a severe drought in the early 1930s, when heavy winds blew the loose topsoil in "black blizzards" that blocked out the sun and piled dirt in drifts. Many farmers and ranchers left the region for California and elsewhere. The planting of windbreaks and grassland enabled the area to recover by the early 1940s.

Dutch East India Co. See Dutch East India Co.

Dutch East Indies See Indonesia

Dutch elm disease Widespread disease that kills elms, caused by the fungus *Ceratocystis ulmi*. It was first identified in the U.S. in 1930, and an eradication campaign could not stop its spread into regions wherever the very susceptible American elm (*Ulmus americana*) grew. The leaves on one or more branches of a stricken tree suddenly wilt, turn dull green to yellow or brown, curl, and may drop early. Because symptoms are easily confused with other diseases, positive diagnosis is possible only through laboratory culturing. The fungus can spread up to 50 ft (15 m) from diseased to healthy trees by natural root grafts. Overland, the fungus normally is spread by the European elm bark beetle (*Scolytus multistriatus*; see bark beetle), less commonly by the American elm bark beetle (*Hylurgopinus rufipes*). Control involves exclusion of the beetles, usually by use of an insecticidal spray applied to the tree.

Dutch Guiana See Suriname

Dutch language West Germanic language spoken by more than 20 million people in The Netherlands, northern Belgium, and a small corner of northern France; it is also an official language in Suriname and the Netherlands Antilles. Though English-speakers are accustomed to calling the main Germanic language of The Netherlands "Dutch" and that of Belgium "Flemish," the two are regarded as the same language, called Nederlands in both countries, where efforts have been made to unify spelling and literary usage. Many Dutch-speakers command both a local dialect and Standard Dutch, based approximately on the speech of the major urban centres of North Holland and South Holland. "Flemish" (or Dutch in Belgium) has its own phonetic and lexical regionalisms.

Dutch Reformed Church See Reformed church

Dutch Republic *officially* **Republic of the United Netherlands** Former state (1581–1795), about the size of the modern kingdom of The Netherlands. It consisted of the seven northern Netherlands provinces that formed the Union of Utrecht in 1579 and declared independence from Spain in 1581 (finally achieved in 1648). Political control shifted between the province of Holland and the princes of Orange. In the 17th century the Dutch Republic developed into a world colonial empire far out of proportion to its resources, emerging as a centre of international finance and a cultural capital of Europe. In the 18th century the republic's colonial empire was eclipsed by that of England. In 1795 the Dutch Republic collapsed under the impact of a Dutch democratic revolution and invading French armies.

Dutch Wars See Anglo-Dutch Wars

Dutchman's-breeches Plant (*Dicentra cucullaria*) of the fumitory family (Fumariaceae) named for its sprays of tremulous, yellow-tipped white flowers that fancifully resemble the wide-legged, traditional pantaloons worn by Dutch men. The plant is native throughout eastern and midwestern North America, usually in open woodlands. The gray-green foliage grows from white underground tubers and is not as tall as the flowering stalk, which also springs directly from the ground.

Dutchman's-breeches (*Dicentra cucullaria*).
JOHN H. GERARD

Dutchman's-pipe Climbing vine (*Aristolochia durior*), also called pipe vine, of the birthwort family (Aristolochiaceae), native to central and eastern North America. It bears heart-shaped or kidney-shaped

leaves and yellowish-brown or purplish-brown tubular flowers resembling a curved pipe. Exhibiting rapid growth, Dutchman's-pipe is often planted as a screen or an ornamental on porches and arbors.

Dutchman's-pipe (*Aristolochia durior*). A.J. HUXLEY

Duvalier \dü-'val-yā**, François** *known as* **Papa Doc** (b. April 14, 1907, Port-au-Prince, Haiti—d. April 21, 1971, Port-au-Prince) President of Haiti (1957–71). After receiving his M.D. in 1934, Duvalier was appointed director general of the National Public Health Service in 1946 under Pres. Dumarsais Estimé. When Estimé was overthrown by Paul Magloire, Duvalier led the opposition and assumed the presidency soon after Magloire's resignation in 1956. He reduced the size of the military and organized the Tontons Macoutes ("Bogeymen"), a private force that terrorized and assassinated alleged foes of his regime. He played on the culture of VODUN to intimidate the opposition as well. Promoting a cult of his person as the semidivine embodiment of the nation, he declared himself president for life in 1964. His regime's corruption and despotism isolated Haiti, the poorest country in the hemisphere, from the rest of the world. His 19-year-old son, Jean-Claude Duvalier ("Baby Doc"; b. 1951), succeeded him on his death. A weak ruler dominated by his mother and later by his wife, Baby Doc instituted slight reforms, but increasing social unrest forced him to flee into exile in France in 1986.

Dvaravati \dvə-'rä-və-tē\ Ancient kingdom of Southeast Asia (fl. 6th–13th centuries). The first MON KINGDOM established in what is now Thailand, it had early commercial and cultural contact with India, which influenced Mon sculpture, writing, law, and governmental forms. Conquered in turn by the Burmans (Burmese), the Khmer, and the Tai (Thai), the Dvaravati Mon passed on Indian culture to their conquerers.

DVD *in full* **digital video disc** *or* **digital versatile disc** Type of optical disc. The DVD represents the second generation of COMPACT-DISC (CD) technology. Like a CD drive, a DVD drive uses a low-power LASER to read digitized (binary) data that have been encoded onto the disc in the form of tiny pits. Because it uses a digital format, a DVD can store any kind of data, including movies, music, text, and graphical images. DVDs are available in single- and double-sided versions, with one or two layers of information per side. Single-sided DVDs have become standard media for recorded motion pictures, largely replacing videotape in the home market. A double-sided, dual-layer version can store about 30 times as much information as a standard CD. DVDs are made in a ROM (read-only memory) format as well as in erasable (DVD-E) and recordable (DVD-R) formats. Though DVD players can usually read CDs, CD players cannot read DVDs. It is expected that DVDs will eventually replace CDs, especially for MULTIMEDIA WORKSTATIONS.

Dvina River, Northern See NORTHERN DVINA RIVER

Dvina River, Western See WESTERN DVINA RIVER

Dvořák \'vȯr-ˌzhäk, də-'vȯr-ˌzhäk**, Antonín (Leopold)** (b. Sept. 8, 1841, Nelahozeves, Bohemia, Austrian Empire—d. May 1, 1904, Prague) Bohemian (Czech) composer. Son of a rural innkeeper and butcher, he was permitted to attend organ school in Prague in 1857. He played viola in a theatre orchestra, often under the Czech nationalist composer BEDŘICH SMETANA, and eventually found employment that left him ample time for composition. JOHANNES BRAHMS assisted in getting Dvořák's works published, and by 1880 his fame had spread throughout Europe. While serving as director of New York's new National Conservatory of Music (1892–95) he composed the symphony *From the New World* (1893), his best-known work, which is thought to be based on black spirituals and other American influences. His music frequently draws on folk tunes and is seen as an expression of Czech nationalism. Highly prolific, he is primarily known for his orchestral and chamber compositions; his works include 9 symphonies, concertos for piano, violin, and cello, 2 serenades, several tone poems, 14 string quartets, 2 piano quartets, and 2 piano quintets. His many piano works include the four-hand *Slavonic Dances* (1878, 1886). His sacred music includes a *Stabat Mater* (1877), a *Requiem* (1890), and a *Te Deum* (1892). Of his 13 operas, only *Rusalka* (1900) is still performed.

dwarf star Any STAR of average or low luminosity, mass, and size, including WHITE DWARF STARS and red dwarf stars. Dwarf stars include most main-sequence stars (see HERTZSPRUNG-RUSSELL DIAGRAM), including the SUN. Their colour can range from blue to red, corresponding to temperatures varying from over 17,500 °F (10,000 °C) to a few thousand degrees.

dwarfism Growth retardation resulting in abnormally short adult stature. It is caused by a variety of hereditary and metabolic disorders. Pituitary dwarfism is caused by insufficient GROWTH HORMONE. Hereditary dwarfisms include achondroplasia, with normal trunk size but short limbs and a large head; hypochondroplasia, similar except for normal head size; and diastrophic dwarfism, with progressive, crippling skeletal deformities. Intelligence is normal in these forms of dwarfism. Some kinds include mental retardation. Dwarfism may also result from inadequate nutrition in early life (see RICKETS).

dybbuk \'di-bək\ In Jewish folklore, a disembodied human spirit that must wander restlessly, burdened by former sins, until it inhabits the body of a living person. Belief in such spirits was common in eastern Europe in the 16th–17th century. Individuals thought to be possessed by a dybbuk were taken to a BA'AL SHEM, who would carry out a rite of EXORCISM. The mystic ISAAC BEN SOLOMON LURIA helped promote belief in dybbukim with his doctrine of the transmigration of souls. The folklorist S. Ansky depicted such a spirit in his classic Yiddish drama *The Dybbuk* (c. 1916).

Dyck, Anthony Van See Anthony VAN DYCK

dye Any of a class of intensely coloured complex organic compounds used to colour textiles, leather, paper, and other materials. Dyes known to the ancients came from plants such as INDIGO and madder (see MADDER FAMILY) or from the shells of mollusks; today most dyes are made from coal tar and PETROCHEMICALS. The chemical structure of dyes is relatively easy to modify, so many new colours and types of dyes have been synthesized. Dye molecules are deposited from solution onto materials in such a way that they cannot be removed by the original solvent. Fibre-reactive dyes form a COVALENT BOND with the fibre. Other dyes require prior application of a mordant, an inorganic material that causes the dye to precipitate as an insoluble salt. Another technique is vat dyeing, in which a soluble colourless compound is absorbed by the fibres, then oxidized (see OXIDATION-REDUCTION) to the insoluble coloured compound, making it remarkably resistant to the fading effects of washing, light, and chemicals. See also AZO DYE.

Dylan \'dil-ən**, Bob** *orig.* **Robert Allen Zimmerman** (b. May 24, 1941, Duluth, Minn., U.S.) U.S. singer and songwriter. He grew up in the iron-range town of Hibbing, Minn., adopted the name of the poet DYLAN THOMAS, and traveled to New York in search of idol WOODY GUTHRIE. In the early 1960s he performed professionally in Greenwich Village coffeehouses and released albums that made him the darling of critics and folk music devotees. "Blowin' in the Wind" and "The Times They Are a-Changin'" became anthems of the civil rights movement. In 1965 he adopted electrically amplified instruments and the rhythms of rock and roll in a major departure. The landmark albums *Highway 61 Revisited* (1965) and *Blonde on Blonde* (1966) established him as a leading figure in rock music, and his lyrics, influenced partly by the BEAT MOVEMENT, brought poetic complexity to pop music. After a motorcycle accident in 1966, he underwent another musical turnabout and released several albums (notably *Nashville Skyline*, 1969) characterized by country music elements and a muted, reflective tone. Among the most praised of his many later albums are *Blood on the Tracks* (1975), *Time Out of Mind* (1997) and *Love and Theft* (2001). He is perhaps the most admired and influential American songwriter of his time.

dynamics Branch of MECHANICS that deals with the MOTION of objects in relation to FORCE, MASS, MOMENTUM, and ENERGY. Dynamics can be divided into two branches, KINEMATICS and kinetics. The foundations of dynamics were laid by GALILEO, who derived the law of motion for falling bodies and was the first to recognize that all changes of velocity of a body are the result of forces. ISAAC NEWTON formulated this observation in his second law of motion (see NEWTON'S LAWS OF MOTION).

dynamite Blasting EXPLOSIVE, patented in 1867 by ALFRED P. NOBEL. Dynamite is based on NITROGLYCERIN but is much safer to handle than nitroglycerin alone. By mixing the nitroglycerin with kieselguhr, a porous silica-containing earth, in proportions that left an essentially dry and granular material, Nobel produced a solid that was resistant to shock but readily explodable by heat or sudden impact. Later, wood pulp was substituted

© 2006 Encyclopædia Britannica, Inc.

as the absorbent, and sodium nitrate was added as an oxidizing agent to increase the strength of the explosive.

dysentery \'di-sᵊn-ˌter-ē\ Infectious intestinal disorder. It is characterized by INFLAMMATION, abdominal pain and straining, and DIARRHEA, often containing blood and mucus. Dysentery is spread in food or water contaminated by feces, often by infected individuals with unwashed hands. Bacillary dysentery (shigellosis), caused by *Shigella* bacteria, may be mild or may be sudden, severe, and fatal. Fluid loss causes DEHYDRATION. Advanced stages include chronic large-intestine ulceration. It is treated with antibiotics, fluid replacement, and sometimes blood transfusion. Amoebic (or amebic) dysentery, caused by the AMOEBA *Entamoeba histolytica*, has two forms, one much like bacillary dysentery and the other chronic and intermittent, sometimes with large-intestine ulcerations. It is treated with drugs that kill the amoeba.

dyslexia \dis-'lek-sē-ə\ Chronic neurological disorder causing inability or great difficulty in learning to read or spell, despite normal intelligence. It inhibits recognition and processing of graphic symbols, particularly those pertaining to language. Symptoms, including very poor reading skills, reversed word and letter sequences, and illegible handwriting, usually become evident in the early school years. With early recognition and specialized approaches to teaching reading, most dyslexics can learn to read. Anomalies have recently been found in reading-related pathways in the brains of dyslexic persons.

dysmenorrhea \ˌdis-ˌme-nə-'rē-ə\ Pain or cramps before or during MENSTRUATION. In primary dysmenorrhea, caused by endocrine imbalances, severity varies widely. Irritability, fatigue, backache, or nausea may also occur. Long assumed to be psychosomatic, it is now known to be due to excess PROSTAGLANDINS, which contract the UTERUS, causing cramps. Pain relievers that block prostaglandin formation can decrease its severity, which may also be eased after childbearing. Secondary dysmenorrhea is caused by other disorders, including genital obstructions, pelvic inflammation, infection, polyps, or tumours. Treatment is directed toward the underlying disorder.

dysphasia See APHASIA

dysplasia \dis-'plā-zhə\ Abnormal formation of a bodily structure or tissue, usually bone, that may occur in any part of the body. Several types are well-defined diseases in humans. In the most common, epiphyseal dysplasia, the ends of children's bones (epiphyses) grow and harden very slowly; DWARFISM often results (sometimes only in the legs), and degenerative joint disease usually develops by middle age. Large dogs bred for narrow hips may have hip dysplasia, with abnormalities involving the head of the thighbone and the hip socket.

Dyushambe See DUSHANBE

Dzerzhinsky \dyir-'zhen-skē**, Feliks (Edmundovich)** (b. Sept. 11, 1877, Dzerzhinovo, near Minsk, Russian Empire—d. July 20, 1926, Moscow, Russia, U.S.S.R.) Russian Bolshevik leader, head of the first Soviet secret-police organization. Son of a Polish nobleman, he was repeatedly arrested for revolutionary activities beginning in 1897. After the Russian Revolution of 1917, he headed the newly created Cheka, which became Soviet Russia's security-police agency. He organized the first concentration camps in Russia and acquired a reputation as a ruthless and fanatical communist. In 1924 he was given control of the Supreme Economic Council.

E. coli \'kō-ˌlī\ *in full* **Escherichia coli** \ˌesh-ə-'ri-kē-ə-'kō-ˌlī\ Species of bacterium that inhabits the stomach and intestines. *E. coli* can be transmitted by water, milk, food, or flies and other insects. Mutations can lead to strains that cause diarrhea by giving off toxins, invading the intestinal lining, or sticking to the intestinal wall. Therapy consists largely of fluid replacement, though specific drugs are effective in some cases. The illness is usually self-limiting, with no evidence of long-lasting effects. However, one dangerous strain causes bloody diarrhea, kidney failure, and death in extreme cases. Proper cooking of meat, washing of produce, and pasteurization of cider prevent infection from contaminated food sources.

e-commerce *in full* **electronic commerce** business-to-consumer and business-to-business commerce conducted by way of the INTERNET or other electronic networks. E-commerce originated in a standard for the exchange of documents during the 1948–49 Berlin blockade and airlift. Various industries elaborated upon the system until the first general standard was published in 1975. The electronic data interchange (EDI) standard is unambiguous, independent of any particular machine, and flexible enough to handle most simple electronic transactions. In addition to standard forms for business-to-business transactions, e-commerce encompasses much wider activity—for example, the deployment of secure private networks (intranets) for sharing information within a company, as well as selective extensions of a company's intranet to collaborating business networks (extranets). A new form of cooperation known as a virtual company, actually a network of firms, each performing some of the processes needed to manufacture a product or deliver a service, has flourished.

e-mail *in full* **electronic mail** Messages and other data exchanged between individuals using COMPUTERS in a network. An e-mail system allows computer users to send text, graphics, and sometimes sounds and animated images to other users. It developed from large organizations using an internal messaging system as a communication link among employees. The mass provision of e-mail addresses for private individuals by INTERNET SERVICE PROVIDERS led to the development of e-mail as a system to supplement or replace communication by letter.

Ea \'ā-ä\ In MESOPOTAMIAN RELIGION, the god of water. He formed a triad of deities with ANU and BEL. Originally a local deity in the city of Eridu, he evolved into the lord of the fresh waters beneath the earth, the god of ritual purification, and a patron of sorcery and incantations. Akkadian mythology makes him the father of MARDUK. His counterpart among the Sumerians was Enki, from whose half-fish, half-goat form the astrological figure of CAPRICORN is derived.

eagle Any of many large, heavy-beaked, big-footed BIRDS OF PREY belonging to the family Accipitridae, found worldwide. Eagles are generally larger and more powerful than HAWKS and may resemble a VULTURE in build and flight characteristics, but they have a fully feathered (often crested) head and strong feet equipped with great curved talons. Most species subsist mainly on live prey, which they generally capture on the ground. Eagles have been a symbol of war and imperial power since Babylonian times. They mate for life. They nest in inaccessible places and use the same nest each year. Species vary from 24 in. to 3.3 ft (60 cm–1 m) long. The SEA EAGLES include the BALD EAGLE. See also GOLDEN EAGLE.

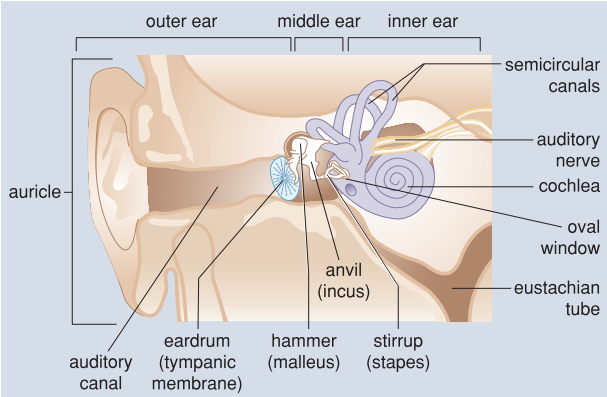
Eagle See F-15

Eakins \'ā-kənz**, Thomas** (b. July 25, 1844, Philadelphia, Pa., U.S.—d. June 25, 1916, Philadelphia) U.S. painter. After early training at the École des Beaux-Arts in Paris (1866–70), he spent most of his life in his native Philadelphia. He reinforced his study of the live model at the Pennsylvania Academy of the Fine Arts by studying anatomy at a medical college. *The Gross Clinic* (1875), depicting a surgical operation, was too realistic for his contemporaries but is now seen as his masterpiece. In 1876 he began teaching at the Pennsylvania Academy, but he was forced to resign in 1886 for working with nude models in mixed classes. In addition to numerous portraits, he painted boating and other outdoor scenes that reflect his fascination with the human body in motion. His interest in locomotion led him to the sequential photography of EADWEARD MUYBRIDGE, and he began producing photographs and sculpture as well as paintings. Perhaps the most outstanding U.S. painter of the 19th century, his work inspired the trend of realism in American painting in the early 20th century.

Eales, John (b. June 27, 1970, Brisbane, Austl.) Australian rugby union player. Between 1990 and 2001 Eales, who stands 6 ft 7 in. (2.01 m), displayed exceptional all-around ability while playing second row forward (lock) for Queensland and Australia. With Australia he won two World Cups (1991, 1999) and two Tri-Nations Cups (2000, 2001) and served as captain of the Wallabies from 1996 to 2001. In 1999 he was awarded the Order of Australia (AM) for services to the community and rugby.

Eames \'ēmz**, Charles and Ray** (respectively b. June 17, 1907, St. Louis, Mo., U.S—d. Aug. 21, 1978, St. Louis; b. Dec. 15, 1912, Sacramento, Calif.—d. Aug. 21, 1988, Los Angeles, Calif.) U.S. designers. Charles was trained as an architect, while Ray (b. Ray Kaiser) studied painting with HANS HOFMANN. After marrying in 1941, they moved to California, where they designed movie sets and researched the uses of plywood for furniture. In 1946 an exhibit of their furniture designs at the Museum of Modern Art, New York City, resulted in the mass production of their molded plywood chairs by the Herman Miller Furniture Co., and their furniture soon became known for its beauty, comfort, and elegance. After 1955 they made educational films, notably *Powers of Ten* (1969). They worked as design consultants to major U.S. corporations, including IBM.



ear Organ of HEARING and balance. The outer ear directs sound vibrations through the auditory canal to the eardrum, which is stretched across the end of the auditory canal and which transmits sound vibrations to the middle ear. There a chain of three tiny bones conducts the vibrations to the INNER EAR. Fluid inside the cochlea of the inner ear stimulates sensory hairs; these in turn initiate the nerve impulses that travel along the auditory nerve to the brain. The inner ear is also an organ of balance: the sensation of dizziness that is felt after spinning is caused when fluid inside the inner ear's semicircular canals continues to move and stimulate sensory hairs after the body has come to rest. The eustachian tube connects the middle ear with the nasal passages; that connection allows the common cold to spread from the nasal passages to the middle ear, especially in infants and small children. The most common cause of hearing loss is otosclerosis, a surgically correctable disease in which one of the bones of the middle ear loses its capacity to vibrate. See also DEAFNESS, OTITIS. See illustration on opposite page.

Earhart \'er-ˌhärt**, Amelia (Mary)** (b. July 24, 1897, Atchinson, Kan. U.S.—disappeared July 2, 1937, near Howland Island, Pacific Ocean) U.S. aviator, the first woman to fly alone across the Atlantic Ocean. Earhart worked as a military nurse in Canada during World War I and later as a social worker in Boston. In 1928 she became the first woman to cross the Atlantic in a plane, though as a passenger. In 1932 she accomplished the flight alone, becoming the first woman and the second person to do so. In 1935 she became the first person to fly solo from Hawaii to California. In 1937 she set out with a navigator, Fred Noonan, to fly around the world; they had completed over two-thirds of the distance when her plane disappeared without a trace in the central Pacific Ocean. Speculation about her fate has continued to the present.

earl See COUNT

Early, Jubal A(nderson) (b. Nov. 3, 1816, Franklin county, Va., U.S.—d. March 2, 1894, Lynchburg, Va.) U.S. and Confederate military leader. He graduated from West Point and served in the second of the SEMINOLE WARS and the MEXICAN WAR. He opposed secession but supported his home state of Virginia when it joined the Confederacy. He fought at the BATTLE OF BULL RUN and in Virginia. In 1864 he led Confederate forces down the SHENANDOAH VALLEY and threatened Washington, D.C., but was defeated by Union troops under PHILIP SHERIDAN. Relieved of his command, he fled to Mexico and then Canada, returning to Virginia in 1869.

Structures of the human ear. The cartilaginous auricle and the auditory canal of the outer ear direct sound waves to the middle ear. The eardrum, stretched across the end of the canal, vibrates as sound waves reach it. Vibrations are transmitted via three small bones (hammer, anvil, stirrup) to the membranous oval window, which links the middle ear to the inner ear. The cochlea is a coiled, fluid-filled tube lined with sensory hairs. Vibrations in the oval window cause movement of the cochlear fluid, stimulating the hairs to initiate impulses that travel along a branch of the auditory nerve to the brain. The eustachian tube, running from the middle ear to the nasopharynx, equalizes pressure between the middle and outer ear. The fluid-filled semicircular canals play a role in balance, as hairs in the canals respond to movement-induced changes in the fluid by initiating impulses that travel to the brain.

Early American furniture Furniture made in the second half of the 17th century by American colonists. The earliest pieces were massive and based on English Jacobean styles. Decoration consisted of carved flower motifs or lunettes and carved scrolls and leaves, sometimes highlighted by painting; oak and pine were the most common woods. Produced in the Connecticut River valley and Massachusetts coastal settlements, it consisted mainly of chests, cupboards, tables, stools, chairs, and beds.

Early Netherlandish art Architecture, painting, sculpture, and other visual arts produced in Flanders in the late 14th and 15th century under the rule of the dukes of Burgundy. In 1384 Philip II the Bold acquired the countship of Flanders by marriage, and the Flemish-Burgundian political alliance remained intact until 1482. Philip embellished the churches and monasteries of his capital, Dijon, with sculpture, especially that of Claus Sluter, and paintings. His grandson, Philip III the Good, patronized the arts on a grander scale, hiring Jan van Eyck and Rogier van der Weyden. Among the masters active until the end of the alliance were Robert Campin, Petrus Christus, Dirck Bouts, Hugo van der Goes, and Hans Memling.

Earnhardt, (Ralph) Dale (b. April 29, 1951, Kannapolis, N.C., U.S.—d. Feb. 18, 2001, Daytona, Fla.) U.S. automobile racer. He earned Rookie of the Year honours on the National Association for Stock Car Auto Racing's Winston Cup series in 1979. In his career he drove to seven Winston Cup titles (1980, 1986–87, 1990–91, 1993–94), equaling the mark of Richard Petty. Earnhardt gained a reputation as an aggressive driver and became known as "the Intimidator." He died from injuries suffered in a crash during the final lap of the 2001 Daytona 500.

Earp \'ərp**, Wyatt (Berry Stapp)** (b. March 19, 1848, Monmouth, Ill., U.S.—d. Jan. 13, 1929, Los Angeles, Calif.) U.S. frontiersman. He worked in the 1870s as a police officer in Wichita and Dodge City, Kan., where he befriended the gunmen Doc Holliday and Bat Masterson. He later worked as a guard for Wells, Fargo & Company. By 1881 he had moved to Tombstone, Ariz., living as a gambler and a saloon guard. His brother Virgil became town marshal, and his other brothers (James, Morgan, and Warren) bought real estate and businesses. A feud with the Clanton gang ended in a shootout at the O.K. Corral in which three of the Clanton gang were killed. In 1882 Morgan was murdered, and in retaliation Wyatt, Warren, and some friends killed two men they suspected of the crime. Accused of murder, Wyatt fled to Colorado and later settled in California. Stuart Lake's *Wyatt Earp, Frontier Marshal* (1931), written with Earp's collaboration, portrayed him as a fearless lawman.

Earth Third planet in distance outward from the Sun. Believed to be about 4.6 billion years old, it is some 92,960,000 mi (149,600,000 km) from the Sun. It orbits the Sun at a speed of 18.5 mi (29.8 km) per second, making one complete revolution in 365.25 days. As it revolves, it rotates on its axis once every 23 hours 56 minutes 4 seconds. The fifth largest planet of the solar system, it has an equatorial circumference of 24,902 mi (40,076 km). Its total surface area is roughly 197,000,000 sq mi (509,600,000 sq km), of which about 29% is land. Earth's atmosphere consists of a mixture of gases, chiefly nitrogen and oxygen. Its only natural satellite, the Moon, orbits the planet at a distance of about 238,860 mi (384,400 km). Earth's surface is traditionally subdivided into seven continental masses: Africa, Antarctica, Asia, Australia, Europe, North America, and South America. These continents are surrounded by four major bodies of water: the Arctic, Atlantic, Indian, and Pacific oceans. Broadly speaking, Earth's interior consists of two regions: a core composed largely of molten, iron-rich metallic alloy; and a rocky shell of silicate minerals comprising both the mantle and crust (see also Moho; lithosphere). Fluid motions in the electrically conductive outer core generate a magnetic field around Earth that is responsible for the Van Allen radiation belts. According to the theory of plate tectonics, the crust and upper mantle are divided into a number of large and small plates that float on and travel independently of the lower mantle. Plate motions are responsible for continental drift and seafloor spreading and for most volcanic and seismic activity on Earth.

Earth's interior may be identified in two distinct ways. In chemical terms, it has three basic layers (left): the crust consists of granitic and basaltic rock, the mantle of silicate materials, and the core primarily of nickel and iron. Measured by physical properties, it has five principal layers (right): the lithosphere is a rigid outer layer, the asthenosphere is a thin layer of plastically deforming material that flows under stress, the mesosphere is a rigid layer that extends down to the core, the outer core is a viscous liquid in which Earth's magnetic field is believed to originate, and the inner core is solid. The layers are not drawn to scale.

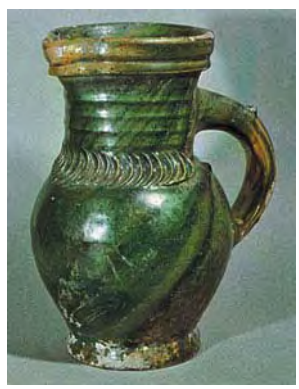
Earth-crossing asteroid Asteroid whose path around the Sun crosses Earth's orbit. Three groups of such asteroids—Aten, Apollo, and Amor asteroids—are distinguished by the size of their orbits and how closely they approach the Sun. The Atens and Apollos cross Earth's orbit on an almost continuous basis, whereas only about half the Amors are Earth crossers and then only part of the time. Astronomers have mounted searches for objects that closely approach Earth, partly to determine whether they may collide with the planet, since early detection might make it possible to avert a catastrophe. According to some estimates,



© 2006 Encyclopædia Britannica, Inc.

1,000 Earth-crossing asteroids larger than 0.6 mi (1 km) may exist. Impacts of 0.6-mi-size asteroids are believed to occur a few times every million years. Such a collision would deliver the explosive force of several HYDROGEN BOMBS, possibly resulting in global climate disturbances or huge tidal waves. The impact of an object about 6 mi (10 km) in diameter is thought to have caused a massive extinction of species, including the DINOSAURS, at the end of the CRETACEOUS PERIOD.

Earth impact hazard The danger of collision with ASTEROIDS and COMETS whose orbits carry them near EARTH. Space around Earth contains vast numbers of objects in a range of sizes, but only the largest, which strike very rarely on average, are thought to pose a great danger. Scientists believe such an impact caused the mass EXTINCTION of DINOSAURS and other species at the end of the CRETACEOUS PERIOD 65 million years ago. In addition to creating tremendous immediate destruction, a large impact could throw great clouds of debris into the atmosphere, cutting off sunlight and causing a prolonged temperature drop—an "impact winter" (similar to a NUCLEAR WINTER) that would kill plant life and bring on worldwide famine. The amount of damage depends primarily on the colliding object's mass and relative velocity. The energy released, expressed in millions of tons (megatons) of TNT, falls between about 10 megatons and 1 billion megatons, corresponding to objects roughly 160 ft (50 m) to 12 mi (20 km) across. The last destructive impact known, the TUNGUSKA EVENT, occurred over Siberia in 1908. Since the 1990s, search programs have scanned for objects on possible collision courses. Should a collision appear likely, nonexplosive projectiles or, in extreme cases, NUCLEAR WEAPONS might succeed in redirecting the object away from Earth.

Earth Summit *officially* **United Nations Conference on Environment and Development** Conference held in Rio de Janeiro (June 3–14, 1992) to reconcile worldwide economic development with environmental protection. It was the largest gathering of world leaders in history, with 117 heads of state and representatives of 178 countries. Biodiversity, GLOBAL WARMING, sustainable development, and preservation of tropical rain forests were among the topics discussed. Five international agreements were signed amid tensions between the industrialized countries of the North and the poorer developing states of the South, who were reluctant to accept environmental restrictions without increased Northern economic aid. Follow-up meetings were held in 1997 at the UN General Assembly in New York and in 2002 in Johannesburg, S.Af. See also RIO TREATY.

earthenware POTTERY that has been fired at low heat and is slightly more porous and coarser than STONEWARE and PORCELAIN. For practical and decorative purposes, it is usually glazed. The earliest known pottery, a soft earthenware excavated at a Neolithic settlement in Turkey, is thought to be about 9,000 years old. Earthenware is still widely used for cooking, freezing, and serving. See also CREAMWARE.

Lead-glazed earthenware water pot, Paris, 15th century, in the National Museum of Ceramics, Sèvres, France.

earthquake Sudden shaking of the ground caused by a disturbance deeper within the crust of the Earth. Most earthquakes occur when masses of rock straining against one another along FAULT lines suddenly fracture and slip. The Earth's major earthquakes occur mainly in belts coinciding with the margins of tectonic plates. These include the Circum-Pacific Belt, which affects New Zealand, New Guinea, Japan, the Aleutian Islands, Alaska, and the western coasts of North and South America; the Alpide Belt, which passes through the Mediterranean region eastward through Asia; oceanic ridges in the Arctic, Atlantic, and western Indian oceans; and the rift valleys of East Africa. The "size," or magnitude, of earthquakes is usually expressed in terms of the RICHTER SCALE, which assigns levels from 1.0 or lower to 8.0 or higher. The largest quake ever recorded (Richter magnitude 9.5) occurred off the coast of Chile in 1960. The "strength" of an earthquake is rated in intensity scales such as the Mercalli scale, which assigns qualitative measures of damage to terrain and structures that range from "not felt" to "damage nearly total." The most destructive quake of modern times occurred in 1976, when the city of Tangshan, China, was leveled and more than 250,000 people killed. See also SEISMIC WAVE; SEISMOLOGY.

earthquake-resistant structure Building designed to prevent total collapse, preserve life, and minimize damage in case of an earthquake or tremor. Earthquakes exert lateral as well as vertical forces, and a structure's response to their random, often sudden motions is a complex task that is just beginning to be understood. Earthquake-resistant structures absorb and dissipate seismically induced motion through a combination of means: damping decreases the amplitude of oscillations of a vibrating structure, while ductile materials (e.g., steel) can withstand considerable inelastic deformation. If a skyscraper has too flexible a structure, then tremendous swaying in its upper floors can develop during an earthquake. Care must be taken to provide built-in tolerance for some structural damage, resist lateral loading through stiffeners (diagonal sway bracing), and allow areas of the building to move somewhat independently.

earthshine Sunlight reflected from Earth, especially that reflected onto the dark side of the MOON. For a few days before and after each new moon, this doubly reflected light is powerful enough to make the whole Moon visible, producing the effect, in the case of the new moon, of "the new moon holding the old moon in her arms."

Earthshine on the moon.
COURTESY OF YERKES OBSERVATORY, WISCONSIN

earthworm Any of more than 1,800 species of terrestrial WORMS, particularly members of the genus *Lumbricus* (class Oligochaeta of the ANNELID order). Earthworms exist in all soils of the world that have sufficient moisture and organic content. The most common U.S. species, *L. terrestris,* grows to about 10 in. (25 cm), but an Australian species can grow as long as 11 ft (3.3 m). The segmented body is tapered at both ends. Earthworms eat decaying organisms and, in the process, ingest soil, sand, and pebbles, which aerates the soil, promotes drainage, and improves the soil's nutrient content for plants. Earthworms are eaten by many animals.

Earthworm (*Lumbricus terrestris*).
JOHN MARKHAM

earwig Any of about 1,100 insect species (order Dermaptera) characterized by large membranous hind wings that lie hidden under short, leathery forewings. Species vary from 0.2 to 2 in. (5 to 50 mm) long, and all are flat, slender, and dark, with a shiny outer covering and simple biting mouthparts. Several species can shoot a foul-smelling liquid, formed in abdominal glands, as far as 4 in. (10 cm). Earwigs have a pair of forceps-like tail pincers (cerci) at the back end of the abdomen that may function in defense, capturing prey, folding wings, or fighting courtship battles.

easement In Anglo-American property law, an interest in land owned by another that entitles its holder to a specific limited use or enjoyment, such as the right to cross the land or have a view over it continue unobstructed. It may be created expressly by a written deed of grant conveying the specific usage right, or it may be created by implication, as when an owner divides property into two parcels in such a way that an already existing, obvious, and continuous use of one parcel (e.g., for access) is necessary for the reasonable enjoyment of the other. Some U.S. states permit the creation of an easement by prescription (acquisition of an interest), as when one person makes continuous use of another's land for some specified period of time (e.g., 20 years). Utility companies often own easements in gross; these are not dependent on ownership of the surrounding estate. Numerous other kinds of easements have been important in Anglo-American law. See also REAL AND PERSONAL PROPERTY.

East, Edward Murray (b. Oct. 4, 1879, Du Quoin, Ill., U.S.—d. Nov. 9, 1938, Boston, Mass.) U.S. plant geneticist, agronomist, and chemist.

© 2006 Encyclopædia Britannica, Inc.

He finished high school at age 15 and received an M.S. in 1904. He was particularly interested in determining and controlling the protein and fat content of corn, both of which significantly influence its value as animal feed. His research, with that of George Harrison Shull, led to the development of modern-day hybrid corn. Commercial production of hybrid seed corn was made possible by the work of his student Donald F. Jones (1890–1963). East's work helped make possible studies in the field of population genetics.

East African Rift System See Great Rift Valley

East Anglia Traditional region of England. It consists of the historic counties of Norfolk and Suffolk and parts of Cambridgeshire and Essex, and its traditional centre is the city of Norwich. The easternmost area in England, it has been settled for thousands of years. Colchester, the oldest recorded town in England, was important in pre-Roman and Roman times. East Anglia was one of the kingdoms of Anglo-Saxon England, and it was ruled by Danes in the 9th century. During the medieval period it was known for its woolen products, but the region's modern economy is predominantly agricultural. Along the coast are many important fishing ports and holiday resorts.

East Asian arts Visual, literary, and performing arts of China, Korea, and Japan. Painting and calligraphy are considered the only true fine arts in China because they alone require no physical labour and have no physical function. Sculpture is considered to be a craft, as are bronze casting, carving, and the making of pottery, textiles, metalwork, and lacquerware. Chinese architecture is characterized by timber buildings, and a building typically consists of a platform, a post-and-lintel frame, a system of roof-supporting brackets, and a heavy, sloping roof. Japanese visual arts have been strongly influenced by three elements: Chinese visual arts, indigenous themes and traditions, and Buddhist iconography. The Hōryū Temple (7th century) initiated the distinctive Japanese architectural approach: asymmetrical layouts following the contours of the land. Japanese artists' fascination with abstraction from nature is most notable in screen and panel paintings of the 16th–18th centuries and the polychrome woodcut, which evolved into the popular ukiyo-e print. Among the remarkable features of Korean art might be noted the use of stone in architecture and sculpture and the development of an outstanding celadon glaze. Chinese literature has the longest continuous history of any literature in the world (more than 3,000 years). It is inextricably bound to the development of the characters of the written language it has shared with both Korea and Japan. Korean literature includes an oral tradition of ballads, legends, mask plays, puppet-show texts, and *p'ansori* ("story singing") texts and a strong written tradition of poetry (notably *hyangga* and *sijo* forms). Like Korean literature, Japanese literature owes a debt to Chinese, since neither country had its own written language (though Japanese syllabary systems emerged about 1000, and Korean Hangul was developed in the 15th century). The earliest Japanese literature dates to the 7th century; in addition to its several literary monuments such as *The Tale of Genji*, Japanese poetry (particularly in the haiku form) is known throughout the world for its exquisite delicacy. Despite a different basis for its establishment, the East Asian music system, like Western music, developed a pentatonic scale based on a 12-tone vocabulary. The preferred size of the East Asian ensemble is small, and compositions emphasize melody and rhythm over harmonics. In the related categories of East Asian dance and theatre, it is noteworthy that in the East Asian countries, music, dance, and drama are typically linked, and there is little evidence of separate evolution of form. The several forms of East Asian performing arts include both masked and unmasked dances, masked dance theatre (as in Japanese *nō* and Korean *sandae*), danced processionals, dance opera (*jingxi*, or "Peking," and other forms of Chinese opera), shadow theatre, puppet theatre, and dialogue plays with music and dance (e.g., Japanese kabuki). See also Fujiwara style; ikebana; Jōgan style paper folding; scroll painting; shinden-zukuri; shoin-zukuri; sukiya style; Tempyō style; Tori style; as well as individual artists such as Bashō; Bo Juyi; Du Fu; Hiroshige Ando; Lu Xun; Murasaki Shikibu.

East China Sea See China Sea

East India Co. *or* **English East India Co.** English chartered company formed for trade with East and Southeast Asia and India, incorporated in 1600. It began as a monopolistic trading body, establishing early trading stations at Surat, Madras (now Chennai), Bombay (Mumbai), and Calcutta (Kolkata). Trade in spices was its original focus; this broadened to include cotton, silk, and other goods. In 1708 it merged with a rival and was renamed the United Co. of Merchants of England Trading to the East Indies. Becoming involved in politics, it acted as the chief agent of British imperialism in India in the 18th–19th century, exercising substantial power over much of the subcontinent. The company's activities in China in the 19th century served as a catalyst for the expansion of British influence there; its financing of the tea trade with illegal opium exports led to the first Opium War (1839–42). From the late 18th century it gradually lost both commercial and political control; its autonomy diminished after two acts of Parliament (1773, 1774) established a regulatory board responsible to Parliament, though the act gave the company supreme authority in its domains. It ceased to exist as a legal entity in 1873. See also Dutch East India Co., French East India Co.

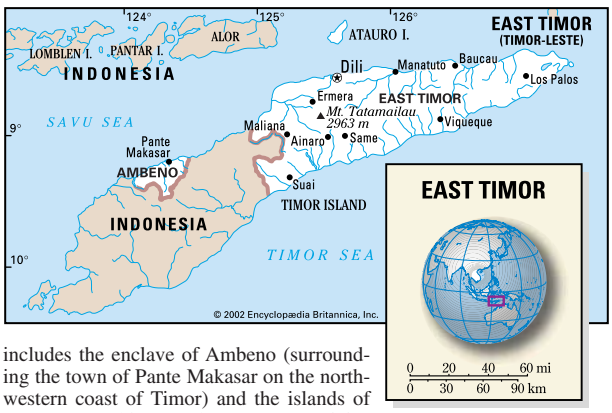
East India Co., Dutch Trading company founded by the Dutch in 1602 to protect their trade in the Indian Ocean and to assist in their war of independence from Spain. The Dutch government granted it a trade monopoly in the waters between the Cape of Good Hope and the Straits of Magellan. Under the administration of forceful governors-general, it was able to defeat the British fleet and largely displace the Portuguese in the East Indies. It prospered through most of the 17th century but then began to decline as a trading and sea power; it was dissolved in 1799. See also East India Co., French East India Co.

East India Co., French Trading company founded by Jean-Baptiste Colbert in 1664, and its successors, established to oversee French commerce with India, East Africa, and other territories of the Indian Ocean and the East Indies. In constant competition with the already-established Dutch East India Co., it mounted expensive expeditions that were often harassed by the Dutch. It also suffered in the French economic crash of 1720, and by 1740 the value of its trade with India was half that of the English East India Co. Its monopoly over French trade with India was ended in 1769, and it languished until its disappearance in the French Revolution.

East Pacific Rise Submarine linear mountain range on the floor of the South Pacific Ocean, roughly paralleling the western coast of South America. The main portion of the rise lies generally about 2,000 mi (3,200 km) off the coast, and it lies about 6,000–9,000 ft (1,800–2,700 m) above the surrounding seafloor. The East Pacific Rise has a generally smooth and flattish surface, and it drops sharply away at the sides. It is composed largely of basic igneous crust, overlain or abutted by more or less flat-lying sediments.

East Prussia *German* **Ostpreussen** \'ōst-ˌprȯis-ᵊn\ Historical region and former Prussian province, east of Pomerania. From 1815 it was known as East Prussia, part of the kingdom of Prussia, and in the 19th century it was a stronghold of Prussian Junkers, a military aristocracy. It was the scene of successful resistance against the Russians in World War I. Following the war, it was separated from the rest of Germany by the Polish Corridor (1919); it was reunited with the Reich by the German conquest of Poland in 1939. Between World War I and World War II, it was bounded to the north by the Baltic Sea, east by Lithuania, and south and west by Poland and the free city of Danzig (now Gdańsk, Pol.). Overrun by Soviet armies at the end of World War II, in 1945 it was divided between the Soviet Union and Poland.

East River Navigable tidal strait in the U.S. linking Upper New York Bay with Long Island Sound in New York City. It separates Manhattan and the Bronx from Brooklyn and Queens. About 16 mi (26 km) long and 600–4,000 ft (200–1200 m) wide, it connects with the Hudson River via the Harlem River and Spuyten Duyvil Creek at the northern end of Manhattan Island. Roosevelt (formerly Welfare), Wards, Randalls, and Rikers islands are in the East River, which has numerous port facilities.



East Saint Louis Race Riot (July 1917) Outbreak of violence in East St. Louis, Ill., sparked by the employment of African Americans in a factory holding government contracts. It was the worst of several attacks during World War I on African Americans newly employed in war industries. Some 6,000 African Americans were driven from their homes and 40 were killed; 8 whites were killed.

East Sussex Administrative and geographic county (pop., 2001: 492,324), southeastern England. It is located on the English Channel; the county's administrative centre is in Lewes. A ridge of chalk hills, the South Downs, crosses the county along the coast; in the southeast the reclaimed marshes of Pevensey Levels have historically been an important entry point for invaders. Neolithic remains and an Iron Age hill fort have been

© 2006 Encyclopædia Britannica, Inc.

found, as well as evidence of Roman occupation. The South Saxons came to dominate the area, and they were in turn subjugated by Wessex. In 1066 William of Normandy (see William I) landed at Pevensey and fought the Battle of Hastings. Along the coast, Hove, Brighton, Peacehaven, Seaford, Eastbourne, Bexhill, and Hastings form an ever-lengthening line of resorts.

East Timor *officially* **Democratic Republic of Timor-Leste** Country occupying the eastern half of the island of Timor, Southeast Asia. Bounded by the Timor Sea and by the western half of Timor, it also

includes the enclave of Ambeno (surrounding the town of Pante Makasar on the northwestern coast of Timor) and the islands of Atauro (Kambing) and Jaco. Area: 5,639 square miles (14,604 square km). Population (2005 est.): 975,000. Capital: Dili. Languages: Tetum and Portuguese (both official). Religions: Christianity (predominantly Roman Catholic; also Protestant); also Islam, traditional beliefs. Currency: U.S. dollar. The Portuguese first settled on Timor in 1520 and were granted rule over Timor's eastern half in 1860. The Timor political party Fretilin declared East Timor independent in 1975 after Portugal withdrew its troops. It was invaded by Indonesian forces and annexed to Indonesia in 1976. The takeover, which resulted in the deaths of thousands of East Timorese during the next two decades, was disputed by the United Nations. In 1999 an independence referendum won overwhelmingly; though Indonesia officially recognized the referendum, anti-independence militias killed hundreds of people and sent thousands fleeing to the western part of the island before and after the vote. A UN-administered interim authority imposed order and oversaw elections, the promulgation of a constitution, and the return of refugees; East Timor became a sovereign nation in 2002.

East-West Schism See Schism of 1054

East York Borough (pop., 2001: 115,185), southeastern Ontario, Canada. With the cities of North York, Toronto, Scarborough, York, and Etobicoke, it forms the municipality of Metropolitan Toronto. A planned industrial and residential urban complex, it was established in 1967 through the amalgamation of the former East York township (created in 1924) and the former town of Leaside (settled 1819).

Easter Major festival of the Christian church year, celebrating the resurrection of Jesus on the third day after his crucifixion. In Western churches it falls on a Sunday between March 22 and April 25, depending on the date of the first full moon after the spring equinox. This time span was fixed after the Council of Nicaea (ad 325). In the Eastern Orthodox calendar, which uses a different calculation, it often falls later. A joyful festival and a time of redemption, Easter brings an end to the long period of penance that constitutes Lent. The word is sometimes said to have been derived from Eostre, a Germanic goddess of spring, but other origins of the term more closely associated with Christian traditions have been proposed. Easter has acquired a number of religious and popular customs. The Easter worship service is one of the high points of the Christian calendar, and since the late 2nd century Easter has also been a time for baptism. The painting of eggs and tales of a rabbit who decorates and hides eggs are among the folk customs associated with the holiday.

Easter Island *Spanish* **Isla de Pascua** *native* **Rapa Nui** \'rä-pä-'nü-ē\ Island (pop., 2002: 3,791), eastern Pacific Ocean. Located 2,200 mi (3,600 km) west of Chile, it has an area of 63 sq mi (163 sq km). Initially inhabited c. ad 400 by Polynesians from the Marquesas, Easter Island has long been famous for its monolithic stone statues in human form. They are some 10–40 ft (3–12 m) high, the heaviest weighing about 82 tons. They were probably erected c. ad 1000–1600. War and disease decimated the island's population over the succeeding centuries, and the statues' origins were forgotten. Annexed by Chile in 1888, the island was designated a UNESCO World Heritage site in 1995.

Easter Rising *or* **Easter Rebellion** (1916) Republican insurrection in Ireland against the British, which began on Easter Monday, April 24. Led by Patrick Pearse and Tom Clarke, some 1,560 Irish Volunteers and 200 members of the Irish Citizen Army seized the Dublin General Post Office and other strategic points in Dublin. After five days of fighting, British troops put down the rebellion, and 15 of its leaders were tried and executed. Though the uprising itself had been unpopular with most of the Irish, the executions caused revulsion against the British authorities. The uprising heralded the end of British power in Ireland.

Eastern Air Lines, Inc. Former U.S. airline that served primarily the eastern U.S. Founded in 1928 as Pitcairn Aviation, Inc., it was incorporated in 1938 with Eddie Rickenbacker as its president. It flourished for several decades, adding flights to the Caribbean and South America. Severe financial reverses in the mid-1980s led to its sale to Texas Air Corp. in 1986 and its liquidation in 1991.

Eastern Catholic Church See Eastern Rite Church

Eastern Hemisphere Part of the Earth east of the Atlantic Ocean. It includes Europe, Asia, Australia, and Africa. Longitudes 20° W and 160° E are often considered its boundaries.

Eastern Indian bronze *or* **Pala bronze** Metal sculptures produced from the 9th century in the area of modern Bihar and West Bengal in India, extending into Bangladesh. Made of an alloy of eight metals and produced by lost-wax casting, they represent various divinities (e.g., Shiva, Vishnu) and are small and portable. Produced in the great Buddhist monasteries and distributed throughout South Asia, they influenced the art of Burma (Myanmar), Siam (Thailand), and Java.

Eastern Orthodoxy *officially* **Orthodox Catholic Church** One of the three major branches of Christianity. Its adherents live mostly in Greece, Russia, the Balkans, Ukraine, and the Middle East, with a large following in North America and Australia. The titular head of Eastern Orthodoxy is the ecumenical patriarch of Constantinople (Istanbul), but its many territorial churches (including the huge Russian Orthodox church and the Greek Orthodox church) are governed autonomously by head bishops or patriarchs, who must be unmarried or widowed even though lower orders of the clergy may marry. Eastern Orthodoxy also boasts a strong monastic tradition. The separation of the Eastern churches from the Western, or Latin, branch began with the division of the Roman Empire into two parts under Constantine I. A formal break was made in 1054 (see Schism of 1054). Doctrinally, Eastern Orthodoxy differs from Roman Catholicism in that it does not accept the primacy of the pope or the clause in the Western creed that states that the Holy Spirit proceeds from both the Father (God) and the Son (Jesus). The Orthodox church accepts the decisions of the seven ecumenical councils as well as several later ones. It maintains that there are seven sacraments and has a worship service that is theologically and spiritually rich. In the early 21st century, Eastern Orthodoxy had more than 200 million adherents worldwide.

Eastern rite church *or* **Eastern Catholic church** Any of several Eastern Christian churches that trace their origins to ethnic or national Eastern churches but are united with the Roman Catholic church (see Roman Catholicism). A few of these churches became associated with Rome in the 12th century, but most trace their origins to the failure to unite Eastern and Western churches at the Council of Ferrara-Florence in 1439 or to churches that rejoined Rome in the 16th century or later. Eastern rite churches acknowledge the authority of the pope but are allowed to use their own ancient liturgies and to maintain rites and customs more typical of Eastern Orthodoxy, such as allowing priests to marry and admitting infants to Holy Communion. The Eastern rite includes the Ukrainian Orthodox church, the Maronite Church, and some Armenians, Ruthenians, and Melchites (in Syria). Today Eastern Catholics number more than 12 million.

Eastern Woodlands Indian Any member of the various North American Indian peoples of the largely wooded area stretching east from the Mississippi River valley to the Atlantic coastline and extending north into Canada and south as far as what are now the U.S. states from Illi-

© 2006 Encyclopædia Britannica, Inc.

nois to North Carolina. The Indians in this region spoke Iroquoian, Algonquian, and Siouan languages. The heaviest population concentrations were near or along the seacoast, lakes, ponds, marshes, creeks, and rivers. There animals could be hunted, fish caught, birds taken, leaves, seeds, and roots of wild plants gathered, shellfish collected, and crops grown. Certain areas were favoured with resources not found elsewhere in the region. In certain parts of the upper Great Lakes area, wild rice (*Zizania aquatica*) grew in abundance, and the Menominee especially depended on it. In addition to the Menominee, Eastern Woodlands groups include the Abenaki, Woodland Cree, Delaware, Fox, Huron, Illinois, Iroquois, Mohican, Miami, Micmac, Mohawk, Mohegan, Montagnais and Naskapi, Ojibwa, Oneida, Ottawa, Pequot, Powhatan, Sauk, Seneca, Tuscarora, and Winnebago.

Eastman, George (b. July 12, 1854, Waterville, N.Y., U.S.—d. March 14, 1932, Rochester, N.Y.) U.S. inventor and manufacturer. Eastman in 1880 perfected a process for making dry plates for photography. In 1889 he introduced transparent film, and in 1892 he reorganized his Rochester company as the Eastman Kodak Co. The introduction of the first Kodak (a coined word that became a trademark) camera helped promote large-scale amateur photography. By 1927 Eastman Kodak had a virtual monopoly of the U.S. photographic industry, and it has remained one of the largest American companies in its field. Eastman's generous bequests to the University of Rochester were acknowledged in the naming of the Eastman School of Music.

Eastman Kodak Co. Major U.S. manufacturer of film, cameras, photographic supplies, and other imaging products. The company was incorporated in 1901 as the successor to a business founded in 1880 by George Eastman, whose innovations included the perfection of a process for making dry plates, roll film (1884), and the Kodak camera (1888), the first camera simple and portable enough to appeal to large numbers of amateur photographers. The company's later innovations included the first home-movie equipment, the easy-to-use Kodachrome color slide film, the cartridge-loaded Instamatic cameras, and the highly automatic Disc cameras. Its headquarters are in Rochester, N.Y. See also Polaroid Corp.

Eastwood, Clint(on) (b. May 31, 1930, San Francisco, Calif., U.S.) U.S. actor and director. He won attention in the television series *Rawhide* (1959–66) before his roles in three of Sergio Leone's "spaghetti westerns" (1964–66) made him an international star. He returned to the U.S. for the successful *Dirty Harry* (1971), the first of a series of action films in which he played laconic and dangerous heroes. He combined directing with acting in films such as *Play Misty for Me* (1971), *Pale Rider* (1985), *Unforgiven* (1992, Academy Award), *A Perfect World* (1993), *The Bridges of Madison County* (1995), and *Million Dollar Baby* (2004, Academy Award). His interest in jazz led him to direct and produce *Bird* (1988), about Charlie Parker. His minimalist style of acting and direction garnered critical acclaim to accompany his long-established box-office success.

eating disorders Abnormal eating patterns, including anorexia nervosa, bulimia, compulsive overeating, and pica (appetite for nonfood substances). These disorders, which usually have a psychological component, may lead to underweight, obesity, or malnutrition.

Eaton, Cyrus S(tephen) (b. Dec. 27, 1883, Pugwash, Nova Scotia, Can.—d. May 9, 1979, near Cleveland, Ohio, U.S.) U.S.-Canadian industrialist and philanthropist. Entering business in 1907, he built several electric-power plants in western Canada and soon diversified into other utilities, banking, and steel in the U.S. In 1930 he merged several steel companies to form Republic Steel, the third-largest U.S. steel company. He lost most of his fortune in the Great Depression but subsequently made another one. An advocate of nuclear disarmament and improved Soviet-U.S. relations, he helped inaugurate the Pugwash Conferences in 1957.

EB virus See Epstein-Barr virus

Ebadi, Shirin (b. 1947, Hamadan, Iran) Iranian lawyer, writer, and teacher. After earning a law degree from the University of Tehrān (1969), Ebadi became one of the first women judges in Iran but was forced to resign after the 1979 revolution and the establishment of an Islamic republic. She then practiced law, taught at the University of Tehrān, and became noted for her efforts to promote democracy and human rights, especially those of women and children in Iran. In 2000 she was briefly jailed after distributing evidence that implicated government officials in the murder of university students in 1999. Found guilty of "disturbing public opinion," she was given a prison term, barred from practicing law for five years, and fined, although her sentence was later suspended. In 2003 Ebadi was awarded the Nobel Prize for Peace, becoming the first Muslim woman and the first Iranian to receive the award.

Ebb, Fred See John Kander

Ebbinghaus \'e-biŋ-ˌhaůs**, Hermann** (b. Jan. 24, 1850, Barmen, Rhenish Prussia—d. Feb. 26, 1909, Halle, Ger.) German psychologist. He pioneered in experimental methods for measuring rote learning and memory, demonstrating that memory is based on associations. His well-known "forgetting curve" relates forgetting to the passage of time. His major works are *Memory* (1885) and *Principles of Psychology* (1902).

Ebert \'ā-bert**, Friedrich** (b. Feb. 4, 1871, Heidelberg, Ger.—d. Feb. 28, 1925, Berlin) German politician. A journeyman saddler and trade unionist, he became chairman of the German Social Democratic Party in 1913. Under his leadership, the Social Democratic movement gained increasing influence in German national politics. After revolution broke out in 1918, he formed a Socialist coalition government. He helped bring about the Weimar constitution and in 1919 was elected the first president of the Weimar Republic. Facing threats to the new government, he waged a civil war, assisted by the Freikorps, against Socialists and Communists and suppressed the Kapp Putsch. His authority was weakened in 1923 by the crisis over the Ruhr occupation, his party's withdrawal from the governing coalition, and Adolf Hitler's abortive Beer Hall Putsch. He died in office.

Ebla *modern* **Tell Mardīkh** \'tel-'mär-dik̲\ Ancient city, northwestern Syria. Located south of Aleppo, it dominated what is now northern Syria, Lebanon, and parts of northern Mesopotamia during the height of its power (c. 2600–2240 BC) and enjoyed trade with states as far away as Egypt, the Iranian plateau, and Sumer. The city's archives, dating to the 3rd millennium BC, were discovered virtually intact during excavations in 1975; they offer a rich source of information about the area's ancient way of life.

Ebola \ē-'bō-lə\ Virus responsible for a severe and often fatal hemorrhagic fever. Outbreaks in primates, including humans, have been recorded. Initial symptoms are fever, severe headaches and muscle aches, and loss of appetite; blood clots and profuse uncontrollable hemorrhaging appear within days, followed by nausea, vomiting, and diarrhea. Death occurs in 8–17 days; fatality rates range from 50% to 90%. There is no known treatment. It takes its name from the Ebola River in northern Congo (Zaire), where it first emerged in 1976. The virus appears as long filaments, sometimes branched or intertwined. The virus particle contains one molecule of RNA. How it attacks cells is unknown. It can be transmitted through contact with bodily fluids; unsanitary conditions and lack of adequate medical supplies have been factors in its spread.

ebony Wood of several species of trees of the genus *Diospyros* (family Ebenaceae), found widely in the tropics. The best is very heavy, almost black, and from heartwood only. Because of its colour, durability, hardness, and ability to take a high polish, ebony is used for cabinetwork and inlaying, piano keys, knife handles, and turned articles. The best Indian and Ceylon ebony is produced by *D. ebenum*, which grows in abundance west of Trincomalee in Sri Lanka. Jamaica, American, or green ebony comes from *Brya ebenus*, a leguminous tree or shrub.

Ebro \'ā-ˌbrō\ **River** *ancient* **Iberus** River, northeastern Spain. Rising in the Cantabrian Mountains and flowing 565 mi (910 km) in a southeasterly course to the Mediterranean Sea, between Barcelona and Valencia, the Ebro is the longest river wholly in Spain and the second longest in the Iberian Peninsula. It has the greatest discharge and the largest drainage basin of any Spanish river. It is navigable for only 15 mi (25 km) upstream from its delta.

Eça de Queirós \'ē-sə-də-'kā-ˌrüsh**, José Maria de** *or* **José Maria de Eça de Queiroz** (b. Nov. 25, 1845, Póvoa do Varzim, Port.—d. Aug. 16, 1900, Paris, France) Portuguese novelist. The illegitimate son of a magistrate, he began a career in law but turned to writing; later he held several diplomatic posts. He was associated with the Generation of '70, a group of intellectuals committed to social and artistic reform. His novels, in which he introduced naturalism and realism to Portuguese fiction, include *The Sin of Father Amaro* (1876), *Cousin Bazilio* (1878), and his masterpiece, *The Maias* (1888), a satire exploring the consequences of decadence in Portuguese society. He is often considered his country's greatest novelist.

eccentric and rod mechanism Arrangement of mechanical parts used to obtain a reciprocating straight-line motion from a rotating shaft. It serves the same purpose as a slider-crank mechanism and is particularly

© 2006 Encyclopædia Britannica, Inc.

useful when the required stroke of the reciprocating motion is small in comparison with the dimensions of the driving shaft. Because an eccentric can be attached anywhere along a shaft, it is unnecessary to form any part of the shaft into a CRANK. Eccentrics are seldom used to transmit large FORCES because FRICTION loss would be high; they are commonly used to drive the valve gears of engines.

Eccles \'ek-əlz**, W(illiam) H(enry)** (b. Aug. 23, 1875, Barrow-in-Furness, Lancashire, Eng.—d. April 29, 1966, Oxford, Oxfordshire) English physicist. After receiving his doctorate from the Royal College of Science, he became an early advocate of OLIVER HEAVISIDE's theory that an upper layer of the atmosphere reflects radio waves, enabling their transmission over long distances. In 1912 he suggested that solar radiation accounted for wave-propagation differences between day and night.

Ecclesia \ə-'klē-zē-ə\ (Greek, *ekklesia*: "gathering of those summoned") In ancient Greece, the assembly of citizens in a CITY-STATE. The Athenian Ecclesia already existed in the 7th century; under SOLON it consisted of all male citizens age 18 and older. It controlled policy, including the right to hear appeals in the public court, elect ARCHONS, and confer special privileges. After discussion, members voted by a show of hands; a simple majority determined the results. The body could not initiate new business, since motions had to originate in the BOULE. Ecclesias existed in most Greek city-states through Roman times, though their powers faded under the empire.

ecclesiastical heraldry Arms associated with the administrative and collegiate bodies of a church, particularly the Anglican, Roman Catholic, and Presbyterian churches. Abbeys, priories, and dioceses have their own arms, and high ecclesiastical functionaries have always added their personal arms. See also coat of ARMS; HERALDRY.

Ecevit \ˌe-je-'vēt**, Bülent** (b. May 28, 1925, Constantinople, Tur.) Turkish poet, journalist, and politician. A writer for the newspaper of the Republican People's Party (RPP), he was elected as a RPP member to the Turkish parliament in 1957. As minister of labour (1961–65), he made the strike a legal weapon for labour for the first time in Turkish history. He became head of the RPP in 1972 and served as prime minister of Turkey, first in the 1970s and later from 1999 to 2002. As head of government, he declared an amnesty for all political prisoners and in 1974 authorized Turkey's military intervention in Cyprus after the Greek-led coup on that island.

Echegaray \ˌā-chā-gä-'rī\ **(y Eizaguirre) , José** (b. April 19, 1832, Madrid, Spain—d. Sept. 4, 1916, Madrid) Spanish dramatist. A mathematics professor in his early life, he later held government positions, including minister of finance, and helped develop the Banco de España. His first play, *The Checkbook*, was not produced until he was 42 years old; from then on he wrote an average of two plays a year for the rest of his life. These melodramas, now forgotten, were very popular in his day, and he was admired for his fertile imagination and his skillful stage effects. With FRÉDÉRIC MISTRAL, he won the 1904 Nobel Prize for Literature.

echidna \i-'kid-nə\ *or* **spiny anteater** any of three species of egg-laying mammals (MONOTREMES) of the family Tachyglossidae. Echidnas are stocky and virtually tailless. They have strong-clawed feet and spines on the upper part of the brownish body. The snout is narrow, the mouth very small, and the tongue long and sticky for feeding on termites, ants, and other invertebrates in the soil. The short-beaked echidna common in Australia and Tasmania is 12–21 in. (30–53 cm) long. Two species of long-beaked echidna live only on the island of New Guinea. They are 18–31 in. (45–78 cm) long and have a prominent downward-pointing snout. They are valued for their meat and are declining in numbers. Echidnas exude milk from mammary openings on the skin, and the young lap it up. See also ANTEATER; PANGOLIN; HEDGEHOG.

Short-beaked echidna (*Tachyglossus aculeatus*).
KRISTI L. BOWMAN

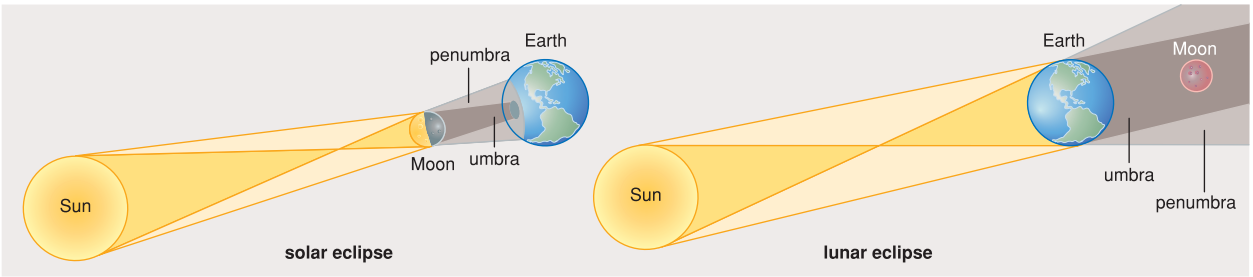
echinacea \ˌe-ki-'nā-shə, ˌe-ki-'nā-sē-ə\ Any member of the CONEFLOWER genus *Echinacea*. Commonly called the purple coneflower, echinacea is used as a border plant. The leaves and roots are used in herbal remedies to boost the immune system and in the treatment of colds and flu.

echinoderm \i-'kī-nə-ˌdərm\ Any of various marine INVERTEBRATES (phylum Echinodermata) characterized by a hard spiny covering, a calcite skeleton, and five-rayed radial body symmetry. About 6,000 existing species are grouped in six classes: FEATHER STARS and sea lilies (Crinoidea), STARFISHES (Asteroidea), brittle stars and basket stars (Ophiuroidea), SEA URCHINS (Echinoidea), sea daisies (Concentricycloidea), and SEA CUCUMBERS (Holothurioidea). Echinoderms are found in all the oceans, from the intertidal zone to the deepest oceanic trenches. Most species have numerous tube feet that are modified for locomotion, respiration, tunneling, sensory perception, feeding, and grasping. Movement of water through a water vascular system composed of five major canals and smaller branches controls extension and retraction of the tube feet. Most echinoderms feed on microscopic detritus or suspended matter, but some eat plants.

Echo In GREEK MYTHOLOGY, a mountain NYMPH transformed into a disembodied voice. According to OVID, her chatter distracted HERA from the infidelities of ZEUS, and the goddess punished her by depriving her of independent speech, rendering her able only to repeat the last words spoken by another. When NARCISSUS failed to requite her love, she faded away into a voice only.

echolocation \ˌe-kō-lō-'kā-shən\ Physiological process for locating distant or invisible objects (such as prey) by emitting sound waves that are reflected back to the emitter by the objects. Echolocation is used by an animal to orient itself, avoid obstacles, find food, and interact socially. Most BATS employ echolocation, as do most, if not all, TOOTHED WHALES (but apparently no BALEEN WHALES), a few SHREWS, and two kinds of birds (oilbirds and certain cave swiftlets). Echolocation pulses consist of short bursts of sound at frequencies ranging from about 1,000 Hz in birds to at least 200,000 Hz in whales. Bats use frequencies from about 30,000 to about 120,000 Hz.

Eck, Johann *orig.* **Johann Maier** (b. Nov. 13, 1486, Egg, Swabia—d. Feb. 10, 1543, Ingolstadt, Bavaria) German Roman Catholic theologian. He was ordained in 1508, became a doctor of theology in 1510, and began a lifelong career at the University of Ingolstadt. Initially friendly with MARTIN LUTHER, Eck assailed Luther's NINETY-FIVE THESES as heretical. In 1519 he debated Luther and Andreas Karlstadt (c. 1480–1541), and LEO X commissioned Eck to publish and enforce the papal bull condemning the Theses. Eck's treatise *Enchiridion Against the Lutherans* (1525) summarized contested Catholic beliefs, Protestant objections to them, and Catholic answers to the objections; it was Eck's most popular work and the best-known Catholic polemical handbook of the 16th century.



Eckert, J(ohn) Presper, Jr. (b. April 9, 1919, Philadelphia, Pa., U.S.—d. June 3, 1995, Bryn Mawr, Pa.) U.S. engineer. He studied at the University of Pennsylvania. In 1946 he and JOHN W. MAUCHLY built a digital computer, the ENIAC, which contained a primitive form of the circuitry used in present-day high-speed computers. In 1949 they introduced the BINAC (Binary Automatic Computer). Their third model, UNIVAC I (Universal Automatic Computer), found many uses in commerce. Eckert received 85 patents and in 1969 was awarded the National Medal of Science.

Eckert, Wallace J(ohn) (b. June 19, 1902, Pittsburgh, Pa., U.S.—d. Aug. 24, 1971, Englewood, N.J.) U.S. astronomer. He received his Ph.D. from Yale University. He was one of the first to apply IBM punched-card equipment to the reduction of astronomical data and to describe planetary orbits numerically. As director of Columbia University's Watson Scientific Computing Laboratory from 1945, he used computers to determine precise planetary positions and made major contributions to the study of the orbit of the Moon, one of whose craters is named for him.

Eckhart, Meister *orig.* **Johannes** (b. c. 1260?, Hochheim?, Thuringia—d. 1327/28?, Avignon) German theologian and mystic. A DOMINICAN from age 15, he studied theology at Cologne and Paris and became a popular preacher and teacher. In his mid 30s he served as vicar of Thuringia. His mystical writings examined the relationship between God and humanity; he pictured the soul achieving complete union with God and posited something (Godhead) beyond God. He took up a professorship in Cologne in his 60th year; shortly thereafter he was charged with heresy on several points in his works. He died before he could rebut a second charge.

Eckstine \'ek-ˌstīn**, Billy** *orig.* **William Clarence Eckstein** (b. July 8, 1914, Pittsburgh, Pa., U.S.—d. March 8, 1993, Pittsburgh) U.S.

© 2006 Encyclopædia Britannica, Inc.

Eclipses of the Sun and Moon. A solar eclipse occurs when the Moon passes between Earth and the Sun. Observers in the Moon's penumbral shadow see a partial blocking of the Sun; those in the umbra see the Sun completely covered by the Moon. A lunar eclipse occurs when the Moon passes into Earth's shadow. In the penumbra, the Moon may appear slightly dimmed; when it enters the umbra, the entire Moon becomes quite dark and may take on a reddish tinge.

© MERRIAM-WEBSTER INC.

singer and bandleader. Eckstine sang with EARL HINES's big band (1939–43), then formed his own band in 1944. Sympathetic with the new sounds of BEBOP, Eckstine engaged many of its innovators, including DIZZY GILLESPIE, CHARLIE PARKER, and SARAH VAUGHAN. Disbanding the group in 1947, he achieved greater popular success as a solo performer, specializing in ballads that featured his deep, resonant baritone. He was one of the greatest interpreters of popular song and blues in jazz.

eclampsia See PREECLAMPSIA AND ECLAMPSIA

eclipse The passage of all or part of one celestial body into the shadow of another, the eclipsing body. Observers on Earth experience two major types—lunar eclipses and solar eclipses—each of which involves the Sun and the Moon. The type observed depends on whether Earth is the eclipsing body or the body in shadow. In a lunar eclipse the orbit of the Moon carries it through Earth's shadow. Observers see the full Moon dim considerably, but it remains faintly visible. In a solar eclipse the Moon is the eclipsing body, passing between Earth and the Sun while casting a traveling shadow across Earth's lighted surface. Observers along the shadow's path see a total or partial obscuring of the Sun's disk by the Moon's silhouette. The shadow cast by the eclipsing body consists of the central umbra, into which no direct sunlight penetrates (total eclipse), and the encircling penumbra, reached by light from only part of the Sun's disk (partial eclipse). Solar eclipses visible from different parts of Earth occur two to five times a year; one total solar eclipse occurs in most years. When Earth is closest to the Sun and the Moon farthest from Earth, the Moon's silhouette may fall entirely within the Sun's disk, with a ring of the disk visible around it (annular eclipse). Lunar eclipses occur twice in most years. Other kinds of eclipses include those of the Sun by Mercury or Venus (transits), of distant stars by planets or planetary satellites (occultations), and of stars by orbiting companion stars (see ECLIPSING VARIABLE STAR). See also BAILY'S BEADS. See illustration above.

eclipsing variable star *or* **eclipsing binary** BINARY STAR in an orbit whose plane passes through or very near Earth. An observer on Earth sees one star pass periodically in front of the other and diminish its light through an ECLIPSE. The star Algol, in the constellation Perseus, was the first such star recognized (1782); thousands are now known. By combining the brightness variations with spectroscopic information for both stars, astronomers can determine the mass and size of each star. See also VARIABLE STAR.

ecliptic \i-'klip-tik\ Great circle that is the apparent path of the SUN among the constellations in the course of a year; from another viewpoint, the projection on the CELESTIAL SPHERE of the orbit of Earth around the Sun, which intersects the plane of the celestial equator at the vernal and autumnal EQUINOXes. The constellations of the ZODIAC are arranged along the ecliptic.

eclogite \'ek-lə-ˌjīt\ Any member of metamorphic rocks whose original composition is similar to that of basalt. Eclogites consist primarily of green PYROXENE (omphacite) and red GARNET (pyrope), with small amounts of various other minerals such as KYANITE and RUTILE. These minerals in the eclogite are the result of reactions in originally igneous minerals having been subjected to extremely high pressures and moderate to relatively high temperatures.

eclogue \'ek-ˌlȯg, 'ek-ˌläg\ Short, usually pastoral, poem in the form of a dialogue or soliloquy (see PASTORAL). The eclogue as a pastoral form first appeared in the IDYLLS of THEOCRITUS, was adopted by VIRGIL, and was revived in the Renaissance by DANTE, PETRARCH, and BOCCACCIO. EDMUND SPENSER's *Shepheardes Calender*, a series of 12 eclogues, was the first outstanding pastoral poem in English. Eighteenth-century English poets used the eclogue for ironic verse on nonpastoral subjects. Since then a distinction has been made between eclogue and pastoral, with eclogue referring only to the dialogue or soliloquy form.

Eco \'ā-kō,\ *English* \'e-kō**, Umberto** (b. Jan. 5, 1932, Alessandria, Italy) Italian critic and novelist. He has taught since 1971 at the University of Bologna. In *The Open Work* (1962), he suggested that some literature and modern music is fundamentally ambiguous and invites the audience to participate in the interpretive and creative process. He explored other areas of communication and SEMIOTICS in *A Theory of Semiotics* (1976), *Semiotics and the Philosophy of Language* (1984), and *The Limits of Interpretation* (1991). His novels include the erudite but best-selling murder mystery *The Name of the Rose* (1980; film, 1986), *Foucault's Pendulum* (1988), and *The Island of the Day Before* (1995).

École (Nationale Supérieure) des Beaux-Arts \bō-'zȧr\ School of fine arts (*beaux arts*) in Paris. It was founded by the merger in 1793 of the Académie de Peinture et de Sculpture, founded by CHARLES LE BRUN in 1648, and the Académie d'Architecture, founded in 1671 by JEAN-BAPTISTE COLBERT. It has traditionally provided instruction in drawing, painting, sculpture, engraving, and (until 1968) architecture. The BEAUX-ARTS STYLE in architecture has been particularly influential.

ecology Study of the relationships between organisms and their environment. Physiological ecology focuses on the relationships between individual organisms and the physical and chemical features of their environment. Behavioral ecologists study the behaviours of individual organisms as they react to their environment. Population ecology, including population GENETICS, is the study of processes that affect the distribution and abundance of animal and plant populations. Community ecology studies how communities of plant and animal populations function and are organized. Paleoecology is the study of the ecology of FOSSIL organisms. Ecologists frequently concentrate on particular taxonomic groups or on specific environments. Applied ecology applies ecological principles to the management of populations of crops and animals. Theoretical ecologists provide simulations of particular practical problems and develop models of general ecological relevance.

econometrics Statistical and mathematical analysis of economic relationships. Econometrics creates equations to describe phenomena such as the relationship between changes in price and demand. Econometricians estimate PRODUCTION FUNCTIONS and cost functions for firms, SUPPLY-AND-DEMAND functions for industries, income distribution in an economy, macroeconomic models and models of the monetary sector for policy makers, and BUSINESS CYCLES and growth for forecasting. Information derived from these models helps both private businesses and governments make decisions and set MONETARY and FISCAL policy. See also RAGNAR FRISCH; MACROECONOMICS; MICROECONOMICS.

Economic Co-operation and Development, Organisation for (OECD) International organization founded in 1961 to stimulate economic progress and world trade. Based in Paris, the OECD serves as a consultative assembly and a clearinghouse for economic data, and it also coordinates economic aid to developing countries. Its members include Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Fin-

land, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Luxembourg, Mexico, The Netherlands, New Zealand, Norway, Poland, Portugal, South Korea, Spain, Sweden, Switzerland, Turkey, the U.K., and the U.S.

economic development Process whereby simple, low-income national economies are transformed into modern industrial economies. Theories of economic development—the evolution of poor countries dependent on agriculture or resource extraction into prosperous countries with diversified economies—are of critical importance to Third World nations. Economic development projects have typically involved large capital investments in infrastructure (roads, irrigation networks, etc.), industry, education, and financial institutions. More recently, the realization that creating capital-intensive industrial sectors provides only limited employment and can disrupt the rest of the economy has led to smaller-scale economic development programs that aim to utilize the specific resources and natural advantages of developing countries and to avoid disruption of their social and economic structures. See also ECONOMIC GROWTH.

economic forecasting Prediction of future economic activity and developments. Economic forecasts, which range from a few weeks to many years, are widely used in business and government to help formulate policy and strategy. MACROECONOMIC forecasts predict the course of the aggregate economy and concentrate on variables such as interest rates, the rate of inflation, and the rate of unemployment. Forecasts of private consumption and investment, government expenditures, and net exports help government policymakers responsible for FISCAL POLICY. For example, part of the justification for a change in taxes is a forecast of its economic effects. MICROECONOMIC forecasts are designed to project the effects of change at the level of an industry or a firm. Most microeconomic forecasts begin with assumptions about the aggregate economy before focusing on the projected effects in the specific sector that is of interest. Manufacturers and retailers use such forecasts to formulate business plans such as those involving inventory, production levels, or hiring.

economic geology Scientific discipline concerned with the distribution of mineral deposits, the economic considerations involved in their recovery, and assessment of the reserves available. Economic geology deals with metal ores, FOSSIL FUELS, and other materials of commercial value, such as salt, gypsum, and building stone. It applies the principles and methods of various other fields, especially GEOPHYSICS, STRUCTURAL GEOLOGY, and STRATIGRAPHY.

economic growth Process by which a nation's wealth increases over time. The most widely used measure of economic growth is the real rate of growth in a country's total output of goods and services (gauged by the GROSS DOMESTIC PRODUCT adjusted for INFLATION, or "real GDP"). Other measures (e.g., national income per capita, consumption per capita) are also used. The rate of economic growth is influenced by natural resources, human resources, capital resources, and technological development in the economy along with institutional structure and stability. Other factors include the level of world economic activity and the terms of TRADE. See also ECONOMIC DEVELOPMENT.

economic indicator Statistic used to determine the state of general economic activity or to predict it in the future. A leading indicator is one that tends to turn up or down before the general economy does (e.g., building permits, common stock prices, and business inventories). Coincident indicators move in line with the economy; lagging indicators change direction after the economy does.

economic planning Use of government to make economic decisions with respect to the use of resources. In communist countries with a state planning apparatus, detailed and rigid planning results in a COMMAND ECONOMY; LAND, CAPITAL, and the means of production are publicly owned and centrally allocated, and the government makes both micro- and macroeconomic decisions. Microeconomic decisions include what goods and services to produce, the quantities to produce, the prices to charge, and the wages to pay. Macroeconomic decisions include the rate of investment and the extent of foreign trade. In most industrialized countries, governments influence their economies indirectly through monetary and fiscal policies. A few key economic sectors may be publicly owned, but the trend has been toward the privatization of industries that were socialized in the aftermath of the Great Depression and World War II. Japan is the most notable example of economic planning in a capitalist framework; government and industry cooperate closely in planning patterns of capital investment, research and development, and export strategies. See also CAPITALISM, COMMUNISM, SOCIALISM, ZAIBATSU.

economic stabilizer Any of the institutions and practices in an economy that serve to reduce fluctuations in the BUSINESS CYCLE through offsetting effects on the amounts of income available for spending (DISPOSABLE INCOME). The progressive income tax, unemployment compensation, and farm price supports all help stabilize the amount of disposable income, as do family and corporate saving.

economic system Set of principles and techniques by which a society decides and organizes the ownership and allocation of economic resources. At one extreme, usually called a free-enterprise system, all resources are privately owned. This system, following ADAM SMITH, is based on the belief that the common good is maximized when all members of society are allowed to pursue their rational self-interest. At the other extreme, usually called a pure-communist system, all resources are publicly owned. This system, following KARL MARX and VLADIMIR ILICH LENIN, is based on the belief that public ownership of the means of production and government control of every aspect of the economy are necessary to minimize inequalities of wealth and achieve other agreed-upon social objectives. No nation exemplifies either extreme. As one moves from CAPITALISM through SOCIALISM to COMMUNISM, a greater share of a nation's productive resources is publicly owned and a greater reliance is placed on ECONOMIC PLANNING. FASCISM, more a political than an economic system, is a hybrid; privately owned resources are combined into syndicates and placed at the disposal of a centrally planned state.

economic warfare Use of economic measures by governments engaged in international conflict. These may include export and import controls, shipping controls, trade agreements with neutral nations, and so on. Economic warfare among belligerents began with the BLOCKADE and interception of contraband. In World War II it was broadened to include economic pressure applied to neutral countries from which the enemy obtained its supplies. In the Cold War it often involved using measures such as an EMBARGO to deny potential enemies goods that might contribute to their war-making ability.

economics Social science that analyzes and describes the consequences of choices made concerning scarce productive resources. Economics is the study of how individuals and societies choose to employ those resources: what goods and services will be produced, how they will be produced, and how they will be distributed among the members of society. Economics is customarily divided into MICROECONOMICS and MACROECONOMICS. Of major concern to macroeconomists are the rate of ECONOMIC GROWTH, the INFLATION rate, and the rate of UNEMPLOYMENT. Specialized areas of economic investigation attempt to answer questions on a variety of economic activity; they include agricultural economics, ECONOMIC DEVELOPMENT, economic history, environmental economics, industrial organization, international trade, LABOUR ECONOMICS, MONEY SUPPLY and banking, public finance, urban economics, and WELFARE ECONOMICS. Specialists in mathematical economics and ECONOMETRICS provide tools used by all economists. The areas of investigation in economics overlap with many other disciplines, notably history, MATHEMATICS, POLITICAL SCIENCE, and SOCIOLOGY.

Economist, The Weekly magazine of news and opinion, founded in 1843 and published in London, generally regarded as one of the world's preeminent journals of its kind. It gives thorough and wide-ranging coverage of general news and particularly of international political developments that bear on the world's economy. In accord with the views promoted by its founders and conveyed by legendary *Economist* editor WALTER BAGEHOT, the publication maintains the position that free markets typically provide the best method of running economies and governments. North America accounts for about half of its total readership.

ecosystem \'ē-kō-ˌsis-təm\ Complex of living organisms, their physical environment, and all their interrelationships in a particular unit of space. An ecosystem's abiotic (nonbiological) constituents include minerals, climate, soil, water, sunlight, and all other nonliving elements; its biotic constituents consist of all its living members. Two major forces link these constituents: the flow of energy and the cycling of nutrients. The fundamental source of energy in almost all ecosystems is radiant energy from the sun; energy and organic matter are passed along an ecosystem's FOOD CHAIN. The study of ecosystems became increasingly sophisticated in the later 20th century; it is now instrumental in assessing and controlling the environmental effects of agricultural development and industrialization. See also BIOME.

© 2006 Encyclopædia Britannica, Inc.

ecoterrorism *or* **ecological terrorism** *or* **environmental terrorism** The destruction, or the threat of destruction, of the environment in order to intimidate or coerce governments. The term has also been applied to crimes committed against companies or government agencies in order to prevent or interfere with activities allegedly harmful to the environment. Ecoterrorism includes threats to contaminate water supplies or to destroy or disable energy utilities, for example, and practices such as the deployment of anthrax. Another form of ecoterrorism, often referred to as environmental warfare, consists of the deliberate and illegal destruction, exploitation, or modification of the environment as a strategy of war or in times of armed conflict. Examples include the U.S. military's use of the defoliant AGENT ORANGE during the VIETNAM WAR and the destruction of Kuwaiti oil wells by retreating Iraqi military forces during the 1991 PERSIAN GULF WAR. The activities of some environmental activists also have been described as ecoterrorism. These activities include criminal trespass on the property of logging companies and other firms and obstruction of their operations through sabotage as well as the environmentally harmless modification of natural resources in order to make them unsuitable for commercial use (a practice known as "monkeywrenching").

Ecstasy Euphoria-inducing stimulant and hallucinogen. It is a derivative of the AMPHETAMINE family and a relative of the stimulant methamphetamine. Taken in pill form, it has a chemical relationship to the psychedelic drug MESCALINE. Developed in 1913 as an appetite suppressant, the drug was not originally approved for release. In the 1950s and '60s, it began to be used in psychotherapy. The drug increases the production of the neurotransmitter SEROTONIN and blocks its reabsorption in the brain; it also increases the amount of the neurotransmitter DOPAMINE. Stimulation of the central nervous system gives users feelings of increased energy and lowers social inhibitions. By the 1980s, parties and dances that featured Ecstasy use (known as "raves") became popular. Despite its ban in the U.S. and the rest of the world, the drug retained a huge following, and it played an important role in the youth subculture, similar to that of LSD during the 1960s.

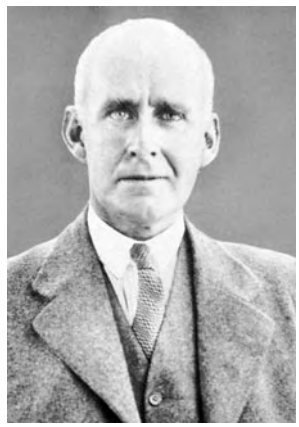
ectopic pregnancy \ek-'tä-pik\ *or* **extrauterine pregnancy** Condition in which a fertilized egg is imbedded outside the UTERUS (see FERTILIZATION). Early on, it may resemble a normal PREGNANCY, with hormonal changes, AMENORRHEA, and development of a placenta. Later, most patients have pain as the growing embryo stretches the structure it is attached to. Rupture may cause life-threatening bleeding. A tubal pregnancy may result from obstruction of the egg's passage through the fallopian tube. In an ovarian pregnancy, the egg is fertilized before it leaves the OVARY. Implantation elsewhere in the abdomen is an abdominal pregnancy.

ectotherm \'ek-tə-ˌthərm\ Any so-called cold-blooded animal; that is, any animal whose regulation of body temperature depends on external sources, such as sunlight or a heated rock surface. The ectotherms include the FISHES, AMPHIBIANS, REPTILES, and INVERTEBRATES. The body temperatures of aquatic ectotherms are usually very close to those of the water. Ectotherms do not require as much food as warm-blooded animals (ENDOTHERMS) of the same size, but most cannot deal as well with cold surroundings.

Ecuador *officially* **Republic of Ecuador** Country, northwestern South America. Area: 105,037 sq mi (272,045 sq km), including the GALÁPAGOS ISLANDS. Population (2005 est.): 13,364,000. Capital: QUITO. About two-fifths of the population are Indian (mostly QUECHUA), and two-fifths are mestizos; most of the rest are of Spanish ancestry. Language: Spanish (official). Religion: Christianity (predominantly Roman Catholic; also Protestant). Currency: U.S. dollar. Pacific coastal lowlands rise to the peaks and highlands of the ANDES MOUNTAINS, which give way to the Ecuadoran portion of the tropical AMAZON RIVER basin in the east. The Andes rise dramatically in two chains that run north to south and are separated by high valleys. The highest peak is CHIMBORAZO, which rises to an elevation of 20,702 ft (6,310 m); nearby COTOPAXI, 19,347 ft (5,897 m) high, is the world's highest active volcano. The country lies in an active earthquake zone and is prone to violent seismic activity. Almost two-fifths of the land is forested, with tropical rainforests in the east. Ecuador straddles the Equator. Its climate varies from tropical in the lowlands to temperate in the highlands. It has a developing economy based primarily on mining, manufacturing, services, and agriculture. Principal exports include crude petroleum, bananas, and shellfish. It is a republic with one legislative house; its head of state and government is the president. What is now Ecuador was conquered by the INCAS in the second half of the 15th century and came under Spanish control in 1534. Under the Spaniards it was a part of the Viceroyalty of PERU until 1740, when it became a part of the Viceroyalty of NEW GRANADA. It gained its independence from Spain in 1822 as part of the

republic of GRAN COLOMBIA and in 1830 became a sovereign state. A succession of authoritarian governments ruled into the mid-20th century, and the military played a prominent role in politics. Border disputes led to war with Peru in 1941; conflicts with that country continued periodically until a final demarcation of the border in 1998. The economy thrived during the 1970s because of large profits from petroleum exports but was depressed in the 1980s because of lower oil prices. In the 1990s social unrest caused political instability and several changes in the presidency. In a controversial move to help stabilize the economy, the U.S. dollar replaced the sucre as the national currency in 2000.

ecumenism \e-'kyü-mə-ˌni-zəm, 'e-kyü-mə-ˌni-zəm\ Movement toward unity or cooperation among the Christian churches. The first major step in the direction of ecumenism was the International Missionary Conference of 1910, a gathering of PROTESTANTS. Several Protestant denominations inaugurated a Life and Work Conference (on social and practical problems) in 1925 and a Faith and Order Conference (on church doctrine and governance) in 1927. After World War II the WORLD COUNCIL OF CHURCHES (WCC) was established; the International Missionary Conference joined it in 1961. The ROMAN CATHOLIC church also has shown strong interest in improving interchurch relations since the Second VATICAN COUNCIL (1962–65) and, with the patriarch of Constantinople, has lifted the excommunication of 1054. The EASTERN ORTHODOX church was active in the movement since 1920 and joined the WCC at its inception. The more conservative or fundamentalist Protestant denominations have generally refrained from involvement. Another important factor in 20th-century ecumenism was the creation of united churches that reconcile splintered sects, such as the United Church of Christ (1957) and the Evangelical Lutheran Church in America (1988).



eczema See DERMATITIS

Edda Body of ancient Icelandic literature. Contained in two 13th-century books, it is the fullest and most detailed source for modern knowledge of Germanic mythology. The *Prose Edda* (*Younger Edda*, or *Snorra-Edda*; c. 1222), a handbook on poetics by SNORRI STURLUSON, explains diction and metre in SKALDIC and Eddic poetry and recounts tales from Norse mythology. The *Poetic Edda* (*Elder Edda*, or *Sæmundar Edda*; c. 1250–1300) is a collection of mythological and heroic poems of unknown authorship composed c. 800–1100. These austere lays are the oldest surviving antecedents of the *NIBELUNGENLIED* legends.

Eddington, Sir Arthur Stanley (b. Dec. 28, 1882, Kendal, Westmorland, Eng.—d. Nov. 22, 1944, Cambridge, Cambridgeshire) British astronomer, physicist, and mathematician. At the University of Cambridge

© 2006 Encyclopædia Britannica, Inc.

he won every mathematical honour. He was chief assistant at the Royal Observatory at Greenwich (1906–13); in 1914 he became director of the Cambridge observatory. Religious and pacifistic, he declared that the world's meaning could not be discovered by science. His greatest contributions were in astrophysics, where his studies included stellar structure, subatomic sources of stellar energy, white dwarf stars, and diffuse matter in interstellar space. His philosophical ideas led him to believe that unifying quantum theory and general relativity would permit the calculation of certain universal constants.

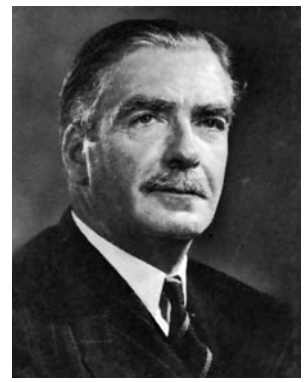
Eddy, Mary Baker *orig.* **Mary Morse Baker** (b. July 16, 1821, Bow, near Concord, N.H., U.S.—d. Dec. 3, 1910, Chestnut Hill, Mass.) U.S. religious leader, founder of CHRISTIAN SCIENCE. A daughter of Congregationalist descendants of old New England families, she married in 1843; her husband died the following year, and she married again in 1853. She suffered from ill health for much of her life. In the early 1860s she was cured of a spinal malady by Phineas P. Quimby (1802–66), who cured ailments without medication. She remained well until shortly after Quimby's death; in 1866 she suffered a severe fall and lost hope for recovery, only to be healed by reading the New Testament. She considered that moment her discovery of Christian Science and spent several years evolving her system. In 1875 she published *Science and Health with Key to the Scriptures*, which her followers regarded as divinely inspired. Having divorced in 1873, in 1877 she married one of her followers, Asa G. Eddy (d. 1882). The Church of Christ, Scientist was organized in 1879. Eddy established the Massachusetts Metaphysical College in 1881; she also founded three periodicals, notably *The* CHRISTIAN SCIENCE MONITOR (1908).

Edelman, Gerald Maurice (b. July 1, 1929, New York, N.Y., U.S.) U.S. biochemist. He received an M.D. from the University of Pennsylvania and a Ph.D. from Rockefeller University. His work with Rodney Porter (b. 1917—d. 1985) on antibodies won a 1972 Nobel Prize. By modeling an entire antibody molecule, Edelman's team found the molecule had more than 1,300 amino acids in a four-chain structure and identified the locations where antigens bind. Focusing on formation and differentiation of tissues and organs, they discovered cell-adhesion molecules, proteins that attach cells together to make tissues. Edelman's attempt at a general theory of neural development and brain function is discussed in his *Neural Darwinism* (1987).



Edelweiss (*Leontopodium alpinum*)
SIEGFRIED EIGSTLER—SHOSTAL

edelweiss \'ā-dᵊl-ˌvīs, 'ā-dᵊl-ˌwīs\ Perennial plant (*Leontopodium alpinum*) of the COMPOSITE FAMILY, native to alpine areas of Europe and South America. It has 2–10 yellow flower heads in a dense cluster. Below these flower heads, 6–9 lance-shaped, woolly, white leaves are arranged in the form of a star. Most varieties are ornamentals.

edema \i-'dē-mə\ Abnormal accumulation of watery fluid in the spaces between CONNECTIVE-TISSUE cells. Usually a symptom of diseases of the kidneys, heart, veins, or lymphatic system, which affect water balance in the cells, tissues, and blood, edema can be pitting (retaining an imprint when compressed) or nonpitting. Edema may be local (e.g., HIVES from allergies) or generalized (also called dropsy), sometimes involving body cavities as well as tissues. Treatment must usually focus on the underlying cause.

Eden, (Robert) Anthony, 1st earl of Avon (b. June 12, 1897, Windlestone, Durham, Eng.—d. Jan. 14, 1977, Alvediston, Wiltshire) British politician. After combat service in World War I, he was elected to the House of Commons in 1923. He became foreign secretary in 1935 but resigned in 1938 to protest NEVILLE CHAMBERLAIN's policy of appeasement. He held the post again in 1940–45 and in 1951–55, and he helped to settle the Anglo-Iranian oil dispute and arranged an armistice in Indochina. Succeeding WINSTON CHURCHILL as prime minister in 1955, he attempted to ease international tension by welcoming to Britain NIKITA KHRUSHCHEV and NIKOLAY A. BULGANIN of the Soviet Union. His fall began when Egypt seized the Suez Canal and he supported an Anglo-French intervention in Egypt (see SUEZ CRISIS). He resigned in 1957, citing ill health.

Eden, photograph by Yousuf Karsh

Eden, River River, northern England. It rises in the uplands that connect the LAKE DISTRICT with the highlands of the PENNINES and flows in a meandering course 90 mi (145 km) northwest to its estuary in the Solway Firth, an IRISH SEA inlet. It is not navigable.

Ederle \'ed-ər-lē**, Gertrude (Caroline)** (b. Oct. 23, 1906, New York, N.Y., U.S.—d. Nov. 30, 2003, Wyckoff, N.J.) U.S. swimmer, the first woman to swim the English Channel. She set women's world freestyle records in the early 1920s, and in 1924 she won a gold medal (400-m freestyle relay) and two bronze medals (100-m and 400-m freestyle) at the Olympic Games. In 1926 she swam the 35-mi (56-km) English Channel in 14 hours 31 minutes, breaking the men's record by 1 hour 59 minutes.

Edessa \i-'de-sə\ Chief city (pop., 1991: 18,000), Macedonia, Greece. Located on a steep bluff above the valley of the Loudhiás River, it is a prominent trading and agricultural centre. The assumption that it was Aigai, the first capital of ancient Macedonia, has been challenged by archaeological discoveries at VERGHINA. Fought over by the Bulgarians, Byzantines, and Serbs, Edessa was taken by the Turks in the 15th century. In 1912 it passed to Greece.

Edgar the Aetheling \'ath-ə-liŋ\ (b. Hungary—d. c. 1125) Anglo-Saxon prince. He was proposed as king of England after the Battle of HASTINGS (1066) but instead served the Norman kings WILLIAM I (the Conqueror) and WILLIAM II. Rebellions in favour of the aetheling (prince) continued in England until 1069. Edgar led the Norman force sent by William I to conquer Apulia in southern Italy (1086) but was deprived of his Norman lands by William II in 1091. In 1097, on William's orders, he overthrew Donald Bane, a Scottish king hostile to the Normans. About 1102 he went on a CRUSADE to the Holy Land. He later unsuccessfully supported Robert Curthose, duke of Normandy, against HENRY I in the struggle for the English throne.

Edgerton, Harold E(ugene) (b. April 6, 1903, Fremont, Neb., U.S.—d. Jan. 4, 1990, Cambridge, Mass.) U.S. electrical engineer and photographer. He was a graduate student at Massachusetts Institute of Technology when in 1926 he developed a flash tube that could produce high-intensity bursts of light in as little as 1/1,000,000 of a second; it is the flash device still used in photography today. Since it can also emit repeated bursts of light at regular brief intervals, it is an ideal STROBOSCOPE. With the new flash Edgerton was able to photograph such things as drops

© 2006 Encyclopædia Britannica, Inc.

of milk falling into a saucer and bullets traveling at speeds of 15,000 mph (24,000 kph); the resulting images have been appreciated for their artistic beauty and their value to industry and science.

Edgeworth, Maria (b. Jan. 1, 1767, Blackbourton, Oxfordshire, Eng.—d. May 22, 1849, Edgeworthstown, Ire.) British-Irish writer. From age 15 she assisted her father in managing his estate, gaining a knowledge of rural economy and the Irish peasantry. Her early children's stories, published as *The Parent's Assistant* (1796), feature the first convincing child characters since Shakespeare. *Castle Rackrent* (1800), her first novel, revealed her gift for social observation and authentic dialogue. Other notable works are *Belinda* (1801); *Tales of Fashionable Life* (1809–12), a six-volume work including the novel *The Absentee*, which focused attention on abuses by absentee English landowners; *Patronage* (1814); and *Ormond* (1817).

Edgeworth-Kuiper belt See KUIPER BELT

Edinburgh \'e-dᵊn-ˌbər-ə\ City and council area (pop., 2001: 448,624), capital of Scotland. The city and most of the council area, including the busy port of Leith on the Firth of Forth, lie within the historic county of Midlothian. Located in southeastern Scotland, the original burgh, now known as the Old Town, arose in the 11th century, around Edinburgh Castle, the royal residence of Malcolm III MacDuncan. In 1329 ROBERT the Bruce granted Edinburgh a town charter; it became the capital of the Scottish kingdom in 1437. The city was destroyed in 1544 in the border wars with England; its characteristic use of stone architecture began with this rebuilding. During the 18th century Scotland experienced a cultural and intellectual renaissance, and Edinburgh was home to such luminaries as DAVID HUME, ADAM SMITH, ROBERT BURNS, and WALTER SCOTT. It was the birthplace of *ENCYCLOPÆDIA BRITANNICA* (1768) and the *Edinburgh Review* (1802). The city expanded in the late 18th century with the development of the Georgian-style New Town, separated from the Old Town by a valley. Edinburgh is the centre of Scottish culture and education and is home to the University of EDINBURGH, the National Library, the National Gallery, and the Royal Scottish Museum. It is the site of the Scottish Parliament, which first convened in 1999.

Edinburgh, University of Private university in Edinburgh, Scotland. It was founded as a college under Presbyterian auspices in 1583 and achieved university status c. 1621 after a divinity school was added. Schools of medicine and law were added in the early 18th century, and faculties of music, science, arts, social sciences, and veterinary medicine were subsequently established. The university has produced a long line of eminent cultural figures, including Sir WALTER SCOTT, JOHN STUART MILL, THOMAS CARLYLE, CHARLES DARWIN, DAVID HUME, ROBERT LOUIS STEVENSON, and ALEXANDER GRAHAM BELL.

Edinburgh Festival International festival of the arts, with an emphasis on music and drama. Founded in 1947 by RUDOLF BING, it is held for three weeks each summer. Its theatrical offerings include plays by major international theatrical companies; plays premiered at the festival include T.S. ELIOT's *The Cocktail Party* (1949) and THORNTON WILDER's *The Matchmaker* (1954). The adjunct Edinburgh Fringe attracts amateur theatre groups and has launched works such as *Beyond the Fringe* (1960) and TOM STOPPARD's *Rosencrantz and Guildenstern Are Dead* (1966). Musically, the Festival offers concerts, recitals, and operas by international companies, orchestras, and soloists.

Edirne \ā-'dir-nə**, Treaty of** *or* **Treaty of Adrianople** \ˌā-drē-ə-'nō-pəl\ (September 14, 1829) Pact concluding the RUSSO-TURKISH WAR of 1828–29. Signed at Edirne (ancient Adrianople), Turkey, the treaty opened the Turkish straits to Russian shipping and granted Russia some territorial concessions. It strengthened Russia's position in Eastern Europe and weakened that of the Ottoman empire, and it foreshadowed the Ottoman empire's dependence on the European balance of power and the dismemberment of its Balkan possessions.

Edison, Thomas Alva (b. Feb. 11, 1847, Milan, Ohio, U.S.—d. Oct. 18, 1931, West Orange, N.J.) U.S. inventor. He had very little formal schooling. He set up a laboratory in his father's basement at age 10; at 12 he was earning money selling newspapers and candy on trains. He worked as a telegrapher (1862–68) before deciding to pursue invention and entrepreneurship. Throughout much of his career, he was strongly motivated by efforts to overcome his handicap of partial deafness. For Western Union he developed a machine capable of sending four telegraph messages down one wire, only to sell the invention to Western Union's rival, JAY GOULD, for more than $100,000. He created the world's first industrial-research laboratory, in Menlo Park, N.J. There he invented the carbon-button transmitter (1877), still used in telephone speakers and microphones today; the phonograph (1877); and the incandescent lightbulb (1879). To develop the lightbulb, he was advanced $30,000 by such financiers as J.P. MORGAN and the Vanderbilts. In 1882 he supervised the installation of the world's first permanent commercial central power system, in lower Manhattan. After the death of his first wife (1884), he built a new laboratory in West Orange, N.J. Its first major endeavour was the commercialization of the phonograph, which ALEXANDER GRAHAM BELL had improved on since Edison's initial invention. At the new laboratory Edison and his team also developed an early movie camera and an instrument for viewing moving pictures; they also developed the alkaline storage battery. Although his later projects were not as successful as his earlier ones, Edison continued to work even in his 80s. Singly or jointly, he held a world-record 1,093 patents, nearly 400 of them for electric light and power. He always invented for necessity, with the object of devising something new that he could manufacture. More than any other, he laid the basis for the technological revolution of the modern electric world.

Edmonton City (pop., 2001: city, 666,104; metro. area, 937,845), capital of Alberta, Canada. Located on the North SASKATCHEWAN RIVER, in the centre of the province, it began as a series of fur-trading posts built from 1795. With the arrival of the railway and an influx of settlers in the late 19th century, Edmonton began to prosper economically, and in 1905 it became the capital of the new province of Alberta. The 1947 discovery of petroleum in the area greatly stimulated the city's growth; an agricultural and oil-based economy still prevails. It is the distribution centre of northwestern Canada. Its cultural and educational institutions include the University of Alberta (1906).

Edmunds, George Franklin (b. Feb. 1, 1828, Richmond, Vt., U.S.—d. Feb. 27, 1919, Pasadena, Calif.) U.S. senator and expert on constitutional law. Despite little formal education, he studied law and was admitted to the bar in 1849. He was a Republican member (1854–59) and speaker (1856–59) of the Vermont House of Representatives and a member and president pro tem (1861–62) of the Vermont Senate. He was appointed to the U.S. Senate in 1866 and served until 1891; he was chairman of the Senate Judiciary Committee (1872–79; 1882–91) and president pro tem of the Senate (1883–85). Edmunds was active in the impeachment (1868) of President ANDREW JOHNSON and was a founding member of the commission that decided the election of 1876. The act for the suppression of polygamy (1882) bears his name, and he was principal author of the SHERMAN ANTI-TRUST ACT (1890).

Edo \'ed-ō\ **culture** Cultural period of Japanese history corresponding to the TOKUGAWA PERIOD of governance (1603–1867). TOKUGAWA IEYASU, the first Tokugawa SHOGUN, chose Edo (present-day Tokyo) as Japan's new capital, and it became one of the largest cities of its time and was the site of a thriving urban culture. In literature, BASHO developed poetic forms later called HAIKU, and IHARA SAIKAKU composed virtuoso comic linked-verse and humorous novels; in theatre, both KABUKI (with live actors) and BUNRAKU (with puppets) entertained townspeople (samurai, for whom theatregoing was forbidden, often attended in disguise). The development of polychrome woodblock printing techniques made it possible for ordinary people to obtain prints of popular kabuki actors or trendsetting courtesans (see UKIYO-E). Travelogues extolled the scenic beauty or historic interest of spots in distant provinces, and temple or shrine pilgrimages to distant places were popular. In scholarship, Kokugaku ("National Learning") called attention to Japan's most ancient poetry and oldest written histories. The study of Europe and its sciences, called *rangaku*, or "Dutch learning," became popular despite extremely limited contact with Europe. NEO-CONFUCIANISM was also popular. See also GENROKU PERIOD.

Edom \'ē-dəm\ Ancient country of the Middle East, south of the DEAD SEA. The Edomites probably occupied the area c. 13th century BC. Though closely related to the Israelites, they were in frequent conflict with and were probably subject to the Israelite kingdom (11th–10th century BC). Located on the trade route between the Arabian Peninsula and the Mediterranean Sea coast, Edom was known for its copper industry. Later conquered by the Nabataeans, the Edomites migrated to southern JUDAEA. Edom and neighbouring MOAB were known in Maccabean and Roman times as Idumaea.

education Learning that takes place in schools or school-like environments (formal education) or in the world at large; the transmission of the

© 2006 Encyclopædia Britannica, Inc.

values and accumulated knowledge of a society. In developing cultures there is often little formal education; children learn from their environment and activities, and the adults around them act as teachers. In more complex societies, where there is more knowledge to be passed on, a more selective and efficient means of transmission—the school and teacher—becomes necessary. The content of formal education, its duration, and who receives it have varied widely from culture to culture and age to age, as has the philosophy of education. Some philosophers (e.g., John Locke) have seen individuals as blank slates onto which knowledge can be written. Others (e.g., Jean-Jacques Rousseau) have seen the innate human state as desirable in itself and therefore to be tampered with as little as possible, a view often taken in alternative education. See also behaviourism; John Dewey; elementary education; higher education; kindergarten; lyceum movement; progressive education; public school; special education; teaching.

education, philosophy of Application of philosophical methods to the theory and practice of education. Among the topics investigated in the philosophy of education are the nature of learning, especially in children; the purpose of education, particularly the question of whether the chief goal of educators should be imparting knowledge, developing intellectual independence, or instilling moral or political values; the nature of education-related concepts, including the concept of education itself; the sources and legitimacy of educational authority; and the conduct of educational research. Major figures in the history of the philosophy of education include Plato, Jean-Jacques Rousseau, and John Dewey.

educational psychology Branch of psychology concerned with the learning processes and psychological issues associated with the teaching and training of students. The educational psychologist studies the cognitive development of students and the various factors involved in learning, including aptitude and learning measurement, the creative process, and the motivational forces that influence student-teacher dynamics. Two early leaders in the field were G. Stanley Hall and Edward L. Thorndike. See also school psychology.

Edward, Lake Lake, eastern Africa. One of the great lakes of the western Great Rift Valley, it lies on the border of Democratic Republic of the Congo and Uganda and is 48 mi (77 km) long and 26 mi (42 km) wide. On the northeast it is connected to the smaller Lake George. Lake Edward empties north through the Semliki River to Lake Albert. The lake abounds in fish; wildlife on its shores is protected within Virunga National Park and Queen Elizabeth National Park. It was named by Henry Morton Stanley, who visited the lake in 1888–89.

Edward I *known as* **Edward Longshanks** (b. June 17, 1239, Westminster, Middlesex, Eng.—d. July 7, 1309, Burgh by Sands, near Carlisle, Cumberland) King of England (1272–1307). The eldest son of Henry III, he supported his father in a civil war with the barons, but his violent temper contributed to Henry's defeat at the Battle of Lewes (1264). Edward triumphed over the rebels in the following year when he defeated them and slew their leader at Evesham. Edward joined the abortive Crusade of Louis IX of France (the Eighth Crusade) in 1271–72, then returned to England to succeed his father. His reign was a time of rising national consciousness, in which he strengthened the crown against the nobility. He fostered the development of Parliament and played an important role in defining English common law. He conquered Wales (1277) and crushed Welsh uprisings against English rule, but his conquest of Scotland (1296), including the defeat of William Wallace, was undone by later revolts. He expelled the Jews from England in 1290; they would not be readmitted until 1655. He died on a campaign against Robert I, who had proclaimed himself king of Scotland the previous year.

Edward II *known as* **Edward of Caernarfon** \kär-'nä-vən\ (b. April 25, 1284, Caernarfon, Caernarfonshire, Wales—d. September 1327, Berkeley, Gloucestershire, Eng.) King of England (1307–27). He was the son of Edward I. He angered the barons by granting the earldom of Cornwall to his favourite, Piers Gaveston; the barons then drew up the Ordinances (1311), a document limiting the king's power over finances and appointments, and executed the arrogant Gaveston (1312). The English defeat by Robert I at the Battle of Bannockburn (1314) ensured Scottish independence and left Edward at the mercy of powerful barons, notably Thomas of Lancaster. Edward defeated and executed Lancaster in 1322, freeing himself from baronial control and revoking the Ordinances. His queen, Isabella, helped her lover, Roger de Mortimer, invade England with other dissatisfied nobles and depose Edward in favour of his son, Edward III. Edward II was imprisoned and probably murdered.

Edward III *known as* **Edward of Windsor** (b. Nov. 13, 1312, Windsor, Berkshire, Eng.—d. June 21, 1377, Sheen, Surrey) King of England (1327–77). His mother, Isabella of France, deposed his father, Edward II, and crowned the 15-year-old Edward in his place. Isabella and her lover, Roger de Mortimer, governed in Edward's name for four years and persuaded him to grant the Scots their independence (1328). After having Mortimer executed in 1330, Edward became the sole ruler of England. By asserting his right to the French crown, he began the Hundred Years' War. He instituted the Order of the Garter in 1342. He defeated the French at the Battle of Crécy (1346) and captured Calais (1347), though lack of funds forced him to sign a truce. The Black Death hit England in 1348, but fighting continued. The Scots surrendered to Edward in 1356, and the same year his son Edward the Black Prince won a major victory for the English at the Battle of Poitiers. In 1360 Edward gave up his claim to the French crown in return for Aquitaine. The war later resumed when Charles V repudiated the Treaty of Calais; Edward lost Aquitaine, and he signed a new truce in 1375. In his later years he fell under the influence of his greedy mistress, Alice Perrers, and his son John of Gaunt.

Edward IV (b. April 28, 1442, Rouen, France—d. April 9, 1483, Westminster, Eng.) King of England (1461–70, 1471–83). His father, a claimant to the throne, was killed in 1461, and Edward was crowned, thanks largely to his cousin the earl of Warwick. This alliance did not last, and, after much intrigue and fighting, Edward was deposed and fled in 1470. The next year he returned to become a leading participant in the Wars of the Roses, defeating and killing Warwick and nearly all the remaining Lancastrian leaders. After murdering Henry VI and repelling an attack on London, Edward remained secure as king for the rest of his life. He invaded France, which Henry had inherited but largely lost; though the attempt was unsuccessful, Edward made an excellent financial settlement by treaty. His administrative achievements made his reign a time of prosperity and success. Seven children survived him; his two sons were probably murdered in the Tower of London, and his eldest daughter married Henry VII.

Edward VI (b. Oct. 12, 1537, London, Eng.—d. July 6, 1553, London) King of England and Ireland (1547–53). Son of Henry VIII and Jane Seymour, Edward succeeded to the throne after Henry's death. During the young king's reign, power was wielded first by his uncle the duke of Somerset (1547–49) and then by the duke of Northumberland. Facing death from tuberculosis, Edward was persuaded to exclude his two half sisters (later queens) Mary I and Elizabeth I from the succession and to put Northumberland's daughter-in-law, Lady Jane Grey, in line for the throne.

Edward VII *orig.* **Albert Edward** (b. Nov. 9, 1841, London, Eng.—d. May 6, 1910, London) King of the United Kingdom (1901–10). Son of Queen Victoria, he attended Oxford and Cambridge and in 1863 married Alexandra (1844–1925), daughter of Christian IX. Noted for his interest in racing and yachting and his sometimes scandalous personal behavior, he was excluded by Victoria from most affairs of state until he was over 50 years old. He succeeded to the throne on her death, and his reign helped restore luster to the monarchy after her long seclusion as a widow. An

immensely popular sovereign, he helped pave the way for the Entente Cordiale with his state visit to Paris in 1903.

Edward VIII (b. June 23, 1894, Richmond, Surrey, Eng.—d. May 28, 1972, Paris, France) King of the United Kingdom (1936) who abdicated voluntarily. Son of George V, he served as a staff officer in World War I. After the war he made extensive goodwill tours of the British Empire and became very popular with the British people. In 1930 he became friends with Wallis Simpson and her husband and by 1934 had fallen in love with her. In January 1936 he succeeded to the throne on his father's death. Unable to gain social and political acceptance for his proposed marriage to Simpson, he abdicated in December, becoming the only British sovereign to resign the crown voluntarily. He was created duke of Windsor and in 1937 married Simpson, who became the duchess of Windsor. At Winston Churchill's invitation, he served as governor of the Bahamas during World War II, and after 1945 the couple lived in Paris. Though they were counted among the social elite, not until 1967 were they invited to attend an official public ceremony with other members of the royal family.

Edward the Black Prince (b. June 15, 1330, Woodstock, Oxfordshire, Eng.—d. June 8, 1376, Westminster, near London) Prince of Wales (1343–76). Son of Edward III, he apparently received his sobriquet because he wore black armour. He was one of the outstanding commanders of the Hundred Years' War, winning a major victory at the Battle of Poitiers in 1356. He was prince of Aquitaine 1362–72; his rule there was a failure, for which he was largely to blame. He returned sick and broken to England and formally surrendered his principality to his father. He had no successor as prince of Aquitaine. Though the heir apparent, he never became king; his son became Richard II.

Edward the Confessor, Saint (b. c. 1003, Islip, Eng.—d. Jan. 5, 1066, London; canonized 1161; feast day originally January 5, now October 13) King of England (1042–66). The son of Ethelred II, he was exiled to Normandy for 25 years (1016–41) while the Danes held England (see Canute the Great). For the first 11 years of his reign, the real master of England was Godwine, earl of Wessex. Edward outlawed Godwine in 1051 and appointed Normans to high positions in government, thus preparing the way for the Norman Conquest. Godwine continued his opposition, and his son Harold (see Harold II) dominated England after 1053, subjugating Wales in 1063. Edward named Harold as his successor on his deathbed, but the duke of Normandy (the future William I) invaded England to claim the crown earlier promised him. Though an ineffectual monarch, Edward was famous for his piety, which earned him the epithet "the Confessor."

Edwards, Blake *orig.* **William Blake McEdwards** (b. July 26, 1922, Tulsa, Okla., U.S.) U.S. film director, producer, and screenwriter. He acted in films in the 1940s, then gained respect as a screenwriter, notably for *My Sister Eileen* (1955) and *The Notorious Landlady* (1962). He created the TV series *Peter Gunn* (1958–60). Among his successful directorial efforts were *Operation Petticoat* (1959), *Breakfast at Tiffany's* (1961), *10* (1979), and *Victor/Victoria* (1982), which he revived in 1995 as a Broadway musical starring his wife, Julie Andrews. He was perhaps best known for *The Pink Panther* (1964) and its sequels.

Edwards, Gareth (b. July 12, 1947, Gwaun-Cae-Gurwen, Wales) Welsh Rugby Union player. Edwards, considered to be among the greatest rugby players, played scrum half on the great Welsh sides that won the Five Nations Championship 11 times in 16 seasons between 1964 and 1978. He played 53 tests for Wales and 10 for the British Lions (1967–78). Amazingly for a half scrum, he scored 20 tries for Wales.

Edwards, Jonathan (b. Oct. 5, 1703, East Windsor, Conn.—d. March 22, 1758, Princeton, N.J.) American theologian. The 5th of 11 children in a strict Puritan home, he entered Yale College at age 13. In 1727 he was named a pastor at his grandfather's church in Northampton, Mass. His sermons on "Justification by Faith Alone" gave rise to a revival in the Connecticut River valley in 1734, and in the 1740s he was also influential in the Great Awakening. In 1750 he was dismissed from the Northampton church over a disagreement on who was eligible to take communion, and he became pastor in Stockbridge in 1751. He died of smallpox shortly after accepting the presidency of the College of New Jersey (now Princeton University). A staunch Calvinist, he emphasized original sin, predestination, and the need for conversion. His most famous sermon, "Sinners in the Hands of an Angry God," vividly evokes the fate of unrepentant sinners in hell.

Edwards, Robert See Patrick Steptoe and Robert Edwards

eel Any of more than 500 fish species (order Anguilliformes) that are slender, elongated, and usually scaleless, with long dorsal and anal fins that are continuous around the tail tip. Eels are found in all seas, from coastal regions to the mid-depths. Freshwater eels are active, predaceous fish with small embedded scales; they grow to maturity in freshwater and return to the sea, where they spawn and die. The transparent young drift to the coast and make their way upstream. Freshwater eels, considered valuable food fish, include species ranging from 4 in. (10 cm) to about 11.5 ft (3.5 m) long. See also moray.

eelworm Any of several species of nematode, named for their resemblance to miniature eels. Eelworms are either free-living or parasitic, and most are about 0.005–0.05 in. (0.1–1.5 mm) long. They are found in all parts of the world. Free-living forms inhabit salt water, freshwater, and damp soil. Parasitic forms are found in the roots of many plant species; the potato-root eelworm, for example, is a serious pest of potatoes. Some species occur in both plants and animals.

efficiency *or* **mechanical efficiency** In mechanics, the measure of the effectiveness with which a system performs. It is stated as the ratio of a system's work output to its work input. The efficiency of a real system is always less than 1 because of friction between moving parts. A machine with an efficiency of 0.8 returns 80% of the work input as work output; the remaining 20% is used to overcome friction. In a theoretically frictionless, or ideal, machine, the work input and work output are equal, and the efficiency would be 1, or 100%.

effigy mound Earthen mound in the form of a bird or animal (e.g, bear, deer, turtle, buffalo), found in the northern central U.S., especially the Ohio River valley. Little is known of the effigy mounds except that most were burial sites. The culture that produced them dates from AD 300 to the mid-17th century. See also Hopewell culture.

Effigy Mounds National Monument Archaeological site, northeastern Iowa, U.S. Located on the Mississippi River, it covers 4 sq mi (10 sq km). Established in 1949, the monument has 183 known mounds, some of which are in the shape of birds and bears. The mounds were built over the course of the Woodland period (1000 BC–AD 1200), with the effigy mounds probably constructed between AD 400 and 1200. Many mounds have yielded copper, bone, and stone tools of Indian origin. One of the bear mounds is 137 ft (42 m) long and 3.5 ft (1 m) high.

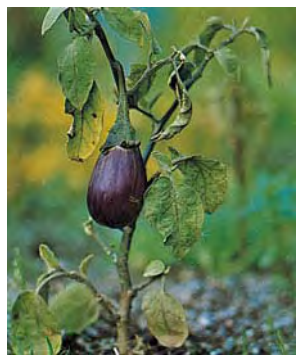
Egas Moniz \ˈā-gäs-mō-ˈnēz**, António Caetano de Abreu Freire** (b. Nov. 29, 1874, Avança, Port.—d. Dec. 13, 1955, Lisbon) Portuguese neurologist and statesman. He introduced cerebral angiography (1927–37). With Almeida Lima, he performed the first prefrontal lobotomy in 1936, and in 1949 he shared a Nobel Prize with Walter Rudolf Hess for the development of the lobotomy. Because of its serious side effects, he advised using lobotomy only when all other treatments failed. He also served in the Portuguese legislature and as a minister and led the Portuguese delegation at the Paris Peace Conference.

egg In biology, the female sex cell, or gamete. In zoology, the Latin term *ovum* is often used to refer to the single cell, whereas the word *egg* may be applied to the entire specialized structure or capsule that consists of the ovum, its various protective membranes, and any accompanying nutritive materials. The egg or ovum, like the male gamete (sperm), bears only a single (haploid; see ploidy) set of chromosomes. When female and male gametes unite during fertilization, the double (diploid) set of chromosomes is restored in the resulting zygote. In humans, the ovum matures inside one of the ovary's follicles (hollow group of cells) and is released when the follicle ruptures (ovulation). The ovum passes into the fallopian tube and



E | F | G

© 2006 Encyclopædia Britannica, Inc.

will degenerate if not fertilized within about 24 hours. In animals, the amount of nutritive material (yolk) deposited in an egg is dependent on the length of time before the developing animal can feed itself or, in the case of mammals, begins to receive nourishment from the maternal circulation. Most animal eggs are enclosed by one or more membranes. Insect eggs are covered by a thick, hard outer membrane, and amphibian eggs are surrounded by a jellylike layer. The term *egg* also refers to the content of the hard-shelled reproductive body produced by a bird or reptile.

Eggleston, Edward (b. Dec. 10, 1837, Vevay, Ind., U.S.—d. Sept. 4, 1902, Lake George, N.Y.) U.S. novelist and historian. He became an itinerant preacher at age 19; he later held various pastorates and edited several periodicals. He realistically portrayed backwoods Indiana in *The Hoosier School-Master* (1871). His other novels include *The End of the World* (1872), *The Circuit Rider* (1874), *Roxy* (1878), and *The Graysons* (1888). He then turned to writing history; his *Beginners of a Nation* (1896) and *Transit of Civilization from England to America* (1900) contributed to the growth of the study of social history.

eggplant Tender perennial plant (*Solanum melongena*) of the NIGHTSHADE FAMILY. It requires a warm climate and is grown extensively in eastern and southern Asia (where it is native) and in the U.S. It is usually grown as an annual for its fleshy fruit. It has an erect, bushy stem; large ovate, slightly lobed leaves; and pendant, violet, solitary flowers. The fruit is a large, glossy, egg-shaped berry, varying in colour from dark purple to red, yellowish, or white, and sometimes striped. It is a staple in cuisines of the Mediterranean region.

Eggplant (*Solanum melongena*).
INGMAR HOLMASEN

Egill Skallagrímsson \'ā-yil-'skä-hlä-grim-ˌsȯn\ *or* **Egill Skalla-Grímsson** (b. c. 910, Borg, Ice.—d. 990) Icelandic poet. One of the greatest skaldic poets (see SKALDIC POETRY), his adventurous life and verses are preserved in the *Egils saga* (1220?), attributed to his descendant SNORRI STURLUSON. In the saga Egill kills the son of King Erik Bloodax and places a curse on the king. He later falls into Erik's hands but saves his own life by composing in one night a long poem praising Erik, *Hofuthlausn* (c. 948). After the death of two sons he composes the lament *Sonatorrek* (c. 961).

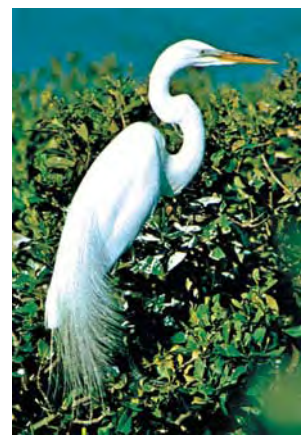
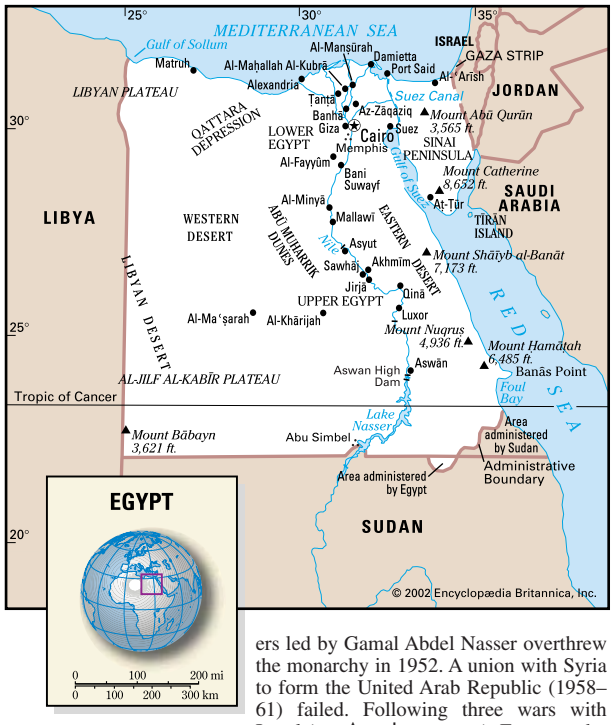
Eglevsky \ig-'lyef-skəi**, André** (b. Dec. 21, 1917, Moscow, Russia—d. Dec. 4, 1977, Elmira, N.Y., U.S.) Russian-born U.S. ballet dancer and teacher. He left Russia as a child and studied in Paris, becoming a lead dancer with the BALLET RUSSE DE MONTE CARLO at age 14. He moved to the U.S. in 1937 and danced with a number of companies before joining the NEW YORK CITY BALLET (1951–58). There he created leading roles in several of GEORGE BALANCHINE's ballets, including *Scotch Symphony* and *Caracole*. He also taught at the School of American Ballet. In 1958 he opened his own ballet school, and in 1961he established the Eglevsky Ballet.



André Eglevsky in *Apollo*, 1944.
FRED FEHL

ego *Latin* **"I"** In psychoanalytic theory, the portion of the psyche experienced as the "self" or "I." It is the part that remembers, evaluates, plans, and in other ways is responsive to and acts in the surrounding physical and social world. According to SIGMUND FREUD, it coexists with the ID (the UNCONSCIOUS, instinctual portion of the psyche) and the SUPEREGO (the portion representing the conscience, or the internalization of societal norms). The ego is not coextensive with either the PERSONALITY or the body; rather, it serves to integrate these and other aspects of the person, such as MEMORY, imagination, and behaviour. It mediates between the id and the superego by building up various DEFENSE MECHANISMS.

egoism In ETHICS, the principle that we should each act so as to promote our own interests. The great advantage of such a position is that it avoids any possible conflict between morality and self-interest; if it is rational for us to pursue our own interest, the rationality of morality is equally clear. The prescriptive thesis of ethical egoism can be distinguished from the descriptive thesis of psychological egoism. Psychological egoism is a generalization about human motivation, namely, that everyone always acts so as to promote his or her own interests.



egret \'ē-grət\ Any of several species (mainly in the genus *Egretta*) of wading birds in the same family (Ardeidae) as HERONS and BITTERNS. Egrets live in marshes, lakes, humid forests, and other wetland environments worldwide. They catch and eat small fishes, amphibians, reptiles, mammals, and crustaceans. They nest in trees and bushes or on the ground. Most are white and develop long plumes for the breeding season. The value of plumes as ornamental objects once drove egrets to near-extinction, but changes in fashion and strict conservation measures have allowed their numbers to increase. The great white egret is about 35 in. (90 cm) long; other common species average 20–24 in. (50–60 cm) long.

Common egret (*Egretta alba*)

Egypt *officially* **Arab Republic of Egypt** *formerly* **United Arab Republic** Country, Middle East, northeastern Africa. Area: 385,229 sq mi (997,739 sq km). Population (2005 est.): 70,457,000. Capital: CAIRO. The people are largely Egyptian Arabs. Language: Arabic (official). Religions: Islam (official; predominantly Sunni); also Christianity. Currency: Egyptian pound. Egypt occupies a crossroads between Africa, Europe, and Asia. The majority of its land is in the arid western and eastern deserts, separated by the country's dominant feature, the NILE RIVER. The Nile forms a flat-bottomed valley, generally 5–10 mi (8–16 km) wide, that fans out into the densely populated delta lowlands north of Cairo. The Nile valley (in Upper Egypt) and delta (Lower Egypt), along with scattered oases, support all of Egypt's agriculture and have virtually all of its population. Egypt has a developing, mainly socialist, partly free-enterprise economy based primarily on industry, including petroleum production, and agriculture. It is a republic with one legislative house; its chief of state is the president, and the head of government is the prime minister. It is one of the world's oldest continuous civilizations. Upper and Lower Egypt were united c. 3000 BC, beginning a period of cultural achievement and a line of native rulers that lasted nearly 3,000 years. Egypt's ancient history is divided into the Old, Middle, and New Kingdoms, spanning 31 dynasties and lasting to 332 BC. The PYRAMIDS date from the Old Kingdom, the cult of OSIRIS and the refinement of sculpture from the Middle Kingdom, and the era of empire and the EXODUS of the Jews from the New Kingdom. An Assyrian invasion occurred in the 671 BC, and the Persian Achaemenids established a dynasty in 525 BC. The invasion by ALEXANDER THE GREAT in 332 BC inaugurated the Macedonian Ptolemaic period and the ascendancy of ALEXANDRIA as a centre of learning and Hellenistic culture. The Romans held Egypt from 30 BC to AD 395; later it was part of the Byzantine Empire. After the Roman emperor CONSTANTINE granted tolerance to the Christians in 313, a formal Egyptian (COPTIC) church emerged. Egypt came under Arab control in 642 and ultimately was transformed into an Arabic-speaking state, with ISLAM as the dominant religion. Held by the UMAYYAD and ʿABBĀSID dynasties, in 969 it became the centre of the FĀṬIMID DYNASTY. In 1250 the MAMLŪK DYNASTY established a state that lasted until 1517, when Egypt fell to the Ottoman Empire. An economic and cultural decline ensued. Egypt became a British protectorate in 1914 and received nominal independence in 1922, when a constitutional monarchy was established. A group of army offic-

© 2006 Encyclopædia Britannica, Inc.

ers led by Gamal Abdel Nasser overthrew the monarchy in 1952. A union with Syria to form the United Arab Republic (1958–61) failed. Following three wars with Israel (see ARAB-ISRAELI WARS), Egypt, under Nasser's successor, ANWAR EL-SĀDĀT, made peace with the Jewish state, thus alienating many fellow Arab countries. Sādāt was assassinated by Islamic extremists in 1981 and was succeeded by ḤOSNĪ MUBĀRAK, who continued to negotiate peace. Although Egypt took part in the coalition against Iraq during the First PERSIAN GULF WAR (1991), it later began peace overtures with countries in the region.

Egyptian architecture Houses, palaces, temples, tombs, and other buildings of ancient Egypt. Most Egyptian towns were situated on the floodplain of the Nile and have been lost, but religious structures built on higher ground have survived in many forms. Tomb architecture was often grandiose. The tomb was not simply a place to lay a corpse, but the home of the deceased, provided with goods to ensure continued existence after death. Wood and bricks made of mud were the standard domestic building materials, but, from the Old Kingdom (c. 2575–c. 2130 BC) on, stone was used for tombs and temples. Egyptian masons used stone to reproduce the forms of wood and brick buildings. MASTABAS and step pyramids were used for tomb superstructures, but the most characteristic form of the Old Kingdom was the true PYRAMID. The finest example is the monumental Great Pyramid of Khufu (Cheops) at GIZA. Simple chapel rooms with stelae (see STELE) for burying commoners were located some distance from the royal burial compounds. In the New Kingdom (1539–1075 BC), royal tombs were cut into the face of cliffs to discourage looting; elaborate complexes of tombs and mortuary TEMPLES were built in the Valley of the Kings at THEBES. Two principal types of temple can be distinguished: cult temples for worship of the gods and funerary, or mortuary, temples. Most notable were the great stone cult temples; imposing remains can be seen at LUXOR, KARNAK, ABYDOS, and ABU SIMBEL.

Egyptian art Ancient sculptures, paintings, and decorative crafts produced in the dynastic periods of the 3rd–1st millennia BC in the Nile Valley of Egypt and NUBIA. Egyptian art served those in power as a forceful propaganda instrument that perpetuated the existing framework of society. Much of what has survived is associated with ancient tombs. The course of art in Egypt paralleled the country's political history and is divided into three periods: Old Kingdom (c. 2700–c. 2150 BC), Middle Kingdom (c. 2000–c. 1670 BC), and New Kingdom (c. 1550–c. 1070 BC). The Old Kingdom's stone tombs and temples were decorated with vigorous and brightly painted reliefs illustrating the daily life of the people. Rules for portraying the human figure were established, specifying proportions, postures, and placement of details, often linked to the subjects' social standing. An artistic decline at the end of the Old Kingdom led to a revival in the more stable political climate of the Middle Kingdom, notable for its expressive portrait sculptures of kings and its excellent relief sculptures and painting. The New Kingdom brought a magnificent flowering of the arts; great granite statues and wall reliefs glorified rulers and gods, painting became an independent art, and the decorative crafts reached new peaks, the treasure of TUTANKHAMEN's tomb typifying the variety of luxury items created. See also EGYPTIAN ARCHITECTURE.

Egyptian language Extinct AFRO-ASIATIC LANGUAGE of the Nile River valley. Its very long history comprises five periods: Old Egyptian (c. 3000–c. 2200 BC), best exemplified by a corpus of religious inscriptions known as the Pyramid Texts and a group of autobiographical tomb inscriptions; Middle Egyptian (c. 2200–c. 1600 BC), the classical literary language; Late Egyptian (1300–700 BC), known mainly from manuscripts; Demotic (c. 700 BC–c. AD 400), used in the periods of Persian, Greek, and Roman dominance and differing from Late Egyptian chiefly in its graphic system; and Coptic (c. AD 300–at least the 17th century), the language of Christian Egypt, gradually supplanted as a vernacular by Arabic from the 9th century on but still preserved to some degree in the liturgy of the COPTIC ORTHODOX CHURCH. Egyptian was originally written in HIEROGLYPHS, out of which evolved hieratic, a cursive rendering of hieroglyphs, and demotic, a kind of shorthand reduction of hieratic. Coptic was written in a modified form of the Greek alphabet, with seven signs added from the demotic script for sounds that did not occur in Greek.

Egyptian law Law that prevailed in Egypt from c. 3000 BC to c. 30 BC. No formal Egyptian code of law has been preserved, but legal documents (e.g., deeds and contracts) have survived. The pharaoh was the ultimate authority in the settlement of disputes. The next most powerful individual was the vizier, who directed all administrative branches of the government, sat in judgment on court cases, and appointed magistrates. Parties to a dispute were not represented by legal advocates; they spoke for themselves, presented any documentary evidence, and sometimes called witnesses. Both men and women could own and bequeath property, file lawsuits, and bear witness. Punishment for criminal offenders could be severe, but in some periods basic human rights, even those of slaves, were acknowledged. Egyptian law strongly influenced both GREEK and ROMAN law.

Egyptian religion Polytheistic belief system of ancient Egypt from the 4th millennium BC to the first centuries AD, including both folk traditions and the court religion. Local deities that sprang up along the Nile Valley had both human and animal form and were synthesized into national deities and cults after political unification c. 2925 BC. The gods were not all-powerful or all-knowing, but were immeasurably greater than humans. Their characters were not neatly defined, and there was much overlap, especially among the leading deities. One important deity was HORUS, the god-king who ruled the universe, who represented the earthly Egyptian king. Other major divinities included RE, the sun god; PTAH and ATON, creator gods; and ISIS and OSIRIS. The concept of Ma'at ("order") was fundamental: the king maintained Ma'at both on a societal and cosmic level. Belief in and preoccupation with the afterlife permeated Egyptian religion, as the surviving tombs and PYRAMIDS attest. Burial near the king helped others gain passage to the netherworld, as did spells and passwords from the BOOK OF THE DEAD.

Egyptology Study of pharaonic Egypt from the putative beginnings of Egyptian culture (c. 4500 BC) to the Arab conquest (AD 641). Egyptology began with discovery of the ROSETTA STONE (1799) and the publication of *Description de l'Égypt* (1809–28) by scholars accompanying Napoleon I. In the 19th century the Egyptian government opened Egypt to Europeans, many of whose collecting activities amounted to little more than plundering. In 1880 FLINDERS PETRIE brought controlled, scientifically recorded excavation to Egypt, revolutionizing archaeology and pushing theories on Egyptian origins back to 4500 BC. The discovery of TUTANKHAMEN's tomb in 1922 heightened public awareness. In 1975 the First International Congress of Egyptology convened in Cairo. Many sites remain that have been only slightly explored.

Ehrenberg \'er-ən-ˌberk**, Christian Gottfried** (b. April 19, 1795, Delitzsch, Saxony—d. June 27, 1876, Berlin, Ger.) German biologist, explorer, and founder of micropaleontology (the study of fossil microorganisms). He received his M.D. from the University of Berlin. He identified and classified a number of land and marine plants, animals, and microorganisms. He proved that fungi come from spores and demon-

© 2006 Encyclopædia Britannica, Inc.

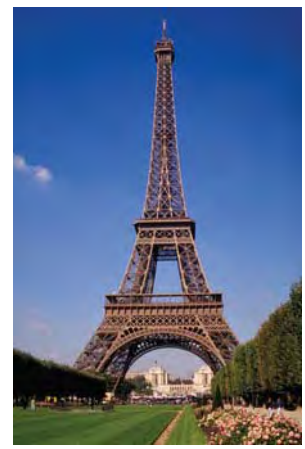
strated the sexual reproduction of molds and mushrooms. He was the first to study coral in detail, and he identified planktonic microorganisms as the cause of phosphorescence in the sea. He advanced the view (opposed by Felix Dujardin) that all animals, including the tiniest, possess complete organ systems. Arguing that a single "ideal type" may be applied to all animals, he worked toward a comprehensive system of classification.

Ehrenburg \'er-ən-ˌbürg, 'er-ən-ˌbůrk**, Ilya (Grigoryevich)** (b. Jan. 27, 1891, Kiev, Ukr., Russian Empire—d. Aug. 31, 1967, Moscow, Russian S.F.S.R., U.S.S.R.) Russian writer and journalist. Arrested as a youth for revolutionary activity, he moved to Paris. He worked as a war correspondent, then returned to write for Soviet newspapers. His first novel and best work was *Julio Jurenito and His Disciples* (1922). He soon embraced the Soviet regime, eventually becoming one of its most effective spokesmen in the West. The vehemently anti-Western *The Fall of Paris* (1941) was followed by *The Storm* (1946–47) and *The Ninth Wave* (1951–52). After Joseph Stalin's death, Ehrenburg's works, including *The Thaw* (1954) and his autobiography, *People, Years, Life*, 6 vol. (1960–66), turned critical of Stalin's heritage.

Ehrlich \'ər-lik**, Paul** (b. March 14, 1854, Strehlen, Silesia, Prussia—d. Aug. 20, 1915, Bad Homburg vor der Höhe, Ger.) German medical scientist. After early work on distribution of foreign substances in the body and on cell nutrition, he found uses for staining agents in diagnosis (including that of tuberculosis) and treatment. He also researched typhoid, fever medications, and eye diseases. In one paper, he showed that different tissues' oxygen consumption reflected the intensity of their cell processes. Ehrlich developed a method of stimulating production of antitoxins by injecting increasing amounts of toxin into animals; his work was crucial to the creation of a diphtheria antitoxin. He and Élie Metchnikoff received the 1908 Nobel Prize for Physiology or Medicine. With Sahachiro Hata, he developed Salvarsan, the first effective syphilis treatment, in 1910.

Ehrlich \'ər-lik**, Paul R(alph)** (b. May 29, 1932, Philadelphia, Pa., U.S.) U.S. biologist. He studied at the University of Kansas and taught at Stanford University from 1959. Though much of his research was done in entomology, his overriding concern became unchecked population growth. His most influential work was *The Population Bomb* (1968). In 1990 he shared with Edward O. Wilson Sweden's prestigious Crafoord Prize.

Ehrlichman, John D(aniel) (b. March 20, 1925, Tacoma, Wash., U.S.—d. Feb. 14, 1999, Atlanta, Ga.) U.S. presidential assistant who played a central role in the Watergate scandal. He received his law degree from Stanford University in 1951 and established a law firm in Seattle, Wash. In 1969 he became domestic affairs adviser to Pres. Richard Nixon. With H.R. Haldeman he formed the so-called "palace guard" that controlled access to the president and filtered information directed to him. Ehrlichman soon established a group known as the "plumbers," whose purpose was to acquire political intelligence and to repair "leaks" of information to the press. When members of the plumbers were caught breaking into Democratic Party headquarters at the Watergate complex, Ehrlichman became involved in a cover-up of involvement by White House officials. He was forced to resign in 1973. Convicted of conspiracy, perjury, and obstruction of justice, he served 18 months in jail. See also Pentagon Papers.



Eichendorff \'ī-kən-ˌdȯrf**, Joseph, Baron von** (b. March 10, 1788, near Ratibor, Prussia—d. Nov. 26, 1857, Neisse) German poet and novelist. Born to the nobility, he and his family lost their castle in the Napoleonic Wars, and he later worked in the Prussian civil service. He became associated with the national leaders of the Romantic movement while studying in Berlin. His most important prose work, *Memoirs of a Good-for-Nothing* (1826), is considered a high point of Romantic fiction. In the 1830s he wrote poetry that achieved the popularity of folk songs and inspired such composers as Robert Schumann, Felix Mendelssohn, Johannes Brahms, Hugo Wolf, and Richard Strauss.

Eichmann \'īk-ˌmän**, (Karl) Adolf** (b. March 19, 1906, Solingen, Ger.—d. May 31, 1962, Tel Aviv, Israel) German Nazi official. In 1932 he joined the Nazi Party and became a member of Heinrich Himmler's SS organization. In World War II he organized the identification, assembly, and transportation of Jews to Auschwitz and other death camps. In 1945 he was captured by U.S. troops but escaped and eventually settled in Argentina. In 1960 he was arrested near Buenos Aires and taken to Israel, where he was tried as a war criminal, with huge worldwide publicity, and hanged for his part in the Holocaust.

eider \'ī-dər\ Any of several species of large diving ducks (in tribes Mergini and Somateriini) that are heavy and round-bodied, with a humped bill that produces a characteristic sloping profile. Eiders are the source of eiderdown, feathers that the hen plucks from her breast to line the nest and insulate her eggs. Eiderdown is used as a warm filling for jackets, pillows, quilts, and sleeping bags. Hens are mottled brown, but drakes (males) are boldly patterned, with a green pigment on the head. Eiders live in the cold far north.

Eider \'ī-dər\ **River** River, Schleswig-Holstein state, northern Germany. It rises east of Rendsburg and flows west for 117 mi (188 km) to the North Sea. It is navigable up to Rendsburg. It formed the northern limit of the Roman Empire from the reign of Charlemagne (768–814), was recognized as the boundary of the Holy Roman Empire in 1027, and formed the traditional frontier between Schleswig and Holstein.

Eiffel Tower \'ī-fəl\ Parisian landmark built for the Centennial Exposition of 1889. Conceived by the bridge engineer Gustave Eiffel (1832–1923), the 984-ft (300-m) tower of open-lattice wrought iron was a technological masterpiece. Making use of advanced knowledge of the behaviour of metal arch and truss forms under loading, the structure presaged a revolution in civil engineering and architectural design. The tower was the world's tallest building until completion of the Chrysler Building in 1930.

Eiffel Tower, Paris.

Eigen \'ī-gən**, Manfred** (b. May 9, 1927, Bochum, Ger.) German physicist. He received his Ph.D. from the University of Göttingen in 1951. He shared a 1967 Nobel Prize with Ronald Norrish (1897–1978) and George Porter (b. 1920) for work on extremely rapid chemical reactions. His methods, called relaxation techniques, involve applying bursts of energy to a solution and following the rates of subsequent changes (flash photolysis); reactions thus studied include hydrogen ion formation during water dissociation and keto-enol tautomerism.

eigenvalue \'ī-gən-ˌval-yü\ In mathematical analysis, one of a set of discrete values of a parameter, k, in an equation of the form $L\mathbf{x} = k\mathbf{x}$. Such characteristic equations are particularly useful in solving differential equations, integral equations, and systems of equations. In the equation, L is a linear transformation such as a matrix or a differential operator, and $\mathbf{x}$ can be a vector or a function (called an eigenvector or eigenfunction). The totality of eigenvalues for a given characteristic equation is a set. In quantum mechanics, where L is an energy operator, the eigenvalues are energy values.

Eight, The Group of U.S. painters who reacted against the traditions of the National Academy of Design. The original eight—Robert Henri, Everett Shinn (1876–1953), John Sloan, Arthur B. Davies (1862–1928), Ernest Lawson (1873–1939), Maurice Prendergast, George Luks (1867–1933), and William Glackens—were later joined by George Wesley Bellows. In 1908 they exhibited together in New York City. Saloons, tenements, pool halls, and slums were among their favourite subjects, and their style was rough and realistic. Their careers took various directions, and a few years later they were absorbed into the Ash Can school.

eighteen schools Divisions of Buddhism that arose in India in the three centuries after the death of the Buddha (c. 483 BC). The number of schools, or sects, was probably closer to 30 than 18. The first division in the Buddhist community occurred as a result of the second council, held at Vaishali in the 4th century BC, where differences among disciples over the nature of the Buddha gave rise to the school known as the Mahasanghikas. Other schools included the Sthaviravadins and their offshoots (3rd century BC), including the Theravadins (see Theravada).

© 2006 Encyclopædia Britannica, Inc.

Eightfold Path Buddhist doctrine, stated by the BUDDHA in his first sermon near Benares, India. The path is regarded as the way for individuals to deal with the problems named in the FOUR NOBLE TRUTHS. The path consists of right understanding (faith in the Buddhist view of existence), right thought (the resolve to practice the faith), right speech (avoidance of falsehoods, slander, and abuse), right action (abstention from taking life, stealing, and improper sexual behavior), right livelihood (rejection of occupations not in keeping with Buddhist principles), right effort (development of good mental states), right mindfulness (awareness of body, feelings, and thought), and right concentration (meditation). It is also called the Middle Path, because it steers a course between sensuality and asceticism. Following the Path leads to escape from suffering and attainment of NIRVANA.

Eijkman \ˈīk-ˌmän, ˈāk-ˌmän**, Christiaan** (b. Aug. 11, 1858, Nijkerk, Neth.—d. Nov. 5, 1930, Utrecht) Dutch physician and pathologist. While seeking a bacterial cause for BERIBERI, he noticed a resemblance between a nerve disorder in his laboratory chickens and that seen in beriberi. He eventually showed that the cause was their diet of white rather than brown rice, but he believed the disorder was caused by a toxin even after it was shown to be due to thiamin deficiency. His work led to the discovery of VITAMINS and earned him a 1929 Nobel Prize, shared with FREDERICK GOWLAND HOPKINS.

Eileithyia \ˌī-lī-ˈthī-ə\ Greek goddess of childbirth. Capable of helping or hindering labour according to her will, she was worshiped over a period of centuries from Neolithic to Roman times. The earliest evidence for her cult was found at Amnisus in Crete. In later Greek polytheism she is sometimes described as the daughter of HERA and is sometimes identified with Hera or with ARTEMIS.

Einaudi \ˌā-nä-ˈü-dē**, Luigi** (b. March 24, 1874, Carrù, Italy—d. Oct. 30, 1961, Rome) Italian economist and politician. He taught at the University of Turin (1900–43) and edited the *Review of Economic History* (1936–43). An opponent of the fascists, he fled to Switzerland in 1943. He returned in 1945 and served as governor of the Bank of Italy (1945–48). As minister of the budget (1947), he successfully curbed inflation and stabilized the currency. He was the first president (1948–55) of the Republic of Italy.

Eindhoven \ˈīnt-ˌhō-vən\ Commune (pop., 2001 est.: 203,397), southern Netherlands. Situated on the Dommel River southeast of ROTTERDAM, it was chartered in 1232 by Henry I, duke of Brabant. After 1900 it developed from a small village into one of the largest industrial centres of The Netherlands, and in 1920 it annexed five adjoining municipalities. The city is the seat of a technical university and the headquarters of PHILIPS ELECTRONICS NV.

Einhard \ˈīn-ˌhärt\ *or* **Eginhard** \ˈā-gin-ˌhärt\ (b. c. 770, Maingau, Franconia—d. March 14, 840, Seligenstadt, Franconia) Frankish historian and scholar. An adviser to CHARLEMAGNE and to LOUIS I the Pious, Einhard was made abbot of several monasteries and held extensive lands. His biography of Charlemagne (c. 830) analyzed Charlemagne's family, achievements, administration, and death and exemplified the classical renaissance at the Carolingian court.

Einstein, Albert (b. March 14, 1879, Ulm, Württemberg, Ger.—d. April 18, 1955, Princeton, N.J., U.S.) German-Swiss-U.S. scientist. Born to a Jewish family in Germany, he grew up in Munich, and his family moved to Switzerland in 1894. He became a junior examiner at the Swiss patent office in 1902 and began producing original theoretical work that laid many of the foundations for 20th-century physics. He received his doctorate from the University of Zürich in 1905, the same year he won international fame with the publication of three articles: one on BROWNIAN MOTION, which he explained in terms of molecular kinetic energy; one on the PHOTOELECTRIC EFFECT, in which he demonstrated the particle nature of light; and one on his special theory of RELATIVITY, which included his formulation of the equivalence of mass and energy ($E = mc^2$). Einstein held several professorships before becoming director of Berlin's Kaiser Wilhelm Institute in 1914. In 1915 he published his general theory of relativity, which was confirmed experimentally during a solar eclipse in 1919 with observations of the deviation of light passing near the Sun. He received a Nobel Prize in 1921 for his work on the photoelectric effect, his work on relativity still being controversial. He made important contributions to QUANTUM FIELD THEORY, and for decades he sought to discover the mathematical relationship between ELECTROMAGNETISM and GRAVITATION, which he believed would be a first step toward discovering the common laws governing the behaviour of everything in the universe, but such a UNIFIED FIELD THEORY eluded him. His theories of relativity and gravitation represented a profound advance over Newtonian physics and revolutionized scientific and philosophical inquiry. He resigned his position at the Prussian Academy when ADOLF HITLER came to power and moved to Princeton, N.J., where he joined the Institute for Advanced Study. Though a longtime pacifist, he was instrumental in persuading Pres. FRANKLIN ROOSEVELT in 1939 to initiate the MANHATTAN PROJECT for the production of an atomic bomb, a technology his own theories greatly furthered, though he did not work on the project himself. The most eminent scientist in the world in the postwar years, he declined an offer to become the first prime minister of Israel and became a strong advocate for nuclear disarmament.

Einstein's mass-energy relation Relationship between MASS (m) and ENERGY (E) in ALBERT EINSTEIN's special theory of RELATIVITY, expressed $E = mc^2$, where c equals 186,000 mi/second (300,000 km/second), the speed of LIGHT. Whereas mass and energy were viewed as distinct in earlier physical theories, in special relativity a body's mass can be converted into energy in accordance with Einstein's formula. Such a release of energy decreases the body's mass (see CONSERVATION LAW).

Eisai \ˈā-ˈsī\ (b. 1141—d. 1215) Japanese monk who introduced Rinzai ZEN Buddhism to Japan. Originally a Tendai (TIANTAI) monk, he visited China twice (1168, 1187) and returned to teach a strict meditational system based on the use of KOAN (riddles). He instructed DŌGEN.

Eisenhower \ˈī-zən-ˌhaù-ər**, Dwight D(avid)** (b. Oct. 14, 1890, Denison, Texas, U.S.—d. March 28, 1969, Washington, D.C.) 34th president of the U.S. (1953–61). He graduated from West Point (1915), then served in the Panama Canal Zone (1922–24) and in the Philippines under DOUGLAS MACARTHUR (1935–39). In World War II Gen. GEORGE MARSHALL appointed him to the army's war-plans division (1941), then chose him to command U.S. forces in Europe (1942). After planning the invasions of North Africa, Sicily, and Italy, he was appointed supreme commander of Allied forces (1943). He planned the NORMANDY CAMPAIGN (1944) and the conduct of the war in Europe until the German surrender (1945). He was promoted to five-star general (1944) and was named army chief of staff in 1945. He served as president of Columbia University from 1948 until being appointed supreme commander of NATO in 1951. Both Democrats and Republicans courted Eisenhower as a presidential candidate; in 1952, as the Republican candidate, he defeated ADLAI STEVENSON with the largest popular vote to that time. He defeated Stevenson again in 1956 in an even larger landslide. His policy of support for Middle Eastern countries facing communist aggression, enunciated in the EISENHOWER DOCTRINE, was a continuation of the CONTAINMENT policy adopted by the HARRY TRUMAN administration (see TRUMAN DOCTRINE). He sent federal troops to Little Rock, Ark., to enforce integration of a city high school (1957). When the Soviet Union launched Sputnik I (1957), he was criticized for failing to develop the U.S. space program; he responded by creating NASA (1958). In his last weeks in office the U.S. broke diplomatic relations with Cuba.

Dwight D. Eisenhower, 1952.
FABIAN BACHRACH

Eisenhower Doctrine U.S. foreign policy pronouncement by Pres. DWIGHT D. EISENHOWER (1957). The Eisenhower Doctrine promised military and economic aid to anticommunist governments, at a time when communist countries were providing arms to Egypt and offering strong support to Arab states. Part of the COLD WAR policy developed by JOHN FOSTER DULLES to contain expansion of the Soviet sphere of influence, the doctrine continued pledges made under the TRUMAN DOCTRINE.

Eisenstaedt \ˈī-zən-ˌstat**, Alfred** (b. Dec. 6, 1898, Dirschau, West Prussia—d. Aug. 23, 1995, Oak Bluffs, Mass., U.S.) German-born U.S. photojournalist. He became a professional photographer in Berlin in 1929 and came under the influence of ERICH SALOMON. His work appeared in many European picture magazines in the 1930s. In 1935 he immigrated

© 2006 Encyclopædia Britannica, Inc.

to New York City, where he became one of the first four photographers hired by *Life* (1936). He would contribute more than 2,500 picture stories and 90 cover photos to the magazine, including outstanding portraits of kings, dictators, film stars, and ordinary people.

Eisenstein \ˈī-zən-ˌstīn**, Sergey (Mikhaylovich)** (b. Jan. 23, 1898, Riga, Latvia—d. Feb. 11, 1948, Moscow, U.S.S.R.) Russian film director and theorist. He began his career at a workers' theatre in Moscow in 1920, designing costumes and scenery. After studying stage direction with Vsevolod Meyerhold, he turned to filmmaking. In *Strike* (1924) he introduced his influential concept of film montage, adding startling and often discordant images to the main action to create the maximum psychological impact. He further developed the style in *The Battleship Potemkin* (1925), a commissioned propaganda film that is one of the most influential films of all time. Among his other films are *October* (*Ten Days That Shook the World*; 1928) and *The General Line* (1929). After a frustrating period in Hollywood and Mexico (1930–33), he returned to the Soviet Union and made two more classics, *Alexander Nevsky* (1938) and *Ivan the Terrible* (2 parts, 1945–46).

Eisner \ˈīz-nər**, Kurt** (b. May 14, 1867, Berlin, Prussia—d. Feb. 21, 1919, Munich, Ger.) German journalist and politician. From 1898 he was editor of *Vorwärts*, the official Social Democratic Party newspaper. He joined the Independent Social Democratic Party in 1917, later becoming its leader. In November 1918 he organized a Socialist revolution that overthrew the monarchy in Bavaria, and he became first prime minister and minister of foreign affairs of the new Bavarian republic. In February 1919 he was assassinated by a reactionary zealot.

Eisner, Michael (Dammann) (b. March 7, 1942, Mount Kisco, N.Y., U.S.) U.S. entertainment executive. He worked at ABC-TV (1966–76) before becoming president of Paramount Pictures (1976–84), and he served as head of the Disney Co. from 1984. He was instrumental in reviving Disney as a major movie studio with films such as *Pretty Woman* (1990), and he restored Disney's reputation for classic animation with *Beauty and the Beast* (1991) and *The Lion King* (1995), which also became hit Broadway musicals. He expanded the company into fields such as television, publishing, home video, and cruise ship travel.

eisteddfod \ī-ˈsteth-vȯd, ā-ˈsteth-vȯd\ *Welsh* **"session"** Formal assembly of Welsh bards and minstrels that originated in the traditions of medieval court bards. Early eisteddfods were competitions of musicians (especially harpists) and poets from which new musical, literary, and oratorical forms emerged. The assembly at Carmarthen in 1451 authoritatively established the arrangement of the strict metres of Welsh poetry. The modern annual National Eisteddfod, revived in the 19th century, includes awards for music, prose, drama, and art, but the investiture of the winning poet remains its high point.

ejido \ā-ˈhē-thō\ In Mexico, village lands held in the traditional Indian system of land tenure, blessed by Mexican law in the 1920s, that combines communal ownership with individual use. The *ejido* consists of cultivated land, pastureland, other uncultivated lands, and the *fundo legal*, or town site. The cultivated land is generally apportioned in family holdings, which until recently could not be sold but could be passed down to heirs. Though the land reform of the mid 18th century was aimed at breaking up the large church holdings, it also forced the Indians to give up their *ejidos*. The village lands were restored by the 1917 constitution. In 1992 the Carlos Salinas government revoked the ban on the sale of *ejido* land.

Ekaterinoslav See Dnipropetrovsk

Ekron \ˈe-ˌkrän\ Canaanite and Philistine city in ancient Palestine. It was one of the five cities of the Philistine Pentapolis and was located in what is now central Israel. Though allocated to Judah after the Israelite conquest, it was a Philistine stronghold in the time of King David; it was later associated with the worship of the deity Baalzebub. Taken by Egypt (c. 918 BC), it paid tribute to Assyria in the 7th century BC. The city was known as Akkaron from Hellenistic times.

El Chief deity of the western Semites. In ancient texts from Ras Shamra in Syria, El was the husband of the mother goddess Asherah and father of all the gods except Baal. He was often depicted as an old man with a white beard and wings. The writers of the Hebrew scriptures used El as a synonym for Yahweh (the God of Israel) or as a general term for deity.

El Aaiún See Laayoune

El Alamein \ˌa-lə-ˈmān**, Battles of** (June–July 1942; October 23–November 6, 1942) Two battles between British and Axis forces in Egypt in World War II. Axis forces under Erwin Rommel began a drive eastward along the North African coast in early 1942. Though initially checked by the British, they managed to reach El Alamein on June 30. The first engagement ended in mid-July with Rommel still there, blocked and on the defensive. In October British forces under Bernard Law Montgomery began a devastating attack from El Alamein, routing Rommel's vastly outnumbered forces. By November 6 the British had driven the Germans back into Libya.

El Cid See The Cid

El Dorado (Spanish: "The Golden") Legendary golden city sought by Spanish explorers in the New World. It was the fabulously wealthy land of a king who was said to have been covered with gold dust so many times that he was permanently gilded. Many Spanish and English expeditions in the Americas were sent in search of El Dorado. In 1540 Francisco Vazquez de Coronado ventured as far north as Kansas seeking the Seven Golden Cities of Cibola. Walter Raleigh searched for El Dorado in vain in South America, leading an expedition up the Orinoco River in 1595.

El Escorial \ˌes-kȯr-ˈyäl\ Palace-monastery northwest of Madrid, built in 1563–67 for Philip II. It is the burial place of Spanish sovereigns and one of the largest religious establishments in the world. It was conceived by Juan Bautista de Toledo (1530–1597) and completed by Juan de Herrera (c. 1530–1597), who is considered responsible for its architectural style. Its plan is a giant rectangle, with a domed church at the center flanked by the palace, monastery, college, library, cloisters, and courts. The massive granite walls, relieved only by a series of unadorned windows and Doric pilasters, with no concession to decorative richness, produced an austerity beyond anything the Italian Renaissance ever envisaged.

El Greco See El Greco

El Malpais \ˌel-ˌmäl-pä-ˈēs\ **National Monument** Natural area, west-central New Mexico, U.S. Located at an elevation of 6,400–8,400 ft (1,950–2,560 m), it covers 179 sq mi (464 sq km), including a lava flow area of 133 sq mi (344 sq km). Features include a 17-mi (27-km) lava tube system, a number of ice caves, volcanic cinder cones, one of New Mexico's largest natural arches, and more than 20 gas and lava spatter cones. Designated a national natural landmark with the name McCarty Lava Flow in 1969, it became a national monument in 1987.

El Morro National Monument Rock formation and archaeological site, west-central New Mexico, U.S. Established in 1906, it has an area of 2 sq mi (5 sq km). El Morro, or Inscription Rock, is a soft sandstone mesa rising 200 ft (60 m) above the valley floor and covering several acres. Spaniards and Americans left their inscriptions (1605–1906) on the cliff sides of the mesa. El Morro also has a number of pre-Columbian petroglyphs, and on its top lie ruins of Indian pueblos.

El Niño In oceanography and climatology, the appearance, every few years, of unusually warm surface waters of the Pacific Ocean along the tropical western coast of South America. It affects fishing, agriculture, and local weather from Ecuador to Chile and can cause global climatic anomalies in the equatorial Pacific, Asia, and North America. The name (Spanish for "the Christ Child") was originally used by 19th-century Peruvian fishermen to describe the annual flow of warm equatorial waters southward around Christmastime. The term is now used for an intense ocean warming that stretches from the western Pacific to South America. This "anomalous occurrence" is caused by an unusual weakening of the normally westward-blowing trade winds, which in turn allows warm surface waters to spread eastward. See also La Niña.

El Paso City (pop., 2000: 563,662), western Texas, U.S. Located on the Rio Grande opposite Ciudad Juárez, Mex., it is the largest of the U.S.-Mexican border cities. The area was the site of several missions from the 17th century; the first village was built on the site of El Paso in 1827. It became U.S. territory in 1848, when an army post was erected; the town was laid out in 1859. It grew slowly until 1881, when four railways arrived; in a decade El Paso's population increased more than tenfold. Spanish language and culture distinguish the modern city. The commercial and financial centre for an extensive trade territory, it is the site of the University of Texas at El Paso (1913) and Fort Bliss (home of the U.S. Army Air Defense Center); the White Sands Missile Range is nearby.

© 2006 Encyclopædia Britannica, Inc.

El Salvador *officially* **Republic of El Salvador** Country, Central America. Area: 8,124 sq mi (21,042 sq km). Population (2005 est.): 6,881,000. Capital: San Salvador. The majority of the people are mestizos; most of the rest are Indians. Language: Spanish (official). Religion: Christianity (predominantly Roman Catholic; also Protestant, other Christians). Currency: U.S. dollar. The smallest and most densely populated Central American country, it is crossed by two volcanic mountain ranges and has a narrow coastal region and a high central plain in the south. The climate ranges from hot and wet in the lowlands to cooler and wetter in the highlands. Cloud forests predominate at the highest elevations. El Salvador has a developing economy based on trade, manufacturing, and agriculture, with coffee, sugarcane, and cotton the major export crops. It is a republic with one legislative house; its chief of state and government is the president. The Spanish arrived in the area in 1524 and subjugated the Pipil Indian kingdom of Cuzcatlán by 1539. The country was divided into two districts, San Salvador and Sonsonate, both attached to Guatemala. When Spanish rule ended in 1821, the Salvadorans opposed incorporation into the Mexican Empire (confronting both Guatemalan and Mexican armies), and, upon its collapse in 1823, Sonsonate and San Salvador combined to form the new state of El Salvador within the United Provinces of Central America. The country attained independence in 1841. From its founding, it experienced a high degree of political turmoil; powerful economic interests controlled the country through most of the 19th and early 20th centuries but were replaced by a military dictatorship that lasted from 1931 to 1979. Elections held in 1982 set up a new government, and, though a new constitution was adopted in 1983, civil war continued throughout the 1980s. An accord in 1992 brought peace, but violent crime became a major problem. Despite attempts at economic reform, the country was plagued by inflation and unemployment into the 21st century.

Elagabalus \ˌe-lə-'ga-bə-ləs\ *or* **Heliogabalus** \ˌhe-lē-ō-'ga-bə-ləs\ *officially* **Caesar Marcus Aurelius Antoninus Augustus** *orig.* **Varius Avitus Bassianus** (b. 204, Emesa, Syria—d. 222) Roman emperor (218–22) notable for his eccentric behaviour. Passed off as Caracalla's illegitimate son, he became emperor with the support of the army. He identified himself with the Syrian god Baal and imposed Baal worship on the empire. His execution of dissidents, promotion of favourites, and homosexual orgies outraged the Romans. After he named his cousin Alexander heir and then changed his mind, the Praetorian Guards mutinied, murdered him, and made Alexander emperor.

Elam \'ē-ləm\ Ancient country of the Middle East. It was located in what is now southwestern Iran, at the head of the Persian Gulf and east of ancient Babylonia; its capital was Susa (the country, thus, is sometimes known as Susiana). It had close cultural ties to Mesopotamia and was in conflict with the Sumerians (see Sumer) and Akkadians (see Akkad) from c. 3000 BC. In the 13th century BC, it became a dominant power that included most of Mesopotamia east of the Tigris and reached almost to Persepolis. Its domination ended when Nebuchadrezzar I of Babylon (r. 1124–1103 BC) captured Susa. Later, Elam formed a satrapy of the Persian Achaemenian dynasty, and Susa became one of its capitals.

eland \'ē-lənd\ Either of two species of easily tamed, oxlike antelope (genus *Taurotragus*) found in herds on the plains or in lightly wooded areas of central and southern Africa. The largest of the antelope, they may stand up to 6 ft (1.8 m) tall at the shoulder and weigh as much as 2,200 lbs (1,000 kg). They have a short, dark mane, a dewlap hanging from the throat, and long horns twisted in a tight spiral. The common eland is pale brown, becoming blue-gray with age, and often marked with narrow, vertical white stripes. The giant, or Derby, eland is reddish brown with a blackish neck and vertical white stripes and horns heavier than those of the common eland.

Giant eland (*Taurotragus derbianus*)
LEONARD LEE RUE III

elapid \'e-lə-pəd\ Any of about 200 species of venomous snakes (family Elapidae) that have short fangs fixed in the front of the upper jaw. Elapids are found in the New World, Africa, southern Asia, Pacific Islands, and Australia. Slender and agile, most are small and harmless to humans, but they include the largest and most lethal of snakes. Their venom is primarily neurotoxic but often contains substances that damage body tissues or blood cells. The relatively painless bite may cause a swift death from paralysis of the heart and lungs. See also black snake, cobra, coral snake, mamba.

elastic modulus *or* **elastic constant** In materials science and physical metallurgy, any of various numbers that quantify the response of a material to elastic or springy deflection. When tensile stress is applied to a material, the resulting strain is determined by Young's modulus (see Thomas Young), a constant defined as the ratio of the stress in a body to the corresponding strain. It has dimensions of (force)/(length)^2 and is measured in units such as the pascal or newton per square meter (1 Pa = 1 N/m^2), dyne/cm^2, or lbs per sq in. (psi). See also elasticity.

elasticity Ability of a deformed material body to return to its original shape and size when the forces causing deformation are removed. Most solids show some elastic behaviour, but there is usually a limit—the material's "elastic limit"—to the force from which recovery is possible. Stresses beyond its elastic limit cause the material to yield, or flow, and the result is permanent deformation or breakage. The limit depends on the material's internal structure; for example, steel, though strong, has a low elastic limit and can be extended only about 1% of its length, whereas rubber can be elastically extended up to about 1,000%. Robert Hooke, one of the first to study elasticity, developed a mathematical relation between tension and extension.

Elba Island off the western coast of Italy, in the Tyrrhenian Sea. Occupying an area of 86 sq mi (223 sq km), it is the largest island of the Tuscan Archipelago. France obtained Elba from Rome in 1802. When Napoleon abdicated in May 1814, he was exiled to Elba. The island was recognized as an independent principality with Napoleon as its ruler until February 1815, when he returned to France to begin the Hundred Days. Thereafter Elba was restored to Tuscany.

Elbe \'el-bə\ **River** *Czech* **Labe** \'lä-be\ *ancient* **Albis** River, central Europe. One of the continent's major waterways, it rises in the Krkonoše (Giant) Mountains on the border of the Czech Republic and Poland and flows southwest across Bohemia. It then flows northwest across Germany and empties into the North Sea near Cuxhaven. From 1945 to 1990 it formed part of the boundary between East and West Germany. It is 724 mi (1,165 km) long and connected by canals with the Baltic Sea, the Havel River and Berlin, the Ruhr industrial region, and the Rhine River. It is navigable for 1,000-ton barges as far upstream as Prague through the Vltava River. Hamburg, Ger., is 55 mi (88 km) upstream from its mouth.

© 2006 Encyclopædia Britannica, Inc.

Elbrus \el-'brüs**, Mount** Peak, Caucasus Mountains, southwestern Russia. The highest peak in the Caucasus, it is an extinct volcano with twin cones reaching elevations of 18,510 ft (5,642 m) and 18,356 ft (5,595 m). There are many mineral springs along its descending streams, while 53 sq mi (138 sq km) of Elbrus is covered by 22 glaciers. It is a major centre for mountaineering and tourism.

Elburz \el-'bůrz\ **Mountains** Mountain range, northern Iran. It is 560 mi (900 km) long and extends along the southern shore of the Caspian Sea, from which it is separated by a narrow coastal lowland. It includes Iran's highest peak, Mount Damāvand (Demavend), at 18,605 ft (5,671 m). The forests of the Elburz cover some 12,500 sq mi (32,400 sq km). The Hyrcanian tigers for which they were famous are now rare, but other wild cats, including the leopard and the lynx, are still numerous.

elder Any of about 20–30 species, mainly shrubs and small trees, that make up the genus *Sambucus*, in the honeysuckle family. Most are native to forested temperate or subtropical areas. Elders are important as garden shrubs, as forest plants, and for their berries (elderberries), which provide food for wildlife and are used for wines, jellies, pies, and folk medicines. Elders have divided leaves and flat, roundish clusters of tiny, yellowish-white, saucer-shaped flowers. The American, or sweet, elder (*S. canadensis*) of North America is the most important species horticulturally.

European red elder (*Sambucus racemosa*).
A.J. Huxley

elder, box See box elder

Elder, John (b. March 8, 1824, Glasgow, Scot.—d. Sept. 17, 1869, London, Eng.) Scottish marine engineer. In 1854 he developed the marine compound steam engine (using both high- and low-pressure steam), which enabled seagoing vessels to save 30–40% of the coal they had been burning and helped make practical long voyages on which refueling was impossible.

Eldridge, (David) Roy (b. Jan. 30, 1911, Pittsburgh, Pa., U.S.—d. Feb. 26, 1989, Valley Stream, N.Y.) U.S. trumpeter, one of the most vital and creative jazz musicians of the swing era. He was influenced by saxophonists such as Coleman Hawkins and developed a fast, nimble technique matched with harmonic sophistication. He played with Fletcher Henderson (1935–36) and was featured with the big bands of Gene Krupa and Artie Shaw in the 1940s. (A nickname reflecting his stature, "Little Jazz," was also the title of a record he made with Shaw). The dominant voice on his instrument in the swing style, he exerted a strong influence on bebop musicians.

Eleanor of Aquitaine (b. c. 1122—d. April 1, 1204, Fontevrault, Anjou, Fr.) Queen consort of Louis VII of France (1137–80) and Henry II of England (1152–89), the most powerful woman of 12th-century Europe. She inherited the duchy of Aquitaine and married the heir to the French throne. Beautiful, capricious, and strong-willed, she accompanied Louis on the Second Crusade (1147–49), and her conduct aroused his jealousy. The marriage was annulled (1152), and she married Henry Plantagenet, soon to be Henry II; the marriage united England, Normandy, and western France under his rule. She bore Henry five sons, including the future kings Richard I the Lionheart and John Lackland, and three daughters who married into other royal houses. Her court at Poitiers became a centre of culture, fostering the poetry of the troubadours. She may have spurred her sons to revolt against Henry (1173); when the rebellion failed she was captured and confined until his death (1189). She was active in government during the reign of Richard I, ruling during his crusade to the Holy Land and ransoming him from Austria. After Richard died (1199) and John became king, she saved Anjou and Aquitaine for John against French threats, then retired to the monastery at Fontevrault.

Eleanor of Castile (b. 1246—d. Nov. 28, 1290, Harby, Nottinghamshire, Eng.) Queen consort of Edward I of England. Daughter of the king of Castile, she brought Edward title to Gascony on their marriage in 1254, and she was sent to France for safety during the baronial rebellion (1264–65). She joined Edward on a crusade to the Holy Land (1270–73), and legend says she saved his life by sucking poison from a dagger wound. On her death, Edward erected Eleanor Crosses at each place where her coffin rested en route to London.

Eleaticism \ˌel-ē-'a-tə-ˌsi-zəm\ School of pre-Socratic philosophy that flourished in the 5th century BC. It took its name from the Greek colony of Elea (Velia) in southern Italy. It is distinguished by its radical monism—i.e., its doctrine of the One, according to which all that exists is a static plenum of Being as such, and nothing exists that stands either in contrast or in contradiction to Being. Thus, all differentiation, motion, and change must be illusory. Its literary sources consist of fragments (most less than 10 lines long) preserved by later Classical authors: 19 from Parmenides, 4 from his pupil Zeno of Elea, and 10 from another pupil, Melissus (fl. 5th century BC). See also pre-Socratics.

Eleazar \ˌel-ē-'ā-zər\ **ben Judah of Worms** *orig.* **Eleazar ben Judah ben Kalonymos** (b. 1160, Mainz, Franconia—d. 1238, Worms) German Jewish mystic and Talmudic scholar. His wife and daughters were killed by Crusaders in 1196, but he nevertheless continued to teach a doctrine of love of humanity. After studying with Judah ben Samuel, to whom he was related, he became a rabbi at Worms (1201). Eleazar attempted to unify the mysticism of the Kabbala with the Talmud. His greatest work was his ethical code, *Rokeah* (1505). He believed that God himself was unknowable but that the *kavod*, a ruling angel that was an emanation from God, was knowable. His writings are a major source of information on medieval Hasidism.

election Formal process by which voters make their political choices on public issues or candidates for public office. The use of elections in the modern era dates to the emergence of representative government in Europe and North America since the 17th century. Regular elections serve to hold leaders accountable for their performance and permit an exchange of influence between the governors and the governed. The availability of alternatives is a necessary condition. Votes may be secret or public. See also electoral system, party system, plebiscite, primary election, referendum and initiative.

elector *German* **Kurfürst.** Prince of the Holy Roman Empire who had a right to participate in electing the German emperor. Beginning c. 1273, and with the confirmation of the Golden Bull, there were seven electors: the archbishops of Trier, Mainz, and Cologne; the duke of Saxony; the count palatine of the Rhine; the margrave of Brandenburg; and the king of Bohemia. Other electorates were created much later for Bavaria (1623–1778), Hanover (1708), and Hesse-Kassel (1803), but by the 17th century the electors' office had become meaningless because the Habsburg dynasty produced the de facto emperors. The office disappeared when the empire was abolished in 1806.

electoral college Constitutionally mandated process for electing the U.S. president and vice president. Each state appoints as many electors as it has senators and representatives in Congress (U.S. senators, representatives, and government officers are ineligible); the District of Columbia has three votes. A winner-take-all rule operates in every state except Maine and Nebraska. Three presidents have been elected by means of an electoral college victory while losing the national popular vote (Rutherford B. Hayes in 1877, Benjamin Harrison in 1888, and George W. Bush in 2000). Though pledged to vote for their state's winners, electors are not constitutionally obliged to do so. A candidate must win 270 of the 538 votes to win the election.

Electoral Commission (1877) Commission created to resolve the disputed 1876 presidential election between Republican Rutherford B. Hayes and Democrat Samuel Tilden. Tilden had won the popular vote and was only one electoral vote short of victory, but the Republicans contested the tallies in four states, charging fraud. Unable to reach a consensus, Congress appointed a 15-member commission, evenly divided between the two parties, except for one justice, Joseph P. Bradley, a Republican considered nonpartisan; Republicans pressured him, and the tally went to Hayes, who was declared the winner on March 2. See also Wormley Conference.

electoral system Method and rules of counting votes to determine the outcome of elections. Winners may be determined by a plurality, a majority (more than 50% of the vote), an extraordinary majority (a percentage of the vote greater than 50%), or unanimity. Candidates for public office may be elected directly or indirectly. Proportional representation is used

© 2006 Encyclopædia Britannica, Inc.

in some areas to ensure a fairer distribution of legislative seats to constituencies that may be denied representation under the plurality or majority formulas. See also PARTY SYSTEM, PLURALITY SYSTEM, PRIMARY ELECTION.

Electra In Greek legend, the daughter of AGAMEMNON and Clytemnestra. When Agamemnon was murdered by Clytemnestra and her lover Aegisthus, Electra saved her young brother ORESTES from the same fate by sending him away. Orestes later returned, and Electra helped him kill their mother and Aegisthus. She then married her brother's friend Pylades. The story is treated in plays by AESCHYLUS, SOPHOCLES, and EURIPIDES.

Electra complex See OEDIPUS COMPLEX

electric automobile Battery-powered motor vehicle. Originating in the 1880s, electric cars were used for private passenger, truck, and bus transportation in cities, where their low speeds and limited battery range were not drawbacks, and the cars became popular for their quietness and low maintenance costs. Until 1920 they were competitive with gasoline-fueled cars; they became less so after the electric self-starter made gasoline-powered cars more attractive and MASS PRODUCTION made them cheaper to produce. In Europe electric vehicles have been used as short-range delivery vans. Renewed interest in electric cars beginning in the 1970s, spurred especially by new consciousness of foreign oil dependency and environmental concern, led to improvements in speed and range. Recent laws, particularly in California, have mandated commercial production. "Hybrid" cars employing both electric and internal combustion engines and providing the best features of both technologies, have recently become commercially available. Experimental vehicles have used solar FUEL CELLS.

electric charge Quantity of ELECTRICITY that flows in ELECTRIC CURRENTS or that accumulates on the surfaces of dissimilar nonmetallic substances that are rubbed together briskly. It occurs in discrete natural units, equal to the charge of an ELECTRON or PROTON. It cannot be created or destroyed. Charge can be positive or negative; one positive charge can combine with one negative charge, and the result is a net charge of zero. Two objects that have an excess of the same type of charge repel each other, while two objects with an excess of opposite charge attract each other. The unit of charge is the coulomb, which consists of 6.24×10^{18} natural units of electric charge.

electric circuit See CIRCUIT

electric current Movement of ELECTRIC CHARGE carriers. In a wire, electric current is a flow of ELECTRONS that have been dislodged from ATOMS and is a measure of the quantity of electrical charge passing any point of the wire per unit time. Current in gases and liquids generally consists of a flow of positive IONS in one direction together with a flow of negative ions in the opposite direction. Conventionally, the direction of electric current is that of the flow of the positive ions. In ALTERNATING CURRENT (AC) the motion of the charges is periodically reversed; in DIRECT CURRENT (DC) it is not. A common unit of current is the ampere, a flow of one coulomb of charge per second, or 6.24×10^{18} electrons per second.

electric dipole \'dī-pōl\ Pair of equal and opposite ELECTRIC CHARGES, the centres of which do not coincide. An ATOM in which the centre of the negative cloud of ELECTRONS has been shifted slightly away from the NUCLEUS by an external ELECTRIC FIELD is an induced electric dipole. When the external field is removed, the atom loses its dipolarity. A water molecule, in which two hydrogen atoms are situated to one side of an oxygen atom, is a permanent electric dipole. The oxygen side is always slightly negative, the hydrogen side slightly positive.

electric discharge lamp *or* **vapor lamp** Lighting device consisting of a transparent container within which a gas is energized by an applied voltage and made to glow. After practical generators were devised in the 19th century, many experimenters applied electric power to tubes of gas. From c. 1900, electric discharge lamps were in use in Europe and the U.S. Fluorescent, neon, mercury, sodium, and metal-halide lamps are of the electric discharge variety.

electric eel Eel-shaped South American fish (*Electrophorus electricus*) capable of producing an electric shock strong enough to stun a human. The electric eel (not a true EEL) is a sluggish inhabitant of slow freshwater, surfacing periodically to gulp air. Long, cylindrical, scaleless, and gray-brown, it sometimes reaches a length of 9 ft (2.75 m) and a weight of 49 lbs (22 kg). The tail region, bordered below by a long anal fin that the fish undulates to move about, contains the electric organs. The shock (up to 650 volts discharged at will) is used mainly to immobilize fish and other prey.

electric eye See PHOTOCELL

electric field Region around an ELECTRIC CHARGE in which an ELECTRIC FORCE is exerted on another charge. The strength of an electric field E at any point is defined as the electric force F exerted per unit positive electric charge q at that point, or $E = F/q$. An electric field has both magnitude and direction and can be represented by lines of force, or field lines, that start on positive charges and terminate on negative charges. The electric field is stronger where the field lines are close together than where they are farther apart. The value of the electric field has dimensions of force per unit charge and is measured in units of newtons per coulomb.

electric force *or* **Coulomb force** Force between two ELECTRIC CHARGES. The magnitude of the force F is proportional to the product of the two charges, q_1 and q_2, divided by the square of the distance r between them, or $F = kq_1q_2/r^2$, where k is a constant that depends on the measurement system being used. The electric force can be one of repulsion, such as the force between two objects having like charges, or it can be attractive, such as the force between two objects having opposite charges.

electric furnace Chamber heated with electricity to very high temperatures, for melting and alloying METALS and REFRACTORIES. Modern electric furnaces generally are either ARC FURNACES or induction furnaces. Arc furnaces produce roughly two-fifths of the STEEL made in the U.S. In the induction furnace, a coil carrying alternating electric current surrounds the container or chamber of metal; circulating eddy currents induced in the metal produce extremely high temperatures.

electric potential Amount of WORK needed to move a unit ELECTRIC CHARGE from a reference point to a specific point against an ELECTRIC FIELD. The POTENTIAL ENERGY of a positive charge increases when it moves against an electric field, and decreases when it moves with the field. Electric potential can be thought of as potential energy per unit charge. The work done in moving a unit charge from one point to another, as in an electric circuit, is equal to the difference in potential energies at each point. Electric potential is expressed in units of joules per coulomb, or volts.

electric ray Any of the aquatic RAYS (families Torpedinidae, Narkidae, and Temeridae) that produce an electrical shock. They are found worldwide in warm and temperate seas, mostly in shallow water but some (genus *Benthobatis*) at depths greater than 3,000 ft (900 m). Slow-moving bottom-dwellers, they feed on fishes and invertebrates. They range in length from less than 1 ft (30 cm) to about 6 ft (1.8 m) and have a short, stout tail. They are soft and smooth-skinned, with a circular or nearly circular body disk formed by the head and pectoral fins. They are harmless unless touched or stepped on. The electric organs, composed of modified muscle tissue, are in the disk near the head. The shock from these organs, which may reach 220 volts and is strong enough to fell a human adult, is used for defense, sensory location, and capturing prey.

Electric ray (*Narcine brasiliensis*)
DOUGLAS FAULKNER

electric shock Physical effect of an ELECTRIC CURRENT that enters the body, ranging from a minor static-electricity discharge to a power-line accident or lightning strike but most often resulting from house current. The effects

© 2006 Encyclopædia Britannica, Inc.

depend on the current (not the voltage), and the worst damage occurs along its path from the entry to the exit point. Causes of immediate death are VENTRICULAR FIBRILLATION and paralysis of the brain's breathing centre or of the heart. CARDIOPULMONARY RESUSCITATION is the best first aid. Though most survivors recover completely, aftereffects may include CATARACT, ANGINA PECTORIS, or nervous-system disorders.

electrical engineering Branch of ENGINEERING concerned with the practical applications of ELECTRICITY in all its forms, including those of ELECTRONICS. Electrical engineering deals with electric light and POWER systems and apparatuses; electronics engineering deals with wire and RADIO communication, the stored-program electronic COMPUTER, RADAR, and automatic control systems. The first practical application of electricity was the TELEGRAPH, in 1837. Electrical engineering emerged as a discipline in 1864 when JAMES CLERK MAXWELL summarized the basic laws of electricity in mathematical form and predicted that radiation of electromagnetic energy would occur in a form that later became known as radio waves. The need for electrical engineers was not felt until the invention of the TELEPHONE (1876) and the INCANDESCENT LAMP (1878).

electrical impedance \im-'pē-dᵊns\ Opposition that a circuit presents to ELECTRIC CURRENT. It includes both RESISTANCE and REACTANCE. Resistance arises from collisions of the current-carrying charged particles with the internal structure of the CONDUCTOR. Reactance is an additional opposition to the movement of electric charge that arises from the changing electric and MAGNETIC FIELDS in circuits carrying ALTERNATING CURRENT. Impedance in circuits carrying steady DIRECT CURRENTS is simply resistance. The magnitude of the impedance Z of a circuit is equal to the maximum value of the potential difference, or voltage V, across the circuit, divided by the maximum value of the current I through the circuit, or simply $Z = V/I$. The unit of impedance is the ohm.

electricity Phenomenon associated with stationary or moving ELECTRIC CHARGES. The word comes from the Greek *elektron* ("amber"); the Greeks discovered that amber rubbed with fur attracted light objects such as feathers. Such effects due to stationary charges, or static electricity, were the first electrical phenomena to be studied. Not until the early 19th century were static electricity and ELECTRIC CURRENT shown to be aspects of the same phenomenon. The discovery of the ELECTRON, which carries a charge designated as negative, showed that the various manifestations of electricity are the result of the accumulation or motion of numbers of electrons. The invention of the incandescent lightbulb (1879) and the construction of the first central power station (1881) by THOMAS ALVA EDISON led to the rapid introduction of electric power into factories and homes. See also JAMES CLERK MAXWELL.

electrification, rural See RURAL ELECTRIFICATION

electrocardiography \i-ˌlek-trō-ˌkärd-ē-'äg-rə-fē\ Method of tracing the ELECTRIC CURRENT of a heartbeat to provide information on the HEART. Electrocardiograms (ECGs) are made by applying ELECTRODES, usually to the arms, legs, and chest wall, attached to an electrocardiograph, which records the tiny heart current. Upward and downward movements on the tracing reflect contractions of the atria and ventricles. Deviations from a standard point to a possible heart disorder and its site, as well as to possible high blood pressure and other diseases.

electrochemistry Branch of CHEMISTRY concerned with the relation between ELECTRICITY and chemical change. Many spontaneous CHEMICAL REACTIONS liberate electrical ENERGY, and some of these reactions are used in BATTERIES and fuel cells to produce electric power. Conversely, electric current can bring about many reactions that do not occur spontaneously. In the process called ELECTROLYSIS, electrical energy is converted directly into chemical energy, which is stored in the products of the reaction. This process is applied in refining metals, in electroplating, and in producing hydrogen and oxygen from water. Passage of electricity through a GAS generally causes chemical changes, a subject that forms a separate branch of electrochemistry. See also OXIDATION-REDUCTION.

electroconvulsive therapy *formerly* **shock therapy** Method of treating psychiatric disorders by inducing shock through electric current. Electroconvulsive, or electroshock, therapy involves passing an electric current through the patient's head between two electrodes placed over the temples and thus causing a convulsive seizure; it was used to treat BIPOLAR DISORDER and other types of DEPRESSION. Shock was previously induced by administering increasingly large doses of insulin until the patient was thrown into a brief coma; the so-called insulin-shock therapy was used for the treatment of SCHIZOPHRENIA. Both forms of shock therapy were developed in the 1930s. Their use declined after the introduction of tranquilizing drugs and antidepressants.

electrocution Method of execution in which the condemned person is subjected to a heavy charge of electric current. The prisoner is shackled into a wired chair, and ELECTRODES are fastened to the head and one leg so that the current will flow through the body. One electrical shock may not be enough to kill the person; if a doctor does not confirm the death, several shocks may be applied. The electric chair was first used in 1890. Electrocution also refers to death by other causes of electrical shock (e.g., accidental contact with high-voltage wiring).

electrode Electric CONDUCTOR, usually metal, used as one of two terminals to conduct ELECTRIC CURRENT through a conducting medium. A simple voltaic cell, or BATTERY, consists of two electrodes, usually one zinc and one copper, immersed in an electrolytic solution (see ELECTROLYTE). When a chemical reaction occurs in the solution, ELECTRONS gather on the zinc electrode, or CATHODE, which becomes negatively charged. At the same time, electrons are drawn from the copper electrode, the ANODE, giving it a positive charge. The difference in charge sets up a potential difference, or voltage, between the two electrodes. When they are connected by a conducting wire, electrons flow from the cathode to the anode, producing a current.

electrodynamics, quantum See QUANTUM ELECTRODYNAMICS

electroencephalography \i-ˌlek-trō-in-ˌsef-ə-'läg-rə-fē\ Technique for recording electrical activity in the brain, whose cells emit distinct patterns of rhythmic electrical impulses. Pairs of ELECTRODES on the scalp transmit signals to an electroencephalograph, which records them as peaks and troughs on a tracing called an electroencephalogram (EEG). Different wave patterns on the EEG are associated with normal and abnormal waking and sleeping states. They help diagnose conditions such as tumours, infections, and epilepsy. The electroencephalograph was invented in the 1920s by Hans Berger (1873–1941).

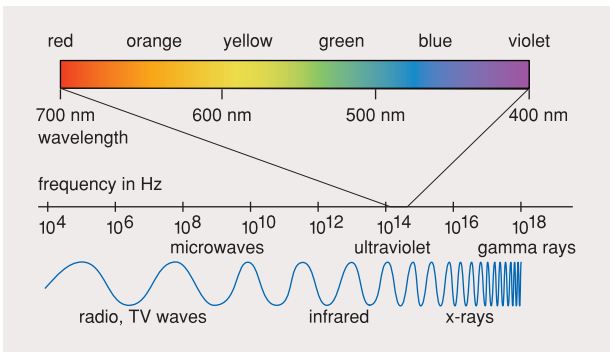
electrolysis \i-ˌlek-'trä-lə-səs\ Process in which ELECTRIC CURRENT passed through a substance causes a chemical change, usually the gaining or losing of ELECTRONS (see OXIDATION-REDUCTION). It is carried out in an electrolytic cell consisting of separated positive and negative ELECTRODES (anode and cathode, respectively) immersed in an ELECTROLYTE SOLUTION containing IONS or in a molten ionic compound. Electric current enters through the CATHODE; positively charged CATIONS travel to it and combine with electrons. Negatively charged ANIONS give up electrons at the ANODE. Both thus become neutral molecules. Electrolysis is used extensively in METALLURGY to extract or purify METALS from ORES or compounds and to deposit them from solution (ELECTROPLATING). Electrolysis of molten SODIUM CHLORIDE yields metallic SODIUM and CHLORINE gas; that of a strong solution of sodium chloride in water (brine) yields hydrogen gas, chlorine gas, and sodium hydroxide (in solution); and that of WATER (with a low concentration of dissolved sodium chloride or other electrolyte) yields HYDROGEN and OXYGEN.

electrolyte Substance that conducts ELECTRIC CURRENT as a result of DISSOCIATION of its molecules into positively and negatively charged particles called IONS. The most familiar electrolytes are ACIDS, BASES, and SALTS, which ionize when dissolved in polar SOLVENTS such as water. Many salts, including SODIUM CHLORIDE, behave as electrolytes when melted in the absence of solvent, since they have IONIC BONDS. The most commonly used electrolytes are dissolved metal salts (for ELECTROPLATING metals) and acids (in electric BATTERIES). See also ELECTROLYSIS.

electromagnet Device consisting of a core of magnetic material such as iron, surrounded by a coil through which an ELECTRIC CURRENT is passed to magnetize the core. When the current is stopped, the core is no longer magnetized. Electromagnets are particularly useful wherever controllable magnets are required, as in devices in which the MAGNETIC FIELD is to be varied, reversed, or switched on and off. Suitably designed magnets can lift many times their own weight and are used in steelworks and scrap yards to lift loads of metal. Other devices that utilize electromagnets include particle accelerators, telephone receivers, loudspeakers, and televisions.

electromagnetic field Property of space caused by the motion of an ELECTRIC CHARGE. A stationary charge produces an ELECTRIC FIELD in the surrounding space. If the charge is moving, a MAGNETIC FIELD is also produced. A changing magnetic field also produces an electric field. The interaction of electric and magnetic fields produces an electromagnetic field, which

© 2006 Encyclopædia Britannica, Inc.



has its own existence in space apart from the charges involved. An electromagnetic field can sometimes be described as a wave that transports ELECTROMAGNETIC RADIATION.

electromagnetic force One of the four known basic FORCES in the universe. Electromagnetism is responsible for interactions between charged particles that occur because of their charge, and for the emission and absorption of PHOTONS (ELECTROMAGNETIC RADIATION). The phenomena of ELECTRICITY and MAGNETISM are consequences of this force, and the relationships between them were first described by JAMES CLERK MAXWELL in the 1860s. The physical description of electromagnetism has since been combined with QUANTUM MECHANICS into the theory of QUANTUM ELECTRODYNAMICS. The electromagnetic force is about 10^{36} times as strong as the gravitational force (see GRAVITATION), but significantly weaker than both the WEAK FORCE and the STRONG FORCE.

electromagnetic induction Induction of an ELECTROMOTIVE FORCE in a CIRCUIT by varying the magnetic flux linked with the circuit. The phenomenon was first investigated in 1830–31 by JOSEPH HENRY and MICHAEL FARADAY, who discovered that when the MAGNETIC FIELD around an electromagnet was increased or decreased, an ELECTRIC CURRENT could be detected in a separate nearby CONDUCTOR. A current can also be induced by constantly moving a permanent magnet in and out of a coil of wire, or by constantly moving a conductor near a stationary permanent magnet. The induced electromotive force is proportional to the rate of change of the magnetic flux cutting across the circuit.

electromagnetic radiation Energy propagated through free space or through a material medium in the form of electromagnetic waves. Examples include RADIO WAVES, INFRARED RADIATION, visible LIGHT, ULTRAVIOLET RADIATION, X RAYS, and GAMMA RAYS. Electromagnetic radiation exhibits wavelike properties such as REFLECTION, REFRACTION, DIFFRACTION, and INTERFERENCE, but also exhibits particlelike properties in that its energy occurs in discrete packets, or quanta. Though all types of electromagnetic radiation travel at the same speed, they vary in FREQUENCY and WAVELENGTH, and interact with matter differently. A VACUUM is the only perfectly transparent medium; all others absorb some frequencies of electromagnetic radiation.

electromagnetic spectrum Total range of FREQUENCIES or WAVELENGTHS of ELECTROMAGNETIC RADIATION. The spectrum ranges from waves of long wavelength (low frequency) to those of short wavelength (high frequency); it comprises, in order of increasing frequency (or decreasing wavelength): very-low-frequency to ultrahigh-frequency RADIO WAVES, MICROWAVES, INFRARED RADIATION, visible LIGHT, ULTRAVIOLET RADIATION, X-RAYS, and GAMMA RAYS. In a VACUUM, all waves of the electromagnetic spectrum travel at the same speed: 299,792,458 m/sec (186,282 mi/sec).

The spectrum of electromagnetic waves ranges from low-frequency radio waves to high-frequency gamma rays. Only a small portion of the spectrum, representing wavelengths of roughly 400–700 nanometers, is visible to the human eye.

© MERRIAM-WEBSTER INC.

electromagnetism Branch of physics that deals with the relationship between ELECTRICITY and MAGNETISM. Their merger into one concept is tied to three historical events. HANS C. ORSTED's accidental discovery in 1820 that MAGNETIC FIELDS are produced by ELECTRIC CURRENTS spurred efforts to prove that magnetic fields can induce currents. MICHAEL FARADAY showed in 1831 that a changing magnetic field can induce a current in a circuit, and JAMES CLERK MAXWELL predicted that a changing electric field has an associated magnetic field. The technological revolution attributed to the development of electric power and modern communications can be traced to these three landmarks.

electromotive force Energy per unit ELECTRIC CHARGE that is imparted by an energy source, such as an electric GENERATOR or a BATTERY. As the device does WORK on the electric charge being transferred within itself, energy is converted from one form to another. The work done on a unit of electric charge or the energy gained by the unit charge is the electromotive force *emf* (or *E*) and is characteristic of any energy source capable of driving electric charge around a circuit. A common unit of electromotive force is the volt *V*, a unit equal to the difference in electric potential between two points in a conductor carrying a current of one ampere and dissipating one watt of power between the two points.

electromyography \i-ˌlek-trō-mī-ˈäg-rə-fē\ Process of graphically recording the electrical activity of muscle, which normally generates an electric current only when contracting or when its nerve is stimulated. Electrical impulses are shown as wavelike tracings on an OSCILLOSCOPE and recorded as an electromyogram (EMG), usually along with audible signals. The EMG can show whether muscle weakness or wasting is due to nerve impairment (as in AMYOTROPHIC LATERAL SCLEROSIS and POLIOMYELITIS) or muscle impairment or disease (myopathy).

electron Lightest electrically charged SUBATOMIC PARTICLE known. It carries a negative charge (see ELECTRIC CHARGE), the basic charge of ELECTRICITY. An electron has a small mass, less than 0.1% the mass of an ATOM. Under normal circumstances, electrons move about the NUCLEUS of an atom in ORBITALS that form an electron cloud bound in varying strengths to the positively charged nucleus. Electrons closer to the nucleus are held more tightly. The first subatomic particle discovered, the electron was identified in 1897 by J. J. THOMSON.

electron microscopy \mī-ˈkräs-kə-pē\ Technique that allows examination of samples too small to be seen with a light MICROSCOPE. Electron beams have much smaller wavelengths than visible light and hence higher resolving power. To make them more observable, samples may be coated with metal atoms. Because electrons cannot travel very far in air, the electron beam and the sample must be kept in a vacuum. Two different instruments are used. In the scanning electron microscope, a moving beam of ELECTRONS is scanned across a sample; electrons scattered by the object are focused by magnetic "lenses" to produce an image of the object's surface similar to an image on a television screen. The images appear three-dimensional; they may be of small organisms or their parts, of molecules such as DNA, or even of large individual atoms (e.g., uranium, thorium). In the transmission electron microscope, the electron beam passes through a very thin, carefully prepared sample and is focused onto a screen or photographic plate to visualize the interior structure of such specimens as cells and tissues.

electron paramagnetic resonance See ELECTRON SPIN RESONANCE

electron spin resonance (ESR) *or* **electron paramagnetic resonance (EPR)** Technique of spectroscopic analysis (see SPECTROSCOPY) used to identify paramagnetic substances (see PARAMAGNETISM) and investigate the nature of the BONDING within molecules by identifying unpaired ELECTRONS and their interaction with their immediate surroundings. Unpaired electrons, because of their SPIN, behave like tiny MAGNETS and can be lined up in an applied magnetic field; energy applied by alternating MICROWAVE radiation is absorbed when its frequency coincides with that of PRECESSION of the electron magnets in the sample. The graph or spectrum of radiation absorbed as the field changes gives information valuable in chemistry, biology, and medicine.

electronic banking Use of computers and telecommunications to enable banking transactions to be done by telephone or computer rather than through human interaction. Its features include electronic funds transfer for retail purchases, automatic teller machines (ATMs), and automatic payroll deposits and bill payments. Some banks offer home banking, whereby a person with a personal computer can make transactions, either via a direct connection or by accessing a Web site. Electronic banking has vastly reduced the physical transfer of paper money and coinage from one place to another or even from one person to another.

electronic mail See E-MAIL

electronic music Any music involving electronic processing (e.g., recording and editing on tape) and whose reproduction involves the use

© 2006 Encyclopædia Britannica, Inc.

of loudspeakers. In the late 1940s, magnetic tape began to be used, especially in France, to modify natural sounds (playing them backward, at different speeds, etc.), creating the genre known as *musique concrète*. By the early 1950s, composers in Germany and the U.S. were employing assembled conglomerations of OSCILLATORS, filters, and other equipment to produce entirely new sounds. The development of voltage-controlled oscillators and filters led, in the 1950s, to the first SYNTHESIZERS, which effectively standardized the assemblages and made them more flexible. No longer relying on tape editing, electronic music could now be created in real time. Since their advent in the late 1970s, personal computers have been used to control the synthesizers. Digital sampling—composing with music and sounds electronically extracted from other recordings—has largely replaced the use of oscillators as a sound source.

electronics Branch of physics that deals with the emission, behaviour, and effects of ELECTRONS and with electronic devices. The beginnings of electronics can be traced to experiments with ELECTRICITY. In the 1880s THOMAS ALVA EDISON and others observed the flow of current between elements in an evacuated glass tube. A two-electrode VACUUM TUBE constructed by John A. Fleming (1849–1945) produced a useful output current. The AUDION, invented by LEE DE FOREST (1907), was followed by further improvements. The invention of the TRANSISTOR at Bell Labs (1947) initiated a progressive miniaturization of electronic components that by the mid 1980s resulted in high-density MICROPROCESSORS, which in turn led to tremendous advances in computer technology and computer-based automated systems. See also SEMICONDUCTOR.

electrophile ATOM or MOLECULE that in a CHEMICAL REACTION seeks an atom or molecule containing an ELECTRON pair available for BONDING or the negative end of a polar molecule (see COVALENT BOND; ELECTRIC DIPOLE). In the Lewis electron theory (see ACID-BASE THEORY) advanced by the U.S. chemist Gilbert Lewis (1875–1946) in 1923, electrophiles are by definition Lewis acids. Examples include the hydronium ion (H_3O^+), boron trifluoride (BF_3), and the HALOGENS fluorine, chlorine, bromine, and iodine in molecular form. See also ACID; NUCLEOPHILE.

electrophoresis \i-ˌlek-trə-fə-ˈrē-səs\ Movement of electrically charged particles in a fluid under the influence of an ELECTRIC FIELD. The particles migrate toward the ELECTRODE of the opposite ELECTRIC CHARGE, often on a gel-coated slab or plate, sometimes in a fluid flowing down a paper. Originated about 1930 by Arne Tiselius (1902–1971) as a technique for ANALYSIS, electrophoresis is used to analyze and separate COLLOIDS (e.g., PROTEINS) or deposit coatings.

electroplating Process of coating with METAL by means of an ELECTRIC CURRENT. Plating metal may be transferred to conductive surfaces (e.g., metals) or to nonconductive surfaces (e.g., plastics, wood, leather) if a conductive coating has been applied. Usually the current deposits a given amount of metal on the CATHODE (workpiece) and the ANODE (source of metal) dissolves to the same extent, maintaining a fairly uniform solution. SILVER plating is used on tableware, electrical contacts, and engine bearings. The most extensive use of GOLD plating is on jewelry and watch cases. ZINC coatings prevent the corrosion of steel articles, and NICKEL and CHROMIUM plate are used on automobiles and household appliances. See also TERNEPLATE, SHEFFIELD PLATE.

electrostatic induction Modification in the distribution of ELECTRIC CHARGE on one material under the influence of an electric charge on a nearby object. It occurs whenever any object is placed in an ELECTRIC FIELD. When a negatively charged object is brought near a neutral object, it induces a positive charge on the near side of the object and a negative charge on the far side. If the negative side of the original object is momentarily grounded, the negative charge may escape, so that the object becomes positively charged by induction.

electroweak theory Theory that describes both the ELECTROMAGNETIC FORCE and the WEAK FORCE. Though the forces appear to be different, they are actually different facets of a more fundamental force. This theory, formulated in the 1960s by Sheldon Glashow (born 1932), Steven Weinberg (born 1933), and Abdus Salam (born 1926), represents a 20th-century scientific landmark and won its authors a 1979 Nobel Prize. It was validated in the 1980s with the discovery of the W PARTICLE and Z PARTICLE, which it had predicted. See also FUNDAMENTAL INTERACTION, UNIFIED FIELD THEORY.

electrum Natural or artificial ALLOY of GOLD with at least 20% SILVER, used to make the first known coins in the Western world. Most natural electrum also contains copper, iron, palladium, bismuth, and perhaps other metals. The colour varies from white-gold to brassy, depending on the percentages of the major constituents and copper. The first Western coinage, possibly begun by King Gyges of Lydia (7th century BC), consisted of irregular ingots of electrum bearing his stamp as a guarantee of negotiability at a predetermined value. See also COINAGE.

elegy \ˈe-lə-jē\ Meditative lyric poem. The classical elegy was any poem written in elegiac metre (alternating lines of dactylic hexameter and pentameter). Today the term may refer to this metre rather than to content, but in English literature since the 16th century it has meant a lament in any metre. A distinct variety with a formal pattern is the pastoral elegy, such as JOHN MILTON's "Lycidas" (1638). Poets of the 18th-century Graveyard School reflected on death and immortality in elegies, most famously THOMAS GRAY's "An Elegy Written in a Country Church Yard" (1751).

element, chemical One of the more than 110 presently known kinds of substances that constitute all MATTER at and above the level of ATOMS (the smallest units of any element). All atoms of an element are identical in nuclear charge (number of PROTONS) and number of ELECTRONS (see ATOMIC NUMBER), but their MASS (ATOMIC WEIGHT) may differ if they have different numbers of NEUTRONS (see ISOTOPE). Each permanently named element has a one- or two-letter CHEMICAL SYMBOL. Elements combine to form a wide variety of COMPOUNDS. All elements with atomic numbers greater than 83 (bismuth), and some isotopes of lighter elements, are unstable and radioactive (see RADIOACTIVITY). The TRANSURANIUM ELEMENTS, with atomic numbers greater than 92 (see URANIUM), artificially created by bombardment of other elements with neutrons or other particles, were discovered beginning in 1940. The most common elements (by weight) in Earth's crust are oxygen, 49%; silicon, 26%; aluminum, 8%; and iron, 5%. Of the known elements, 11 (hydrogen, nitrogen, oxygen, fluorine, chlorine, and the six noble gases) are GASES under ordinary conditions, two (bromine and mercury) are LIQUIDS (two more, cesium and gallium, melt at about or just above room temperature), and the rest are SOLIDS. See also PERIODIC TABLE. See illustration and table on following pages.

elementary education *or* **primary education** Traditionally, the first stage of formal education, beginning at age 5–7 and ending at age 11–13. Often preceded by some form of PRESCHOOL, it usually includes middle school, or junior high school (ages 11–13), though this is sometimes regarded as part of SECONDARY EDUCATION. Nearly all nations are committed to some form of elementary education, though in many developing countries many children are unable to continue full-time studies past the age of 10 or 11. The elementary curriculum usually emphasizes reading and writing, arithmetic, social studies, and science. A basic teaching strategy involves moving the student from the immediate and familiar to the distant and unfamiliar, an approach first formulated by JOHANN HEINRICH PESTALOZZI.

elementary particle See SUBATOMIC PARTICLE

elephant Any of three UNGULATE species in the order Proboscidea (family Elephantidae), characterized by their large size, long trunk, tusks, massive legs, large ears, and huge head. All species are grayish to brown, with sparse, coarse body hair. The trunk is used for breathing, drinking, and reaching for food. Elephants eat grasses, leaves, and fruit. The African savanna, or bush elephant (*Loxodonta africana*), of sub-Saharan Africa, is the largest living land animal, weighing up to 16,500 lbs (7,500 kg) and standing 10–13 ft (3–4 m) tall at the shoulder. The African forest elephant (*L. cyclotis*) is smaller. The Indian elephant (*Elephas maximus*), of South and Southeast Asia, weighs about 12,000 lbs (5,500 kg) and stands about 10 ft (3 m) tall. Elephants live in habitats ranging from thick jungle to savanna, in small family groups led by old cows. Most bulls live in bachelor herds. Elephants migrate seasonally. They may eat more than 500 lbs (225 kg) of vegetation daily. All species are considered endangered by the International Union for Conservation of Nature and Natural Resources (IUCN).

Asian elephant (*Elephas maximus*). E.S. ROSS

* Numbering system adopted by the International Union of Pure and Applied Chemistry (IUPAC).
** Numbering system widely used, especially in the U.S., from the mid-20th century.
*** Discoveries of elements 112–116 are claimed but not confirmed. Symbols in parentheses are temporarily assigned by IUPAC.

The periodic table arranges the elements into groups (vertically) of elements sharing common physical and chemical characteristics, and into periods (horizontally) of sequentially increasing atomic number and electron-shell configuration. Elements 112–116 are reported to have been created experimentally but have not yet received permanent names.

Elephant Man *orig.* **Joseph (Carey) Merrick** (b. Aug. 5, 1862, Leicester, Leicestershire, Eng.—d. April 11, 1890, London) Englishman disfigured by a disease that caused growths over his skin and bone surfaces. His head was 3 ft (.9 m) around, with large bags of skin hanging from it, the jaw so deformed he could not speak clearly. One arm ended in a 12-in. (.3-m) wrist and a finlike hand. His legs were similarly deformed, and a defective hip made him lame. He escaped from a workhouse at 21 to join a freak show, where a London physician, Frederick Treves, discovered him and admitted him to London Hospital. He died in his sleep at 27 of accidental suffocation. His disease was probably the very rare Proteus syndrome. A successful play and film were based on Merrick's life.

elephant seal Either of the two largest PINNIPED species: the northern elephant seal (*Mirounga angustirostris*), of coastal islands off California and Baja California, or the southern elephant seal (*M. leonina*), of sub-Antarctic regions. Both are gregarious earless SEALS. The male has an inflatable, trunklike snout. The northern species is yellowish or gray-brown, the southern species blue-gray. Males of both species reach a length of about 21 ft (6.5 m) and a weight of about 7,780 lbs (3,530 kg) and are much larger than the females. Elephant seals feed on fish and squid or other CEPHALOPODS. During the breeding season, bulls fight to establish territories along beaches and to acquire harems of up to 40 cows.

Elephant seal bull (*Mirounga*)
ANTHONY MERCIECA—ROOT RESOURCES

Eleusinian Mysteries \ˌel-yù-'si-nē-ən\ Most famous MYSTERY RELIGION of ancient Greece. It was based on the story of DEMETER, whose daughter PERSEPHONE was kidnapped by HADES. While searching for her daughter, Demeter stopped at ELEUSIS, revealed her identity to the royal family, and taught the natives her rites. The Greater Mysteries were celebrated in autumn, beginning with a procession from Athens to the temple at Eleusis. This was followed by a ritual bath in the sea, three days of fasting, and completion of secret rites. Initiates were promised personal salvation and benefits in the afterlife.

Eleusis \i-'lü-səs\ *Greek* **Elevsís** \ˌe-lef-'sēs\ Town, with ruins of an ancient city, eastern Greece. Famous as the site of the ELEUSINIAN MYSTERIES, it is about 14 mi (23 km) west of Athens. It was independent until the 7th century BC, when Athens annexed the city and made the Eleusinian Mysteries a major Athenian religious festival. The Gothic leader ALARIC destroyed Eleusis in AD 395. Deserted until the 18th century, it was revived as the modern town of Eleusis (Greek Lepsina), now a suburb of Athens. Some of the ruins have been excavated, including the Hall of Initiation, which dates back some 3,000 years to late Mycenaean times.

elevator Car that moves in a vertical shaft to carry passengers or freight between the levels of a multistory building. The use of mechanical lifting platforms dates to Roman times. Steam and hydraulic elevators came into use in the 19th century; electric elevators had been introduced by the end of the century. Most modern elevators are electrically propelled through a system of cables and pulleys with the aid of a counterweight, though hydraulic elevators are still used in low buildings. The introduc-

*Parentheses indicate the mass number of the most stable isotope of a radioactive element.
**Discovery is claimed but not yet ratified; name and symbol are temporary.

tion of an automatic safety device by Elisha Otis (1811–1861) in 1853 made the passenger elevator possible. By opening the way to higher buildings, the elevator played a decisive role in creating the characteristic urban geography of modern cities.

Elgar, Sir Edward (William) (b. June 2, 1857, Broadheath, Worcestershire, Eng.—d. Feb. 23, 1934, Worcester, Worcestershire) British composer. Son of a piano tuner, he became proficient on violin and organ. His *Enigma Variations* (1896) brought him fame; he followed it with the oratorio *The Dream of Gerontius* (1900), which many consider his masterpiece. He composed in the orchestral idiom of late 19th-century Romanticism—characterized by bold tunes, striking colour effects, and mastery of large forms—stimulating a renaissance of English music. His principal works include the five *Pomp and Circumstance Marches* (1901–07), two symphonies (1908, 1911), concertos for violin (1910) and cello (1919), and the tone poems *Cockaigne* (1901) and *Falstaff* (1913).

Elgin \'el-gən**, James Bruce, 8th earl of** (b. July 20, 1811, London, Eng.—d. Nov. 20, 1863, Dharmshala, India) British governor-general of Canada. He was appointed governor of Jamaica in 1842. As governor of British North America (1847–54), he implemented the policy of responsible, or cabinet, government recommended by Lord Durham. Elgin supported the Rebellion Losses Act (1849), which compensated Canadians for losses during the 1837 rebellion in Lower Canada, a stand criticized

© 2006 Encyclopædia Britannica, Inc.

by Tory opponents in England and French-Canadian rioters in Montreal. He negotiated the Reciprocity Treaty (1854) between the Canadian colonies and the U.S. In 1857 he left Canada to serve in diplomatic posts in China, Japan, and India.

Elgin Marbles \'el-gən\ Collection of ancient Greek marble sculptures and architectural fragments in the British Museum. They were removed from the Parthenon in Athens and other buildings by Thomas Bruce, Lord Elgin (1766–1841), ambassador to the Ottoman Empire, and shipped to England between 1802 and 1811. Elgin claimed he was saving the works from destruction by the Turks, who then controlled Greece. He secured permission from the Turks to remove "any pieces of stone" bearing figures or inscriptions. They remained in his private possession, amid mounting criticism, until 1816, when the crown bought them. The controversy still continues; the Greek government frequently demands their return.

Elgon \'el-ˌgän**, Mount** Extinct volcano on the Kenya-Uganda border. Located northeast of Lake Victoria, its crater, about 5 mi (8 km) in diameter, contains several peaks, of which Wagagai, at 14,178 ft (4,321 m), is the highest. The Bantu-speaking Gishu (Gisu) occupy the mountain's western slopes.

Eliade \ˌel-ē-ˈä-dā**, Mircea** (b. March 9, 1907, Bucharest, Rom.—d. April 22, 1986, Chicago, Ill., U.S.) Romanian-born U.S. historian of religion. He studied Sanskrit and Indian philosophy at the University of Calcutta, then returned to complete his Ph.D. at the University of Bucharest, where he taught until 1939. In 1945 he moved to Paris to teach at the Sorbonne, and from 1956 he taught at the University of Chicago. Eliade considered religious experiences to be credible phenomena, manifestations of the sacred in the world, and his work traced the forms they have taken throughout the world and through time. He founded the journal *History of Religions* in 1961. His books include *The Myth of the Eternal Return* (1949) and *A History of Religious Ideas* (3 vol., 1978–85); he edited the 16-volume *Encyclopedia of Religion* (1987).

Elijah \i-ˈlī-jə\ *or* **Elias** *Hebrew* **Eliyyahu** (fl. 9th century BC) Hebrew prophet. The Bible related that he denounced foreign cults and defeated 450 prophets of Baal in a contest on Mount Carmel. In doing so, he earned the enmity of King Ahab and his consort, Jezebel, who forced him to flee into the wilderness. Later he was taken up into heaven in a whirlwind, leaving behind his successor, Elisha. His insistence that only the God of Israel is entitled to the name of divinity expresses a fully conscious monotheism. He is also recognized as a prophet in Islam.

Elijah ben Solomon (b. April 23, 1720, Sielec, Lith., Russian Empire—d. Oct. 9, 1797, Vilna) Lithuanian scholar and Jewish leader. Born into a long line of scholars, he traveled in Poland and Germany before settling in Vilna, the cultural centre of eastern European Jewry. He refused rabbinic office and lived as a recluse while devoting himself to study and prayer, but he nevertheless became famous and revered in the Jewish community. His scholarly interests included biblical exegesis, Talmudic studies, folk medicine, grammar, and philosophy. A vehement opponent of Hasidism, he denounced its claims to miracles, visions, and spiritual ecstasy, calling instead for the intellectual love of God.

Elion \'e-lē-ən**, Gertrude (Belle)** (b. Jan. 23, 1918, New York, N.Y., U.S.—d. Feb. 21, 1999, Chapel Hill, N.C.) U.S. pharmacologist. She graduated from Hunter College. Unable to find a research position because of her sex, she initially taught high school chemistry. In 1944 she became George Herbert Hitchings's assistant at Burroughs Wellcome. They developed drugs for leukemia, autoimmune disorders, urinary-tract infections, gout, malaria, and viral herpes using innovative research methods. They examined the biochemistry of normal human cells and of disease-causing agents and used the results to formulate drugs that could kill or inhibit reproduction of a particular pathogen but leave normal host cells unharmed. In 1988 they shared a Nobel Prize with James Black.

Eliot, Charles William (b. March 20, 1834, Boston, Mass., U.S.—d. Aug. 22, 1926, Northeast Harbor, Maine) U.S. educator and influential university president. He studied at Harvard University and taught mathematics and chemistry there (1858–63) and at MIT (1865–69). Eliot was named president of Harvard in 1869 after studying European educational systems, and he soon set about a program of fundamental reforms. He demanded a place for the sciences in liberal education, and he replaced the program of required courses for undergraduates with the elective system. Under Eliot, the graduate school of arts and sciences was created (1890), Radcliffe College was established (1894), the quality of the professional schools was raised, and the university became an institution of world renown. His reforms had widespread influence in American higher education. After resigning in 1909, he edited the 50-volume *Harvard Classics* (1909–10), wrote several books, and devoted himself to public service.

Eliot, George *orig.* **Mary Ann Evans** *later* **Marian Evans** (b. Nov. 22, 1819, Chilvers Coton, Warwickshire, Eng.—d. Dec. 22, 1880, London) British novelist. Eliot was raised with a strong evangelical piety but broke with religious orthodoxy in her 20s. She worked as a translator, a critic, and a subeditor of the *Westminster Review* (1851–54). Later she turned to fiction. Adopting a masculine pseudonym to evade prejudice against women novelists, she first brought out *Scenes of Clerical Life* (1858). This was followed by such classic works as *Adam Bede* (1859), *The Mill on the Floss* (1860), *Silas Marner* (1861), *Romola* (1862–63), *Felix Holt, the Radical* (1866), and *Daniel Deronda* (1876). Her masterpiece, *Middlemarch* (1871–72), provides a thorough study of every class of provincial society. The method of psychological analysis she developed would become characteristic of modern fiction. With the journalist, philosopher, and critic George Henry Lewes (1817–78), a married man, she enjoyed a long and happy, though scandalous, liaison; their Sunday-afternoon salons were a brilliant feature of Victorian life.

George Eliot, chalk drawing by F.W. Burton, 1865; in the National Portrait Gallery, London.

COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Eliot, John (b. 1604, Widford, Hertfordshire, Eng.—d. May 21, 1690, Roxbury, Massachusetts Bay Colony) English Puritan missionary to the Indians of Massachusetts Bay Colony. He emigrated to Boston in 1631 and became pastor of a church in nearby Roxbury. Supported by his congregation and fellow ministers, he began a mission to the American Indians that inspired the creation in 1649 of the first genuine missionary society (financed chiefly from England). His methods set the pattern of subsequent Native American missions for almost two centuries. His translation of the Bible into the Algonquian language was the first Bible printed in North America.

Eliot, T(homas) S(tearns) (b. Sept. 26, 1888, St. Louis, Mo., U.S.—d. Jan. 4, 1965, London, Eng.) U.S.-British poet, playwright, and critic. Eliot studied at Harvard University before moving to England in 1914, where he would work as an editor from the early 1920s until his death. His first important poem, and the first modernist masterpiece in English, was the radically experimental "Love Song of J. Alfred Prufrock" (1915). *The Waste Land* (1922), which expresses with startling power the disillusionment of the postwar years, made his international reputation. His first critical volume, *The Sacred Wood* (1920), introduced concepts much discussed in later critical theory. He married in 1915; his wife was mentally unstable, and they separated in 1933. (He married again, happily, in 1957.) His conversion to Anglicanism in 1927 shaped all his subsequent works. His last great work was *Four Quartets* (1936–42), four poems on spiritual renewal and the connections of the personal and historical past and present. Influential later essays include "The Idea of a Christian Society" (1939) and "Notes Towards the Definition of Culture" (1948). His play *Murder in the Cathedral* (1935) is a verse treatment of St. Thomas Becket's martyrdom; his other plays, including *The Cocktail Party* (1950), are lesser works. From the 1920s on he was the most influ-

© 2006 Encyclopædia Britannica, Inc.

ential English-language modernist poet. He won the Nobel Prize for Literature in 1948; from then until his death he achieved public admiration unequaled by any other 20th-century poet.

Elis \'ē-lis\ *modern* **Iliá** \ēl-'yä\ Ancient Greek region and city-state, northwestern Peloponnese, Greece. Bounded by Achaea, Arcadia, Messenia, and the Ionian Sea, the region was known for its horse breeding and was the site of the Olympic Games. As an ally of Athens in the Peloponnesian War, Elis lost much of its territory. Later, by emphasizing the sanctity of the Olympic Games, it regained some land and even some independence after the Roman occupation of Greece (146 BC), only to disintegrate with the collapse of the Roman Empire. The modern locality contains the archaeological site of Olympia, scene of the games.

Elisabethville See Lubumbashi

Elisha \i-'lī-shə\ (fl. 9th century BC) Hebrew prophet. As the successor of Elijah, he was strongly devoted to the Mosaic tradition of Israel and a potent enemy of all foreign gods and cults. He instigated a revolt against the ruling house of Israel, the dynasty of Omri, that resulted in the death of the king and his family. Elisha's story is told in the Hebrew scriptures in the books 1 and 2 Kings.

Elisha ben Abuyah (fl. AD 100) Jewish scholar and apostate. Born before the destruction of the Second Temple of Jerusalem (AD 70), he became a respected rabbi but then won notoriety for breaking Jewish laws and abandoning Judaism. He was well versed in Greek thought, and the motives for his apostasy may have been devotion to philosophy, membership in a Gnostic sect, or conversion to Christianity. He was denounced in the Talmud and was known as Aḥer ("the Other") because his apostasy made his name repugnant.

Elista \e-'lyē-stə,\ *English* \ē-'lis-tə\ *formerly (1944–57)* **Stepnoy** \styip-'nȯi\ City (pop., 1999 est.: 101,700), capital of Kalmykia republic, southwestern Russia. It was founded in 1865 and became a city in 1930. In 1944, when the Kalmyks were exiled by Joseph Stalin for their alleged collaboration with the Germans, the republic was dissolved and the city became known as Stepnoy. The name Elista was restored in 1957. Agriculture is important, and Elista also is a trade centre for the area.

Elizabeth (b. Dec. 24, 1837, Munich, Bavaria—d. Sept. 10, 1898, Geneva, Switz.) Empress consort of Austria (1854–98) and queen of Hungary (1867–98). Regarded as the most beautiful princess in Europe, she married her cousin, Emperor Francis Joseph, in 1854. She was popular with her subjects but offended Viennese high society with her impatience with rigid court etiquette. The Hungarians admired her, especially for her efforts in bringing about the Compromise of 1867. During a visit to Switzerland she was assassinated by an Italian anarchist.

Elizabeth *or* **Elizabeth Stuart** (b. Aug. 19, 1596, Falkland Palace, Fifeshire, Scot.—d. Feb. 13, 1662, Westminster, London, Eng.) Titular queen of Bohemia from 1619. Daughter of the Scottish king James VI (later James I of England), she came to English royal court in 1606. Noted for her beauty and charm, she became a favorite subject of the poets. In 1613 she was married to Frederick V, the elector palatine, who became king of Bohemia (as Frederick I) in 1619. After his defeat by the Catholic League in 1620, the couple went into exile, where Elizabeth spent the next 40 years. In 1661 her nephew Charles II grudgingly allowed her to return to England. Her most famous son was Prince Rupert.

Elizabeth *Russian* **Yelizaveta Petrovna** (b. Dec. 18, 1709, Kolomenskoye, near Moscow, Russia—d. Dec. 25, 1761, St. Petersburg) Empress of Russia (1741–61). Daughter of Peter I and Catherine I, she was proclaimed empress after staging a coup d'état and arresting Ivan VI, his mother, and their chief advisers. She encouraged the development of education and art and left control of most state affairs to her advisers and favorites. Her reign was characterized by court intrigues, a deteriorating financial situation, and the gentry's acquisition of privileges at the expense of the peasantry. However, Russia's prestige as a major European power grew. Russia adhered to a pro-Austrian, anti-Prussian foreign policy, annexed a portion of southern Finland after fighting a war with Sweden, improved its relations with Britain, and fought Prussia in the Seven Years' War. Elizabeth was succeeded by her nephew Peter III.

Elizabeth I (b. Sept. 7, 1533, Greenwich, near London, Eng.—d. March 24, 1603, Richmond, Surrey) Queen of England (1558–1603). Daughter of Henry VIII and his second wife, Anne Boleyn, she displayed precocious seriousness as a child and received the rigorous education normally reserved for male heirs. Her situation was precarious during the reigns of her half brother Edward VI and her half sister Mary I. After Sir Thomas Wyatt's rebellion in 1554, she was imprisoned but later released. Her accession to the throne on Mary's death was greeted with public jubilation. She assembled a core of experienced advisers, including William Cecil and Francis Walsingham, but she zealously retained her power to make final decisions. Important events of her reign included the restoration of England to Protestantism; the execution of Mary, Queen of Scots; and England's defeat of the Spanish Armada. She lived under constant threat of conspiracies by British Catholics. Over time she became known as the Virgin Queen, wedded to her kingdom. Many important suitors came forward, and she showed signs of romantic attachment to the earl of Leicester, but she remained single, perhaps because she was unwilling to compromise her power. She had another suitor, the 2nd earl of Essex, executed in 1601 for treason. Though her later years saw an economic decline and disastrous military efforts to subdue the Irish, her reign had already seen England's emergence as a world power and her presence had helped unify the nation against foreign enemies. Highly intelligent and strong-willed, Elizabeth inspired ardent expressions of loyalty, and her reign saw a brilliant flourishing in the arts, especially literature and music. After her death, she was succeeded by James I.

Elizabeth II *in full* **Elizabeth Alexandra Mary** (b. April 21, 1926, London, Eng.) Queen of the United Kingdom from 1952. She became heir presumptive when her uncle, Edward VIII, abdicated and her father became king as George VI. In 1947 she married her distant cousin Philip, duke of Edinburgh, with whom she had four children, including Charles, prince of Wales. She became queen on her father's death in 1952. Increasingly aware of the modern role of the monarchy, she favoured simplicity in court life and took an informed interest in government business. In the 1990s the monarchy was troubled by the highly publicized marital difficulties of two of the queen's sons and the death of Diana, princess of Wales. In 2002 the queen's mother and sister died within two months of each other.

Elizabeth II, 1985.

Elizabeth City (pop., 2000: 120,568), northeastern New Jersey, U.S. Located on Newark Bay adjacent to Newark, it is connected by bridge to Staten Island. Settlement began in 1664 with the purchase of land from the Delaware Indians. The first colonial assembly met there (1668–82). It was the scene of four military engagements during the American Revolution. It grew throughout the 19th century and is now highly industrialized, with important shipping operations. Alexander Hamilton and Aaron Burr attended an academy in Elizabeth, and Princeton University originated there (1746) as the college of New Jersey.

Elizabeth Islands Chain of small islands, southeastern Massachusetts, U.S. Extending southwest for 16 mi (26 km) from the southwestern tip of Cape Cod, the group lies between Buzzards Bay and Vineyard Sound. The islands were visited in 1602 by the English navigator Bartholomew Gosnold, who established a short-lived (three-week) colony on the westernmost island of Cuttyhunk 18 years before the arrival of the *Mayflower* at Plymouth. Naushon, the largest island, was a British naval base during the War of 1812. The islands, covering an area of about 14 sq mi (36 sq km), are mostly privately owned. Cuttyhunk is a popular base for sportfishing.

Elizabeth of Hungary, Saint (b. 1207, probably Pressburg, Hung.—d. Nov. 17, 1231, Marburg, Thuringia; canonized 1235; feast day November 17) Princess of Hungary canonized for her devotion to the poor. She married Louis IV of Thuringia, who died of plague in 1227 en route to the Sixth Crusade. She then joined the Third Order of St. Francis and devoted her life to the poor and sick, for whom she built a hospice. As a young girl, Elizabeth is said to have stolen bread, which she gave to the poor, and later distributed grain during famines. In the best-known legend, which is often depicted in art, Elizabeth met her husband unexpectedly on one of her charitable errands; the loaves of bread she was carrying were

© 2006 Encyclopædia Britannica, Inc.

miraculously changed into roses. This transformation convinced him of the worthiness of her kind endeavours, about which he had been chiding her.

Elizabethan \i-ˌli-zə-ˈbē-thən\ **literature** Body of works written during the reign of Elizabeth I (1558–1603). Probably the most illustrious age in the history of English literature, the Elizabethan era saw a flowering of poetry, produced a golden age of drama, and inspired a wide variety of splendid prose. The period encompasses the work of Sir Philip Sidney, Edmund Spenser, Christopher Marlowe, William Shakespeare, and others. Though some patterns and themes persisted, the tone of most forms of literary expression, especially drama, darkened rather suddenly around the start of the 17th century. See also Jacobean literature.

elk Any of several species of large deer in the genus *Cervus*, notably the red deer of Europe, the Kashmir stag, and the Himalayan shou, as well as the North American deer more correctly called wapiti. The creature called elk in Europe is a member of the species (*Alces alces*) known in North America as moose. The name is also applied to the extinct Irish elk.

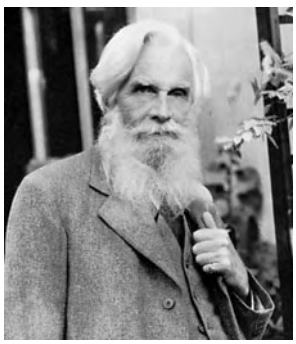
Elkin, Stanley (Lawrence) (b. May 11, 1930, New York, N.Y., U.S.—d. May 31, 1995, St. Louis, Mo.) U.S. writer. He grew up in Chicago; from 1960 he taught writing at Washington University. His works explore contemporary life with tragicomic wit and imaginative insight. *Criers and Kibitzers, Kibitzers and Criers* (1966) was an acclaimed collection of short stories on Jewish themes. The novel *The Franchiser* (1976) tells of Ben Flesh, who, like Elkin, suffered from multiple sclerosis, which is for Flesh both an enlightenment and a burden. *The Living End* (1979) consists of three interwoven novellas.

Ellesmere, Lake Coastal lake, eastern South Island, New Zealand. Located on the southern side of Banks Peninsula, the tidal lake, which is shallow and brackish, is 14 mi (23 km) long by 8 mi (13 km) wide and is no deeper than 7 ft (2 m). The lake sustains great flocks of waterfowl.

Ellesmere \ˈelz-ˌmēr\ **Island** Island, Nunavut, Canada. The largest of the Queen Elizabeth Islands and lying off the northwestern coast of Greenland, it is believed to have been visited by Vikings in the 10th century AD. It is roughly 300 mi (500 km) wide by 500 mi (800 km) long, the most rugged in the Arctic Archipelago, with towering mountains and vast ice fields. Cape Columbia is the most northerly point of Canada. Ellesmere Island National Park Reserve (established 1986) became Quttinirpaaq National Park in 2001.

Ellice Islands See Gilbert and Ellice Islands, Tuvalu

Ellington, Duke *orig.* **Edward Kennedy Ellington** (b. April 29, 1899, Washington, D.C., U.S.—d. May 24, 1974, New York, N.Y.) U.S. pianist, bandleader, arranger, and composer. He formed his band in 1924 in Washington, D.C.; by 1927 it was performing regularly at the Cotton Club in Harlem. Until the end of his life his band would enjoy the highest professional and artistic reputation in jazz. First known for his distinctive "jungle" sound—a description derived from the use of growling muted brass and sinister harmonies—Ellington increasingly integrated blues elements into his music. He composed with the idiosyncratic sounds of his instrumentalists in mind. Many of his players spent most of their careers with the band; they included saxophonists Johnny Hodges and Harry Carney, bassist Jimmy Blanton, trombonists Tricky Sam Nanton and Lawrence Brown, and trumpeters Bubber Miley and Cootie Williams. Pianist Billy Strayhorn was Ellington's frequent collaborator. Ellington composed a massive body of work, including music for dancing, popular songs, large-scale concert works, musical theatre, and film scores. His best-known compositions include "Mood Indigo," "Satin Doll," "Don't Get Around Much Anymore," and "Sophisticated Lady."



Duke Ellington.
REPRINTED WITH PERMISSION OF *DOWN BEAT* MAGAZINE

ellipse Closed curve, one of the conic sections of analytic geometry, consisting of all points whose distances from each of two fixed points (foci) add up to the same value. The midpoint between the foci is the center. One property of an ellipse is that the reflection off its boundary of a line from one focus will pass through the other. In an elliptical room, a person whispering at one focus is easily heard by someone at the other. An oval may or may not fit the definition of an ellipse.

elliptic geometry Non-Euclidean geometry that rejects Euclid's fifth postulate (the parallel postulate) and modifies his second postulate. It is also known as Riemannian geometry, after Bernhard Riemann. It asserts that no line passing through a point not on a given line is parallel to that line. It also states that while any straight line of finite length can be extended indefinitely, all straight lines are the same length. Though many of elliptic geometry's theorems are identical to those of Euclidean geometry, others differ (e.g., the angles in a triangle add up to more than 180°). It can most easily be pictured as geometry done on the surface of a sphere where all lines are great circles.

Ellis, (Henry) Havelock (b. Feb. 2, 1859, Croydon, Surrey, Eng.—d. July 8, 1939, Washbrook, Suffolk) British sexuality researcher. A medical doctor, he gave up his practice to devote himself to scientific and literary work. His major work, the seven-volume *Studies in the Psychology of Sex* (1897–1928), was a comprehensive, groundbreaking encyclopaedia of human sexual biology, behaviour, and attitudes whose topics included homosexuality, masturbation, and the physiology of sexual behaviour. Sale of the first volume led to a trial when the salesman was arrested on obscenity charges; the later volumes had to be published in the U.S. and were legally available only to the medical profession until 1935. Ellis viewed sexual activity as a natural expression of love and sought to dispel the widespread fear and ignorance surrounding it. He was also known as a champion of women's rights.

Havelock Ellis
THE MANSELL COLLECTION

Ellis Island Island, Upper New York Bay, southeastern New York, U.S. It lies southwest of Manhattan island and has an area of about 27 acres (11 hectares). In 1808 the state of New York sold the island to the federal government. It served as the nation's major immigration station from 1892 until 1924, when immigrant processing was moved to New York City proper. It became part of the Statue of Liberty National Monument in 1965; its restored main hall is the site of the Ellis Island Immigration Museum.

Ellison, Ralph (Waldo) (b. March 1, 1914, Oklahoma City, Okla., U.S.—d. April 16, 1994, New York, N.Y.) U.S. writer. Ellison studied music at Tuskegee Institute before joining the Federal Writers' Project. He won eminence for his novel *Invisible Man* (1952); narrated by a nameless young black man, it reflects bitterly on American race relations. It is regarded as among the most distinguished works of American fiction since World War II. He later published two essay collections, *Shadow and Act* (1964) and *Going to the Territory* (1986) and lectured and taught widely. In 1999 an edition of his unfinished second novel was published by his literary executor, John Callahan, with the title *Juneteenth*.

Ellsworth, Oliver (b. April 29, 1745, Windsor, Conn.—d. Nov. 26, 1807, Windsor) U.S. politician, diplomat, and jurist. He served in the Continental Congress (1777–83) and coauthored the Connecticut Compromise (1787), which resolved the issue of representation in Congress. In 1789 he became one of Connecticut's first U.S. senators. He was the chief author of the Judiciary Act (1789), which established the federal court system. He was appointed chief justice of the Supreme Court of the United States in 1796; ill health forced his resignation in 1800.

elm Any of about 18 species of forest and ornamental shade trees that make up the genus *Ulmus* (family Ulmaceae), native mostly to northern temperate areas. Many are grown for their height and attractive foliage. The leaves are doubly toothed and

Leaves and fruit of an American elm tree.

often lopsided at the base. The flowers, which lack petals, appear before the leaves and are borne in clusters. Seeds are borne in a samara (dry, winged fruit). The American elm (*U. americana*) has dark gray, ridged bark and elliptical leaves. Many species are susceptible to Dutch elm disease. Elm wood is important for boats and farm buildings because it is durable in water; it is also used for furniture. See also slippery elm.

Elman, Mischa (b. Jan. 20, 1891, Talnoye, Ukraine, Russian Empire—d. April 5, 1967, New York, N.Y., U.S.) Ukrainian-born U.S. violinist. He studied with Leopold Auer (1845–1930) in St. Petersburg from age 10 and made his professional debut in Berlin at 13. Tours of Germany and England followed, and he first played in the U.S. in 1908. With Jascha Heifetz and Efrem Zimbalist (1889–1985), he established the "Russian school" of violin playing. Admired for his full tone and passionate style, he had many pieces written for him by eminent composers.

Elsevier family See Elzevir family

Elsheimer \'els-ˌhī-mər**, Adam** (baptized March 18, 1578, Frankfurt am Main—d. December 1610, Rome, Papal States) German painter and printmaker. After studying in Frankfurt, he went to Rome in 1600 and began producing images of Italian Classical subjects, nocturnal scenes, and landscapes. He painted on small copper plates and executed drawings and etchings. He frequently depicted illumination by firelight, candlelight, and moonlight. His *Flight into Egypt* (1609) was the first painting to depict the constellations accurately. An important figure in the development of 17th-century landscape painting, he greatly influenced Dutch, Italian, and French artists. He died at age 32.

Elssler, Fanny (b. June 23, 1810, Vienna, Austria—d. Nov. 27, 1884, Vienna) Austrian ballerina. She studied in Vienna and toured in Europe before making her Paris Opéra debut in 1834. Her warm, spirited style, contrasting with the cool, academic style of the then-reigning Marie Taglioni, made her an immediate success. She introduced theatricalized folk dance (character dance) into ballet. During 1840–42 Elssler toured the U.S., earning wild adulation. She returned to Europe and toured until her retirement to Vienna in 1851.

Éluard \ā-lüē-'är**, Paul** *orig.* **Eugène Grindel** (b. Dec. 14, 1895, Saint-Denis, Paris, France—d. Nov. 18, 1952, Charenton-le-Pont) French poet. In 1919 he met André Breton, Philippe Soupault, and Louis Aragon, with whom he founded the movement they would call Surrealism. His subsequent poetry—*Capitale de la douleur* (1926), *Les Dessous d'une vie ou la pyramide humaine* (1926), *La Rose publique* (1934), and *Les Yeux fertiles* (1936)—is considered the best to have come out of the movement. After the Spanish Civil War he abandoned Surrealist experimentation. During World War II he wrote poems dealing with suffering and brotherhood that were circulated secretly and strengthened the morale of the Resistance. His postwar poetry, including *Le Phénix* (1951), was more lyrical.

eluviation Removal of dissolved or suspended material from a layer or layers of the soil by the movement of water when rainfall exceeds evaporation. Such loss of material in solution is often referred to as leaching. The process of eluviation influences soil composition.

Elway, John (Albert) (b. June 28, 1960, Port Angeles, Wash., U.S.) U.S. football player. He had an outstanding athletic career at Stanford University, then played professional baseball briefly before joining the Denver Broncos in 1983. He is one of only three quarterbacks to have passed for more than 45,000 yd; he holds the record for victories by a starting quarterback (148); and he ranks among the top three for pass attempts (7,250), pass completions (4,123), passing yardage (51,475), and passing touchdowns (300). Famous for last-minute heroics, he led a total of 47 fourth-quarter game-winning or game-tying touchdown drives. He announced his retirement in 1999 after leading the Broncos to a second consecutive Super Bowl victory.

Ely \'ē-lē**, Richard T(heodore)** (b. April 13, 1854, Ripley, N.Y., U.S.—d. Oct. 4, 1943, Old Lyme, Conn.) U.S. economist. He studied at Columbia University and the University of Heidelberg. His career interests focused on labour unrest, agricultural economics, and the problems of rural poverty. He taught at Johns Hopkins University (1881–92) but resigned in the face of harsh opposition to his ideas on academic freedom and the labour movement. He was a founder of the American Economic Association (1885). At the University of Wisconsin (1892–1925), he helped create Wisconsin's progressive program of social reform legislation.

Elysium \i-'li-zhē-əm, i-'li-zē-əm\ *or* **Elysian Fields** Ancient Greek paradise reserved for heroes to whom the gods had granted immortality. Homer described it as a land of perfect happiness at the end of the earth, on the banks of the Oceanus River. From the time of Pindar (c. 500 BC) on, Elysium was imagined as a dwelling place for those who had lived a righteous life.

Elytis \e-'lē-ˌtēs**, Odysseus** *or* **Odysseas Elytēs,** *orig.* **Odysseus Alepoudhelis** (b. Nov. 2, 1911, Iráklion, Crete—d. March 18, 1996, Athens, Greece) Greek poet. The scion of a prosperous Cretan family, he began publishing verse influenced by French Surrealism in the 1930s. His first two collections reveal his love of the Greek landscape and the Aegean Sea. During World War II he joined the antifascist resistance and became something of a bard among young Greeks. One of his best-known poems is *The Axion Esti* (1959); later works include *The Sovereign Sun* (1971) and *The Little Mariner* (1986). He won the Nobel Prize for Literature in 1979.

Elzevir \'el-zə-ˌvir\ **family** *or* **Elsevier family** Family of Dutch booksellers, publishers, and printers, 15 members of which were in business between 1587 and 1681. Members of the family operated at The Hague, Utrecht, and Amsterdam. They were best known for their books or editions of the Greek New Testament and the classics. Though their work enjoyed an almost legendary reputation for excellence of typography and design, it is now regarded as merely typical of the high quality that prevailed in their day in Holland.

Emain Macha \'e-vən^{y}-'vä-kə\ Political center of Ulster during pre-Christian and early Christian times. Now called Navan Fort, it is located near the town of Armagh in Northen Ireland. It was the seat of the semi-historical king Conchobar, a subject of the medieval Irish tales of the Ulster cycle along with Cú Chulainn and other great warriors. St. Patrick established his base near Emain Macha, and it is still the primatial see of both the Roman Catholic and Protestant churches in Ireland.

Emancipation, Edict of (March 3, 1861) Manifesto issued by Alexander II that freed the serfs of the Russian Empire. Defeat in the Crimean War, change in public opinion, and the increasing number and violence of peasant revolts had convinced Alexander of the need for reform. The final edict was a compromise and fully satisfied no one, particularly the peasants. It immediately granted personal liberties to the serfs, but the process by which they were to acquire land was slow, complex, and expensive. Though it failed to create an economically viable class of peasant proprietors, its psychological impact was immense.

Emancipation Proclamation (1863) Edict issued by U.S. Pres. Abraham Lincoln that freed the slaves of the Confederacy. On taking office, Lincoln was concerned with preserving the Union and wanted only to prevent slavery from expanding into the Western territories; but, after the South seceded, there was no political reason to tolerate slavery. In September 1862 he called on the seceded states to return to the Union or have their slaves declared free. When no state returned, he issued the proclamation on Jan. 1, 1863. The edict had no power in the Confederacy, but it provided moral inspiration for the North and discouraged European countries from supporting the South. It also had the practical effect of permitting recruitment of African Americans for the Union army; by 1865 nearly 180,000 African American soldiers had enlisted. The Thirteenth Amendment to the Constitution, ratified in 1865, officially abolished slavery in the entire country.

embargo Legal action by a government or group of governments restricting the departure of vessels or movement of goods from some or all locations to one or more countries. A trade embargo is a prohibition on exports to one or more countries. A strategic embargo restricts only the sale of goods that make a direct and specific contribution to a country's military power; similarly, an oil embargo prohibits only the export of oil. Broad embargoes often allow the export of certain goods (e.g., medicines or foodstuffs) to continue for humanitarian purposes, and most multilateral embargoes include escape clauses that specify a limited set of conditions under which exporters may be exempt from their prohibitions. An embargo is a tool of economic warfare that may be employed for a variety of political purposes, including demonstrating resolve, sending a political signal, retaliating for another country's actions, compelling a country to change its behaviour, deterring it from engaging in undesired activities, and weakening its military capability.

© 2006 Encyclopædia Britannica, Inc.

Embargo Act Legislation by the U.S. Congress in December 1807 that closed U.S. ports to all exports and restricted imports from Britain. The act was Pres. Thomas Jefferson's response to British and French interference with neutral U.S. merchant ships during the Napoleonic Wars. The embargo had little effect in Europe, but it imposed an unpopular restriction on New England merchants and exporters (see Hartford Convention). Legislation passed in 1809 lifted the embargo, but continued British interference with U.S. shipping led to the War of 1812.

Embden \'em-dən\, Gustav Georg (b. Nov. 10, 1874, Hamburg, Ger.—d. July 25, 1933, Nassau) German physiological chemist. He taught at the University of Frankfurt am Main from its founding in 1914. He conducted studies on the chemistry of carbohydrate metabolism and muscle contraction and was the first to discover and link all the steps in the conversion of glycogen to lactic acid. His studies focused mainly on chemical processes in living organisms, especially intermediate metabolic processes in liver tissue. By developing a technique to prevent tissue damage, Embden discovered the liver's important role in metabolism and did preliminary studies that led to the investigation of normal sugar metabolism and of diabetes.

Embden-Meyerhof-Parnas pathway See glycolysis

embezzlement Crime of fraudulently appropriating property entrusted to one's care and converting it to one's own use. It occurs when a person gains possession of goods lawfully and then misappropriates them. It thus stands in contrast to larceny, the taking of goods from another without the latter's consent. The most widely adopted embezzlement statutes cover custodians of public funds. Many laws subject public servants to severe penalties, even if funds are lost through improper administration rather than a clear attempt to steal. See also fraud, theft.

embolism \'em-bə-ˌli-zəm\ Obstruction of blood flow by an embolus—a substance (e.g., a blood clot, a fat globule from a crush injury, or a gas bubble) not normally present in the bloodstream. Obstruction of an artery to the brain may cause stroke. Pulmonary embolism (in the pulmonary artery or a branch) causes difficulty breathing, chest pain, and death of a section of lung tissue, with fever and rapid heartbeat. Embolism in a coronary artery can cause heart attack. See also thrombosis.

embroidery Art of decorating textiles with needle and thread. Among the basic techniques are cross-stitch, crewel work, and quilting. The Persians and Greeks wore quilted garments as armor. The earliest surviving examples of embroidery are Scythian (c. 5th–3rd century BC). The most notable extant Chinese examples are the imperial silk robes of the Qing dynasty (1644–1911/12). Islamic embroideries (16th–17th century) show stylized geometric patterns based on animal and plant shapes. Northern European embroidery was mostly ecclesiastical until the Renaissance. European skills and conventions prevailed in North America in the 17th–18th century. The Native Americans embroidered skins and bark with dyed porcupine quills; later the beads they acquired in trade took the place of quills. The indigenous peoples of Central America produced a kind of embroidery with feathers. The Bayeux Tapestry is the most famous surviving piece of needlework.

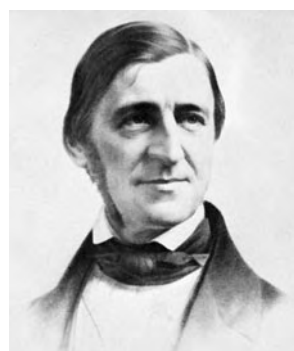
embryo \'em-brē-ˌō\ Early stage of development of an organism in the egg or the uterus, during which its essential form and its organs and tissues develop. In humans, the organism is called an embryo for the first seven or eight weeks after conception, after which it is called a fetus. In mammals, the fertilized egg or zygote undergoes cleavage (cell division without cell growth) to form a hollow ball or blastocyst. During the second week following fertilization, gastrulation (cell differentiation and migration) results in the formation of three tissue types. These three types of tissue develop into different organ systems: the ectoderm develops into the skin and nervous system; the mesoderm develops into connective tissues, the circulatory system, muscles, and bones; and the endoderm develops into the lining of the digestive system, lungs, and urinary system. In humans, by about the fourth week, the head and trunk can be distinguished and the brain, spinal cord, and internal organs begin to develop. By the fifth week, limbs begin to appear and the embryo is about .33 in. (.8 cm) long. By the end of eight weeks, the embryo has grown to about 1 in. (2.5 cm) long and all subsequent change is limited primarily to growth and specialization of existing structures. Any congenital disorders begin in this stage. See also pregnancy.

embryology Study of the formation and development of an embryo and fetus. Before widespread use of the microscope and the advent of cellular biology in the 19th century, embryology was based on descriptive and comparative studies. From the time of Aristotle it was debated whether the embryo was a preformed, miniature individual or an undifferentiated form that gradually became specialized. The latter theory was proved in 1827 when Karl Ernst Baer discovered the mammalian ovum (egg). The German anatomist Wilhelm Roux (1850–1924), noted for his pioneering studies on frog eggs (from 1885), became the founder of experimental embryology.



ʻEmeq Yizreʻel See Plain of Esdraelon

emerald Grass-green variety of beryl that is highly valued as a gemstone. Its physical properties are those of beryl. Its refractive and dispersive powers (i.e., its capacity to deflect light and to break white light into its component colours) are not high, so cut stones display little brilliancy or fire (flashes of colour). The colour that gives this gem its value is due to the presence of small amounts of chromium. The most important production of fine quality gem material is from Colombia; emeralds are also mined in Russia, Australia, South Africa, and Zimbabwe. Synthetic emeralds are identical to natural crystals and may rival them in colour and beauty.

emergence In the theory of evolution, the rise of a system that cannot be predicted or explained from antecedent conditions. The British philosopher of science G.H. Lewes (1817–78) distinguished between resultants and emergents—phenomena that are predictable from their constituent parts (e.g., a physical mixture of sand and talcum powder) and those that are not (e.g., a chemical compound such as salt, which looks nothing like sodium or chlorine). The evolutionary account of life is a continuous history marked by stages at which fundamentally new forms have appeared. Each new mode of life, though grounded in the conditions of the previous stage, is intelligible only in terms of its own ordering principle. These are thus cases of emergence. In the philosophy of mind, the primary candidates for the status of emergent properties are mental states and events.

Emerson, P(eter) H(enry) (b. May 13, 1856, Cuba—d. May 12, 1936, Falmouth, Eng.) English photographer. Trained as a physician, he began using photography in an anthropological study of East Anglia; the images were published in several books. A proponent of photography as a medium of artistic expression, he published a handbook, *Naturalistic Photography* (1889), in which he outlined his aesthetic system ("naturalism"), emphasizing that photographs should look like photographs rather than paintings. The book was so popular that he became known as one of the world's leading photographers, and his views influenced much of 20th-century photography.

Emerson, Ralph Waldo (b. May 25, 1803, Boston, Mass., U.S.—d. April 27, 1882, Concord) U.S. poet, essayist, and lecturer. Emerson graduated from Harvard University and was ordained a Unitarian minister in 1829. His questioning of traditional doctrine led him to resign the ministry three years later. He formulated his philosophy in *Nature* (1836); the book helped initiate New England Transcendentalism, a movement of which he soon became the leading exponent. In 1834 he moved to Concord, Mass., the home of his friend Henry David Thoreau. His lectures on the proper role of the scholar and the waning of the Christian tradition caused consid-

erable controversy. In 1840, with Margaret Fuller, he helped launch *The Dial*, a journal that provided an outlet for Transcendentalist ideas. He became internationally famous with his *Essays* (1841, 1844), including "Self-Reliance." *Representative Men* (1850) consists of biographies of historical figures. *The Conduct of Life* (1860), his most mature work, reveals a developed humanism and a full awareness of human limitations. His *Poems* (1847) and *May-Day* (1867) established his reputation as a major poet.

emery Granular rock consisting of a mixture of the mineral corundum (aluminum oxide, Al_2O_3) and iron oxides such as magnetite (Fe_3O_4) or hematite (Fe_2O_3). It is a dark, dense substance that looks much like iron ore. Turkey is the world's major producer. Long used as an abrasive or polishing material, particularly in sandpapers, it has largely been replaced by synthetic materials such as alumina. Its largest application now is as a nonskid material in floors, stair treads, and pavements.

émigré nobility \ˌā-mē-ˈgrā,\ *English* \ˈe-mi-ˌgrā\ Members of the French nobility who fled France during the French Revolution. In exile, mainly in England, many émigrés plotted against the Revolutionary government, seeking foreign help to restore the old regime. In response, Revolutionary leaders in France decreed that those émigrés who did not return by January 1792 were liable to death as traitors, and their property was confiscated. Napoleon granted the great majority of émigrés amnesty in 1802. During the Bourbon Restoration they were an important force in French politics.

Emilia-Romagna \ā-ˈmēl-yä-rō-ˈmän-yä\ Autonomous region (pop., 2001 prelim.: 3,960,549), northern Italy. It covers an area of 8,542 sq mi (22,123 sq km); its chief city and capital is Bologna. Located on the Adriatic Sea, Emilia-Romagna includes the Po River to the north and the Apennines to the west and south. It takes its name from the Roman Aemilian Way, built c. 187 BC. The region formerly comprised the duchies of Parma and Modena and papal Romagna. Emilia-Romagna became part of the Kingdom of Italy in 1861; the present political region was created in 1948. The fertile Emilian Plain in the north makes Emilia-Romagna one of the leading agricultural regions of Italy. It has a large food-processing industry, and livestock and dairy farming are extensive.

Emin Pasha \e-ˈmēn-pä-ˈshä**, Mehmed** *orig.* **Eduard Schnitzer** (b. March 28, 1840, Oppeln, Silesia—d. Oct. 23, 1892, Kanema, Congo Free State) German physician, explorer, and administrator in Egyptian Sudan. Schnitzer adopted a Turkish name while serving as a medical officer and administrator in the Ottoman government. In 1876 he joined with British forces led by Gen. Charles George Gordon at Khartoum. In 1878 he was appointed governor of Equatoria province. During the Mahdist movement uprising, the Egyptian government abandoned the Sudan (1884), and the isolated Emin was rescued by Henry Morton Stanley in 1888. On an expedition to equatorial Africa, he was killed by Arab slave-traders. Through his scholarly papers and specimen collections, he contributed vastly to the knowledge of African geography, natural history, ethnology, and languages.

eminent domain Government power to take private property for public use without the owner's consent. Constitutional provisions in most countries, including the U.S. (in the 5th Amendment to the Constitution), require the payment of just compensation to the owner. As a power peculiar to sovereign authority and coupled with a duty to pay compensation, the concept was developed by such 17th-century natural-law jurists as Hugo Grotius and Samuel Pufendorf. See also confiscation.

emir \i-ˈmir\ In the Muslim Middle East, a military commander, governor of a province, or high military official. The first leader to call himself emir was the second caliph, Umar ibn al-Khattab. The title was used by all his successors until the abolition of the caliphate in 1924. In the 10th century the commander of the caliph's armies at Baghdad held the title. It was later adopted by the rulers of independent states in central Asia, notably Bukhara and Afghanistan. The United Arab Emirates, despite their name, are all ruled by sheikhs.

Emmett, Daniel Decatur (b. Oct. 29, 1815, Mount Vernon, Ohio, U.S.—d. June 28, 1904, Mount Vernon) U.S. showman and songwriter. The son of an Ohio blacksmith, he joined the army at age 17 as a fifer. In 1843 in New York he helped organize the Virginia Minstrels, one of the earliest minstrel-show troupes. He is credited with writing "Dixie" (1859), a minstrel "walk-around" (concluding number) that became the Confederacy's unofficial national anthem. His other songs include "Old Dan Tucker" and "Blue-Tail Fly." He also wrote banjo tunes and music instruction manuals.

Emmy award Annual presentation for outstanding achievement in U.S. television. Its name is taken from the nickname "immy" for the image orthicon, a television camera tube. The Emmys are presented by the National Academy of Television Arts and Sciences, founded in 1946, whose members vote on outstanding programs, actors, directors, and writers in such categories as drama, comedy, and variety.

Emory University Private university in Atlanta, Georgia, U.S. It was chartered as a college in 1836 under Methodist auspices; in 1915 it merged with a school of medicine to become a university. It consists of two undergraduate colleges (one four-year and one two-year), a graduate school of arts and sciences, a division of allied health professions, and schools of law, business, theology, public health, nursing, and medicine. Research facilities include the Carter Presidential Center, the Yerkes Primate Center, and a cancer centre.

emotion Affective aspect of consciousness. The emotions are generally understood as representing a synthesis of subjective experience, expressive behaviour, and neurochemical activity. Most researchers hold that they are part of the human evolutionary legacy and serve adaptive ends by adding to general awareness and the facilitation of social communication. Some nonhuman animals are also considered to possess emotions, as first described by Charles Darwin in 1872. An influential early theory of emotion was that proposed independently by William James and Carl Georg Lange (1834–1900), who held that emotion was a perception of internal physiological reactions to external stimuli. Walter B. Cannon questioned this view and directed attention to the thalamus as a possible source of emotional content. Later researchers have focused on the brainstem structure known as the reticular formation, which serves to integrate brain activity and may infuse perceptions or actions with emotional valence. Cognitive psychologists have emphasized the role of comparison, matching, appraisal, memory, and attribution in the forming of emotions. All modern theorists agree that emotions influence what people perceive, learn, and remember, and that they play an important part in personality development. Cross-cultural studies have shown that, whereas many emotions are universal, their specific content and manner of expression vary considerably.

emotivism In metaethics (see ethics), the view that moral judgments do not function as statements of fact but rather as expressions of the speaker's or writer's feelings. According to the emotivist, when we say "You acted wrongly in stealing that money," we are not expressing any fact beyond that stated by "You stole that money." It is, however, as if we had stated this fact with a special tone of abhorrence, for in saying that something is wrong, we are expressing our feelings of disapproval toward it. Emotivism was expounded by A. J. Ayer in *Language, Truth and Logic* (1936) and developed by Charles Stevenson in *Ethics and Language* (1945).

empathy Ability to imagine oneself in another's place and understand the other's feelings, desires, ideas, and actions. The empathic actor or singer is one who genuinely feels the part he or she is performing. The spectator of a work of art or the reader of a piece of literature may similarly become involved in what he or she observes or contemplates. The use of empathy was an important part of the psychological counseling technique developed by Carl R. Rogers.

Empedocles \em-ˈped-ə-ˌklēz\ (b. c. 490, Acragas, Sicily—d. 430 BC, the Peloponnese) Greek philosopher, statesman, poet, and physiologist. All that remains of his writings are 500 lines from two poems. He held that all matter was composed of four basic ingredients: fire, air, water, and earth. Like Heracleitus, he held that two forces, love and strife, interact to bring together and separate the four substances. Believing in the transmigration of souls, he declared that salvation requires abstention from the flesh of animals, whose souls may once have inhabited human bodies.

emperor Title of the sovereigns of the ancient Roman empire and, by derivation, various later European rulers, also applied to certain non-European monarchs. Caesar Augustus was the first Roman emperor. Byzantine emperors ruled at Constantinople until 1453. Charlemagne became the first of the Western emperors (later Holy Roman emperors) in 800. After Otto I became emperor in 962, only German kings held the title. In other parts of Europe, monarchs who ruled multiple kingdoms (e.g., Alfonso VI, who ruled Léon and Castile) sometimes took the title emperor. Napoleon's

© 2006 Encyclopædia Britannica, Inc.

assumption of the title, as a putative successor of Charlemagne, was a direct threat to the HABSBURG DYNASTY. Queen VICTORIA of Britain took the title empress of India. Non-European peoples whose rulers have been called emperor include the Chinese, Japanese, Mughals, Incas, and Aztecs.

emphysema \ˌem-fə-ˈzē-mə, ˌem-fə-ˈsē-mə\ *or* **pulmonary emphysema** Abnormal distension of the lungs with air, usually associated with cigarette smoking and chronic BRONCHITIS. Elastic tissue degenerates, severely interfering with exhalation. Capillary walls disappear, leaving lung tissue dry and pale. The walls of the pulmonary alveoli (see PULMONARY ALVEOLUS) break down, so the lung fills with pools of air. Symptoms include severe breathlessness, weight loss, bluish skin, chest tightness, and wheezing. In bullous emphysema, the alveoli form large air CYSTS that may rupture, causing lung collapse (see ATELECTASIS), or require surgery. Emphysema is irreversible; it normally continues to progress even after the cessation of smoking and may lead to death. See also PULMONARY HEART DISEASE.

Empire State Building Steel-framed 102-story building designed by Shreve, Lamb & Harmon Associates and completed in New York City in 1931. At a height of 1,250 ft (381 m), it surpassed the CHRYSLER BUILDING to become the highest structure in the world (until 1954). It is notable for its use of the SETBACK.

Empire \ˈäm-ˌpir, ˈem-ˌpīr\ **style** Style of furniture and interior decoration that flourished in France during the First Empire (1804–14). It corresponds to the REGENCY STYLE in England. Responding to the desire of NAPOLEON for a style inspired by imperial Rome, the architects Charles Percier (1764–1838) and Pierre Fontaine (1762–1853) decorated his state rooms with Classical styles of furniture and ornamental motifs, supplemented by sphinxes and palm leaves to commemorate his Egyptian campaigns. The style influenced the arts (JACQUES-LOUIS DAVID in painting, ANTONIO CANOVA in sculpture, the ARC DE TRIOMPHE in architecture) and fashion and spread quickly throughout Europe.

empiricism Either of two closely related philosophical doctrines, one pertaining to concepts and the other to knowledge. The first doctrine is that most, if not all, concepts are ultimately derived from experience; the second is that most, if not all, knowledge derives from experience, in the sense that appeals to experience are necessarily involved in its justification. Neither doctrine implies the other. Several empiricists have allowed that some knowledge is A PRIORI, or independent of experience, but have denied that any concepts are. On the other hand, few if any empiricists have denied the existence of a priori knowledge while maintaining the existence of a priori concepts. JOHN LOCKE, GEORGE BERKELEY, and DAVID HUME are classical representatives of empiricism. See also FRANCIS BACON.

employee training *or* **job training** *or* **occupational training** Vocational instruction for employed persons, first used commonly in the developed world during World War II. Work-related training is necessary as new techniques, new methods, new tools, new synthetic materials, new sources of power, and increased uses of AUTOMATION continue to bring extensive changes. The UN and its agencies contribute to training programs in developing countries. See also TECHNICAL EDUCATION.

Empson, Sir William (b. Sept. 27, 1906, Hawdon, Yorkshire, Eng.—d. April 15, 1984, London) British poet and critic. He studied at Cambridge and later taught in Japan and China. His precocious *Seven Types of Ambiguity* (1930), which suggests that uncertainty or overlap of meanings in the use of a word can be an enrichment of poetry rather than a fault, had an immense influence on 20th-century criticism; its close examination of poetic texts helped lay the foundation for NEW CRITICISM. Later works include *Some Versions of Pastoral* (1935) and *The Structure of Complex Words* (1951).

Ems River River, northwestern Germany. It rises on the southern slope of the TEUTOBURG FOREST and flows generally northwest and north through the states of North Rhine–Westphalia and Lower Saxony for 230 mi (371 km) to the NORTH SEA. Its mouth is a wide estuary (the Dollart) bordering The Netherlands. Between 1892 and 1899 the river was canalized, connecting it with the Dortmund-Ems Canal and the RUHR RIVER in order to provide a German water link for the Ruhr industrial district.

Ems Telegram (July 13, 1870) Telegram sent from Ems, Ger., to Otto von BISMARCK and subsequently published by him in an edited version designed to offend the French government. The telegram reported an encounter between King WILLIAM I of Prussia and the French ambassador, in which William politely refused to promise that no member of his family would seek the Spanish throne, which would constitute a threat to France. The version published by Bismarck, which made it seem that the two men had insulted each other, precipitated the FRANCO-PRUSSIAN WAR.

emu \ˈē-ˌmyü\ RATITE of Australia. After the OSTRICH, the emu is the second-largest living bird. They stand more than 5 ft (1.5 m) tall and often weigh more than 100 lbs (45 kg). The common emu (*Dromaius novaehollandiae*, family Dromaiidae), the only survivor of several forms exterminated by settlers, has a stout body and long legs. Both sexes are brownish, with a dark-gray head and neck. Emus can run up to 30 mph (50 kph); if cornered, they kick with their large feet. They mate for life and forage in small flocks for fruits and insects but sometimes damage crops. See also CASSOWARY.

Emu (*Dromaius novaehollandiae*)
V. SERVENTY—BRUCE COLEMAN INC./EB INC.

emulsion Mixture of two or more liquids in which one is dispersed in the other as microscopic or ultramicroscopic droplets (see COLLOID). Emulsions are stabilized by agents (emulsifiers) that (e.g., in the case of SOAP or DETERGENT molecules) form films at the droplets' surface or (e.g., in the case of colloidal carbon, bentonite clay, PROTEINS, or CARBOHYDRATE polymers) impart mechanical stability. Less-stable emulsions eventually separate spontaneously into two liquid layers; more-stable ones can be destroyed by inactivating the emulsifier, by freezing, or by heating. POLYMERIZATION reactions are often carried out in emulsions. Many familiar and industrial products are oil-in-water (o/w) or water-in-oil (w/o) emulsions: milk (o/w), butter (w/o), latex paints (o/w), floor and glass waxes (o/w), and many cosmetic and personal-care preparations and medications (either type).

Enabling Act Law passed by the German Reichstag in 1933 that enabled ADOLF HITLER to assume dictatorial powers. Deputies from the NAZI PARTY, the GERMAN NATIONAL PEOPLE'S PARTY, and the CENTER PARTY voted in favor of the act, which "enabled" Hitler's government to issue decrees independently of the Reichstag and the presidency. It gave Hitler a base from which to carry out the first steps of his National Socialist revolution.

enamelwork Metal objects decorated with an opaque glaze fused to the surface by intense heat. The resulting surface is hard and durable and can be brilliantly colourful. Objects most suitable for enamelwork are delicate, small (e.g., jewelry, snuffboxes, scent bottles, watches), and made of copper, brass, bronze, or gold. The best-known processes are CLOISONNÉ and CHAMPLEVÉ. Enamelwork was produced as early as the 13th century BC, reached its peak in the Byzantine Empire, and flourished throughout medieval and Renaissance Europe. In the early 20th century CARL FABERGÉ produced highly prized objects made of gold, enamel, and jewels. See also LIMOGES PAINTED ENAMEL.

encephalitis \in-ˌse-fə-ˈlī-təs\ INFLAMMATION of the brain, most often due to infection, usually with a virus. One class of encephalitis (including MULTIPLE SCLEROSIS) attacks the myelin sheath that insulates nerve fibres rather than the neurons themselves. In most cases, symptoms include fever, headache, lethargy, and coma. Convulsions are most common in infants. Characteristic neurological signs include uncoordinated, involuntary movements and localized weakness. The symptoms and a lumbar puncture (to obtain cerebrospinal fluid for analysis) may establish the presence but not the cause. Treatment usually aims to relieve the symptoms and ensure quiet rest. Various symptoms may remain after recovery.

Encke's Comet \ˈeŋ-kəz\ Faint COMET having the shortest orbital period (about 3.3 years) of any known, first observed in 1786. It was the second comet (after HALLEY'S COMET) to have its period determined (1819), by Johann Franz Encke (1791–1865). Encke also found that the comet's period decreases by about 2½ hours in each revolution and showed that this effect could not be explained by the planets' gravitational influence. Its period continues to decrease, though more slowly, and appears to be related to the effects of outgassing.

enclosure movement Division or consolidation of communal lands in Western Europe into the carefully delineated and individually owned farm plots of modern times. Before enclosure, farmland was under the control of individual cultivators only during the growing season; after

© 2006 Encyclopædia Britannica, Inc.

harvest and before the next growing season, the land was used by the community for the grazing of livestock and other purposes. In England the movement for enclosure began in the 12th century and proceeded rapidly from 1450 to 1640; the process was virtually complete by the end of the 19th century. In the rest of Europe, enclosure made little progress until the 19th century. Common rights over arable land have now been largely eliminated.

encomienda \en-ˌkō-mē-'en-də\ In colonial Spanish America, a system by which the Spanish crown defined the status of the Indian population in its colonies. An *encomienda* consisted of a grant by the crown of a specified number of Indians living in a particular area. The receiver (*encomenderos*) could exact tribute from the Indians and was required to protect them and instruct them in the Christian faith. The *encomienda* did not include a grant of land, but in practice the *encomenderos* gained control of Indian lands. Though the original intent was to reduce the abuses of forced labour, in practice it became a form of enslavement.

encryption, data See DATA ENCRYPTION

encyclopaedia Reference work that contains information on all branches of knowledge or that treats a particular branch of knowledge comprehensively. It is self-contained and explains subjects in greater detail than a DICTIONARY. It differs from an ALMANAC in that its information is not dated and not from pedagogical texts in its attempt to be easy to consult and to be readily understood by the layperson. Though generally written in the form of many separate articles, encyclopaedias vary greatly in format and content. The prototype of modern encyclopaedias is usually acknowledged to be Ephraim Chambers's *Cyclopaedia* (1728), and the first modern encyclopaedia was the French *Encyclopédie* (1751–65). The largest general encyclopaedia in English is the *Encyclopædia Britannica*.

Encyclopædia Britannica Oldest and largest English-language general encyclopaedia. Its three-volume first edition was published in 1768–71 in Edinburgh, Scot. In subsequent editions it grew in size and reputation. The most famous editions include the ninth (1875–89), known as "the scholar's encyclopaedia," and the 11th (1910–11), which, with contributions from more than 1,500 experts of world reputation, was also the first to divide the traditionally lengthy treatises into more particularized articles. The current edition, the 15th (1974, with a major revision in 1985), embodied a new structure, dividing the major articles from the shorter ones. *Encyclopædia Britannica* now also appears in CD-ROM and on-line versions. A series of ownership changes led to its purchase by American publishers in 1901; since the 1940s it has been published in Chicago.

Encyclopédie \ä"-ˌsē-klȯ-pā-'dē\ French encyclopedia created in the 18th century by the PHILOSOPHES; one of the principal works of the ENLIGHTENMENT. Under the full title *Encyclopédie, ou dictionnaire raisonné des sciences, des arts et des métiers* ("Encyclopedia, or Classified Dictionary of Sciences, Arts, and Trades"), it was inspired by the success of E. Chambers's British *Cyclopaedia; or An Universal Dictionary of Arts and Sciences* (1728). Under the direction of DENIS DIDEROT and initially aided by JEAN LE ROND D'ALEMBERT, 17 volumes were published between 1751 and 1765; other volumes were added later for a total of 35. Though opposed by conservative ecclesiastics and government officials and subjected to censorship, the *Encyclopédie* attracted articles from many important thinkers of the time, including Jean-Jacques ROUSSEAU, VOLTAIRE, and Denis Diderot, who were called "Encyclopedists." In its skepticism, its emphasis on scientific determinism, and its criticism of the abuses perpetrated by contemporary legal, judicial, and clerical institutions, the work had widespread influence as an expression of progressive thought prior to the FRENCH REVOLUTION.

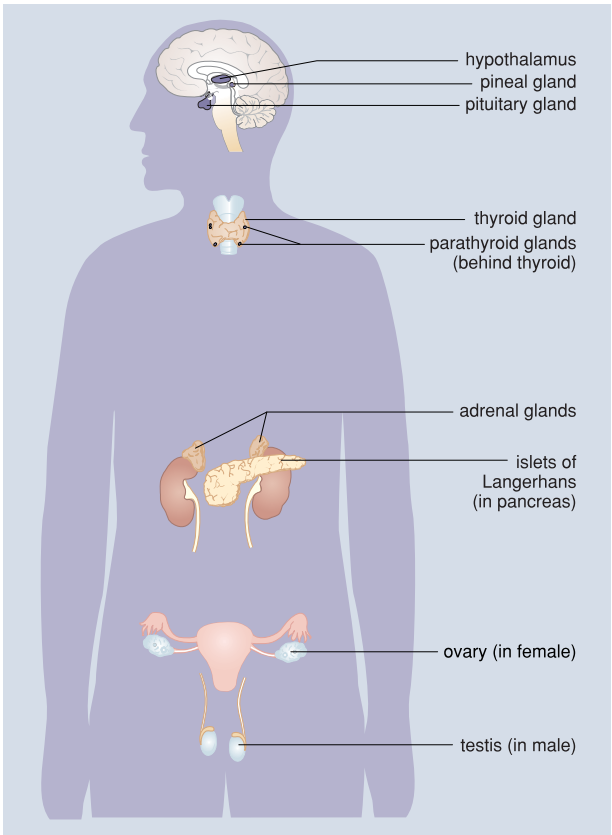
endangered species Any species of plant or animal threatened with EXTINCTION. International and national agencies work to maintain lists of endangered species, to protect and preserve natural habitats, and to promote programs for recovery and reestablishment of these species. The Species Survival Commission of the International Union for Conservation of Nature and Natural Resources (IUCN) publishes information online about endangered species worldwide as the *Red List of Threatened Species*. Separate books for animal and plant species are also published. In the United States, the Fish and Wildlife Service is responsible for the CONSERVATION and management of fish and wildlife, including endangered species, and their habitats. Its list now consists of about 1,200 domestic species of endangered or threatened animals and plants, and some 200 recovery programs are in effect.

endive \'en-ˌdīv, ˌän-'dēv\ Edible annual leafy plant (*Cichorium endivia*) of the COMPOSITE FAMILY. It is variously believed to have originated in Egypt and Indonesia, and it has been cultivated in Europe since the 16th century. The many kinds of endive form two groups: the curly or narrow-leaved endive (*C. endivia*, variety *crispa*) and the Batavian, or broad-leaved, endive (*C. endivia*, variety *latifolia*), which is also called escarole. The former is used mostly for salads, the latter for cooking.

endocarditis \ˌen-dō-kär-'dī-təs\ INFLAMMATION of the heart lining (endocardium), in association with a noninfectious disease (e.g., systemic LUPUS ERYTHEMATOSUS) or caused by INFECTION, usually at the heart valves. Severe bacterial infection causes an acute form with fever, sweating, chills, joint pain and swelling, and EMBOLISMS. Subacute endocarditis usually comes from bacteria that do not ordinarily cause disease. Bacterial endocarditis is usually treated with long-term antibiotics. In nonbacterial thrombotic endocarditis, blood clots form along heart valve edges.

endocrine \'en-də-krən\ **system** Group of ductless GLANDS that secrete HORMONES necessary for normal growth and development, reproduction, and HOMEOSTASIS. The major endocrine glands are the HYPOTHALAMUS, PITUITARY, PINEAL, THYROID, PARATHYROIDS, ADRENALS, islets of LANGERHANS in the PANCREAS, OVARIES, and TESTES. Secretion is regulated either by regulators in a gland that detect high or low levels of a chemical and inhibit or stimulate secretion or by a complex mechanism involving the hypothalamus and the pituitary. TUMOURS that produce hormones can throw off this balance. Diseases of the endocrine system result from over- or underproduction of a hormone or an abnormal response to a hormone. See illustration opposite on following page.

endocrinology \ˌen-də-kri-'näl-ə-jē\ Medical discipline dealing with regulation of body functions by HORMONES and other biochemicals and treatment of ENDOCRINE SYSTEM imbalances. In 1841 FRIEDRICH GUSTAV HENLE first recognized "ductless GLANDS," which secrete products directly into the bloodstream. The field was essentially established in the early 20th century, when ERNEST H. STARLING, who introduced the term *hormone*, proposed that chemical and nervous regulation of physiological processes were linked. Endocrine therapy is based on replacing deficient hormones with purified extracts. Nuclear technology has led to new treatments; use of radioactive iodine for hyperthyroidism greatly reduced the need for THYROID GLAND surgery. The detection of minute amounts of hormone with radioimmunoassays (see RADIOLOGY) permits early diagnosis and treatment of endocrine disorders.



endogamy See EXOGAMY AND ENDOGAMY

endometriosis \ˌen-dō-ˌmē-trē-'ō-səs\ Disorder of the female reproductive system in which endometrium (uterine lining) grows in an abnormal location because some endometrial fragments traverse the fallopian tubes into the abdominal cavity and become embedded on structures there, usually the ovaries, rather than exiting the uterus via the vagina (during menstruation). Symptoms include pain on menstruation, sexual intercourse, defecation, and/or urination; heavy menstrual flow; blood in the urine; and infertility. Diagnosis is best made by LAPAROSCOPY. Treatment includes surgery and hormones to suppress ovulation for six to nine months.

endoplasmic reticulum \ˌen-də-'plaz-mik-rə-'tik-yə-ləm\ **(ER)** Membrane system within the CYTOPLASM of a eukaryotic cell (see EUKARYOTE), important in the synthesis of proteins and lipids. The ER usually makes up more than half the membrane of the cell and is continuous with the outer membrane of the nuclear envelope (see NUCLEUS). There are two distinct regions of ER: the rough ER, or RER (so called because of the protein-synthesizing RIBOSOMES attached to it), and the smooth ER (SER), which is not associated with ribosomes and is involved in the synthesis of lipids and the detoxification of some toxic chemicals.

endorphin \en-'dȯr-fən\ Any of a group of PROTEINS occurring in the brain and having pain-relieving properties typical of OPIUM and related opiates. Discovered in the 1970s, they include enkephalin, beta-endorphin, and dynorphin. Each is distributed in characteristic patterns throughout the nervous system. Endorphins are released in response to PAIN or sustained exertion (causing, e.g., the "runner's high"). They are also believed to have a role in appetite control, release of PITUITARY sex hormones, and SHOCK. There is strong evidence that they are connected with "pleasure centres" in the brain, and they seem to be activated by ACUPUNCTURE. Knowledge of their behaviour has implications for treating addictions and chronic pain.

© 2006 Encyclopædia Britannica, Inc.

Major glands of the human endocrine system. The hypothalamus stimulates the pituitary gland and influences food intake, weight regulation, fluid intake and balance, thirst, body heat, and the sleep cycle. Pituitary hormones stimulate growth, egg and sperm development, milk secretion, and release of hormones by other glands. The pineal gland may play a significant role in sexual maturation and the circadian rhythm. Thyroid hormones regulate the metabolic rate of tissues, stimulate the contraction of heart muscle, and are necessary for normal growth and brain development before birth and during infancy. Parathyroid hormone regulates calcium, phosphorus, and magnesium levels. The adrenal glands regulate salt and water retention, some reactions of the immune system, and blood pressure. The islets of Langerhans regulate blood sugar levels. The ovaries and testes produce hormones that regulate the reproductive system and that produce male and female secondary sex characteristics.

© MERRIAM-WEBSTER INC.

endoscopy \en-'däs-kə-pē\ Examination of the body's interior through an instrument inserted into a natural opening or an incision, usually as an outpatient procedure. Endoscopes include the upper gastrointestinal endoscope (for the esophagus, stomach, and duodenum), the colonoscope (for the colon), and the bronchoscope (for the bronchial tubes). With FIBRE OPTICS, much more maneuverable instruments can reach formerly inaccessible sites, while causing much less discomfort. Attachments can take tissue samples, excise polyps and small tumours, and remove foreign objects.

endotherm So-called warm-blooded animals; that is, those that maintain a constant body temperature independent of the environment. The endotherms include the BIRDS and MAMMALS. If heat loss exceeds heat generation, metabolism increases to make up the loss or the animal shivers to raise its body temperature. If heat generation exceeds the heat loss, mechanisms such as panting or perspiring increase heat loss. Unlike ECTOTHERMS, endotherms can be active and survive at quite low external temperatures, but because they must produce heat continuously, they require high quantities of "fuel" (i.e., food).

Energia *also called* **RKK Energia** *formerly* **OKB-1** Russian aerospace company that is a major producer of spacecraft, rockets, and missiles. Energia originated in 1946 as a department within a Soviet institute conducting work on long-range missiles. Ten years later, under SERGEY KOROLYOV, it became the independent design bureau OKB-1. In the 1950s it developed the R-7 (SS-6), the world's first inter-continental ballistic missile; a modified R-7 placed the first artificial satellite into orbit (see SPUTNIK). OKB-1 was responsible for the U.S.S.R.'s commanding early lead in the "space race," although it failed in its secret project to beat the U.S. to a manned Moon landing. In 1974 the conglomerate NPO Energia was created with OKB-1 at its center. A main focus for the company was the development and operation of space stations (see SALYUT, MIR). In the early 1990s Energia became the main contractor for the Russian portion of the INTERNATIONAL SPACE STATION (it provided the station's Zvezda habitat and control module), but its role was later reduced. In 1994 it was renamed RKK Energia and partially privatized. After the dissolution of the Soviet Union in 1991, Energia partnered with multinational satellite launching services, to which it provided its Block DM upper stage for boosting payloads to geostationary orbit.

energy Capacity for doing WORK. Energy exists in various forms—including KINETIC, POTENTIAL, THERMAL, CHEMICAL, electrical (see ELECTRICITY), and NUCLEAR—and can be converted from one form to another. For example, fuel-burning heat engines convert chemical energy to thermal energy; batteries convert chemical energy to electrical energy. Though energy may be converted from one form to another, it may not be created or destroyed; that is, total energy in a closed system remains constant. All forms of energy are associated with MOTION. A rolling ball has kinetic energy, for instance, whereas a ball lifted above the ground has potential energy, as it has the potential to move if released. HEAT and work involve the transfer of energy; heat transferred may become thermal energy. See also ACTIVATION ENERGY, BINDING ENERGY, IONIZATION ENERGY, MECHANICAL ENERGY, SOLAR ENERGY, ZERO-POINT ENERGY.

energy, conservation of Principle of physics according to which the ENERGY of interacting bodies or particles in a closed system remains constant, though it may take different forms (e.g., KINETIC ENERGY, POTENTIAL ENERGY, THERMAL ENERGY, energy in an ELECTRIC CURRENT, or energy stored in an ELECTRIC FIELD, in a MAGNETIC FIELD, or in chemical bonds [see BONDING]). With the advent of RELATIVITY physics in 1905, MASS was recognized as equivalent to energy. When accounting for a system of high-speed particles whose mass increases as a consequence of their speed, the laws of conservation of energy and conservation of mass become one CONSERVATION LAW. See also HERMANN VON HELMHOLTZ.

energy, equipartition of Law of STATISTICAL MECHANICS stating that, in a system in thermal EQUILIBRIUM, on average, an equal amount of energy is associated with each independent energy state. It states specifically that a system of particles in equilibrium at absolute temperature T will have an average energy of $\frac{1}{2}kT$, where k is the BOLTZMANN CONSTANT, associated with each degree of freedom. For example, an ATOM of a gas has three degrees of freedom (its three position coordinates); therefore, it will have an average total energy of $\frac{3}{2}kT$.

Engelbart, Douglas (b. Jan. 30, 1925, near Portland, Ore., U.S.) U.S. computer scientist. He received a Ph.D. in electrical engineering from the University of California, Berkeley. In the 1960s he set up the Augmentation Research Center at the Stanford Research Institute in Utah. He invented HYPERTEXT, the multiwindow display, the MOUSE, and groupware. His demonstration of these capabilities in San Francisco in 1968 started the process of development that led to the Microsoft WINDOWS operating system. Engelbart's group at SRI was one of the original four members of the ARPANET, precursor of the INTERNET. After his retirement, he led the Bootstrap Institute, researching ways to support cooperative work by computers. In 1997 he received the Turing Award.

Engels \'eŋ-əls**, Friedrich** (b. Nov. 28, 1820, Barmen, Rhine Province, Prussia—d. Aug. 5, 1895, London, Eng.) German socialist philosopher. Son of a factory owner, he eventually became a successful businessman himself, never allowing his criticism of capitalism to interfere with the profitable operations of his firm. As a young man, he developed an interest in the philosophy of G.W.F. HEGEL as expounded by the Young Hegelians, and he became persuaded that the logical consequence of HEGELIANISM and dialectic was communism. In 1844 he published *The Condition of the Working Class in England.* With KARL MARX, whom he met in Cologne, he formed a permanent partnership to promote the socialist movement. After persuading the second Communist Congress to adopt their views, the two men were authorized to draft the *COMMUNIST MANIFESTO* (1848). After Marx's death (1883), Engels served as the foremost

© 2006 Encyclopædia Britannica, Inc.

authority on Marx and Marxism. Aside from his own books, he completed volumes 2 and 3 of *Das Kapital* on the basis of Marx's uncompleted manuscripts and rough notes.

engine Machine that can convert any of various forms of energy into mechanical power or motion. The steam engines developed during the Industrial Revolution to power stationary machinery were modified in the 19th century to propel locomotives and ships, and were joined later by steam turbines. Internal-combustion engines were developed by Nikolaus Otto and Rudolf Diesel in the late 19th century. Gas turbines and rocket engines came into use in the later 20th century. See also diesel engine, gasoline engine, jet engine, rocket, and rotary engine.

engineering Professional art of applying science to the optimum conversion of the resources of nature to the uses of humankind. Engineering is based principally on physics, chemistry, and mathematics and their extensions into materials science, solid and fluid mechanics, thermodynamics, transfer and rate processes, and systems analysis. A great body of special knowledge is associated with engineering; preparation for professional practice involves extensive training in the application of that knowledge. Engineers employ two types of natural resources, materials and energy. Materials acquire uses that reflect their properties: their strength, ease of fabrication, lightness, or durability; their ability to insulate or conduct; and their chemical, electrical, or acoustical properties. Important sources of energy include fossil fuels (coal, petroleum, gas), wind, sunlight, falling water, and nuclear fission. See also aerospace engineering, civil engineering, chemical engineering. genetic engineering, mechanical engineering, military engineering.

engineering geology *or* **geological engineering** Scientific discipline concerned with the application of geologic knowledge to engineering problems such as reservoir design and location, determination of slope stability for construction purposes, and determination of earthquake, flood, or subsidence danger in areas considered for roads, pipelines, bridges, dams, or other engineering works.

England Southern part of the island of Great Britain, excluding Wales. Area: 50,351 sq mi (130,410 sq km). Population (2001): 49,138,831. It is the largest constituent unit of the United Kingdom of Great Britain and Northern Ireland. England is often erroneously considered synonymous with the island of Great Britain and even with the entire kingdom. Despite the political, economic, and cultural legacy that has perpetuated its name, however, England no longer officially exists as a country and enjoys no separate political status within the United Kingdom. It is a land of low hills and plateaus, with a 2,000-mi (3,200-km) coastline. A substantial upland, the Pennines, divides northern England; the Cheviot Hills define the Scottish border. In the southwest lie the Cotswold Hills and the plateau regions of Exmoor and Dartmoor; in the southeast lie the Downs and in the south the Salisbury Plain. English weather is diverse, with a generally mild but erratic maritime climate. England is divided into eight geographic regions, often referred to as the standard regions of England; they do not serve any administrative function. The South East, centred on London, is an economically dominant area. It contains an extensive range of manufacturing and science-based industries and commercial endeavours. The West Midlands, in west-central England, is a diversified manufacturing region that centres on Birmingham. The region also includes the Shakespeare country, centred on Stratford-upon-Avon. The East Midlands, in east-central England, is also a manufacturing region and contains some of England's best farmland. East Anglia is the easternmost part of England. It is mainly an agricultural region, but high-technology industries have developed there. Manchester and Liverpool are the chief industrial cities of the North West; the region has long been known for textile production, but that has rapidly given way to diversified manufacturing. The Humberside region lies to the east and is noted for textiles and steelmaking, though its economy has become more diversified and there is extensive farmland. The North region extends north to the Scottish border. It includes the celebrated Lake District and is a centre of engineering and pharmaceutical manufacture. The South West region, which includes Cornwall, has a growing tourist industry, and some areas are becoming industrialized. England is especially noted for its long and rich literary tradition, as well as for its architecture, painting, theatres, museums, and universities (see University of Oxford; University of Cambridge). It also played an integral role in rock music (see British Invasion).

England, Church of English national church and the mother church of the Anglican Communion. Christianity was brought to England in the 2nd century, and though nearly destroyed by the Anglo-Saxon invasions, it was reestablished after the mission of St. Augustine of Canterbury in 597. Medieval conflicts between church and state culminated in Henry VIII's break with Roman Catholicism in the Reformation. When the pope refused to annul Henry's marriage to Catherine of Aragon, the king issued the Act of Supremacy (1534), which declared the English monarch to be head of the Church of England. Under Henry's successor, Edward VI, more Protestant reforms were instituted. After a five-year Catholic reaction under Mary I, Elizabeth I ascended the throne (1558), and the Church of England was reestablished. The Book of Common Prayer (1549) and the Thirty-nine Articles (1571) became the standards for liturgy and doctrine. The rise of Puritanism in the 17th century led to the English Civil Wars; during the Commonwealth the Church of England was suppressed, but it was reestablished in 1660. The evangelical movement in the 18th century emphasized the church's Protestant heritage, while the Oxford movement in the 19th century emphasized its Roman Catholic heritage. The Church of England has maintained an episcopal form of government, and its leader is the archbishop of Canterbury. In 1992 the church voted to ordain women as priests. In the U.S., the Protestant Episcopal Church is descended from and remains associated with the Church of England.

Engle, Robert F. (b. November 1942, Syracuse, N.Y., U.S.) U.S. economist. After graduating from Cornell University (M.S., 1966; Ph.D., 1969), Engle taught at such universities as the Massachusetts Institute of Technology and the University of California at San Diego and held associate editorships on several academic journals. In the 1970s and '80s he developed improved mathematical techniques for the evaluation and more-accurate forecasting of risk, which enabled researchers to test if and how volatility in one period was related to volatility in another period. His work had particular relevance in financial market analysis and enabled economists to make more-accurate forecasts. In 2003 he shared the Nobel Prize for Economics with Clive W.J. Granger.

English Channel *or* **the Channel** *French* **La Manche** \lä-'mäüsh\ **("The Sleeve")** Strait between southern England and northern France. It connects the Atlantic Ocean with the North Sea through the Strait of Dover. The French name, La Manche ("The Sleeve"), is a reference to its shape, which gradually narrows from about 112 mi (180 km) in the west to only 21 mi (34 km) in the east, between Dover, Eng., and Calais, France. Historically both a route for and a barrier to invaders of Britain, it developed into one of the world's busiest sea routes for oil tankers and ore carriers. The Channel Tunnel, completed in 1994, provides a land route between Paris and London.

English Civil Wars (1642–51) Armed conflict in the British Isles between Parliamentarians and supporters of the monarchy (Royalists). Tension between Charles I and the House of Commons had been building for some time, and after his unsuccessful attempt to arrest five members of Parliament, both sides prepared for war. The first phase of the wars (1642–46) was initially characterized by inconclusive encounters, but victories by Parliamentarian forces under Oliver Cromwell at the Battles of Marston Moor and Naseby turned the tide. In 1646 the Royalist forces were disbanded. In 1647 Charles I negotiated with a Scottish group for assistance, starting the second phase of the wars, a series of Royalist rebellions, and a Scottish invasion. All were defeated, and Charles I was executed in 1649. The fighting continued, and Royalist forces under Charles II invaded England in 1651. Parliamentary forces defeated the Royalists at Worcester in 1651 and Charles II fled abroad, effectively ending the civil wars. The wars' political consequence was the establishment of the Commonwealth and Protectorate. See also New Model Army, Solemn League and Covenant.

English East India Co. See East India Co.

English horn Orchestral woodwind instrument, a large oboe pitched a 5th below the ordinary oboe. It has a bent metal crook, to hold the double reed, and a bulbous bell. It is a transposing instrument (its music written in a different tone than it actually sounds) in F. It is neither English nor a horn; in its original name, *cor anglais*, *cor* ("horn") referred to its original hornlike curved shape, but the source of *anglais* ("English") is a mystery. It has remained a basically orchestral instrument since its first appearance c. 1750.

English language Language belonging to the Germanic languages branch of the Indo-European language family, widely spoken on six continents. The primary language of the U.S., Britain, Canada, Australia, Ireland, New Zealand, and various Caribbean and Pacific island nations, it is

© 2006 Encyclopædia Britannica, Inc.

also an official language of India, the Philippines, and many sub-Saharan African countries. It is the second most widely spoken native language in the world, the mother tongue of more than 350 million people, the most widely taught foreign language, and the international language of science and business. English relies mainly on word order (usually subject-verb-object) to indicate relationships between words (see SYNTAX). Written in the LATIN ALPHABET, it is most closely related to FRISIAN, GERMAN, and DUTCH. Its history began with the migration of the Jutes, Angles, and SAXONS from Germany and Denmark to Britain in the 5th and 6th centuries. The NORMAN CONQUEST of 1066 brought many French words into English. Greek and Latin words began to enter it in the 15th century, and Modern English is usually dated from 1500. English easily borrows words from other languages and has coined many new words to reflect advances in technology.

English school Dominant school in painting in England from the 18th century to c. 1850. From 1730 to 1750 two distinctive British forms of painting were perfected by WILLIAM HOGARTH: genre scenes depicting the "modern moral subject," and the small-scale group portrait, or "conversation piece." Full-scale portraiture was popularized by JOSHUA REYNOLDS and THOMAS GAINSBOROUGH; the landscape tradition was founded by RICHARD WILSON; and historical painting was practiced by two American-born painters, BENJAMIN WEST and JOHN SINGLETON COPLEY. The flowering of English Romantic art was embodied in the landscapes of J.M.W. TURNER and JOHN CONSTABLE. The art of the period rivaled continental art in quality and had great influence on European painting.

The Countess's Morning Levée, oil painting, part of the *Marriage à la Mode* series by William Hogarth, 1743–45; in the National Gallery, London.
TRUSTEES OF THE NATIONAL GALLERY, LONDON

English sparrow See HOUSE SPARROW

engraving Any of various processes of cutting a design into a plate or block of metal or wood. The cutting is done by a graver, or burin, on a copper, zinc, aluminum, or magnesium plate, and the design is printed with a roller press from ink rubbed into the incised grooves. Wood engraving derives from the WOODCUT, but the use of the hard, smooth boxwood, cut with the burin commonly used by the copper-plate engraver, produces a finer, more detailed image. By contrast with engraving from metal plates, the printing of wood engravings is done from the surface of the plate or block; the parts that are not to be printed are cut away. See also ETCHING.

ENIAC \'ē-nē-ˌak, 'en-ē-ˌak\ *in full* **Electronic Numerical Integrator and Computer** Early electronic DIGITAL COMPUTER built in the U.S. in 1945 by J. PRESPER ECKERT and JOHN W. MAUCHLY. The massive ENIAC, which weighed 30 tons and filled an entire room, used some 18,000 VACUUM TUBES, 70,000 resistors, and 10,000 capacitors. In December 1945 it solved its first problem, calculations for the HYDROGEN BOMB. After its official unveiling in 1946, it was used to prepare artillery-shell trajectory tables and perform other military and scientific calculations.

Enigma Device used by the German military to encode strategic messages before and during World War II. The Enigma code was first broken by the Poles in the early 1930s, so that German messages were eventually intercepted and deciphered by Allied code-breakers during the war. (See also ULTRA.)

Enkidu \'en-kē-ˌdü\ Friend and companion of the Mesopotamian hero GILGAMESH. In the ancient *Epic of Gilgamesh*, Enkidu is a wild man created by the god ANU. After Gilgamesh defeats him, the two become friends (in some versions Enkidu becomes Gilgamesh's servant). He aids Gilgamesh in killing the divine bull sent by the goddess ISHTAR to destroy them. The gods then kill Enkidu in revenge, prompting Gilgamesh to search for immortality.

Enlightenment European intellectual movement of the 17th–18th century in which ideas concerning God, reason, nature, and man were blended into a worldview that inspired revolutionary developments in art, philosophy, and politics. Central to Enlightenment thought were the use and celebration of reason. For Enlightenment thinkers, received authority, whether in science or religion, was to be subject to the investigation of unfettered minds. In the sciences and mathematics, the logics of induction and deduction made possible the creation of a sweeping new cosmology. The search for a rational religion led to DEISM; the more radical products of the application of reason to religion were SKEPTICISM, ATHEISM, and materialism. The Enlightenment produced modern secularized theories of psychology and ethics by men such as JOHN LOCKE and THOMAS HOBBES, and it also gave rise to radical political theories. Locke, JEREMY BENTHAM, J.-J. ROUSSEAU, MONTESQUIEU, VOLTAIRE, and THOMAS JEFFERSON all contributed to an evolving critique of the authoritarian state and to sketching the outline of a higher form of social organization based on natural rights. One of the Enlightenment's enduring legacies is the belief that human history is a record of general progress.

Ennin \'en-ˌnēn\ (b. 794, Tsuga district, Shimotsuke province, Japan—d. Feb. 24, 864, Japan) Japanese Buddhist who founded the Sammon branch of the Tendai (TIANTAI) sect. Educated in the Enryaku-ji monastery near Kyōto, he was a disciple of SAICHŌ. He spent nine years studying BUDDHISM in China, returning home in AD 847 with 559 volumes of Chinese Buddhist texts and a system of musical notation for religious chants that is still used in Japan. He introduced to Japanese Buddhism the practice of chanting the name of Amida (AMITABHA) as a route to rebirth in Amida's paradise. He also established Tendai esotericism. He became chief priest of his order in 854, and his teachings were influential in Japanese Buddhism for centuries.

Enniskillen \ˌe-ni-'ski-lən\ *or* **Inniskilling** Town (pop., 1995 est.: 11,000), seat of FERMANAGH district, southwestern Northern Ireland. Situated on an island in the River Erne, it was a strategic crossing point of Lough ERNE. Incorporated by English King JAMES I, Enniskillen defeated a force sent by JAMES II in 1689 and gained a reputation as a Protestant stronghold. Long a garrison town, it gave its name to the Royal Inniskilling Fusiliers and the 6th (Inniskilling) Dragoons, both famous regiments of the British army. The town is an agricultural market.

Ennius \'e-nē-əs**, Quintus** (b. 239, Rudiae, southern Italy—d. 169 BC) Roman poet, dramatist, and satirist. The most influential of the early Latin poets, he is considered the founder of Roman literature. His epic *Annales*, a narrative poem telling the story of Rome from the wanderings of AENEAS to the poet's own day, was the national epic until it was eclipsed by VIRGIL's *Aeneid*. He excelled in tragedy, adapting 19 plays from the Greek, of which only about 420 lines survive.

ensilage See SILAGE

Ensor \'en-sȯr**, James (Sidney), Baron** (b. April 13, 1860, Ostend, Belg.—d. Nov. 19, 1949, Ostend) Belgian painter and printmaker. Trained in Brussels, he spent most of his life in his native Ostend. In 1883 he joined a group known as Les VINGT ("The Twenty") and began depicting skeletons, phantoms, masks, and other images of grotesque fantasy as social commentary. His work from this period has often been described as SYMBOLIST. His *Entry of Christ into Brussels* (1888), painted in smeared, garish colours, provoked outrage. Continuing negative criticism plunged him ever deeper into cynicism until he finally became a recluse. The exhibition of *Entry of Christ* in 1929 led to his being ennobled by King Albert of Belgium. He was one of the formative influences on EXPRESSIONISM.

enstatite \'enz-tə-ˌtīt\ Common silicate mineral in the PYROXENE family. It is the stable form of magnesium silicate ($MgSiO_3$, often with up to 10%

© 2006 Encyclopædia Britannica, Inc.

iron) in magnesium- and iron-rich igneous rock types. Enstatite crystallizes in the orthorhombic system (three unequal axes at right angles to each other).

entablature Assemblage of horizontal moldings and bands supported by the columns of Classical buildings. The entablature is usually divided into three main sections: the lowest band, or architrave, which originally took the form of a beam running from support to support; the central band, or frieze, consisting of an unmolded strip with or without ornament; and the top band, or cornice, constructed from a series of moldings that project from the edge of the frieze. Most entablatures correspond to or are derived from the Doric, Ionic, or Corinthian ORDER.

entamoeba \ˌen-tə-ˈmē-bə\ Any PROTOZOAN of the genus *Entamoeba*. Most are parasites in the intestines of vertebrates, including humans. *E. histolytica* causes human amebic dysentery. Infection of the large intestine with *E. histolytica* often causes no symptoms; however, diarrhea, abdominal pain, and fever may result from invasion and ulceration of intestinal walls. In the worst cases, the liver, lungs, brain, and spleen may be affected. Cysts of *E. histolytica* are transmitted through food and water, often by fly and cockroach droppings. *E. gingivalis,* found especially in unhealthy mouths, has not been shown to cause disease.

entasis \ˈen-tə-səs\ Convex curve given to a column, spire, or similar upright member to avoid the optical illusion of hollowness or weakness that would arise from normal tapering. Exaggerated in Greek work of the Doric ORDER, it grew more and more subtle in the 5th–4th century BC. Entasis is also occasionally found in Gothic spires and in smaller Romanesque columns.

Entebbe \en-ˈte-bē\ **raid** (July 3–4, 1976) Israeli rescue of 103 hostages from a French airliner hijacked by members of the PALESTINE LIBERATION ORGANIZATION. The plane, en route from Israel to France, was hijacked on June 27 and flown to Entebbe, Ugan. There the hijackers released 258 non-Israeli passengers and held the rest, demanding that Israel release 53 imprisoned PLO members. In response, Israel airlifted to Uganda 100–200 soldiers in cargo planes escorted by fighter planes; in a brilliantly executed raid, seven hijackers, one soldier, and three hostages were killed.

Entente, Little See LITTLE ENTENTE

Entente Cordiale \äⁿ-ˈtäⁿt-kȯrd-ˈyäl\ *French* **"Cordial Understanding"** (April 8, 1904) Anglo-French agreement that settled numerous colonial disputes and ended antagonisms between Britain and France. It granted freedom of action to Britain in Egypt and to France in Morocco and resolved several other imperial disputes. The agreement reduced the virtual isolation of each country and was consequently upsetting to Germany, which had benefited from their antagonism. The Entente paved the way for Anglo-French diplomatic cooperation against Germany before World War I and for later military alliances.

enthalpy \ˈen-thəl-pē\ Sum of the internal energy E and the product of the PRESSURE P and volume V of a thermodynamic system (see THERMODYNAMICS). So, enthalpy $H = E + PV$. Its value is determined by the temperature, pressure, and composition of the system at any given time. According to the law of conservation of energy (see CONSERVATION LAW), the change in internal energy is equal to the HEAT transferred to the system minus the WORK done by the system. If the only work done is a change of volume at constant pressure, the enthalpy change is exactly equal to the heat transferred to the system.

entomology Branch of ZOOLOGY dealing with the scientific study of INSECTS, including their taxonomy, morphology, physiology, and ecology. Applied aspects of entomology, such as the harmful and beneficial impact of insects on humans, are also studied.

entropy \ˈen-trə-pē\ Measure of a system's ENERGY that is unavailable for WORK, or of the degree of a system's disorder. When heat is added to a system held at constant temperature, the change in entropy is related to the change in energy, the PRESSURE, the temperature, and the change in volume. Its magnitude varies from zero to the total amount of energy in a system. The concept, first proposed in 1850 by the German physicist Rudolf Clausius (1822–1888), is sometimes presented as the second law of THERMODYNAMICS, which states that entropy increases during irreversible processes such as spontaneous mixing of hot and cold gases, uncontrolled expansion of a gas into a vacuum, and combustion of fuel. In popular, nontechnical use, entropy is regarded as a measure of the chaos or randomness of a system.

enuresis \ˌen-yù-ˈrē-səs\ Repeated URINATION into bedding or clothing, usually at night, in a normal child old enough to have completed toilet training. Enuresis may be voluntary or involuntary. It may run in families. Stressful life events, poor toilet training, and chronic social disadvantage increase its likelihood. It usually resolves with time. Treatment includes family education, reassurance, and behaviour therapy. An alarm to wake the child when urination begins has proved highly effective but takes time to achieve complete success. Drug treatment, though not the treatment of choice, is sometimes effective.

Enver Pasha \en-ˈver-pä-ˈshä\ (b. Nov. 22, 1881, Constantinople, Ottoman Empire—d. Aug. 4, 1922, Baldzhuan, Turkistan) Soldier and politician in the OTTOMAN EMPIRE. He was one of the YOUNG TURKS who deposed the Ottoman sultan ABDÜLHAMID II in 1908. He later served as governor of Banghāzī, Libya (1912), chief of staff of the Ottoman army in the Second Balkan War (1913), and minister of war during World War I (1914–18). A rival of MUSTAFA KEMAL ATATÜRK in the postwar period, he unsuccessfully sought Soviet help to overthrow him (1920). The Soviets permitted him to help organize the Turkic and Muslim Central Asian republics, but he joined Basmachi rebels against the Soviet Union and was killed fighting the RED ARMY.

environmental geology Scientific field concerned with applying the findings of geologic research to the problems of land use and civil engineering. It is closely allied with urban geology and deals with the impact of human activities on the physical environment. Other important concerns of environmental geology include reclaiming mined lands; identifying geologically stable sites for constructing buildings, nuclear power plants, and other facilities; and locating sources of building materials, such as sand and gravel.

Environmental Protection Agency (EPA) U.S. government agency that sets and enforces national pollution-control standards. It was established by Pres. RICHARD NIXON (1970) to supersede a welter of confusing and ineffective state environmental laws. Its early accomplishments include banning the use of DDT (1972), setting deadlines for the removal of lead from gasoline (1973), establishing health standards for drinking water (1974), and monitoring fuel efficiency in automobiles (1975). The EPA's enforcement was in large part responsible for a decline of one-third to one-half in most air-pollution emissions in the U.S. from 1970 to 1990, and during the 1980s the pollution standards index improved by half in major cities; water quality and waste disposal also improved significantly. The EPA also oversees the cleanup of abandoned waste sites through Superfund. Its existence has resulted in heightened awareness and concern for the environment worldwide.

environmental sculpture Art form, developed in the 20th century, that involves or encompasses the spectator. The environmental sculptor can use any medium, from mud and stone to light and sound. Indoor environmental works often incorporate sculptural figures in detailed settings in gallery or museum spaces. Outdoor works in natural or urban settings include "earthworks" (large-scale alterations of the Earth's surface effected by earth-moving equipment) such as Robert Smithson's *Spiral Jetty* (1970), a rock-and-dirt spiral 1,500 feet long in the Great Salt Lake. The wrapped buildings of CHRISTO are notable urban environmental works.

environmentalism Advocacy of the preservation or improvement of the natural environment, especially the social and political movement to control environmental pollution. Other specific goals of environmentalism include control of human population growth, conservation of natural resources, restriction of the negative effects of modern technology, and the adoption of environmentally benign forms of political and economic organization. Environmental advocacy at the international level by NONGOVERNMENTAL ORGANIZATIONS and some states has resulted in treaties, conventions, and other instruments of environmental law addressing problems such as GLOBAL WARMING, the depletion of the OZONE LAYER, and the danger of transboundary pollution from nuclear accidents. Influential U.S. and British environmentalists have included THOMAS ROBERT MALTHUS, JOHN MUIR, RACHEL CARSON, BARRY COMMONER, PAUL R. EHRLICH, and EDWARD O. WILSON. In the social sciences, the term refers to any theory that emphasizes the importance of environmental factors in the development of culture and society.

enzyme Substance that acts as a CATALYST in living organisms, regulating the RATE at which life's CHEMICAL REACTIONS proceed without being altered in the process. Enzymes reduce the ACTIVATION ENERGY needed to start these reactions; without them, most such reactions would not take place at a

© 2006 Encyclopædia Britannica, Inc.

useful rate. Because enzymes are not consumed, only tiny amounts of them are needed. Enzymes catalyze all aspects of cell METABOLISM, including the digestion of food, in which large nutrient molecules (including proteins, carbohydrates, and fats) are broken down into smaller molecules; the conservation and transformation of chemical energy; and the construction of cellular materials and components. Almost all enzymes are PROTEINS; many depend on a nonprotein COFACTOR, either a loosely associated organic compound (e.g., a VITAMIN; see COENZYME) or a tightly bound metal ION (e.g., iron, zinc) or organic (often metal-containing) group. The enzyme-cofactor combination provides an active CONFIGURATION, usually including an active site into which the substance (substrate) involved in the reaction can fit. Many enzymes are specific to one substrate. If a competing molecule blocks the active site or changes its shape, the enzyme's activity is inhibited. If the enzyme's configuration is destroyed (see DENATURATION), its activity is lost. Enzymes are classified by the type of reaction they catalyze: (1) OXIDATION-REDUCTION, (2) transfer of a chemical group, (3) HYDROLYSIS, (4) removal or addition of a chemical group, (5) isomerization (see ISOMER; ISOMERISM), and (6) binding together of substrate units (POLYMERIZATION). Most enzyme names end in *-ase*. Enzymes are chiral catalysts, producing mostly or only one of the possible stereoisomeric products (see OPTICAL ACTIVITY). The FERMENTATION of wine, leavening of bread, curdling of milk into cheese, and brewing of beer are all enzymatic reactions. The uses of enzymes in medicine include killing disease-causing microorganisms, promoting wound healing, and diagnosing certain diseases.

Eocene \'ē-ə-ˌsēn\ **Epoch** Major division of the TERTIARY PERIOD, from 54.8 to 33.7 million years ago. It follows the PALEOCENE EPOCH and precedes the OLIGOCENE EPOCH. The name, derived from the Greek *eos* ("dawn"), refers to the dawn of recent life; during the Eocene, all the major divisions, or orders, of modern mammals appeared, as well as many essentially modern bird orders. Climates were warm and humid. Temperate and subtropical forests were widespread, but grasslands were limited.

Eochaid Ollathair See DAGDA

Eohippus \ˌē-ō-'hi-pəs\ Former name of a genus of ancestral horses, commonly called dawn horses, that flourished in North America during the Early EOCENE EPOCH (54.8–49 million years ago). It is now classified with European species in the genus *Hyracotherium*. *Eohippus* stood 1–2 ft (30–60 cm) high at the shoulders and was adapted to running, with hind legs longer than the forelegs. The body was lightly constructed, with slender legs and elongated feet that were functionally three-toed (though the front feet had four toes). The skull varied from shortened (primitive) to relatively long (more horselike).

Eolie \ā-'ō-lē-ˌä\ **Islands** *or* **Lipari** \'li-pə-rē\ **Islands** Volcanic island group, Tyrrhenian Sea, in the west-central Mediterranean Sea. Located off the northern coast of SICILY, the seven major islands and several islets have a total land area of 34 sq mi (88 sq km). The major islands are Alicudi, Eilcudi, Lipari, Panarea, Salina, Stromboli, and Vulcano. Vulcano and Stromboli are active volcanoes. The Greeks believed the islands to be the home of the god Aeolus, king of the winds. They have been inhabited since the NEOLITHIC PERIOD and were held successively by the Greeks, Carthaginians, Romans, Saracens, Normans, Angevins, and Aragonese.

eon Long span of geologic time. In formal usage, eons are the longest portions of geologic time (ERAS are the second-longest). Three eons are recognized: the PHANEROZOIC EON (dating from the present back to the beginning of the Cambrian Period), the PROTEROZOIC EON, and the ARCHEAN EON. Less formally, eon often refers to a span of one billion years.

eon (Gnosticism) See AEON

EPA See ENVIRONMENTAL PROTECTION AGENCY

Epaminondas \i-ˌpam-ə-'nän-dəs\ (b. c. 410, Thebes—d. 362 BC, Mantineia) Theban statesman, tactician, and leader. He defeated the Spartans at Leuctra in 371, using a new strategy that attacked the opponent's strongest point first with overwhelming power, and made Thebes the most powerful state in Greece. He led four more successful expeditions into the Peloponnese. In 370–369 he freed the Messenian HELOTS from Spartan enslavement. In 362, at the head of a large allied force, he defeated Sparta, Athens, and their allies at MANTINEIA, but he was mortally wounded.

ephemeris \i-'fe-mə-rəs\ Table of the positions of celestial bodies at regular intervals, often with supplementary information. Constructed as early as the 4th century BC, ephemerides are still essential to astronomers and navigators. Modern ephemerides are calculated, with heavy computing and careful checking, after a mathematical description of a heavenly body's observed motion has been evolved. Various national ephemerides are published regularly; the U.S. ephemeris, first published in 1852, became the best and is now published jointly with the U.K. as *The Astronomical Almanac*.

Ephesus \'e-fə-səs\ Ancient Ionian Greek city; its ruins lie near the modern village of Selçuk in western Turkey. It was situated south of the Cayster River and was the site of the Temple of ARTEMIS. Traditionally founded by the Carians, it was one of the 12 Ionian Cities and was involved in the PERSIAN and PELOPONNESIAN wars. It was taken by ALEXANDER THE GREAT c. 334 BC and prospered throughout the HELLENISTIC period. It passed to Rome in 133 BC and under the emperor AUGUSTUS became the capital of the Roman province of Asia. It was an early seat of Christianity, which was visited by St. PAUL; the Letter of Paul to the Ephesians was directed to the residents of the city. The Goths destroyed the city and temple in AD 262; neither ever recovered. There are extensively excavated ruins at the modern site.

ephor \'e-fər, 'e-ˌfȯr\ (Greek *ephoros*) Title of the five highest Spartan magistrates. With the two kings of SPARTA they formed the state's executive wing. The list of ephors dates back to 754 BC. Every male citizen was eligible for election to the ephorate, which conducted meetings of the GEROUSIA and APELLA and executed their decrees. The ephors' extensive police powers allowed them to declare war on the HELOTS annually, with legal license to attack and kill them if necessary. In an emergency they could even arrest and try a king.

epic Long, narrative poem in an elevated style that celebrates heroic achievement and treats themes of historical, national, religious, or legendary significance. Primary (or traditional) epics are shaped from the legends and traditions of a heroic age and are part of ORAL TRADITION; secondary (or literary) epics are written down from the beginning, and their poets adapt aspects of traditional epics. The poems of HOMER are usually regarded as the first important epics and the main source of epic conventions in western Europe. These conventions include the centrality of a HERO, sometimes semidivine; an extensive, perhaps cosmic, setting; heroic battle; extended journeying; and the involvement of supernatural beings.

epic theatre Dramatic form developed in Germany after World War I by BERTOLT BRECHT and others, intended to provoke rational thought rather than to create illusion. It presents loosely connected scenes often interrupted by direct addresses to the audience providing analysis, argument, or documentation. Brecht's goal was to use alienating or distancing effects to block the emotional responses of the audience members and force them to think objectively about the play. Actors were instructed to keep a distance between themselves and the characters they portrayed and to emphasize external actions rather than emotions.

epicentre Point on the surface of the Earth that is directly above the source (or focus) of an EARTHQUAKE. There the effects of the earthquake usually are most severe. See also SEISMOLOGY.

Epictetus \ˌep-ik-'tet-əs\ (b. c. AD 55—d. c. 135) Greek philosopher associated with STOICISM. His original name is not known; *epiktetos* means "acquired." He is not known to have written anything, but his teachings were transmitted by his pupil Arrian (d. c. AD 180) in two works, the *Discourses* and the *Encheiridion*. True education, Epictetus believed, consists in recognizing that the only thing that belongs to an individual fully is his will. Humans are not responsible for the ideas that present themselves to their consciousness, though they are wholly responsible for how they react to them.

Epicureanism \ˌe-pi-kyù-'rē-ə-ˌni-zəm, ˌe-pi-'kyùr-ē-ə-ˌni-zəm\ Metaphysical and ethical doctrines taught by EPICURUS. In metaphysics, the basic concepts of Epicureanism were ATOMISM; mechanical causality limited by the spontaneous "swerve" of atoms, which accounted for the freedom of motion in man and animals; the infinity of the universe; and the existence of gods as beatified and immortal natures completely extraneous to happenings in the world. In ethics, the basic concepts were the identification of the good with pleasure and of the supreme good with the absence of bodily and mental pain; the limitation of all desire and the practice of virtue; withdrawal from public life; and the cultivation of friendship. Because of its dogmatic character and its practical end, Epicureanism did not lend itself easily to development.

© 2006 Encyclopædia Britannica, Inc.

Epicurus \ˌe-pi-ˈkyů-rəs\ (b. 341, Samos, Greece—d. 270 BC, Athens) Greek philosopher. He was author of an ethical philosophy of simple pleasure, friendship, and retirement (see EPICUREANISM) and a metaphysics based on ATOMISM. His school in Athens, the Garden, competed with the Academy of PLATO and the Lyceum of ARISTOTLE. Unlike both of these schools, it admitted women, and even one of Epicurus's slaves. It taught the avoidance of political activity and of public life. Notwithstanding the usual connotations of the term *epicurean* today, life at the school was simple. He was a widely appealing figure in Rome during the 1st century BC; the poet-philosopher LUCRETIUS based his work on Epicurus's thought. His atomism was revived in the 17th century by Pierre Gassendi (1592–1655).

Epicurus, bronze bust from a Greek original, c. 280–270 BC; in the Museo Archeologico Nazionale, Naples.
COURTESY OF THE SOPRINTENDENZA ALLE ANTICHITA DELLA CAMPANIA, NAPLES

Epidaurus \ˌe-pi-ˈdȯr-əs\ Town, ancient Greece. An important commercial centre in the northeastern PELOPONNESE, it was famed for its 4th-century-BC temple of ASCLEPIUS. Excavations of the sacred precinct have uncovered that temple and other buildings, including a theatre, stadium, and hospital. Offerings of small clay body parts have been found, and inscriptions record divine medical cures. Originally Ionic, Epidaurus became Doric under the influence of ARGOS, to which it owed religious allegiance; politically it remained independent until Roman times.

epidemiology \ˌe-pə-ˌdē-mē-ˈä-lə-ˌjē\ Study of disease distribution in populations. It focuses on groups rather than individuals and often takes a historical perspective. Descriptive epidemiology surveys a population to see what segments (e.g., age, sex, ethnic group, occupation) are affected by a disorder, follows changes or variations in its incidence or mortality over time and in different locations, and helps identify syndromes or suggest associations with risk factors. Analytic epidemiology conducts studies to test the conclusions of descriptive surveys or laboratory observations. Epidemiologic data on diseases is used to find those at high risk, identify causes and take preventive measures, and plan new health services.

epidote \ˈe-pə-ˌdōt\ Any of a group of colourless to green or yellow-green silicate minerals with the general chemical formula $A_2B_3(SiO_4)(Si_2O_7)O(OH)$, in which *A* is usually calcium (Ca) and *B* is generally aluminum (Al), although other elements are sometimes substituted. The epidote minerals occur as reaction products of other (earlier) minerals in low-grade (formed under relatively low-temperature, low-pressure conditions), regionally metamorphosed rocks, where their occurrence is used as an indicator of metamorphic grade.

epidote-amphibolite facies \ˈe-pə-ˌdōt-am-ˈfi-bə-ˌlīt-ˈfā-shēz\ One of the major divisions of the mineral facies classification of METAMORPHIC ROCKS, encompassing rocks that formed under moderate temperature (500–750°F, or 250–400°C) and pressure conditions. This facies grades into the GREENSCHIST FACIES under less intense metamorphic conditions and into the AMPHIBOLITE FACIES with greater temperature and pressure. Typical minerals include biotite, almandine garnet, plagioclase, epidote, and amphibole. Chlorite, muscovite, staurolite, and chloritoid may also occur.

epigram Short poem treating concisely, pointedly, and often satirically a single thought or event and often ending with a witticism or ingenious turn of thought. By extension, the term applies to a terse, sage, or witty (often paradoxical) saying, usually in the form of a generalization. Writers of Latin epigrams included CATULLUS and MARTIAL. The form was revived in the Renaissance. Later masters of the epigram have included BEN JONSON; François VI, duke de LA ROCHEFOUCAULD; VOLTAIRE; ALEXANDER POPE; SAMUEL TAYLOR COLERIDGE; OSCAR WILDE; and GEORGE BERNARD SHAW.

epilepsy Neurological disorder caused by paroxysmal malfunction of neurons in the brain (seizures). It is characterized by strange movements or sensations in parts of the body, odd behaviours, emotional disturbances, and sometimes convulsions and momentary lapses of consciousness. Seizures may result from abnormal electrical activity in most or all of the brain (generalized), or they may originate in a specific brain area (partial). Causes include brain tumours, infections, genetic or developmental abnormalities, stroke, and head trauma, although no cause can be found in most cases. Treatment is usually with anticonvulsant medications; brain surgery may be beneficial if drugs cannot control seizures.

epinephrine \ˌe-pə-ˈne-frən\ *or* **adrenaline** \ə-ˈdre-nᵊl-ən\ One of two HORMONES (the other being NOREPINEPHRINE) secreted by the ADRENAL GLANDS, as well as at some nerve endings (see NEURON), where they serve as NEUROTRANSMITTERS. They are similar chemically and have similar actions on the body. They increase the rate and force of heart contractions, increasing blood output and raising BLOOD PRESSURE. Epinephrine also stimulates breakdown of GLYCOGEN to GLUCOSE in the liver, raising blood glucose levels, and both hormones increase the level of circulating free FATTY ACIDS. All these actions ready the body for action in times of stress or danger, times requiring increased alertness or exertion. Epinephrine is used in medical situations including cardiac arrest, ASTHMA, and acute allergic reaction (see ALLERGY). See also DOPAMINE.

Epiphany Christian festival celebrated on January 6. One of the oldest Christian holy days (along with CHRISTMAS and EASTER), the festival originated in the Eastern church and was adopted in the Western church by the 4th century. It commemorates the first manifestation of JESUS to the Gentiles, as represented by the MAGI. The eve of Epiphany, called Twelfth Night, is thought to mark the arrival of the Wise Men in Bethlehem. Epiphany also celebrates the (much later) baptism of Jesus by JOHN THE BAPTIST and Jesus' first miracle, performed at Cana.

epiphyte Any plant that grows upon or is attached to another plant or object merely for physical support. Epiphytes are found mostly in the tropics and are also known as air plants because they have no attachment to the ground or other obvious nutrient source. They obtain water and minerals from rain and from debris on the supporting plants. ORCHIDS, FERNS, and members of the PINEAPPLE family are common tropical epiphytes. LICHENS, MOSSES, LIVERWORTS, and ALGAE are epiphytes of temperate regions.

Epirus \i-ˈpī-rəs\ Ancient country, northwestern Greece. It was bounded by ILLYRIA, MACEDONIA, THESSALY, AETOLIA, ACARNANIA, and the Ionian Sea. In the NEOLITHIC PERIOD Epirus was populated by peoples from the southwestern Balkans, who brought with them the Greek language and who may have been among the founders of MYCENAE. Epirus was the launching area of the DORIAN invasions (1100–1000 BC) into Greece. A princess from Epirus was married to PHILIP II of Macedon; their son was ALEXANDER THE GREAT. The area became a Roman province in the 2nd century BC, and later it was part of the BYZANTINE EMPIRE. An independent state in 1204 AD, Epirus was taken in 1430 by the Ottoman Turks. Greece gained the southern part of the region by 1919; the northern part is now in southern Albania.

episcopacy \i-ˈpis-kə-pə-sē\ System of church government by BISHOPS. It existed as early as the 2nd century AD, when bishops were chosen to oversee preaching and worship within a specific region, now called a diocese. Today local congregations are shepherded by priests and deacons, but only bishops can ordain priests, perform the rite of CONFIRMATION, and consecrate other bishops. Their special duties are closely tied to the idea of APOSTOLIC SUCCESSION. Some Protestant churches abandoned episcopacy during the REFORMATION, but it was retained by the Roman Catholic, Eastern Orthodox, Anglican, and Swedish Lutheran churches, among others.

Episcopal Church, USA *also called* **Episcopal Church in the United States of America** *or* **Protestant Episcopal Church** Descendant of the Church of ENGLAND in the U.S. Part of the Anglican Communion, it was formally organized in 1789 as the successor of the Church of England in the former British colonies. The church accepts both the Apostles' Creed and the NICENE CREED, as well as a modified version of the Thirty-nine Articles of the Church of England. The highest authority in the church is the General Convention, which is headed by the presiding bishop (elected by the House of Bishops). The Reformed Episcopal Church broke away from the main body in 1873. The church accepted the ordination of women in 1976. In 1988 the church elected its first woman bishop, and in 2003 an openly gay man was consecrated bishop of New Hampshire. These steps generated controversy within the church as well as among other churches of the Anglican Communion.

episome \ˈe-pə-ˌsōm\ Any of a group of genetic elements consisting of DNA and capable of giving selective advantage to the bacteria in which they occur. Episomes may be attached to the bacterial cell membrane or become part of the CHROMOSOME. Cells with episomes act like males during conjugation, a mating process in certain bacteria. During conjugation, cells lacking the episome may receive either the episome or the episome plus the genes to which it is attached. Experiments involving gene trans-

© 2006 Encyclopædia Britannica, Inc.

fers from cells in which episomes have been incorporated in the chromosomes have been used to determine the locations of genes on the chromosome.

epistatic gene \ˌe-pə-ˈsta-tik\ GENE that determines whether or not a trait determined by another gene will be expressed. For example, when the gene responsible for albinism occurs, the genes that determine skin color are present but not expressed; the gene for albinism is therefore called an epistatic gene.

epistemology Study of the origin, nature, and limits of human knowledge. Nearly every great philosopher has contributed to the epistemological literature. Some historically important issues in epistemology are: (1) whether knowledge of any kind is possible, and if so what kind; (2) whether some human knowledge is innate (i.e., present, in some sense, at birth) or whether instead all significant knowledge is acquired through experience (see EMPIRICISM; RATIONALISM); (3) whether knowledge is inherently a mental state (see BEHAVIOURISM); (4) whether certainty is a form of knowledge; and (5) whether the primary task of epistemology is to provide justifications for broad categories of knowledge claim or merely to describe what kinds of things are known and how that knowledge is acquired. Issues related to (1) arise in the consideration of SKEPTICISM, radical versions of which challenge the possibility of knowledge of matters of fact, knowledge of an external world, and knowledge of the existence and natures of OTHER MINDS.

epistolary \i-ˈpis-tə-ˌler-ē, ˌe-pi-ˈstȯl-ə-rē\ **novel** NOVEL in the form of a series of letters written by one or more characters. It allows the author to present the characters' thoughts without interference, convey events with dramatic immediacy, and present events from several points of view. It was one of the first novelistic forms to be developed. It was foreshadowed by APHRA BEHN's poem cycle *Love-Letters Between a Nobleman and His Sister* (1683). The outstanding early example is SAMUEL RICHARDSON's *Pamela* (1740); distinguished later works include TOBIAS SMOLLETT's *Humphry Clinker* (1771) and PIERRE LACLOS's *Les Liaisons dangereuses* (1782). The genre remained popular up to the 19th century. Its reliance on subjective points of view makes it the forerunner of the modern psychological novel.

epitaph \ˈe-pə-ˌtaf\ Inscription in verse or prose on a tomb, or, by extension, anything written as if to be inscribed on a tomb. Probably the earliest surviving epitaphs are those written on ancient Egyptian sarcophagi and coffins. Ancient Greek examples are often of literary interest. In Elizabethan times epitaphs began to assume a more literary character. Many of the best known are literary memorials (often deliberately witty) not intended for a tomb.

epitaxy Process of growing a crystal of a particular orientation on top of another crystal. If both crystals are of the same material, the process is known as homoepitaxy; if the materials are different, it is known as heteroepitaxy. Common types of epitaxy include vapour phase, liquid phase, and solid phase, according to the source of the atoms being arranged on the substrate. Epitaxy is most frequently employed in the production of semiconductor wafers for use in the creation of integrated circuits.

epithalamium \ˌe-pə-thə-ˈlā-mē-əm\ *or* **epithalamion** \ˌe-pə-thə-ˈlā-mē-ən\ Nuptial song or poem in honour or praise of a bride and bridegroom. In ancient Greece such songs were a traditional way of invoking good fortune on a marriage and often of indulging in ribaldry. The earliest evidence for literary epithalamiums are fragments by SAPPHO; the oldest surviving Latin examples are three by CATULLUS. In the Renaissance, epithalamiums based on classical models were written in Italy, France, and England; that of EDMUND SPENSER (1595) is considered the finest in English.

epoch Unit of geologic time during which a rock series is deposited. It is a subdivision of a geologic PERIOD. Additional distinctions can be made by adding relative time terms, such as early, middle, and late. The use of the term is usually restricted to divisions of the TERTIARY and QUATERNARY PERIODS.

Epona \ˈe-pō-nə\ Horse goddess of the ancient CELTIC RELIGION. Associated with kingship and fertility, she was known as Epona in Gaul, Rhiannon in Wales, and Macha in Ireland. Her cult was found throughout the Western Roman empire and was spread by members of the Roman army, especially cavalry units.

epoxy \i-ˈpäk-sē\ Any of a class of thermosetting POLYMERS, polyethers built up from MONOMERS with an ETHER group that takes the form of a three-membered epoxide ring. The familiar two-part epoxy adhesives consist of a RESIN with epoxide rings at the ends of its MOLECULES and a curing agent containing AMINES or ANHYDRIDES. When mixed, these react to yield, after curing, a complex network with ether groups linking the monomers. Stable, tough, and resistant to corrosive chemicals, epoxies are excellent adhesives and useful surface coatings.

EPROM \ˈē-ˌpräm\ *in full* **erasable programmable read-only memory** Form of computer MEMORY that does not lose its content when the power supply is cut off and that can be erased and reused. EPROMs are generally employed for programs designed for repeated use (such as the BIOS) but that can be upgraded with a later version of the program.

Epstein \ˈep-ˌstīn**, Sir Jacob** (b. Nov. 10, 1880, New York, N.Y., U.S.—d. Aug. 21, 1959, London, Eng.) U.S.-born British sculptor. He studied in Paris and settled in England in 1905. His 18 nude figures known as the Strand Statues (1907–08) provoked charges of indecency; his nude angel on the tomb of OSCAR WILDE (1912) in Paris was also attacked. In 1913 he became affiliated with VORTICISM and developed a style characterized by simple forms and calm surfaces carved from stone; his works often partly retained the shape of the original block, or sometimes they were modeled in plaster. He is best known for religious and allegorical figures carved in colossal blocks of stone and for bronze portrait busts of celebrities. Occasionally he produced monumental bronze groups, such as *St. Michael and the Devil* (1958) for Coventry Cathedral.

Epstein-Barr \ˌep-ˌstīn-ˈbär\ **virus (EBV)** Virus of the Herpesviridae family that is the major cause of acute infectious MONONUCLEOSIS. The virus, named for two of its discoverers, infects only salivary gland cells and one type of white blood cell. Saliva is the only bodily fluid that has been proved to contain infectious EBV particles. In less-developed nations, infection with EBV occurs in almost all children before the age of 5 and is not associated with recognizable symptoms. When EBV infection is delayed until the teen or early adult years, the body commonly responds differently, resulting in mononucleosis. Other, rarer disorders have also been linked with EBV, including certain cancers. There are no specific treatments for any form of EBV infection, and no vaccines have been developed.

equal-field system Chinese land-distribution system, AD 485–8th century. Borrowed by Japan in 646, it lasted about a century there. Under the system, all adults were assigned a fixed amount of land; a portion of its produce was paid as taxes. On a person's death, most of the land was returned to the government. Increases in population and a tendency for the land to come to be held permanently led to the system's collapse in China; tax-free status and additional allotments for nobles and monasteries resulted in its demise in Japan.

equal protection In U.S. law, the constitutional guarantee that no person or group will be denied such protection under the law as is enjoyed by similar persons or groups—i.e., persons similarly situated must be treated similarly. The 14th Amendment to the CONSTITUTION OF THE UNITED STATES prohibits states from denying any person "the equal protection of the laws." Until the mid-20th century the requirement was applied minimally—except in some cases of racial discrimination, such as the use of literacy tests and GRANDFATHER CLAUSES to restrict the voting rights of blacks. In *PLESSY V. FERGUSON* (1896), the SUPREME COURT OF THE UNITED STATES upheld "separate but equal" facilities for the races, thus sanctioning racial segregation. Beginning in the 1960s, the court under Chief Justice EARL WARREN dramatically expanded the concept, applying it to cases involving welfare benefits, exclusionary ZONING, municipal services, and school financing. During the tenure of Chief Justices WARREN E. BURGER and WILLIAM H. REHNQUIST, the court continued to add to the types of cases that might be adjudicated under equal protection, including cases involving sexual discrimination, the status and rights of aliens, abortion rights, and access to the courts.

Equal Rights Amendment (ERA) Proposed but unratified amendment to the U.S. CONSTITUTION designed mainly to invalidate many state and federal laws that discriminated against women. Its central tenet was that sex should not be a determining factor in establishing the legal rights of individuals. It was first introduced in Congress in 1923, shortly after women obtained the right to vote. It was finally approved by the U.S. Senate 49 years later (1972) but was subsequently ratified by only 30 of the 50 state legislatures. Critics claimed it would cause women to lose

© 2006 Encyclopædia Britannica, Inc.

privileges and protections, such as exemption from compulsory military service and economic support by their husbands. Supporters, led by the National Organization for Women, argued that discriminatory state and federal laws left many women in a state of economic dependency.

equality Generally, an ideal of uniformity in treatment or status by those in a position to affect either. Acknowledgment of the right to equality often must be coerced from the advantaged by the disadvantaged. Equality of opportunity was the founding creed of U.S. society, but equality among all peoples and between the sexes has proved easier to legislate than to achieve in practice. Social or religious inequality is deeply ingrained in some cultures and thus difficult to overcome (see caste). Government efforts to achieve economic equality include enhancing opportunities through tax policy, subsidized training and education, redistributing wealth or resources, and preferential treatment of those historically treated unequally (see affirmative action). See also civil rights movement; feminism; gay rights movement; human rights; Universal Declaration of Human Rights.

equation Statement of equality between two expressions consisting of variables and/or numbers. In essence, equations are questions, and the development of mathematics has been driven by attempts to find answers to those questions in a systematic way. Equations vary in complexity from simple algebraic equations (involving only addition or multiplication) to differential equations, exponential equations (involving exponential expressions), and integral equations. They are used to express many of the laws of physics. See also system of equations.

equation, algebraic See algebraic equation

equation, difference See difference equation

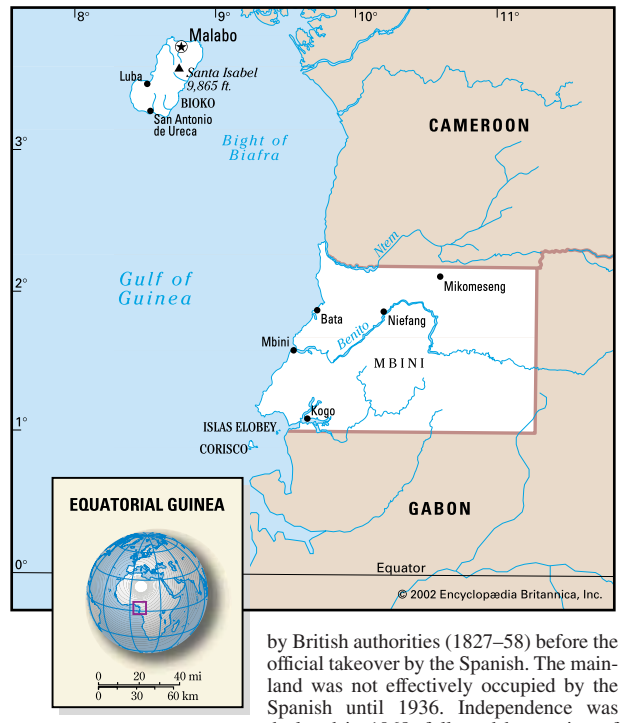
equation of motion See equation of motion

equation of state See equation of state



equations, system of See system of equations

Equator Great circle around the Earth that is everywhere equidistant from the geographic poles and lies in a plane perpendicular to the Earth's axis. This geographic, or terrestrial, Equator divides the Earth into the Northern and Southern Hemispheres and forms the imaginary reference line on the Earth's surface from which latitude is reckoned (i.e., 0° latitude). In astronomy, the celestial equator is the great circle in which the plane of the terrestrial Equator intersects the celestial sphere; it is thus equidistant from the celestial poles. When the Sun lies in its plane, day and night are everywhere of equal length; this happens at the equinoxes.

Equatorial Africa See French Equatorial Africa

equatorial coordinates See celestial coordinates

Equatorial Guinea *officially* **Republic of Equatorial Guinea** *formerly* **Spanish Guinea** Country, on the western coast of equatorial Africa and including Bioko Island. Area: 10,831 sq mi (28,051 sq km). Population (2005 est.): 504,000. Capital: Malabo. The majority of the mainland population are Bantu-speaking Fang people, with a minority of other Bantu-speaking ethnic groups (see Bantu languages). The majority on Bioko are Bubi, descendants of Bantu migrants from the mainland. Languages: Spanish, French (both official), Pidgin English (commonly spoken). Religions: Christianity (predominantly Roman Catholic, also other Christians, Protestant); also Islam, traditional beliefs. Currency: CFA franc. Bordered by Cameroon and Gabon, Equatorial Guinea's mainland region is separated by the Bight of Biafra from the island of Bioko to the northwest. The mainland has a coastal plain some 12 mi (20 km) wide, with a long stretch of beach, low cliffs to the south, and hills and plateaus to the east. The Benito River divides the region. Bioko consists of three extinct volcanic cones and has several crater lakes and rich lava soils. Dense tropical rainforest prevails throughout the mainland and includes valuable hardwoods. Animal life has been decimated by overhunting. Cacao, timber, and coffee are exported from the country, but since the 1990s petroleum is the major export. Equatorial Guinea is a republic with one legislative house; its chief of state is the president, and the head of government is the prime minister. The first inhabitants of the mainland appear to have been Bantu-speaking people. The now-prominent Fang and Bubi reached the mainland in the Bantu migrations of the late 19th and the early 20th century. Equatorial Guinea was ceded by the Portuguese to the Spanish in the late 18th century; it was frequented by slave traders, as well as by British and other merchants. Bioko was administered

by British authorities (1827–58) before the official takeover by the Spanish. The mainland was not effectively occupied by the Spanish until 1936. Independence was declared in 1968, followed by a reign of terror and economic chaos under the dictatorial president Macías Nguema, who was overthrown by a military coup in 1979 and later executed. Teodoro Obiang Nguema Mbasogo became leader of the country in 1979. A new constitution was adopted in 1982, but political unrest persisted into the 21st century despite the country's oil wealth.

eques \'e-ˌkwes, 'ē-ˌkwēz\ (Latin: "horseman") In ancient Rome, a knight. In early Rome, the *equites* (in full, *equites equo publico*, "horsemen with mounts provided at public expense") were of the senatorial class. They were the most influential members of the Comitia Centuriata. By the early 4th century BC, non-senators could be *equites*, providing their own horses. Augustus reorganized them as a military class, removing them from politics; qualifications were free birth, good health and character, and wealth. In the 1st century AD, *equites* were permitted civil careers, and they became particularly involved in financial administration.

equilibrium Condition in which the net force acting on a particle is zero. A body in equilibrium experiences no acceleration and, unless disturbed by an outside force, will remain in equilibrium indefinitely. A stable equilibrium is one in which small, externally induced displacements from that state produce forces that tend to oppose the displacement and return the body to equilibrium. An unstable equilibrium is one in which the least departures produce forces tending to increase the displacement. A brick lying on the floor is in stable equilibrium, while a ball bearing balanced on a knife-edge is in unstable equilibrium.

equilibrium, chemical Condition in the course of a reversible chemical reaction in which no net change in the amounts of reactants and products occurs: Products are reverting to reactants at the same rate as reactants are forming products. For practical purposes, the reaction under those conditions is completed. Expressed in terms of the law of mass action, the reaction rate to form products is equal to the reaction rate to re-form reactants. The ratio of the reaction rate constants (i.e., of the amounts of reactants and products, each raised to the proper power), defines the equilibrium constant. Changing the conditions of temperature or pressure changes the reaction's equilibrium; a high temperature or pressure may be used to "push" a reaction that at ordinary conditions makes little product. See also H.-L. Le Châtelier.

equine \'ē-ˌkwīn, 'e-ˌkwīn\ Any member of the ungulate family Equidae, which includes the modern horses, zebras, and asses, all in the genus *Equus*, as well as more than 60 species known only from fossils. Equines

© 2006 Encyclopædia Britannica, Inc.

descended from the dawn horse (see EOHIPPUS). Wild horses, which once inhabited much of northern Eurasia, were smaller and had shorter legs than their domesticated descendants. See also PRZEWALSKI'S HORSE.

equinox \'ē-kwə-ˌnäks, 'e-kwə-ˌnäks\ Either of two moments in the year when the Sun is exactly above the EQUATOR and day and night are of equal length all over Earth; also, either of two points in the sky where the ECLIPTIC and the celestial equator (see CELESTIAL SPHERE) intersect. The vernal equinox, when spring begins in the Northern Hemisphere, occurs about March 21, when the Sun moves north across the celestial equator. The autumnal equinox falls about September 23, as the Sun crosses the celestial equator going south. See also SOLSTICE.

equinoxes, precession of the Motion of the points where the Sun crosses the celestial equator, caused by PRECESSION of Earth's axis. HIPPARCHUS noticed that the stars' positions were shifted consistently from earlier measures, indicating that Earth, not the stars, was moving. This precession, a wobbling in the orientation of Earth's axis with a cycle of almost 26,000 years, is caused by the gravity of the Sun and the Moon acting on Earth's equatorial bulge. The planets also have a small influence on precession. Projecting Earth's axis onto the CELESTIAL SPHERE locates the northern and southern celestial poles. Precession makes these points trace out circles on the sky and also makes the celestial equator wobble, changing its points of intersection (EQUINOXes) with the ECLIPTIC.

equipartition of energy See equipartition of ENERGY

equistetum See HORSETAIL

equity Finance and accounting concept. Equity represents any of three separate but related values: the money value of a property or of an interest in a property in excess of claims or liens against it; a risk interest or ownership right in property; and the common STOCK of a corporation. In CORPORATE FINANCE, a basic equation holds that a company's total assets minus total liabilities equals total owners' equity.

equity Justice according to fairness, especially as distinguished from mechanical application of rules under COMMON LAW. Courts of equity (also called chancery courts) arose in England in the 14th century in response to the increasingly strict rules of proof and other requirements of the courts of law. Equity provided remedies not available under the old WRIT system. Often these remedies involved something other than damages, such as specific performance of contractual obligations, enforcement of a TRUST, restitution of goods wrongfully acquired, imposition of an INJUNCTION, or the correction and cancellation of false or misleading documents. The equity courts eventually established their own precedents, rules, and doctrines and began to rival the law courts in power. The two systems were united in 1873. Courts of equity also developed early in U.S. history, but by the early 20th century most jurisdictions had combined them with courts of law into a single system. Modern courts apply both legal and equitable principles and offer both legal and equitable relief.

equivalence principle Fundamental principle of physics that in its weak form states that gravitational (see GRAVITATION) and inertial (see INERTIA) masses are the same. ALBERT EINSTEIN's stronger version states that gravitation and ACCELERATION are indistinguishable. It implies that the effect of gravity is removed in a suitably accelerated reference frame, such as an elevator with its cable cut, in which a person would experience FREE FALL.

equivalence relation In mathematics, a generalization of the idea of equality between elements of a SET. All equivalence relations (e.g., that symbolized by the equals sign) obey three conditions: reflexivity (every element is in the relation to itself), symmetry (element A has the same relation to element B that B has to A), and transitivity (see TRANSITIVE LAW). Congruence of triangles is an equivalence relation in geometry. Members of a set are said to be in the same equivalence class if they have an equivalence relation.

equivalent weight *or* **combining weight** Quantity of an element that exactly reacts with (equals the combining value of) 1 g of hydrogen, 8 g of oxygen, or a corresponding amount of any other element. An element's equivalent weight is its ATOMIC WEIGHT divided by its VALENCE. In general, for OXIDATION-REDUCTION, including ELECTROLYSIS, the equivalent weight is the weight associated with the loss or gain of 6.02×10^{23} electrons (AVOGADRO'S NUMBER) or 96,500 coulombs of ELECTRIC CHARGE; this is also the MOLECULAR WEIGHT divided by the number of electrons lost or gained. The equivalent weight of a substance with several valences differs depending on the number of electrons transferred in the given reaction. The number of equivalent weights of any substance dissolved in one litre of solution is called the solution's normality (*N*). See also STOICHIOMETRY.

Er, Lake *Chinese* **Er Hai** \'er-'hī\ *or* **Erh Hai** Lake, western YUNNAN province, China. It lies in a deep basin at the foot of Mount Diancang between the upper YANGTZE (Chang; there called the Jinsha) and MEKONG rivers; it is about 30 mi (50 km) long and 6–10 mi (10–16 km) wide. The south of the basin has connections to eastern Yunnan and to SICHUAN province and is on the main route southwest to Myanmar (Burma). The surrounding area was brought under Chinese control during the YUAN DYNASTY (late 13th century).

era Very long span of geologic time; in formal usage, a portion of geologic time of the second-greatest magnitude (eons are longer). Three eras are recognized: PALEOZOIC, MESOZOIC, and CENOZOIC. Because of the difficulties involved in establishing accurate chronologies, the PRECAMBRIAN, or earliest, eras are classified independently. An era is composed of one or more geologic PERIODS.

ERA See EQUAL RIGHTS AMENDMENT

Era of Good Feelings See Era of GOOD FEELINGS

erasable programmable read-only memory See EPROM

Erasmus \i-'raz-məs**, Desiderius** (b. Oct. 27, 1469, Rotterdam, Holland—d. July 12, 1536, Basel, Switz.) Dutch priest and humanist, considered the greatest European scholar of the 16th century. The illegitimate son of a priest and a physician's daughter, he entered a monastery and was ordained a priest in 1492. He studied at the University of Paris and traveled throughout Europe, coming under the influence of ST. THOMAS MORE and JOHN COLET. The book that first made him famous was the *Adagia* (1500, 1508), an annotated collection of Greek and Latin proverbs. He became noted for his editions of Classical authors, Church Fathers, and the New Testament as well as for his own works, including *Handbook of a Christian Knight* (1503) and *Praise of Folly* (1509). Using the philological methods pioneered by Italian humanists, he helped lay the groundwork for the historical-critical study of the past. By criticizing ecclesiastical abuses, he encouraged the growing urge for reform, which found expression both in the Protestant REFORMATION and in the Catholic COUNTER-REFORMATION. Though he saw much to admire in MARTIN LUTHER, he came under pressure to attack him; he took an independent stance, rejecting both Luther's doctrine of predestination and the powers claimed for the papacy.

Eratosthenes \ˌer-ə-'täs-thə-ˌnēz\ **of Cyrene** (b. c. 276 BC, Cyrene, Libya—d. c. 194, Alexandria, Egypt) Greek scientific writer, astronomer, and poet. He settled in Alexandria c. 255 BC and became director of its great library. He is the first person known to have calculated the Earth's circumference, though the exact length of the units (stadia) he used is uncertain. He also measured the tilt of Earth's axis with great accuracy, compiled a star catalog, worked out a calendar that included leap years, and tried to fix the dates of literary and political events since the siege of Troy.

Erbakan \ˌer-bä-'kän**, Necmettin** (b. c. 1926, Sinop, Tur.) First leader of an Islamic political party to win a general election in Turkey (1995). Son of an Ottoman-era religious court judge, he studied mechanical engineering before being elected to the National Assembly in 1969. Despite Turkey's strong secular tradition and its laws prohibiting the formation of parties based on religious ideology, Erbakan formed an Islamic party in 1970 and another in 1972, serving twice as deputy prime minister. His third attempt to form a party created the REFAH ("WELFARE") PARTY, which won the most seats in the 1995 elections. As prime minister, he formed a coalition government in 1996, but his party was outlawed in 1997; he was then banned from politics.

Ercker, Lazarus (b. c. 1530, Annaberg, Saxony—d. c. 1594, Prague, Bohemia) German writer on early METALLURGY. In 1554 Ercker was appointed assayer at Dresden, the first of his many positions in the Saxony bureaucracy, and later became a control tester of coins. His systematic review of the techniques then in use for testing alloys and minerals of silver, gold, copper, antimony, mercury, bismuth, and lead, of obtaining and refining such metals, and of extracting acids, salts, and other compounds may be regarded as the first manual of analytical and metallurgical chemistry.

Erdös \'er-dösh**, Paul** (b. March 26, 1913, Budapest, Hung.—d. Sept. 20, 1996, Warsaw, Pol.) Hungarian mathematician. He proved a classic theorem of NUMBER THEORY (1933), founded the study of probabilistic number theory with Aurel Wintner and Mark Kac, proved important results

© 2006 Encyclopædia Britannica, Inc.

in approximation theory with Paul Turan, and with Atle Selberg gave an astounding elementary proof of the prime number theorem (1949). Famously eccentric, he traveled almost constantly for his last 40 years, collaborating with hundreds of mathematicians on numerous problems.

Erech \'ē-ˌrek\ *or* **Uruk** \'ü-ˌrůk\ Ancient city, Mesopotamia. Located northwest of Ur on the Euphrates River, it was one of the greatest cities of Sumer and was enclosed by brickwork walls that, according to legend, were built by the mythical hero Gilgamesh. Excavations have traced successive cities that date from the prehistoric Ubaid period (c. 5000 BC) to Parthian times (126 BC–AD 224), when in c. 70 BC an ancient school of learned scribes was still using cuneiform script. Urban life in what is known as the Erech-Jamdat Nasr period (c. 3500–2900 BC) is more fully illustrated at Erech than at any other Mesopotamian city.

Erechtheus \i-'rek-ˌthüs, i-'rek-thē-əs\ Legendary god-king of Athens. According to Homer's *Iliad*, he was born from the earth and raised by Athena, who established him in her temple at Athens. Later tradition associates him with a huge snake that was thought to live in the temple. In a lost play by Euripides, Erechtheus sacrificed his daughter Chthonia to ensure a victory in war, and as punishment was destroyed by either Poseidon or Zeus.

eremite See hermit

Ereshkigal \ā-'resh-ˌkē-gəl\ In Mesopotamian religion, the goddess of the underworld. Her chief enemy was her sister Ishtar, a fertility goddess and guardian of life. Namtar, the death-bringing demon, was her offspring and servant. Her cult extended to Egypt, Arabia, and Asia Minor.

Eretria \e-'rē-trē-ə\ Ancient Greek town on the island of Euboea. Jointly with its neighbour Chalkís, it founded Cumae in Italy (c. 750 BC), the first of the Greek colonies in the west. Subsequent rivalry with Chalkís culminated in war, and by the Classical period Chalkís was the leading city of Euboea. In 499–498 BC Eretrian triremes sailed to support the Ionian revolt against Persia, for which act Darius I destroyed the city (490 BC) and deported the population. It was rebuilt, but under Macedonian and Roman rule it became insignificant. There are extensive ruins at the site.

Erfurt \'er-ˌfůrt\ City (pop., 2002 est.: 200,126), central Germany. Boniface founded a bishopric in Erfurt in AD 742, and by 805 it was an important centre on the Frankish empire's eastern border. Erfurt was granted municipal rights c. 1250 and joined the Hanseatic League in the 15th century. The city passed to Prussia in 1802, forming part of Prussian Saxony until 1945. Erfurt was the site of the first meeting of the leaders of East and West Germany in 1970. It is dominated by its 12th-century cathedral; other buildings include the monastery where Martin Luther was a monk (1505–08). Erfurt is an important road and railway junction and a commercial centre.

ergativity Tendency of a language to pair the subject, or agent, of an intransitive verb with the object, or patient, of a transitive verb. This contrasts with the situation in nominative-accusative languages such as Latin or English, in which the subjects of both transitive and intransitive verbs are paired grammatically and distinguished from the object of a transitive verb. Languages or language families that display ergativity to varying degrees include Sumerian, Caucasian languages, Eskimo-Aleut, Maya, Australian Aboriginal languages, and many American Indian languages.

ergonomics *or* **human engineering** *or* **human factors engineering** Profession of designing machines, tools, and work environments to best accommodate human performance and behaviour. It aims to improve the practicality, efficiency, and safety of a person working with a single machine or device (e.g., using a telephone, driving a car, or operating a computer terminal). Taking the user into consideration has probably always been a part of tool design; for example, the scythe, one of the oldest and most efficient human implements, shows a remarkable degree of ergonomic engineering. Examples of common devices that are poorly designed ergonomically include the snow shovel and the computer or typewriter keyboard.

ergot \'er-gət, 'er-ˌgät\ Disease of cereal grasses, especially rye, caused by the fungus *Claviceps purpurea*. An ear of rye infected with ergot exudes a sweet, yellowish mucus. Ergot is the source of drugs used to control postpartum hemorrhage and to treat migraine headaches. Lysergic acid, from which the powerful hallucinogen LSD is synthesized, comes from ergot. Taking an overdose of ergot-derived medications or eating flour milled from ergot-infected rye can cause ergotism (also called St. Anthony's Fire) in humans and livestock; symptoms may include convulsions, miscarriages in females, and dry gangrene, and may result in death.

Ergun River See Argun River

Erhard \'er-ˌhärt**, Ludwig** (b. Feb. 4, 1897, Fürth, Ger.—d. May 5, 1977, Bonn, W.Ger.) German economist and politician. As economics minister (1949–63), he was the chief architect of West Germany's postwar economic recovery. He achieved what has been called an economic miracle through his "social market system," which was based on free-market capitalism but included special provisions for housing, farming, and social programs. In 1957 he was appointed federal vice-chancellor, and in 1963 he succeeded Konrad Adenauer as chancellor. His government was troubled by an economic downturn and a budget deficit, as well as Erhard's relative weakness as a leader, and he was forced to resign in 1966.

Eric the Red See Erik the Red

erica \'er-i-kə\ Any of the approximately 500 species of low evergreen shrubs that make up the genus *Erica*, in the heath family, most native to South Africa. Some also occur in the Mediterranean and in northern Europe, and species have been introduced to North America. They have small, narrow leaves arranged in whorls set closely together on the shoots. Some African species are large bushes or trees. The white, or tree, heath (*E. arborea*) is also known as brier. Some southern African species are cultivated in cool greenhouses and outdoors in southwestern North America.

Erickson, Arthur (Charles) (b. June 16, 1924, Vancouver, B.C., Can.) Canadian architect. He first earned wide recognition with his plan for Simon Fraser University (1963–65), designed with Geoffrey Massey, which included an enormous skylit indoor plaza that served as a sensitive response to a cool, rainy climate. Robson Square, Vancouver (1978–79), a large civic centre, incorporates waterfalls, a roof garden, plazas, and stairs with integrated ramps. His other works include the University of British Columbia's Museum of Anthropology (1976), with its succession of concrete piers and broad expanses of glass, and the Canadian Embassy in Washington, D.C. (1989), a blend of contemporary and Neoclassical elements that echo its surroundings.

Ericsson, John (b. July 31, 1803, Långbanshyttan, Swed.—d. March 8, 1889, New York, N.Y., U.S.) Swedish-U.S. naval engineer and inventor. He moved to England in 1826, where he constructed a steam locomotive (1829) and later devised a caloric engine and patented a screw propeller. He immigrated to the U.S in 1839. During the Civil War he proposed, designed, and built a novel warship, the *Monitor*. Its battle with the Confederacy's *Merrimack* led the government to place an order for many more such vessels. Wholly steam-powered and with a screw propeller and an armoured revolving turret, it set a new pattern for U.S. warships that continued until the 20th century. He later developed a torpedo and investigated solar-powered motors.

Eridu \'er-i-ˌdü, e-'rē-dü\ Ancient Sumerian city on the Persian Gulf. Although it was the chief seaport of Sumer and Babylonia and was located on the Euphrates River near the city of Ur, siltation has since moved the coastline southward and the city's remains are now some 120 mi (200 km) inland, in modern Iraq. It was revered as the oldest city in Sumer, and its patron god was Enki (Ea). Founded on sand dunes c. 5th millennium BC, its ruins show the sequence of the preliterate Ubaid civilization, with a long succession of superimposed temples portraying the development of an elaborate mud-brick architecture. It was occupied until c. 600 BC.

Eridu Genesis \e-'rē-dü\ Sumerian creation epic. It recounted the origins of the world and humanity, the founding of cities, and the great flood sent by the gods to destroy humanity. Forewarned by the god Ea, a man named Ziusudra, known for his humility and obedience, built a huge boat in which to ride out the flood. As a reward for his good life, the gods later granted him immortality.

Erie City (pop., 2000: 103,717), northwestern Pennsylvania, U.S. Named for the Erie Indians, it was the site of a French fort (1753) on Lake Erie. The site was acquired by the U.S. in 1795, when the town was laid out. Nearby naval shipyards built most of the fleet that defeated the British at the Battle of Lake Erie (1813) in the War of 1812. Economic development began with the opening (1844) of the Erie and Pittsburgh Canal and with railway construction in the 1850s. Pennsylvania's only port on the

St. Lawrence Seaway, it is a shipping point for many products, including lumber, coal, and petroleum. While early industries were largely agricultural, manufactures, including electrical equipment and construction machinery, are now well diversified.

Erie, Lake Lake, in U.S. and Canada. The fourth largest of the five Great Lakes, it lies between lakes Huron and Ontario and forms the boundary between Canada (Ontario) and the U.S. (Michigan, Ohio, Pennsylvania, and New York). It is 240 mi (388 km) long and has a maximum width of 57 mi (92 km), with a surface area of 9,910 sq mi (22,666 sq km). The Detroit River carries inflow from Lake Huron to the west, and the lake discharges at its eastern end through the Niagara River. It is an important link in the St. Lawrence Seaway; its ports handle steel, iron ore, coal, and grain. The area was once inhabited by Erie Indians; when the French arrived in the 17th century they found the Iroquois living there. The British were in the region in the 18th century, and the U.S. shores were settled after 1796. It was the site of the Battle of Lake Erie, an important engagement of the War of 1812.

Erie Canal Historic waterway, northern U.S. It stretches from Buffalo, N.Y., on Lake Erie to Albany, N.Y., on the Hudson River. Commissioned by Gov. DeWitt Clinton of New York, it opened in 1825. It connected the Great Lakes with New York City and contributed greatly to the settlement of the Midwest, allowing for the transport of people and supplies. Enlarged several times, the canal is 340 mi (547 km) long, 150 ft (46 m) wide, and 12 ft (4 m) deep. Now used mainly for pleasure boating, it is part of the New York State Canal System.

Erie Railroad Co. Former railroad running between New York City, Buffalo, and Chicago. Incorporated in 1832 and completed in 1851, the Erie became known as "the scarlet woman of Wall Street" in the mid-19th century, when it was the object of financial struggles between Daniel Drew, Jay Gould, James Fisk, and Cornelius Vanderbilt. Manipulations of its stock by Gould and Fisk became notorious. It went bankrupt four times, and in 1976 it was taken over by Conrail.

Erigena \ə-'rē-ge-nə**, John Scotus** *Latin* **Johannes Scotus Erigena** (b. 810, Ireland—d. c. 877) Irish-born theologian, translator, and commentator. In his philosophical system, which came to be known as Scotism, he attempted to integrate Greek and Neoplatonist philosophy with Christian belief in such works as *On Predestination* (851), which was condemned by church authorities. *On the Division of Nature* (862–66) tries to reconcile Neoplatonism with the Christian doctrine of creation; for its pantheistic implications, it too was condemned. His Latin translations of major works of Greek patristic literature made them accessible to Western thinkers. Remembered for the nonconformity of his thought, he is said to have been stabbed to death by his students with their pens for attempting to make them think.

Erik the Red *orig.* **Erik Thorvaldson** (fl. 10th century, Norway) Founder of the first European settlement on Greenland (c. 986) and father of Leif Eriksson. A native of Norway, Erik grew up in Iceland; exiled for manslaughter c. 980, he set sail and landed on Greenland. With 350 colonists he founded a colony that numbered about 1,000 settlers by AD 1000. In 1002 the colony was ravaged by sickness, and it gradually died out, though other Norse settlements in Greenland continued. Erik's story is told in the Icelandic *Eiríks saga.*

Erikson, Erik H(omburger) (b. June 15, 1902, Frankfurt am Main, Ger.—d. May 12, 1994, Harwich, Mass., U.S.) German-U.S. psychoanalyst. Trained in Vienna by Anna Freud, in 1933 he immigrated to the U.S., where he practiced child psychoanalysis in Boston and joined the Harvard Medical School faculty. In 1936 he moved to Yale University, and in 1938 he began his first studies of cultural influences on psychological development, working with Sioux Indian children and later with the Yurok Indians. He later taught at the University of California at Berkeley but left in 1950, in the era of McCarthyism, after refusing to sign a loyalty oath vowing support of the Constitution of the U.S. Personality development, in Erikson's view, takes place through a series of identity crises that must be overcome and internalized in preparation for the next developmental stage; he posited eight such stages. His other concerns included social psychology and the interactions of psychology with history, politics, and culture. His works include *Childhood and Society* (1950), *Young Man Luther* (1958), *Gandhi's Truth* (1969), and *Life History and the Historical Moment* (1975).

Eriksson, Leif See Leif Eriksson the Lucky

Eris \'er-is\ Ancient Greek personification of strife. Her Roman counterpart was Discordia. The daughter of Nyx and the sister of Ares, she was best known for her role in starting the Trojan War. When she alone was not invited to the wedding of Peleus and Thetis, she threw down among the guests a golden apple inscribed "for the most beautiful." Hera, Athena, and Aphrodite each claimed it, and Zeus assigned the task of judging to the Trojan Paris. He awarded the apple to Aphrodite, who in turn helped him carry off the beautiful Helen, an act that triggered war.

Eritrea \ˌer-ə-'trē-ə, ˌer-ə-'trā-ə,\ *officially* **State of Eritrea** *Tigrinya* **Ertra** Country, eastern Africa. It extends about 600 mi (1,000 km) along the Red Sea coast and includes the Dahlak Archipelago. Area: 46,770 sq

mi (121,144 sq km). Population (2005 est.): 4,670,000 (including about 350,000 refugees from The Sudan). Capital: Asmara. There is no official religion or language. The varied population is about half Tigrinya-speaking (see Tigray) Christians, with a large minority of Muslims and diverse other peoples. Arabic, English, and Italian are also spoken. Currency: nakfa. The land varies from temperate central highlands to coastal desert plain, with savanna and open woodlands in the western lowlands. The economy is based on livestock herding and subsistence agriculture. Industry, based in Asmara, includes food products, textiles, and leather goods; exports include salt, hides, cement, and gum arabic. Eritrea's form of government is a transitional regime with one interim legislative body; the head of state and government is the president. As the site of the main ports of the Aksumite empire, it was linked to the beginnings of the Ethiopian kingdom, but it retained much of its independence until it came under Ottoman rule in the 16th century. In the 17th–19th centuries, control of the territory was disputed among Ethiopia, the Ottomans, the kingdom of Tigray, Egypt, and Italy; it became an Italian colony in 1890. Eritrea was used as the main base for the Italian invasions of Ethiopia (1896, 1935–36) and in 1936 became part of Italian East Africa. It was captured by the British in 1941, federated to Ethiopia in 1952, and made a province of Ethiopia in 1962. Three decades of guerrilla warfare by Eritrean secessionist groups ensued. A provisional Eritrean government was established in 1991 after the overthrow of the Ethiopian government, and independence came in 1993. A new constitution was ratified in 1997. A border war with Ethiopia that began in 1998 ended in an Ethiopian victory in 2000.

Erlitou \'er-lē-'tō\ **culture** Neolithic culture (1900–1350 BC) of the central plains of northern China. It was the first state-level society in China, and its remains are taken to be correlates of the Xia dynasty. Remains of

© 2006 Encyclopædia Britannica, Inc.

palatial buildings, royal tombs, and paved roads have been uncovered, leading to hypotheses that the site represents a Xia capital. The society employed advanced bronze technology. The relationship between Erlitou bronzes and those produced earlier at Qijia in Gansu remains unclear. See HONGSHAN CULTURE; NEOLITHIC PERIOD.

ermine \'ər-mən\ *or* **stoat** Species of the WEASEL family (*Mustela erminea*). Its white winter coat has historically adorned royal robes and is still used in the fur trade. Ermines are found in North America and northern Eurasia. They are most abundant in thickets, woodland, and semitimbered areas. In summer they are brown, with whitish throat, chest, and belly. Species are 5–12 in. (13–29 cm) long (excluding the 2–5-in., or 5–12-cm, tail) and weigh less than 11 oz (0.3 kg). Voracious carnivores, ermines feed on small mammals, birds, eggs, frogs, and, occasionally, invertebrates.

Erne \'ərn**, Lough** Lake, FERMANAGH district, NORTHERN IRELAND. An average of 5 mi (8 km) wide, the lake consists of the shallow Upper Lough Erne, 12 mi (19 km) long, and Lower Lough Erne, 18 mi (29 km) long, linked by a 10-mi (16-km) strait that is part of the River Erne. Numerous islands dot the lakes and provide recreation facilities. The River Erne, which flows north across the border of Northern Ireland and empties into Donegal Bay, is 72 mi (116 km) long.

Ernst \'ernst, 'ərnst**, Max** (b. April 2, 1891, Brühl, Ger.—d. April 1, 1976, Paris, Fr.) German-born French painter and sculptor. He gave up studying philosophy and psychology at Bonn University for painting. After serving in World War I, he became the leader of the DADA movement in Cologne (1919), working in collage and photomontage. A characteristic work is *Here Everything Is Still Floating* (1920), a startlingly illogical composition made from cut-out photographs of insects, fish, and anatomical drawings. In 1922 he settled in Paris and was among the founders of SURREALISM. His work was imaginative and experimental; he pioneered the technique of FROTTAGE and experimented with AUTOMATISM. After 1934 the irrational and whimsical imagery seen in his paintings appeared also in his sculpture. In 1941 he moved to New York City, where he joined his third wife, PEGGY GUGGENHEIM, and began collaborating with MARCEL DUCHAMP. He returned to France in 1953 and continued to produce lyrical and abstract works.

Eros \'er-ˌäs, 'ir-ˌäs\ Greek god of love. Though HESIOD declared him one of the primeval gods born of CHAOS, he was later said to be the son of APHRODITE. His Roman counterpart was CUPID. Eros was depicted as a beautiful winged youth carrying a bow and a quiver of arrows. In later literature and art he became increasingly younger, ending as an infant. His cult centre was at Thespiae, but he also shared a sanctuary with Aphrodite at Athens.

Eros First ASTEROID found to travel mainly inside the orbit of Mars and the first to be landed on by a spacecraft. Discovered in 1898 and named for the Greek god of love, Eros is an elongated body about 20.5 mi (33 km) in its greatest dimension. It can approach to within 14 million mi (22 million km) of Earth. In 2000 the Near Earth Asteroid Rendezvous (NEAR Shoemaker) spacecraft orbited Eros, collecting a full year of data, and in 2001 it set down gently on Eros's surface.

erosion Removal of surface material from the Earth's crust and transportation of the eroded materials by natural agencies from the point of removal. Erosion is caused by wind action, river and stream processes, marine processes (sea waves), and glacial processes. The complementary actions of erosion and deposition or sedimentation operate through wind, moving water, and ice to alter existing landforms and create new landforms. Erosion will often occur after rock has been disintegrated or altered through WEATHERING. Moving water is the most important natural agent of erosion. Sea wave erosion results primarily from the impact of waves striking the shore and the abrasive action of sand and pebbles agitated by wave action. Erosion by rivers is caused by the scouring action of the sediment-containing flowing water. Glacial erosion occurs by surface abrasion as the ice, embedded with debris, moves slowly over the ground accompanied by the plucking of rock from the surface. Wind plays a key role in arid regions as blowing sand breaks down rock and dislodges surface sand from unprotected sand dunes. Human intervention, as by the removal of natural vegetation for farming or grazing purposes, can lead to or accelerate erosion by wind and water. See also SHEET EROSION.

error In applied mathematics, the difference between a value and an estimate of that value. In statistics, a common example is the difference between the mean age of a given group of people (see MEAN, MEDIAN, AND MODE) and that of a sample drawn from the group. In NUMERICAL ANALYSIS, an example of round-off error is the difference between the true value of PI and commonly substituted expressions like $22/7$ and shorter versions like 3.14159. Truncation error results from using only the first few terms of an infinite series. Relative error is the ratio of the size of an error to the size of the quantity measured, and percentage error is relative error expressed as a percent.

Erskine \'ər-skən\ **(of Restormel), Thomas Erskine, 1st Baron** (b. Jan. 10, 1750, Edinburgh, Scot.—d. Nov. 17, 1823, Almondell, Linlithgowshire) Scottish lawyer. He was the youngest son of Henry David Erskine, 10th Earl of Buchan. After service in the British navy and army, he entered the law, and in 1778 he was called to the bar. His practice flourished after he won a seminal libel case, and he went on to make important contributions to the protection of personal liberties. His defense of politicians and reformers on charges of treason and related offenses, including an unsuccessful defense of THOMAS PAINE (1792), checked repressive measures taken by the British government in the aftermath of the French Revolution. He contributed to the law of criminal responsibility by defending, on the novel ground of insanity, a would-be assassin of GEORGE III. He served in Parliament (1783–84, 1790–1806) until elevated to the peerage (1806), and he was lord chancellor (1806–07) in William Grenville's "ministry of all talents." In 1820 he defended Queen Caroline, whom GEORGE IV had brought to trial before the House of Lords for adultery in order to deprive her of her rights and title. Erskine's courtroom speeches are characterized by vigour, cogency, and lucidity and often by great literary merit.

Erté \'er-'tā\ *orig.* **Romain de Tirtoff** (b. Nov. 23, 1892, St. Petersburg, Russia—d. April 21, 1990, Paris, France) Russian-born French fashion illustrator and designer. In 1912 he arrived in Paris, where he worked briefly with the couturier PAUL POIRET. From 1916 to 1937 he published elegant, highly stylized illustrations depicting models in mannered poses against ART DECO interiors in *Harper's Bazaar*. He also designed theatrical scenery and costumes for the Folies-Bergère in Paris (1919–30), and in the 1920s he costumed performers in U.S. musicals, most notably the *Ziegfeld Follies*. His designs continue to be widely reproduced.

Ervin, Sam *orig.* **Samuel James Ervin, Jr.** (b. Sept. 27, 1896, Morganton, N.C., U.S.—d. April 23, 1985, Winston-Salem, N.C.) U.S. senator (1954–74). He served on the Supreme Court of North Carolina (1948–54) before being appointed to a vacant U.S. Senate seat. An eloquent expert on the Constitution, he sat on the Senate committee that censured Sen. JOSEPH MCCARTHY, and he helped investigate labour racketeering. In the 1960s he led Southern filibusters against civil-rights legislation while simultaneously acting as a champion of civil liberties. As chairman of the special committee investigating the

© 2006 Encyclopædia Britannica, Inc.

WATERGATE SCANDAL, he became something of a folk hero for his unceasing pursuit of evidence in the face of White House claims of executive privilege. His earthy humour, distinctive accent, and unfailing charm contributed to his popularity.

Erving, Julius (Winfield) (b. Feb. 22, 1950, Roosevelt, N.Y., U.S.) U.S. basketball star. He played two years at the University of Massachusetts before joining the professional American Basketball Association (ABA). At 6 ft 7 in. (2 m), "Doctor J" played forward for the Virginia Squires (1971–73) and the New York Nets (1973–76), whom he led to two ABA titles (1974, 1976). After the merger of the ABA and NBA, Erving was traded to the Philadelphia 76ers (1977–87) and won a league title in 1983. He was known for swarming defense, imaginative drives to the basket, and climactic slam dunks.

erythema \ˌer-ə-ˈthē-mə\ Abnormal skin redness from increased blood flow, caused by dilation and irritation of surface CAPILLARIES. It has a variety of manifestations. In erythema multiforme, a symptom complex seen in several diseases, spots appear suddenly, often with a bull's-eye pattern. It may become life-threatening in severe cases; in mild cases symptoms may recur. Hormone treatment may be effective. In erythema nodosum, a hypersensitivity reaction usually associated with strep infection (see STREPTOCOCCUS), drugs, or the disease sarcoidosis, painful red nodules appear in the deeper skin layer of the lower legs. They usually disappear over several weeks and do not recur. Another form of erythema is PELLAGRA.

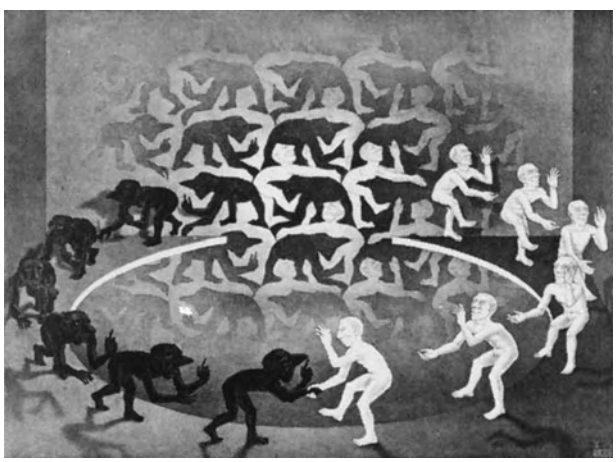
Erythrae \ˈer-ə-ˌthrē\ Ancient city of LYDIA. Located on the Aegean coast opposite the island of CHIOS, it was one of the 12 Ionian Cities. The original site of the settlement is uncertain, but from the 4th century BC it was located at modern Ildır, where traces of the wall circuit, theatre, and citadel are visible. It took various sides in 5th century BC Greek politics, came under Persian control, and was freed by ALEXANDER THE GREAT in 334 BC. A free city in the Roman province of Asia, it was noted for its wine and goats, as well as its prophetic SIBYLS, Herophile and Athenais.

erythroblastosis fetalis \i-ˌrith-rə-ˌblas-ˈtō-səs-fi-ˈta-ləs\ *or* **hemolytic disease of the newborn** ANEMIA in an infant, caused when a pregnant woman produces ANTIBODIES to an ANTIGEN in her fetus's red blood cells. An Rh-negative woman (see RH BLOOD-GROUP SYSTEM) with an Rh-positive fetus whose ABO blood group (see ABO BLOOD-GROUP SYSTEM) matches hers is likely to have an immune reaction after the first such pregnancy, which sensitizes her when fetal red blood cells enter her bloodstream, usually during labour. If BLOOD TYPING shows incompatibility, an anti-Rh antibody injection given to the mother after the birth can destroy the fetal red cells, thus preventing trouble in a future pregnancy. If AMNIOCENTESIS detects products of blood destruction, Rh-negative blood transfusions to the fetus before birth or exchange transfusion after it may save the baby's life. ABO incompatibilities are more common but usually less severe.

erythrocyte \i-ˈrith-rə-ˌsīt\ *or* **red blood cell** *or* **red blood corpuscle** Blood cell that carries oxygen from the lungs to the body tissues. HEMOGLOBIN gives the cell—and whole blood—its colour. Red cells are small, round, flexible, and concave on both sides and lack a NUCLEUS. They develop continuously in BONE MARROW in several stages and are stored in the SPLEEN. The mature form lives 100–120 days. Adult human blood has about 5.2 million red cells per cu mm. Some conditions change their shape (e.g., PERNICIOUS ANEMIA, SICKLE-CELL ANEMIA) or number (e.g., ANEMIA, polycythemia).

Erzberger \ˈerts-ˌber-gər**, Matthias** (b. Sept. 20, 1875, Buttenhausen, Württemberg, Ger.—d. Aug. 26, 1921, Black Forest, Baden) German politician. Elected to the Reichstag in 1903, he became the leader of the left wing of the CENTRE PARTY. During World War I he was involved in the Reichstag resolution proposing a negotiated peace with no territorial gains. He headed the German delegation that signed the Armistice, and he advocated acceptance of the Treaty of Versailles. In 1919–20 he served as vice-chancellor and finance minister. As a supporter of the republican-democratic system, he became the victim of a slander campaign from the extreme right. He resigned his ministry and was later assassinated by nationalist partisans.

Esagila \ˈā-sä-ˈgē-lä\ Temple complex in ancient BABYLON dedicated to MARDUK. The huge edifice was 660 ft (202 m) long, with three vast courtyards surrounded by many chambers. It took centuries to construct; most of the work being done in the 6th century BC during the reign of NEBUCHADNEZZAR II. Its wealth was famous in antiquity, but by the time Babylon was excavated in 1899–1917 it had been thoroughly plundered.



Esaki, Leo *orig.* **Esaki Reiona** (b. March 12, 1925, Ōsaka, Japan) Japanese physicist. In 1956 he became chief physicist of the Sony Corp., and in 1960 he was awarded an IBM fellowship for further research in the U.S., subsequently joining IBM's research laboratories in Yorktown, N.Y. He worked intensively on TUNNELING in semiconductors and constructed the tunnel diode, which found broad applications in computers and other devices. He shared a 1973 Nobel Prize with Ivar Giaever (b. 1929) and BRIAN JOSEPHSON.

escalator Moving staircase used as transportation between floors or levels in stores, airports, subways, and other mass pedestrian areas. The name was first applied to a moving stairway shown at the Paris Exposition of 1900. Modern escalators are electrically powered, driven by chain and sprocket, and held in place by two tracks. As the treads approach a landing, they pass through a comb device; a switch cuts off power if an object becomes jammed between comb and treads.

escape velocity Speed sufficient for a body to escape from a gravitational centre of attraction without accelerating further. It decreases with altitude and equals the square root of 2 (about 1.414) times the speed needed to maintain a circular orbit at the same altitude. At the surface of Earth, disregarding atmospheric resistance, escape velocity is about 6.96 mi/second (11.2 km/second). Escape velocity from the surface of the Moon is about one-third of this.

eschatology \ˌes-kə-ˈtä-lə-jē\ Theological doctrine of the "last things," or the end of the world. Mythological eschatologies depict an eternal struggle between order and chaos and celebrate the eternity of order and the repeatability of the origin of the world. The most notable expression of mythological eschatology is in HINDUISM, which maintains belief in great cycles of the destruction and creation of the universe. Historical eschatologies are grounded in datable events that are perceived as fundamental to the progress of history. Judaism, Christianity, and Islam all have historical eschatologies. Eschatology in the Hebrew Scriptures sees the catastrophes that beset the people of Israel as due to their disobedience to the laws and will of God and holds that conformity to God's plan will result in renewal and the fulfillment of God's purpose. In Christianity, the end times are thought to have begun with the life and ministry of Jesus, the MESSIAH who will return to establish the KINGDOM OF GOD. MILLENNIALISM focuses especially on Christ's second coming and the reign of the righteous on earth. In SHIʿITE Islam it is believed that the MAHDI, or restorer of the faith, will come to inaugurate the last judgment, in which the good will enter HEAVEN and the evil will fall into HELL. In BUDDHISM, eschatological traditions are associated with the Buddha MAITREYA and with PURE LAND BUDDHISM, as well as with individual efforts to achieve NIRVANA.

Escher \ˈe-shər**, M(aurits) C(ornelis)** (b. June 17, 1898, Leeuwarden, Neth.—d. March 27, 1972, Laren) Dutch graphic artist. He became

Encounter, lithograph printed in black by M.C. Escher, 1944; in the Museum of Modern Art, New York City.
COLLECTION, THE MUSEUM OF MODERN ART, NEW YORK CITY; GIFT OF THE INTERNATIONAL GRAPHIC ARTS SOCIETY

© 2006 Encyclopædia Britannica, Inc.

well-known for prints in which he used realistic detail to achieve bizarre optical illusions, such as staircases that appear to lead both up and down from the same level. His work assumed a Surrealist flavour as he began depicting unexpected metamorphoses of mundane objects. His works were of interest to mathematicians, cognitive psychologists, and the general public and were widely reproduced throughout the 20th century.

Escoffier \es-kȯf-'yā**, (Georges-) Auguste** (b. Oct. 28, 1846, Villeneuve-Loubet, Fr.—d. Feb. 12, 1935, Monte Carlo, Monaco) French chef known for his innovations in haute cuisine. He earned a worldwide reputation as director of the kitchens at the Grand Hotel at Monte Carlo and at César Ritz's Savoy (1890–99) and Carlton (1899–1922) hotels in London. He helped reform *grande cuisine* by simplifying and refining it and making its preparation more efficient. He wrote *Guide culinaire* (1903), *Ma Cuisine* (1934), and other classic works. He is often called the greatest chef of all time.

Escorial, El See El Escorial

escrow \'es-ˌkrō\ Instrument, such as a deed, money, or property, that constitutes evidence of obligations between two or more parties and is held by a third party. It is delivered by the third party only upon fulfillment of some condition. In commercial usage, this condition is most often the performance of an act (e.g., payment) by the party who is to receive the instrument. Escrow is also used in family transactions (e.g., when a death in the family results in an instrument being delivered to another family member).

Esdraelon \ˌez-drə-'ē-lən**, Plain of** *Hebrew* **Emeq Yizre'el** \'e-mek-ˌyēz-rā-'el\ Plain, northern Israel. About 25 mi (40 km) long, it divides the hilly areas of Galilee in the north and Samaria in the south. Part of the ancient passage between Egypt and the Fertile Crescent, it was an avenue of commerce and a scene of conflict from earliest antiquity. To the northwest is the site of ancient Megiddo. Owing to poor natural drainage, it was swampy and sparsely inhabited for many centuries, but since 1920 the land has been reclaimed, and dozens of settlements, combining intensive agriculture with light industry, have been set up. ʿAfula is the principal urban centre.

Esenin, Sergey See Sergey Yesenin

Eṣfahān \ˌes-fä-'hän\ *or* **Iṣfahān** \ˌis-fä-'hän\ City (pop., 1996: 1,266,072), west-central Iran. An ancient Median town, it was known as Aspadana. It was a major city in the 11th–12th centuries under the Seljūq Turks and during the Safavid dynasty of Iran (16th–18th centuries). Its golden age began in 1598 when Shah ʿAbbās I made it his capital and rebuilt it into one of the 17th century's greatest cities. At its centre he created the immense Maydān-e Shāh, or "Royal Square" (now Maydān-e Emām; "Imam's Square"), a great rectangular garden enclosing the Masjid-e Shāh ("Royal Mosque"; now Masjid-e Emām). In 1722 Afghans took the city, and it went into decline. Recovery began in the 20th century, and it is now a major textile centre, whose other industries include steelmaking and petroleum refining. The square was designated a UNESCO World Heritage site in 1979.

Eshnunna \esh-'nən-ə\ *or* **Tell Asmar** \ˌtel-'as-mər\ Ancient city ruins, eastern Iraq. Occupied before 3000 BC, it was, during the 3rd dynasty of Ur, the seat of an *ensi* (governor). After the collapse of Ur, it became independent but was later conquered by Hammurabi. Stone tablets found near Babylon, called the "Laws of Eshnunna," predate the Code of Hammurabi by about two generations and help show the development of ancient law. After Hammurabi's time it fell into decline. Sumerian artifacts from the site include stone statuettes dating from the 3rd millennium BC. See photo opposite.

Eskimo *or* **Inuit** \'i-nù-wət\ Group of peoples who, with the closely related Aleut, constitute the native population of the Arctic and subarctic regions of Greenland, Alaska (U.S.), Canada, and far eastern Siberia (Russia). Self-designations include such names as Inuit, Inupiat, Yupik, and Alutiit, each being a more or less local variant meaning "the people." The name Eskimo, first applied by Europeans, may derive from a Montagnais word for snowshoes; it is favoured by Arctic peoples in Alaska, while those in Canada and Greenland prefer Inuit. The Eskimo are of Asian origin, like the American Indians, but they are distinguishable from the latter by their climatic adaptations, the presence of the B blood type, and their languages (Eskimo-Aleut), all of which suggest that they are of distinctive origin. Traditional Eskimo culture was totally adapted to an extremely cold, snow- and ice-bound environment in which vegetable foods were almost nonexistent and caribou, fish, and marine mammals were the major food source. Harpoons and one-person kayaks or larger umiaks were used for hunting on the sea. Clothing was fashioned of caribou furs and sealskins. Snow-block igloos or semisubterranean sod and stone houses were used in winter, while in summer animal-skin tents were erected. Dogsleds were the basic means of land transport. Religion centred on shamanism and the unseen world of spirits. By the late 20th century, snowmobiles and rifles had replaced dogsleds and harpoons. Many Eskimo have abandoned their nomadic hunting pursuits and moved into northern towns and cities. Some have formed cooperatives to market their handicrafts and other wares. The Eskimo (Inuit, Inupiat, Yupik, etc.) peoples number some 177,000.

Statuettes found at Tell Asmar, Early Dynastic II (*c.* 2775–*c.* 2650 BC); in the Oriental Institute, the University of Chicago
COURTESY OF THE ORIENTAL INSTITUTE, THE UNIVERSITY OF CHICAGO

Eskimo-Aleut \ˌal-ē-'üt\ **languages** Family of languages spoken in Greenland, Canada, Alaska, U.S., and eastern Siberia by the Eskimo and Aleut peoples. Aleut, distantly related to the Eskimo languages, consists of eastern and western dialects; today both are spoken by fewer than 400 people. The Eskimo languages have two subgroups: Yupik (five languages), spoken on the Chukchi Peninsula in Siberia and in southwestern Alaska; and Inupiaq-Inuktitut, a continuum of dialects spoken across arctic Alaska and Canada to the coasts of Labrador and Greenland. Yupik languages are spoken today by about 13,000 people, while Inupiaq-Inuktitut has more than 100,000 speakers, nearly half of whom speak Greenlandic Inuktitut.

Eskimo dog Breed of hunting and sled dog found near the Arctic Circle. It is believed by some to be representative of a pure breed 25,000–50,000 years old and by others to be descended from the wolf. It is powerfully built and big-boned, and it stands about 20–25 in. (51–64 cm) tall and weighs 65–85 lb (30–39 kg). Its long, waterproof outer coat, which varies in colour, covers a thick, woolly undercoat. See also spitz.

esophagus \i-'sä-fə-gəs\ Muscular tube that conveys food by peristalsis from the pharynx to the stomach. Both ends are closed off by sphincters (muscular constrictions), which relax to let food through and close to keep it from backing up. Disorders include ulceration and bleeding, heartburn from stomach acid, achalasia (failure of one or both sphincters to open), and muscle spasms. Scleroderma may involve the esophagus.

ESP See extrasensory perception

espalier \is-'pal-yər\ Tree or other plant trained to grow flat against a support (such as a trellis or wall). The term is also used for the support

© 2006 Encyclopædia Britannica, Inc.

itself, as well as for the method or technique. The technique was developed in Europe to encourage fruit-tree production in an incompatible climate; it originally used a wall to provide heat as well as support. Decorative or space-saving espaliers use metal, wire, or wooden frames to create ornamental shapes for shrubbery or to train trees on trellises, walls, or fences. Evergreens such as LOQUAT, fire thorn, sweet bay magnolia, and upright YEW, as well as dwarf APPLE and PEAR trees, make excellent espaliers.

Español, Pedro See Pedro BERRUGUETE

Espartero \ˌā-spär-'tā-rō**, Baldomero, prince de Vergara** (b. Oct. 27, 1793, Granátula, Spain—d. Jan. 8, 1879, Logroño) Spanish general and politician. After the accession of ISABELLA II, he joined the government forces opposed to Don Carlos (see CARLISM) and helped win the First Carlist War. He became head of the government in 1840 and was appointed regent in 1841. In 1843 a generals' revolt forced him to flee to England, where he lived until 1849. He returned to Spain, then shared control of the government (1854–56) with Gen. Leopoldo O'Donnell (1809–67) before returning to retirement.

esparto \is-'pär-tō\ Either of two species of gray-green needlegrasses (*Stipa tenacissima* and *Lygeum spartum*), native to southern Spain and northern Africa, or the fibre produced by esparto. *L. spartum* grows in rocky soil on the high plains. *S. tenacissima* flourishes in sandy, iron-rich soils in dry, sunny locations on the seacoast. Esparto fibre has great strength and flexibility; it is used for making ropes, sandals, baskets, mats, and other durable articles. Esparto leaves are used in the manufacture of paper.

Esperanto \ˌes-pə-'rän-tō\ Artificial language created in 1887 by Lazarus Ludwig Zamenhof (1859–1917), a Polish oculist, for use as an international second language. Zamenhof's *Fundamento de Esperanto* (1905) outlines its basic principles. All words, derived from roots commonly found in the European languages, are spelled as pronounced, and grammar is simple and regular. Nouns have no gender and end in *-o*, and there is only one definite article, *la* (e.g., *la amiko*, "the friend"). Adjectives are marked by the ending *-a*. Verbs are regular and have only one form for each tense or mood. The Universal Esperanto Association (founded 1908) has members in 83 countries. Estimates of the number of Esperanto-speakers range from 100,000 to several million.

espionage \'es-pē-ə-ˌnäzh\ Practice of obtaining military, political, commercial, or other secret information by means of spies or illegal monitoring devices. It is sometimes distinguished from the broader category of INTELLIGENCE gathering by its aggressive nature and its illegality. Counterespionage efforts are directed at detecting and thwarting espionage by others.

Espíritu Santo *formerly* **Marina** Island, northwestern VANUATU, South Pacific Ocean. Vanuatu's largest island, Espíritu Santo is 76 mi (122 km) long and 45 mi (72 km) wide and covers 1,420 sq mi (3,677 sq km). Volcanic in origin, it has a mountain range running along its western coast; Mount Tabwémasana rises to 6,165 ft (1,879 m). It is heavily wooded and has broad, fertile, well-watered valleys. Agriculturally developed, its principal settlement is Luganville (Santo) on the southeastern coast.

Esquire U.S. monthly magazine, founded in 1933 by Arnold Gingrich. It began as an oversized magazine for men that featured a sophisticated style and drawings of scantily clad young women. It later abandoned the risqué drawings but continued to cultivate the image of affluence and refined taste. It pioneered the treatment of unconventional topics and feature stories and attracted a general-interest audience with pieces by well-known writers. In the 1940s, because of its early notoriety, it was the object of an ultimately unsuccessful court case challenging its worthiness for mailing privileges at desirable rates. By the late 20th century, *Esquire* had lost its literary distinctiveness.

essay Analytic, interpretative, or critical literary composition, usually dealing with its subject from a limited and often personal point of view. Flexible and versatile, the essay was perfected by Michel de MONTAIGNE, who chose the name *essai* to emphasize that his compositions were "attempts" to express his thoughts and experiences. The essay has been the vehicle of literary and social criticism for some, while for others it could serve semipolitical, nationalistic, or polemical purposes and could have a detached, playful, earnest, or bitter tone.

Essen City (pop., 2002 est.: city, 591,889; metro. area, 5,823,685), North Rhine–Westphalia state, western Germany. Located on the RUHR RIVER, it is the site of an extensive ironworks and steelworks. It was originally the seat of a convent (founded 852), whose 15th-century cathedral still stands. Essen became a city in the 10th century and was locally sovereign until 1802, when it passed to Prussia. The development of ironworks, steelworks, and coal mines stimulated growth in the 19th century. The city was largely destroyed in World War II, when it was targeted by the Allies as a centre of the German war industry. It has since been rebuilt with large, modern buildings, including concert halls, an economic research institute, and an art institute.

Essene \i-'sēn, 'e-sēn\ Member of a Jewish sect active in Palestine from the 2nd century BC to the 1st century AD. The Essenes formed small monastic communities whose members strictly observed the laws of MOSES and the Sabbath and held their property in common. They withdrew from society, avoiding temple worship in Jerusalem and supporting themselves by manual labor. They usually excluded women. It is likely that the DEAD SEA SCROLLS were composed, copied, or collected by the Essenes.

essential oil Any of a class of highly volatile (readily evaporating) organic compounds found in plants and usually named for them (e.g., rose oil, peppermint oil). They have been known and traded since ancient times. Many essential oils contain ISOPRENOIDS. Some, such as oil of wintergreen (methyl salicylate) and orange oil (*d*-limonene), have one predominant component, but most have dozens or hundreds. Trace components impart an oil's characteristic odour, which synthetic or blended oils can rarely duplicate. Essential oils have three primary commercial uses: as odorants in perfumes, soaps, detergents, and other products; as flavours in baked goods, candies, soft drinks, and many other foods; and as pharmaceuticals, in dental products and many medicines (see AROMATHERAPY).

essentialism In ONTOLOGY, the view that some properties of objects are essential to them. The "essence" of a thing is conceived as the totality of its essential properties. Theories of essentialism differ with respect to their conception of what it means to say that a property is essential to an object. The concept of an essential property is closely related to the concept of necessity, since one way of saying that a property P is essential to an object O is to say that the proposition "O has P" is necessarily true (see NECESSITY). A general but not very informative way of characterizing essential properties is to say that a property is essential to an object if the object cannot lack the property and still be the object that it is. Properties of an object that are not essential in this sense are said to be accidental. See also IDENTITY OF INDISCERNABLES.

Essequibo \ˌe-se-'kwē-bō\ **River** River, east-central Guyana. The largest river between the AMAZON and the ORINOCO rivers and the longest in Guyana, it rises in the Acarai Mountains on the Brazilian border. It flows north for about 630 mi (1,000 km) to empty into the Atlantic Ocean 13 mi (21 km) from GEORGETOWN. Its estuary, 20 mi (32 km) wide, is obstructed by islands and silt but is navigable by small ocean vessels to Bartica, 50 mi (80 km) inland.

Essex Administrative (pop., 2001: 1,310,922), geographic, and historic county, eastern England. It extends along the North Sea coastline between the estuaries of the Rivers THAMES and STOUR. CHELMSFORD, centrally situated, has long been the county headquarters and is also the seat of a church diocese. The ancient county stretched west as far as MIDDLESEX, but Greater London now incorporates its southwestern corner. It was a Roman centre until the 5th-century Saxon invasions; it became one of the Anglo-Saxon kingdoms of the Heptarchy and had its centre at London. It came under Danish control in the 9th century and was later reconquered by WESSEX. Despite its proximity to London, much of Essex remains rural, and the county is highly farmed; it is also the site of petroleum installations on the River Thames and of a nuclear power plant. The University of Essex is at Colchester.

Essex Junto \'jən-ˌtō\ Informal group of FEDERALIST PARTY political leaders in Massachusetts, mainly from Essex county. Its members supported ALEXANDER HAMILTON and friendship with Britain and opposed THOMAS JEFFERSON, the EMBARGO ACT, and the WAR OF 1812. Its leaders, including TIMOTHY PICKERING, tried to form a separate confederation in New England and participated in the HARTFORD CONVENTION. They declined in importance after 1814.

© 2006 Encyclopædia Britannica, Inc.

Essex, Robert Devereux, 2nd earl of (b. Nov. 10, 1567, Netherwood, Herefordshire, Eng.—d. Feb. 25, 1601, London) English soldier and courtier. He was the son of the 1st earl of Essex. As a young man, he became the aging Elizabeth I's favorite, though their relationship was stormy. In 1591–92 he commanded the English force in France that helped Henry IV fight the French Roman Catholics, and in 1596 he commanded forces in the sack of Cádiz. In 1599 Elizabeth sent him to Ireland as lord lieutenant, where he fought an unsuccessful campaign against Irish rebels and concluded an unfavorable truce, leading Elizabeth to deprive him of his offices in 1600. In 1601 he made an unsuccessful attempt to raise the populace of London in revolt against Elizabeth; he was captured, tried by his former mentor Francis Bacon, and beheaded.

Robert Devereux, 2nd earl of Essex, detail of a painting after Marcus Gheeraerts the Younger, late 16th century; in the National Portrait Gallery, London

COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Essex, Robert Devereux, 3rd earl of (b. 1591, London, Eng.—d. Sept. 14, 1646, London) English military commander. Son of the 2nd earl of Essex, he began his military career in 1620 and commanded forces for Charles I until the Long Parliament deposed Charles's ministers (1640). As the English Civil Wars began, he was appointed to command the Parliamentary army. He fought against the Royalists at the indecisive Battle of Edgehill (1642) and advanced on London in 1643. His army was besieged at Lostwithiel, Cornwall, in 1644, and all surrendered except Essex, who escaped by sea. He resigned his command in 1645.

Essex, Walter Devereux, 1st earl of (b. Sept. 16, 1541, Carmarthen, Carmarthenshire, Wales—d. Sept. 22, 1576, Dublin, Ire.) English soldier. Born to a titled family, he helped suppress a rebellion in northern England in 1569 and was made earl of Essex in 1572. In 1573 he offered to subdue and colonize, at his own expense, a portion of Ulster that had not accepted English overlordship. There he treacherously captured and executed the Irish rebel leaders and massacred hundreds of the populace, contributing to Irish bitterness toward the English. Elizabeth I commanded him to break off the enterprise in 1575. He died of dysentery shortly after returning to Ireland from England.

establishment clause *or* **establishment-of-religion clause** Clause in the 1st Amendment to the U.S. Constitution forbidding Congress from establishing a state religion. It prevents the passage of any law that gives preference to or forces belief in any one religion. It is paired with a clause that prohibits limiting the free expression of religion.

estate law Laws governing the nature and extent of an owner's rights with respect to real and personal property. When used in connection with probate proceedings, it refers to the laws governing the disposition of the total property of whatever kind owned by a person at the time of death. See also estate tax, property, property tax.

estate tax Levy on the value of property changing hands at the death of the owner, fixed mainly by reference to its total value. Estate tax is generally applied only to estates whose value exceeds a set amount, and it is applied at graduated rates. An estate tax was first instituted in the U.S. in 1898 to help finance the Spanish-American War; it was repealed in 1902 but permanently reimposed in 1916, initially to help finance mobilization for World War I. Methods of avoiding estate tax (e.g., gifts and trust funds) were largely foiled by the U.S. Tax Reform Act of 1976.

Estates General *or* **States General** *French* **États-Généraux.** In pre-Revolutionary France, the representative assembly of the three "estates" or orders of the realm: the clergy and the nobility (both privileged minorities) as well as the Third Estate, which represented the majority of the people. Usually summoned by monarchs in times of crisis, the Estates General met at irregular intervals from the 14th century on; it was of limited effectiveness because the monarchy usually dealt with local Estates instead. The last meeting of the Estates General was at the start of the French Revolution in 1789, when the deputies of the Third Estate led in founding the National Assembly.

Este family \'es-tā\ Princely family of Lombard origin prominent in the history of medieval and Renaissance Italy. The Estensi, a branch of the 10th-century dynasty of the Obertenghi, took their name from the township and castle of Este, near Padua. The founder of the family was the margrave Alberto Azzo II (died 1097), through whose son Folco I (died 1136?) descended the House of Este. The family first gained prominence as leaders of the Guelphs in the wars between the Guelphs and Ghibellines. Members of the family ruled in Ferrara in the 13th–16th century. After Alfonso II (1533–1597), the fifth and last duke of Ferrara, died childless, direct papal rule was established in Ferrara in 1598, and the main branch of the Este family came to an end. The family also ruled in Modena and Reggio from the late Middle Ages to the late 18th century. In addition to their political prominence, members of the family also played an important role as promoters of art and culture.

Estenssoro, Víctor Paz See Victor Paz Estenssoro

ester Any of a class of organic compounds that can react with water (see hydrolysis) to produce an alcohol and an organic or inorganic acid. They are formed by the reverse process, esterification, in which acid reacts with alcohol to form an ester and water. Esters of carboxylic acids, the most common esters, contain the acid's carbonyl group (—C═O; see functional group); the carbon's fourth bond is with the alcohol's oxygen atom. Hydrolysis of esters in the presence of an alkali (saponification) is used to make soaps from fats and oils. Carboxylic acid esters of low molecular weight are colourless, volatile liquids with pleasant odours; they give flavour and fragrance to fruits and flowers and are used as synthetic flavours and fragrances. Others, such as ethyl acetate and butyl acetate, are used as solvents for lacquers, paints, and varnishes. Certain polymers are esters, including Lucite (polymethyl methacrylate) and Dacron (polyethylene terephthalate). Esters of alcohols and inorganic acids include nitrate esters (e.g., nitroglycerin), which are explosive; phosphate esters, including such biologically important compounds as nucleic acids; and others that are used as flame retardants, solvents, plasticizers, gasoline and oil additives, and insecticides.

Esterházy family \'es-tər-ˌhá-zē\ Aristocratic Magyar family, dating from at least the 15th century, that produced numerous Hungarian diplomats, army officers, and patrons of the arts. By the 18th century the Esterházys were the largest landowners in Hungary and possessed a private fortune even larger than that of the Habsburg emperors, whom they supported. The great Esterházy palace was built at Eisenstadt, on Neusiedler Lake. F.J. Haydn spent most of his career as music director at the palace. The family's various members held important governmental, ecclesiastical, diplomatic, and military posts in Hungary well into the 20th century.

Estes \'es-tēz**, William K(aye)** (b. June 17, 1919, Minneapolis, Minn., U.S.) U.S. psychologist. He worked with B.F. Skinner on instrumental learning in the 1940s, and in 1950 he introduced stimulus sampling theory (SST), a model for describing learning mathematically. He taught at Stanford, Rockefeller, and Harvard universities, among others. Estes's later work focused on "cognitive architectures." His works include *Learning Theory and Mental Development* (1970), *Statistical Models in Behavioral Research* (1991), and *Classification and Cognition* (1994). In 1997 he received the National Medal of Science.

Esther Heroine and central figure in the book of Esther. She was a beautiful Jewish woman, the wife of the Persian king Ahasuerus (Xerxes I). She and her cousin Mordecai persuaded the king to cancel an order for the extermination of Jews in his realm, plotted by the king's chief minister, Haman. Instead, Haman was hanged on the gallows he had built for Mordecai, and the Jews were given permission to destroy their enemies. The Jewish festival of Purim celebrates this event. The book of Esther was probably written in the 2nd century BC.

Estienne \ā-'tyen**, Henri II** *or* **Henri II Étienne** (b. 1528, Paris, France—d. 1598, Lyon) French scholar-printer. As a young man he traveled Europe studying ancient manuscripts and visiting scholars before returning to his father's Geneva printing firm to publish the first printed editions of several Greek texts. In 1566 he published a Latin edition of Herodotus with a controversial apologia in which he bitterly satirized his own age. His voluminous output of classical scholarship also included a 13-volume Greek and Latin text of Plutarch and a 5-volume Greek dic-

© 2006 Encyclopædia Britannica, Inc.

tionary, *Thesaurus graecae linguae* (both 1572). New editions of the dictionary, his greatest work, were printed into the 19th century.

estimation In mathematics, use of a FUNCTION or formula to derive a solution or make a prediction. Unlike approximation, it has precise connotations. In statistics, for example, it connotes the careful selection and testing of a function called an estimator. In calculus, it usually refers to an initial guess for a solution to an equation, which is gradually refined by a process that generates closer estimates. The difference between the estimate and the exact value is the ERROR.

Estonia *officially* **Republic of Estonia** Country, northeastern Europe. It consists of a mainland area and some 1,500 islands and islets in the Baltic Sea. Area: 17,462 sq mi (45,227 sq km). Population (2005 est.):

1,345,000. Capital: TALLINN. Estonians make up about two-thirds of the population. Russians account for almost one-third, and there are Ukrainian, Finnish, and Belarusian minorities. Language: Estonian (official). Religion: Christianity (other Christians [mostly unaffiliated], Protestant, Eastern Orthodox). Currency: kroon. The land is low and hilly, with numerous lakes, forests, and rivers. It has a cool-temperate and humid climate. The economy is mainly industrial, producing shale oil, machinery, fabricated metal products, and building materials. It is noted for its textiles, and woodworking is a traditional and important industry. Estonia is a republic with one legislative body; the chief of state is the president, and the head of government is the prime minister. It was invaded by Vikings in the 9th century AD and later by Danes, Swedes, and Russians, but the Estonians were able to withstand the assaults until the Danes took control in 1219. In 1346 the Danes sold their sovereignty over Estonia to the TEUTONIC ORDER, which was then in possession of LIVONIA (southern Estonia and Latvia). In the mid-16th century Estonia was once again divided: northern Estonia capitulated to Sweden, and Poland gained Livonia, which it surrendered to Sweden in 1629. Russia acquired Livonia and Estonia in 1721. Nearly a century later, serfdom was abolished. From 1881 Estonia underwent intensive Russification. In 1918 Estonia obtained independence from Russia, which lasted until the Soviet Union occupied the country in 1940 and forcibly incorporated it into the U.S.S.R. Germany held the region (1941–44) during World War II, but the Soviet regime was restored in 1944, after which Estonia's economy was collectivized and integrated into that of the Soviet Union. In 1991, along with other parts of the former U.S.S.R., Estonia proclaimed its independence and subsequently held elections. In the 21st century Estonia continued negotiations with Russia to settle their common border, and, along with the other Baltic states, it joined the EUROPEAN UNION in 2004.

Estremadura See EXTREMADURA

estrogen \'es-trə-jən\ Any of a class of hormones that primarily influence the female REPRODUCTIVE SYSTEM's development, maturation, and function. The three major estrogens—estradiol, estrone, and estriol—are produced mainly by the OVARIES and PLACENTA; the ADRENAL GLANDS and the TESTES secrete smaller amounts. Estrogens affect the ovaries, VAGINA, fallopian tubes, UTERUS, and MAMMARY GLANDS and play crucial roles in PUBERTY, MENSTRUATION, PREGNANCY, and PARTURITION (labour). They also influence the structural differences between female and male bodies. In experimental animals, loss of estrogens diminishes mating desires and other behavioral patterns.

estrus Period in the sexual cycle of female MAMMALS, except the higher PRIMATES, during which they are in heat (ready to accept a male for mating). Some animals (e.g., DOGS) have only one heat during a breeding season; others (e.g., GROUND SQUIRRELS) will come into heat repeatedly during the breeding season until impregnated. During estrus the female secretes PHEROMONES that signal her receptivity to the males; her genital area may become swollen, and she may also give behavioral signals.

estuary \'es-chə-ˌwer-ē\ Partly enclosed coastal body of water in which river water is mixed with seawater. An estuary is thus defined by salinity rather than geography. Many coastal features designated by other names are in fact estuaries (e.g., Chesapeake Bay). Some of the oldest continuous civilizations have flourished in estuarine environments (e.g., the land between the Tigris and Euphrates rivers, the Nile delta, the Ganges delta, and the lower Huang He valley). Cities such as London (River Thames), New York (Hudson River), and Montreal (St. Lawrence River) developed on estuaries and became important commercial centres.

Etana Epic \ā-'tä-nä\ Ancient Mesopotamian myth concerning dynastic succession. The gods chose Etana as the first king, but his wife, though pregnant, could not give birth, and thus Etana had no heir. The god SHAMASH answered Etana's prayers by directing him to rescue a maimed eagle, which rewarded Etana by carrying him high up in the sky, near heaven, where Etana could obtain the birth plant to help his wife. Surviving texts are incomplete and divergent: in one version Etana makes it to heaven (but the text then breaks off); in another he falls to earth. A king named Etana ruled Kish in southern Mesopotamia sometime in the 3rd millennium BC.

etching Method of engraving in which lines or textures are bitten, or etched, into a metal plate, usually copper, with acid. The image produced has a spontaneity of line that comes from drawing on the plate in the same direct way as with pen or pencil on paper. The first etchings date from the early 16th century, but the basic principle had been used earlier for the decoration of armour. Among the pioneers of the medium were ALBRECHT ALTDORFER, ALBRECHT DÜRER, and PARMIGIANINO; the greatest of all etchers was REMBRANDT. In the 20th century, etching was especially popular for book illustration. See also AQUATINT; ENGRAVING.

ethanol \'e-thə-ˌnȯl\ *or* **ethyl alcohol** *or* **grain alcohol** Organic compound, most important of the ALCOHOLS, chemical formula CH_3CH_2OH. Produced by FERMENTATION, it is the intoxicating ingredient in ALCOHOLIC BEVERAGES. Ethanol for industrial purposes is made by either fermentation or chemical synthesis, then purified by DISTILLATION and, to avoid the tax levied on ethyl alcohol for drinking, made unfit to drink (see DENATURATION) by mixing it with compounds such as METHANOL, BENZENE, or KEROSENE. Ethanol has many uses as a solvent, a raw material, an extraction medium, an antifreeze, an antiseptic, and a gasoline additive and substitute. It is toxic, depressing the central NERVOUS SYSTEM, and addictive to some persons (see ALCOHOLISM). Moderate amounts depress the inhibitory activities of the brain and so appear to stimulate the mind, but larger amounts seriously impair coordination and judgment; excessive consumption can cause COMA and death. Taking ethanol in combination with BARBITURATES or related drugs is especially dangerous.

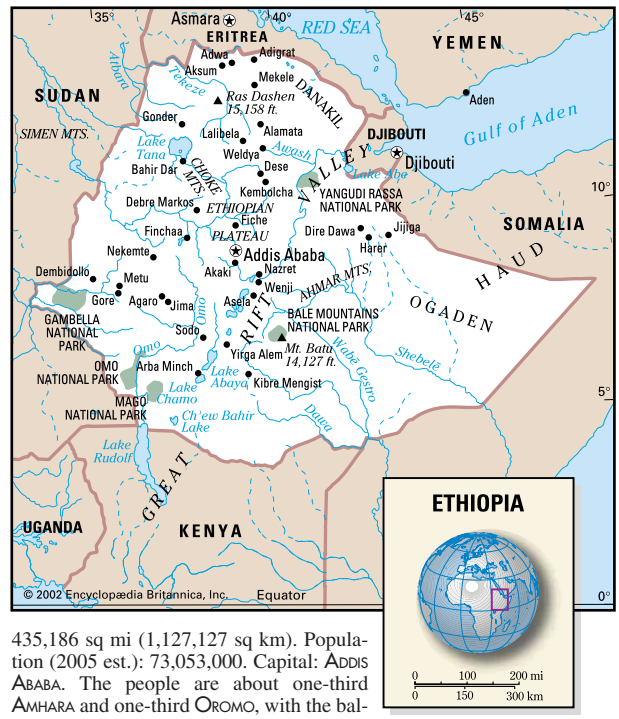
Ethelbert I *or* **Aethelberht I** (d. Feb. 24, 616) King of Kent (560–616). He married the Christian Bertha, daughter of the king of Paris, and, when St. AUGUSTINE OF CANTERBURY and other missionaries arrived in Kent in 597, he welcomed them and gave them a dwelling at Canterbury. Though baptized by Augustine along with thousands of his subjects, he did not try to establish Christianity by decree. He produced the first written laws in Anglo-Saxon (see ANGLO-SAXON LAW).

Ethelred II *or* **Aethelred Unraed** *known as* **Ethelred the Unready** (b. 968?—d. April 23, 1016, London) King of the English

© 2006 Encyclopædia Britannica, Inc.

(978–1013, 1014–16). He became king after his half brother's assassination and was suspected of involvement in the murder. An ineffectual ruler, he failed to mount an organized defense against the Danish invasions (from 980); his massacre of Danish settlers (1002) provoked further attacks. When SWEYN I was accepted as king in England in 1013, Ethelred fled to Normandy. He returned to the throne on the death of Sweyn in 1014, but on his death he was succeeded by the Dane CANUTE THE GREAT. His epithet "Unraed" means "evil counsel" and has been translated incorrectly as "the Unready."

ether \'ē-thər\ Any of a class of organic compounds whose molecular structure has an oxygen atom interposed between two carbon atoms that are part of hydrocarbon molecules. Ethers have the general chemical formula ROR', in which R and R' represent the hydrocarbons. They resemble ALCOHOLS but generally are less dense, less soluble in water, more volatile, and more inert. They are used in chemical processing, for extraction and separation of chemicals, and as solvents. Some are used as insecticides and soil fumigants. They are also used in medicine and pharmacology. CODEINE is the methyl ether of MORPHINE. The term *ether* often refers to ethyl ether ($C_2H_5OC_2H_5$), best known as an anesthetic but also used as a solvent, an extractant, and a reaction medium.



Etherege \'eth-rij**, Sir George** (b. c. 1635, Maidenhead, Berkshire, Eng.?—d. c. May 10, 1692) British playwright. He is remembered as the creator of the Restoration comedy of manners. His first comedy, *Love in a Tub* (1664), was an immediate success and was novel in its lively exploitation of contemporary manners. He also wrote *She Wou'd if She Cou'd* (1668) and the popular *The Man of Mode* (1676). Though his own plays ceased to be performed after the 18th century, his style of comedy was adopted by later playwrights and persisted into modern times.

Ethernet Telecommunications networking PROTOCOL introduced by Xerox Corp. in 1979. It was developed as an inexpensive way of sending information quickly between office machines connected together in a single room or building, but it rapidly became a standard computer interconnection method. The original data rate of 10 megabits per second has been increased to 100 megabits per second for a new standard known as fast ethernet. The original specification required COAXIAL CABLE as the communications medium, but costs have been reduced through the employment of simple paired wires. See also computer NETWORK.

ethical relativism Philosophical view that what is right or wrong and good or bad is not absolute but variable and relative, depending on the person, circumstances, or social situation. Rather than claiming that an action's rightness or wrongness can depend on the circumstances, or that people's beliefs about right and wrong are relative to their social conditioning, it claims (in one common form) that what is truly right depends solely on what the individual or the society thinks is right. Because what people think will vary with time and place, what is right will also vary. If, however, changing and even conflicting moral principles are equally valid, there is apparently no objective way of justifying any principle as valid for all people and all societies. This conclusion is rejected by consequentialists (see CONSEQUENTIALISM) and deontologists (see DEONTOLOGICAL ETHICS) alike.

ethics Branch of philosophy concerned with the nature of ultimate value and the standards by which human actions can be judged right or wrong. The term is also applied to any system or theory of moral values or principles. Ethics is traditionally subdivided into normative ethics, metaethics, and applied ethics. Normative ethics seeks to establish norms or standards of conduct; a crucial question in this field is whether actions are to be judged right or wrong based on their consequences or based on their conformity to some moral rule, such as "Do not tell a lie." Theories that adopt the former basis of judgment are called consequentialist (see CONSEQUENTIALISM); those that adopt the latter are known as deontological (see DEONTOLOGICAL ETHICS). Metaethics is concerned with the nature of ethical judgments and theories. Since the beginning of the 20th century, much work in metaethics has focused on the logical and semantic aspects of moral language. Some major metaethical theories are naturalism (see NATURALISTIC FALLACY), INTUITIONISM, EMOTIVISM, and PRESCRIPTIVISM. Applied ethics, as the name implies, consists of the application of normative ethical theories to practical moral problems (e.g., abortion). Among the major fields of applied ethics are bioethics, business ethics, legal ethics, and medical ethics.

Ethiopia \ˌē-thē-'ō-pē-ə\ *officially* **Federal Democratic Republic of Ethiopia** *formerly* **Abyssinia** Country, eastern Africa. It is situated on the Horn of Africa, the continent's easternmost projection. Area:

435,186 sq mi (1,127,127 sq km). Population (2005 est.): 73,053,000. Capital: ADDIS ABABA. The people are about one-third AMHARA and one-third OROMO, with the balance mostly Tigray, Afar, Somali, Saho, and Agew. Languages: Amharic, Oromo. Religions: Christianity (predominantly Ethiopian Orthodox; also Protestant), Islam, traditional beliefs. Currency: birr. The landlocked country is mountainous in the north, with lowlands to the east and west. The central Ethiopian Plateau is split by the GREAT RIFT VALLEY, which divides the eastern and western highlands. The climate is temperate in the highlands, which are mainly savanna, and hot in the arid lowlands. Intensive farming and deforestation have led to severe erosion; this, along with periodic droughts, has produced periodic food shortages. The country's once abundant wildlife has been decimated; many species are endangered. Ethiopia is one of the world's poorest countries. Agriculture is mainly for subsistence, with cereals the main crop. Livestock is also important. Coffee is the main export, followed by hides and skins. A new republic was established in 1995; it has two legislative houses, the chief of state is the president, and the head of government is the prime minister. Ethiopia, the Biblical land of KUSH, was inhabited from earliest antiquity and was once under ancient Egyptian rule. Ge'ez-speaking agriculturalists established the kingdom of Da'amat in the 7th century BC. After 300 BC they were superseded by the kingdom of AKSUM, whose King Menilek I was, according to legend, the son of King SOLOMON and the Queen of Sheba. Christianity was introduced in the 4th century AD and became widespread (see ETHIOPIAN ORTHODOX CHURCH). Ethiopia's prosperous Mediterranean trade was cut off by the Muslim Arabs in the 7th–8th century, and the area's interests were directed southward. Contact with Europe resumed in the late 15th century with the arrival of the Portuguese. Modern Ethiopia began with the reign of TEWODROS II, who began the consolidation of the country. In the wake of European encroachment, the coastal region was made an Italian colony in 1889, but under Emperor MENILEK II the Italians were defeated and ousted in 1896. Ethiopia prospered under his rule, and his modernization programs were continued by Emperor HAILE SELASSIE in the 1930s. In 1936 Italy again gained control of the country and held it as part of Italian East Africa until 1941, when it was occupied by the British. Ethiopia incorporated ERITREA in 1952. In 1974 Haile Selassie was deposed, and a Marxist government, plagued by civil wars and famine, controlled the country until 1991. In 1993 Eritrea gained its independence, but there were continued border conflicts with it and neighbouring Somalia.

Ethiopian Orthodox church Independent Christian patriarchate in Ethiopia. Traditionally thought to have been founded by the preaching of the apostle Matthew or the eunuch of the Acts of the Apostles, the church was established in the 4th century by St. Frumentius and his brother

© 2006 Encyclopædia Britannica, Inc.

Aedesius. Based in Addis Ababa, the church adheres to Monophysite doctrine (see MONOPHYSITE HERESY). It accepts the honorary primacy of the Coptic PATRIARCH of Alexandria, who appointed its ARCHBISHOPS from the 12th century until 1959, when an autonomous Ethiopian patriarchate was established. Its customs include circumcision, rigorous fasting, and the participation of laypersons known as *debtera*, who perform liturgical music and dances and act as astrologers, scribes, and fortune-tellers. Its principal adherents are the Amhara and Tigray peoples of the northern and central highlands. See also COPTIC ORTHODOX CHURCH.

Ethiopianism Religious movement among sub-Saharan Africans during the colonial era. It originated in South Africa in the 1880s, with the formation of all-African Christian churches such as the Tembu tribal church and the Church of Africa. The term was first used by Mangena Mokone when he founded the Ethiopian Church in 1892. Africans resented the blatant racism of European colonialists, who denied them advancement in religious and political hierarchies. They also wanted a version of Christianity relevant for Africa and a return to tribal life. Parallel developments occurred in Nigeria, Cameroon, Ghana, Kenya, and other locations. Ethiopian movements played some part in the Zulu rebellion of 1906 and the Nyasaland rising of 1915. In the 1920s political aspirations moved away from religion and became tied to political parties and trade unions.

Ethiopic \ˌē-thē-ˈō-pik\ **languages** Group of SEMITIC LANGUAGES, spoken by more than 25 million people in Eritrea and Ethiopia. Ethiopic has been divided by linguists into North Ethiopic, comprising Ge'ez, Tigré, and Tigrinya (or Tigrai), and South Ethiopic, comprising the rest of the 22 languages. Ge'ez (or Ethiopic) is the oldest Ethiopian Semitic language, first attested in inscriptions from the kingdom of AKSUM. It became the language of Christianity in the Aksumite period, and—though probably extinct as a vernacular sometime before the 10th century AD—it remained the classical language of highland Ethiopian civilization and the liturgical language of the ETHIOPIAN ORTHODOX CHURCH into the 20th century. Tigré has about 800,000 speakers in northern Eritrea, while Tigrinya has about 4 million speakers. The estimated 1.3 million Tigrinya speakers in Eritrea constitute about 50% of the country's population. The most important South Ethiopic language is AMHARIC.

ethnic cleansing The creation of an ethnically homogenous geographic area through the elimination of unwanted ethnic groups by deportation, forcible displacement, or GENOCIDE. Ethnic cleansing also has involved attempts to remove physical vestiges of the targeted group in the territory through the destruction and desecration of monuments, cemeteries, and houses of worship. Although some critics of the term have claimed that ethnic cleansing is simply a form of genocide, defenders of the usage have noted that, whereas the murder of an ethnic, racial, or religious group is the primary intention of a genocidal policy, the chief goal of ethnic cleansing is the establishment of homogenous lands, which may be achieved by any of a number of methods including genocide. The term was widely employed in the 1990s to describe the brutal treatment of Bosniacs (Bosnian Muslims), ethnic Serbs in the Krajina region of Croatia, and ethnic Albanians in the Serbian province of Kosovo during the conflicts that erupted in the wake of the disintegration of Yugoslavia.

ethnic group Social group or category of the population that, in a larger society, is set apart and bound together by common ties of LANGUAGE, nationality, or CULTURE. Ethnic diversity, the legacy of political conquests and migrations, is one aspect of the social complexity found in most contemporary societies. The nation-state has traditionally been uneasy with ethnic diversity, and nation-states have often attempted to eliminate or expel ethnic groups. Most nations today practice some form of PLURALISM, which usually rests on a combination of toleration, interdependence, and separatism. The concept of ethnicity is more important today than ever, as a result of the spread of doctrines of freedom, self-determination, and democracy. See also CULTURE CONTACT; ETHNIC CLEANSING; ETHNOCENTRISM; RACE; RACISM.

ethnocentrism Tendency to interpret or evaluate other cultures in terms of one's own. Generally considered a human universal, it is evident in the widespread practice of labeling outsiders as "savages" or "barbarians" simply because their societies differ from those of the dominant culture. Early anthropologists often reflected this tendency, as did Sir John Lubbock, who characterized all nonliterate peoples as being without religion, and Lucien Lévy-Bruhl, who found them to have a "prelogical mentality" because their worldview was unlike that of western Europe. The opposite of ethnocentrism is cultural relativism, the understanding of cultural phenomena within the context in which they occur.

ethnography \eth-ˈnä-grə-fē\ Descriptive study of a particular human society. Contemporary ethnography is based almost entirely on fieldwork. The ethnographer lives among the people who are the subject of study for a year or more, learning the local language and participating in everyday life while striving to maintain a degree of objective detachment. He or she usually cultivates close relationships with "informants" who can provide specific information on aspects of cultural life. While detailed written notes are the mainstay of fieldwork, ethnographers may also use tape recorders, cameras, or video recorders. Contemporary ethnographies have both influenced and been influenced by literary theory. See also BRONISŁAW MALINOWSKI; CULTURAL ANTHROPOLOGY.

ethnomusicology Scholarly study of music as an aspect of culture. Taking an anthropological approach (it was originally called "comparative musicology"), it has tended to focus on non-Western music, particularly music of oral traditions. The field's origins lie in the late 19th century with the work of scholars such as François-Joseph Fétis (1784–1871) and Carl Stumpf (1848–1936). Much work was motivated by the search for musical universals, under the assumption that prehistory could be studied through research into "primitive" cultures of the present. Recognizing that traditional societies were quickly disappearing with the modern world's encroachment, ethnomusicologists soon put their highest priority on collection (by field recording, using the new recording technology) and transcription (using newly devised pitch calibrations). A number of classification schemes for comparative analysis of different musics have been proposed, but the natural focus remains on diversity.

ethology \ē-ˈthä-lə-jē\ Study of animal behaviour. It is a combination of laboratory and field science, with strong ties to other disciplines (e.g., neuroanatomy, ECOLOGY, EVOLUTION). Though many naturalists have studied aspects of animal behaviour through the centuries, the modern science of ethology is considered to have arisen as a discrete discipline with the work in the 1920s of NIKOLAAS TINBERGEN and KONRAD LORENZ. Interested in the behavioral process rather than in a particular animal group, ethologists often study one type of behaviour (e.g., aggression) in various unrelated animals.

ethyl alcohol See ETHANOL

ethylene Simplest OLEFIN (CH_2CH_2), a colourless, flammable gas with a sweetish taste and odour. The PETROCHEMICAL having the highest volume, it occurs in PETROLEUM and NATURAL GAS but is usually produced by heating higher HYDROCARBONS (usually ethane and ethane-propane mixtures). Ethylene is polymerized to POLYETHYLENE either at high pressures and temperatures or by CATALYSIS. It reacts with numerous other chemicals to produce ETHANOL, solvents, gasoline additives, ANTIFREEZE, detergents, and various plastics. In plants, ethylene is a HORMONE that inhibits growth and promotes leaf fall and fruit ripening.

ethylene glycol \ˈe-thə-ˌlēn-ˈglī-ˌkȯl\ Simplest member of the GLYCOL family, also called 1,2-ethanediol ($HOCH_2CH_2OH$). It is a colourless, oily liquid with a mild odour and sweet taste. Widely used as an ANTIFREEZE in automobile cooling systems, it is also used in many other chemical processes. It and some of its derivatives are fairly toxic. Many dogs, cats, and wild animals are attracted by its sweetness and poisoned by drinking ethylene glycol antifreeze that has been carelessly discarded.

ethyne See ACETYLENE

Etna, Mount Active volcano, eastern coast of Sicily, Italy. The highest active volcano in Europe, its elevation is more than 10,000 ft (3,200 m); its base has a circumference of about 93 mi (150 km). Mount Etna has repeatedly erupted over the centuries, most violently in 1669, when the lava flow destroyed villages on the lower slope and submerged part of the town of CATANIA. Activity was almost continuous in the decade following 1971, and in 1983 an eruption that lasted four months prompted authorities to explode dynamite in an attempt to divert lava flows. Mount Etna also experienced violent eruptions in 2001–02, prompting the Italian government to declare a state of emergency.

Etobicoke \i-ˈtō-bə-ˌkōk\ Former city (pop., 2001: 338,117), southeastern Ontario, Canada. In 1998 it joined the cities of NORTH YORK, SCARBOROUGH, YORK, and TORONTO and the borough of EAST YORK to become the City of Toronto. Etobicoke occupies an area of 48 sq mi (124 sq km); it was established in 1967 through the amalgamation of the township of Etobicoke and several surrounding municipalities. Its name is derived from an Indian word meaning "place where the alders grow."

© 2006 Encyclopædia Britannica, Inc.

Eton \'ē-tən\ **College** Largest public school (independent secondary school) in England and one of the most prestigious. It is located in Eton, Berkshire. It was founded by Henry VI in 1440–41, the same year he founded King's College, Cambridge. By tradition, 24 scholarships are reserved at Cambridge for Etonians. Boys enter Eton at about age 13. Most come from England's wealthiest families, though 70 scholarships are awarded on the basis of competitive examination.

Etosha \ē-'tō-shə\ **National Park** National reserve, northern Namibia. Covering some 8,598 sq mi (22,269 sq km), it centres on the Etosha Pan, a vast expanse of salt with lone salt springs, used by animals as salt licks. It has one of the largest populations of big-game species in the world, including lions, elephants, rhinoceros, elands, zebras, and springbok.

Etruria \i-'trůr-ē-ə\ Ancient country, central Italy. It covered the region that now comprises Tuscany and part of Umbria. Etruria was inhabited by the Etruscans, who established a civilization by the 7th century BC. Their chief confederation, traditionally including 12 cities, developed a culture that reached its height in the 6th century BC. Etruscan power extended into northern and southern Italy at its peak, but the cities of Etruria were gradually absorbed by Rome during the 3rd century BC.

Etruscan Any member of an ancient people of Etruria, whose urban civilization reached its height in the 6th century BC. Their origins are obscure. By the 7th century they had incorporated all of Tuscany into their territory, and in the 6th century they pushed north to the Po River valley and became rulers of Rome. The Etruscans gave the city its first public works, including walls and a sewer system. By the end of the 6th century, pressure from other peoples in the region, including Greeks, Romans, and Gauls, weakened Etruria. The Romans expelled their dynasty in 509 BC. The Etruscans had a commercial and agricultural civilization and left a rich cultural heritage, including wall frescoes and realistic tomb portraits. Many features of their culture were adopted by the Romans. See also Etruscan language; Etruscan religion.

Etruscan art (c. 8th–4th centuries BC) Art of the people of Etruria. The art of the Etruscans falls into three categories: funerary, urban, and sacred. Because of Etruscan attitudes toward the afterlife, most of the art that remains is funerary. Characteristic achievements are the wall frescoes—painted in two-dimensional style—and realistic terra-cotta portraits found in tombs. Bronze reliefs and sculptures are also common. Tombs found at Caere, carved underground out of soft volcanic rock, resemble houses. Urban architecture was another specialty; Etruscans were among the first in the Mediterranean to lay out cities with a grid plan, a practice copied by the Romans. In the sacred area, Etruscan temples had a deep front porch with columns and abundant terra-cotta roof sculptures, such as those from the temple at Veii (late 6th century). Etruscan art was influenced by Greek art and in turn influenced the development of realistic portraiture in Italy.

A detail from a fresco dating from the 5th century BC shows Etruscan musicians wearing tunics and sandals.
SCALA/ART RESOURCE, NEW YORK CITY

Etruscan language Language spoken by the ancient people of Etruria in what is now Italy. Its proposed relations with the Indo-European family have not been generally accepted, and Etruscan remains a linguistic isolate (i.e., unrelated to any other language). Known mainly from inscriptions that date from the 7th century BC to the 1st century AD, Etruscan was written in an alphabet probably derived from one of the Greek alphabets.

Etruscan religion Beliefs and practices of the ancient people of Etruria in western Italy. The Etruscans believed that the gods manifested their nature and will in every aspect of the natural world, such that every bird and berry was a potential source of knowledge of the gods. The characteristics of their more than 40 deities were often vague or changeable, though some were later equated with the major Greek and Roman deities. Famous for divination, the Etruscans sought to learn the future, looking for divine signs in lightning, the livers of sacrificed animals, and the flights of birds. Belief in the afterlife led to the construction of elaborate tombs that were furnished as houses for the dead. Many features of Etruscan religion were later adopted by the Romans.

Etymander River See Helmand River

eubacteria \ˌyü-bak-'tir-ē-ə\ Group consisting of the true bacteria, one of two major groups of the prokaryotes. The other is the archaebacteria, which are as different from eubacteria as either is from eukaryotes. The two groups are thought to have evolved separately from a common ancestor early in earth's history, and they differ in fundamental ways. Virtually all the familiar bacteria that cause diseases (e.g., *E. coli*, staphylococcus and salmonella strains, mycobacteria) or are important in food, agriculture, biotechnology, and other industrial activity (e.g., *Lactobacillus*, nitrifying and denitrifying bacteria, and lactobacillus and streptomyces strains) are eubacteria.

Euboea \yü-'bē-ə\ *Greek* **Évvoia** \'e-vē-ä\ Island, Greece, in the Aegean Sea. The second largest of the Greek islands, it is about 110 mi (180 km) long and 4–30 mi (6–48 km) wide. It is mainly mountainous but includes the fertile plain of the Lílas River, which was in antiquity a famous horse-breeding region. Euboea is connected with Boeotia by a bridge built by the Chalcidians. It was dominated by Athens for much of the 5th century BC, while its main cities of Chalcis and Eretria were involved in the Persian and Peloponnesian wars. From 146 BC it was part of the Roman province of Macedon. Euboea was controlled by Venice from 1366, conquered by the Turks in 1470, and passed to Greece in 1830.

eucalyptus \ˌyü-kə-'lip-təs\ Any of the more than 500 species of mostly very large trees in the genus *Eucalyptus*, in the myrtle family, native to Australia, New Zealand, Tasmania, and nearby islands. Many species are grown widely throughout the temperate regions of the world as shade trees or in forestry plantations. Because they grow rapidly, many species attain great height. The leaf glands of many species, especially *E. salicifolia* and *E. globulus*, contain a volatile, aromatic oil known as eucalyptus oil, used mostly in medicines. Eucalyptus wood is used extensively in Australia as fuel, and the timber is commonly used in buildings and fencing. The bark of many species is used in papermaking and tanning.

Eucharist \'yü-kə-rəst\ *or* **Holy Communion** *or* **Lord's Supper** Christian rite commemorating the Last Supper of Jesus with his disciples. On the night before his death, according to the Christian scriptures, Jesus consecrated bread and wine and gave them to his disciples, saying "this is my body" and "this is my blood." He also commanded his followers to repeat this rite in his memory, and the Eucharist traditionally involves consecration of bread and wine by the clergy and their consumption by worshipers. Although celebrated spontaneously when the first Christians gathered to share a meal, the Eucharist quickly became a central part of the formal worship service and remained that way despite the many controversies over its nature and meaning. Intended as a means of fostering unity in the church, it has also been a source of division because of differing interpretations of its nature. In Roman Catholicism the Eucharist is a sacrament, and the bread and wine are thought to become the actual body and blood of Jesus through transubstantiation. Anglicans and Lutherans also emphasize the divine presence in the offering and recognize it as a sacrament, while others regard it as a memorial with largely symbolic meaning. Also controversial has been the belief in the Eucharist as a sacrifice, the renewed offering of Christ each time the rite is celebrated at the altar.

Eucken \'öi-kən**, Rudolf Christoph** (b. Jan. 5, 1846, Aurich, East Friesland—d. Sept. 14, 1926, Jena, Ger.) German philosopher. He taught primarily at the University of Jena (1874–1920). Distrusting abstract intellectualism and systematics, Eucken centred his philosophy upon actual human experience. He maintained that man is the meeting place of nature and spirit and that it is a human duty and privilege to overcome nature by incessant striving after the spiritual life. A strong critic of naturalism,

© 2006 Encyclopædia Britannica, Inc.

he held that humans are differentiated from the rest of the natural world by their possession of a soul, an entity that cannot be explained in terms of natural processes. He also was known as an interpreter of Aristotle. He won the Nobel Prize for Literature in 1908.

Euclid \'yü-kləd\ (fl. c. 300 BC, Alexandria, Egypt) Greek mathematician of antiquity, known primarily for his highly influential treatise on geometry, the *Elements*. He founded a school in Alexandria during the reign of Ptolemy I. Little is known of his life, but there are many anecdotes. In the most famous, asked by Ptolemy if there is a shorter way to geometry than through his *Elements*, Euclid replies, "There is no royal road to geometry." The *Elements*, based on the works of earlier mathematicians, is a brilliant synthesis of old and new. It has been a major influence on rational thought and a model for many philosophical treatises, and it has set a standard for logical thinking and methods of proof in the sciences. The starting point not just of Euclidean geometry but of an approach to reasoning, it is sometimes said to be the most translated, published, and studied work after the Bible.

Euclidean geometry Study of points, lines, angles, surfaces, and solids based on Euclid's axioms. Its importance lies less in its results than in the systematic method Euclid used to develop and present them. This axiomatic method has been the model for many systems of rational thought, even outside mathematics, for over 2,000 years. From 10 axioms and postulates, Euclid deduced 465 theorems, or propositions, concerning aspects of plane and solid geometric figures. This work was long held to constitute an accurate description of the physical world and to provide a sufficient basis for understanding it. During the 19th century, rejection of some of Euclid's postulates resulted in two non-Euclidean geometries that proved just as valid and consistent.

Euclidean space In geometry, a two- or three-dimensional space in which the axioms and postulates of Euclidean geometry apply; also, a space in any finite number of dimensions, in which points are designated by coordinates (one for each dimension) and the distance between two points is given by a distance formula. The only conception of physical space for over 2,000 years, it remains the most compelling and useful way of modeling the world as it is experienced. Though non-Euclidean spaces, such as those that emerge from elliptic geometry and hyperbolic geometry, have led scientists to a better understanding of the universe and of mathematics itself, Euclidean space remains the point of departure for their study.

eudaemonism \yü-'dē-mə-ˌni-zəm\ In ethics, the view that the ultimate justification of virtuous activity is happiness. Virtuous activity may be conceived as a means to happiness, or well-being, or as partly constitutive of it (see teleological ethics). Ethical eudaemonism should be distinguished from psychological eudaemonism, which holds that happiness is the ultimate motive of virtuous activity.

Eudocia Macrembolitissa \yü-'dō-shə-ˌmak-rəm-ˌbä-lə-'ti-sə\ (b. 1021, Constantinople, Byzantine Empire—d. 1096, Constantinople) Byzantine empress and regent, called the wisest woman of her time. As the wife of Constantine X Ducas, she became regent for her three sons after his death (1067). To fend off the Seljuq Turks, she married a Cappadocian general, Romanus Diogenes (later Romanus IV Diogenes). After his capture at the Battle of Manzikert (1071), Eudocia and her son Michael ruled jointly and deposed Romanus. After Michael succeeded to the throne, Eudocia entered a convent.

Eugene City (pop., 2000: 137,893), western Oregon, U.S. Located on the Willamette River, it was settled by Eugene Skinner in 1846. Named Eugene City in 1853, it grew as an agricultural and lumber centre with the arrival of the railroad in 1870. It is the site of the University of Oregon (founded 1872) and Northwest Christian College (1895). It is a tourist centre for the MacKenzie River recreational area and Willamette National Forest.

Eugene of Savoy *orig.* **François-Eugène, prince de Savoie-Carignan** (b. Oct. 18, 1663, Paris, France—d. April 24, 1736, Vienna, Austria) French-Austrian general. Born in Paris, he was the son of the count de Soissons, of the house of Savoy-Carignan, and of Olympe Mancini (see Mancini family), niece of Jules Mazarin. Louis XIV severely restrained Eugene's ambitions, prompting him to leave France and enter the service of Emperor Leopold I. He later served Joseph I and Charles VI. He quickly distinguished himself in battle and advanced in rank to imperial field marshal at age 29. He fought notably against the Turks in central Europe and the Balkans and against France in the War of the Grand Alliance and the War of the Spanish Succession. With his friend the duke of Marlborough, he won the important victory at the Battle of Blenheim (1704) and ousted the French from Italy. In 1718 he won a great triumph over the Turks, taking the city of Belgrade. He later served as governor in the Austrian Netherlands (1714–24). An outstanding strategist and an inspired leader, he was regarded as one of the greatest soldiers of his generation.

eugenics \yü-'je-niks\ Study of human improvement by genetic means. The first thorough exposition of eugenics was made by Francis Galton, who in *Hereditary Genius* (1869) proposed that a system of arranged marriages between men of distinction and women of wealth would eventually produce a gifted race. The American Eugenics Society, founded in 1926, supported Galton's theories. U.S. eugenicists also supported restriction on immigration from nations with "inferior" stock, such as Italy, Greece, and countries of eastern Europe, and argued for the sterilization of insane, retarded, and epileptic citizens. Sterilization laws were passed in more than half the states, and isolated instances of involuntary sterilization continued into the 1970s. The assumptions of eugenicists came under sharp criticism beginning in the 1930s and were discredited after the German Nazis used eugenics to support the extermination of Jews, blacks, and homosexuals. See also genetics, race, social Darwinism.

Eugénie \ō̂-zhā-'nē\ *orig.* **Eugénia María de Montijo de Guzmán** (b. May 5, 1826, Granada, Spain—d. July 11, 1920, Madrid) Wife of Napoleon III and empress of France (1853–70). Daughter of a Spanish noble, she married Napoleon III in 1853 and came to have an important influence on her husband's foreign policy. As a devoted Roman Catholic, she favored a strong papacy and supported Ultramontane causes. She also encouraged French opposition to a Prussian candidate for the Spanish throne in the controversy that precipitated the Franco-Prussian War. After the French defeat at Sedan, she joined her family in exile in England.

Eugenius \yü-'jē-nē-əs\ **III** *orig.* **Bernard of Pisa** (b. near Pisa—d. July 8, 1153, Tivoli, near Rome; beatified 1872; feast day July 8) Pope (1145–53). A Cistercian abbot, he was elected pope when Rome was on the verge of anarchy, and in 1146 he was forced into exile. While in France he supported Louis VII's intention to launch the Second Crusade to free Edessa, an effort that ended in failure. He returned to Italy (1148), but the hostility of the Senate often kept him away from Rome. In the Treaty of Constance (1153) Eugenius fixed conditions for the coronation of Frederick I Barbarossa but died before it could take place.

euhemerism \yü-'hē-mə-ˌri-zəm\ Attempt to find a historical basis for mythical beings and events. It takes its name from Euhemerus (fl. 300 BC), a Greek scholar who examined popular mythology in his *Sacred History* and asserted that the gods originated as heroes or conquerors who were admired and later deified. Though modern scholars do not accept euhemerism as the sole explanation for the origin of gods, it is thought to be valid in some cases.

eukaryote \yü-'kar-ē-ˌōt\ Any organism composed of one or more cells, each of which contains a clearly defined nucleus enclosed by a membrane, along with organelles (small, self-contained, cellular parts that perform specific functions). The organelles include mitochondria, chloroplasts, a Golgi apparatus, an endoplasmic reticulum, and lysosomes. All organisms except bacteria are eukaryotes; bacteria are prokaryotes.

Eulenspiegel \'o͡ī̄l-ən-ˌshpē-gəl,\ *English* \'o͡il-ən-ˌspē-gəl**, Till** German peasant trickster of folk and literary tales. The historical Till is said to have died in 1350; anecdotes associated with his name were printed c. 1500 in Low German and from 1515 in High German. In the tales the stupid yet cunning peasant demonstrates his superiority to the narrow, dishonest, condescending townsmen, as well as to the clergy and nobility. The tales were translated into Dutch and English (c. 1520), French (1532), and Latin (1558).

Euler \'o͡i-lər**, Leonhard** (b. April 15, 1707, Basel, Switz.—d. Sept. 18, 1783, St. Petersburg, Russia) Swiss mathematician. In 1733 he succeeded Daniel Bernoulli (see Bernoulli family) at the St. Petersburg Academy of Sciences. There he developed the theory of trigonometric and logarithmic functions and advanced mathematics generally. Under the patronage of Frederick the Great, he worked at the Berlin Academy for many years (1744–66), where he developed the concept of function in mathematical analysis and discovered the imaginary logarithms of negative numbers. Throughout his life he was interested in number theory. In

© 2006 Encyclopædia Britannica, Inc.

addition to inspiring the use of arithmetic terms in writing mathematics and physics, Euler introduced many symbols that became standard, including Σ for summation; $\int n$ for the sum of divisors of n; e for the base of the natural LOGARITHM; a, b, and c for the sides of a triangle with A, B, and C for the opposite angles; $f(x)$ for a function; π for the ratio of the circumference to the diameter of a circle; and i for $\sqrt{-1}$. He is considered one of the greatest mathematicians of all time.

Euler's formula Either of two important mathematical theorems of LEONHARD EULER. The first is a topological invariance (see TOPOLOGY) relating the number of faces, vertices, and edges of any POLYHEDRON. It is written $F + V = E + 2$, where F is the number of faces, V the number of vertices, and E the number of edges. A cube, for example, has 6 faces, 8 vertices, and 12 edges, and satisfies this formula. The second formula, used in TRIGONOMETRY, says $e^{ix} = \cos x + i\sin x$ where e is the base of the natural LOGARITHM and i is the square root of -1 (see IRRATIONAL NUMBER). When x is equal to π or 2π, the formula yields two elegant expressions relating π, e, and i: $e^{i\pi} = -1$ and $e^{2i\pi} = 1$.

Eumenes \'yü-mə-ˌnēz\ **II** (d. 160/159 BC) King of PERGAMUM (197 BC–c. 160). He continued the policy of his father, ATTALUS I SOTER, of cooperation with Rome. He helped defeat ANTIOCHUS III, thus enlarging his realm. He brought his kingdom to its height and made it a great centre of Greek culture; in particular, he is credited with constructing nearly all the public buildings and sculpture on the Pergamum acropolis. He was suspected of disloyalty in the Roman struggle against PERSEUS; Rome subsequently withdrew its support, and Eumenes's power and the glory of Pergamum declined. His brother Attalus II became coruler c. 160 BC.

Eumolpus \yü-'mäl-pəs\ Mythological ancestor of the priestly class, the Eumolpids, at ELEUSIS in ancient Greece. His name means "sweet singer." Three divergent identities for him exist in legend: he is the father, son, or pupil of Musaeus, a mythical singer connected with ORPHEUS, in one; an originator of the ELEUSINIAN MYSTERIES in another; and a king of Thrace and son of POSEIDON in a third.

eunuch \'yü-nək\ Castrated human male. From remote antiquity on, eunuchs were employed in the Middle East and China as guards and servants in harems or other women's quarters and as chamberlains to kings. The eunuchs' confidential position frequently enabled them to exercise an important influence over their royal masters. Many of the patriarchs of Constantinople during Byzantine times were eunuchs. Eunuch advisers disappeared as a class only with the end of the Ottoman Empire. See also CASTRATO.

euonymus \yü-'ä-nə-məs\ Any of about 170 species of shrubs, woody climbers, and small trees that make up the genus *Euonymus* (family Celastraceae), native to temperate Asia, North America, and Europe, including many popular landscape ornamental shrubs and ground covers. The winged spindle tree (*E. alata*), also called burning bush, is a handsome shrub with corky winged stems. Wood of the common spindle tree (*E. europaea*) is used for pegs and spindles; several varieties are grown as ornamentals.

euphonium \yü-'fō-nē-əm\ *or* **tenor tuba** Large valved BRASS INSTRUMENT, the leading lower-pitched instrument in military bands. It developed from the valved BUGLE and CORNET in Germany c. 1840. It has four valves and a wide conical bore resembling the tuba's. Its range is an octave below the trumpet and cornet. It is played either vertically or with the bell facing forward. The very similar baritone has the same range and transposition and is distinguished only by its narrower bore. Both are essential members of bands of all kinds and are often given significant solo roles.

euphorbia See SPURGE

Euphranor \yü-'frā-nȯr\ (b. c. 390 BC, Greece—d. c. 325, Athens?) Greek sculptor and painter active in Athens. The only surviving work identified as his is the fragments of a colossal marble statue of Apollo (c. 330 BC) found in the agora at Athens. Other recorded (but lost) works suggest that he was one of the foremost Athenian artists of the mid 4th century BC. He also wrote treatises on proportion and colour.

Euphrates \yü-'frā-tēz\ **River** *Turkish* **Fırat Nehri** \fə-'rät-ne-'rē\ *Arabic* **Nahr al Furāt** River, Middle East. The largest river in Southwest Asia, it rises in Turkey and flows southeast across Syria and through Iraq. Formed by the confluence of the Karasu and the Murat rivers in the high Armenian plateau, the Euphrates descends between major ranges of the TAURUS MOUNTAINS to the Syrian plateau. It then flows through western and central Iraq to unite with the TIGRIS and continues, as Shatt al-Arab, to the PERSIAN GULF. In all, it is 1,740 mi (2,800 km) long. Its valley was heavily irrigated in ancient times, and many great cities, some of whose ruins remain, lined its banks. With the Tigris, it defines an area known historically as MESOPOTAMIA.

Euphronius \yü-'frō-nē-əs\ *or* **Euphronios** (fl. c. 520–470 BC, Athens, Greece) Greek vase painter and potter. His signature has been identified on 20 vessels, 8 that he signed as painter and 12 as potter. He was an outstanding early proponent of RED-FIGURE POTTERY. His best-known work as a painter is a krater in the Louvre depicting Herakles wrestling Antaeus. As a potter, he worked with the finest vase painters of his time. His greatest rival was EUTHYMIDES.

Eure River \'œr\ River, northern France. From its source in the Perche Hills it flows chiefly through agricultural and wooded regions on its 140-mi (225-km) course, passing through CHARTRES below the cathedral, which is located on high ground on its left bank. It joins the SEINE above ROUEN.

Euripides \yü-'ri-pə-ˌdēz\ (b. c. 484 BC, Athens—d. 406 BC, Macedonia) Greek playwright. With AESCHYLUS and SOPHOCLES, he is recognized as one of Athens's three great tragic dramatists. An associate of the philosopher ANAXAGORAS, he expressed his questions about Greek religion in his plays. Beginning in 455, he was repeatedly chosen to compete in the dramatic festival of Dionysus; he won his first victory in 441. He competed 22 times, writing four plays for each occasion. Of his 92 plays, about 19 survive, including *Medea* (431), *Hippolytus* (428), *Electra* (418), *The Trojan Women* (415), *Ion* (413), *Iphigenia at Aulis* (406), and *The Bacchae* (406). Many of his plays include prologues and rely on a DEUS EX MACHINA. Unlike Aeschylus and Sophocles, Euripides made his characters' tragic fates stem almost entirely from their own flawed natures and uncontrolled passions. In his plays chance, disorder, and human irrationality and immorality frequently result in apparently meaningless suffering that is looked on with indifference by the gods.

Euripus See CHALKÍS

Euripus \yü-'rī-pəs\ **Strait** *or* **Evripos** \'e-vrē-ˌpȯs\ **Strait** Narrow strait in the Aegean Sea. Located between the Greek island of EUBOEA and the mainland of central Greece, it is 5 mi (8 km) long and varies from 130 ft (40 m) to 1 mi (1.6 km) in width. It has strong tidal currents that reverse directions seven or more times a day, a phenomenon still not fully understood. The main port on the strait is CHALKÍS, an important trading centre since the times of ancient Greece. A 130-ft (40-m) movable bridge spans the strait at Chalkís, replacing earlier structures that dated to 411 BC.

euro Single currency of 12 countries of the EUROPEAN UNION (EU), including Germany, France, and Italy. The euro was adopted as a unit of exchange in January 1999. Those who advocated the currency believed it would strengthen Europe as an economic power, increase international trade, simplify monetary transactions, and lead to pricing equality throughout Europe. Euro currency notes and coins were introduced in January 2002 and became the sole national currency in all participating countries by March 1. Britain and Sweden decided not to adopt the euro immediately, and voters in Denmark rejected it.

Eurocommunism Trend among European communist parties toward independence from Soviet COMMUNIST PARTY doctrine in the 1970s and '80s. The term, coined in the mid-1970s, received wide publicity after the publication of Santiago Carrillo's *Eurocommunism and the State* (1977). The Eurocommunist movement rejected the Soviet doctrine of one monolithic world communist movement and advocated instead that each country's communist party base its policies on the traditions and needs of its own country. With MIKHAIL GORBACHEV's encouragement, all communist parties took independent courses in the late 1980s. Most of the European communist parties declined after the breakup of the Soviet Union.

Eurodollar U.S. dollar that has been deposited outside the U.S., especially in Europe. Foreign banks holding Eurodollars are obligated to pay in U.S. dollars when the deposits are withdrawn. Most Eurodollars are used to finance trade, but many central banks also operate in the Eurodollar market. See also CURRENCY, FOREIGN EXCHANGE.

Europa \yü-'rō-pə\ In GREEK MYTHOLOGY, the daughter either of Phoenix or of Agenor, king of Phoenicia. Her beauty inspired the love of ZEUS, who approached her in the form of a white bull and carried her off across the sea to Crete. After bearing Zeus three sons, she married the king of

© 2006 Encyclopædia Britannica, Inc.

Crete, who adopted her sons. They grew up to become King Minos of Crete, King Rhadamanthus of the Cyclades, and Prince Sarpedon of Lycia. On Crete she was worshiped under the name Hellotis. The continent of Europe is named for her.

Europe Second smallest continent on Earth. It is bordered by the Arctic Ocean, the Atlantic Ocean, and the Mediterranean, Black, and Caspian seas. The continent's eastern boundary runs along the Ural Mountains and the Ural River. Its area includes numerous islands, archipelagoes, and peninsulas. Indented by bays, fjords, and seas, continental Europe's irregular coastline is about 24,000 mi (38,000 km) long. Area: 4,000,000 sq mi (10,400,000 sq km). Population (2001 est.): 666,498,000. The greater part of Europe combines low elevations with low relief; about three-fifths of the land is below 600 ft (180 m) above sea level, and another one-third is between 600 and 3,000 ft (180 and 900 m). The highest points are in the mountain systems crossing the southern part of the continent, including the Pyrenees, Alps, Apennines, Carpathians, and Balkan Mountains. A well-watered continent with many rivers, Europe has few sizable lakes. Glaciers cover an area of about 44,800 sq mi (116,000 sq km), mostly in the north. Roughly one-third of Europe is arable, and about half of that land is devoted to cereals, principally wheat and barley. One-third is forested. Europe was the first of the world's regions to develop a modern economy based on commercial agriculture and industry, and it remains one of the world's major industrial regions, with average annual income per capita among the world's highest. The people of Europe constitute about one-seventh of the world's population. Most of the continent's approximately 60 native languages belong to either the Romance, Germanic, or Slavic language groups. Europe's population is overwhelmingly Christian. Modern humans supplanted the scanty Neanderthal population in Europe about 40,000 years ago, and by the beginning of the 2nd millennium BC the general population groups that would become the historical peoples and countries of Europe were in place. The Greek civilizations were the earliest in Europe, and in the Classical period the Greeks were a conduit for the advanced civilizations of the Middle East, which, along with the unique Greek contribution, laid the foundation for European civilization. By the mid-2nd century BC the Greeks had come under Roman control, and the vast Roman Empire brought to the conquered parts of Europe the civilization the Greeks had begun. It was through the Romans that Christianity penetrated into Europe. The Roman Empire in the West finally collapsed in the 5th century AD, which led to an extensive breakdown of Classical civilization. This civilization was not to be revived until the Renaissance (15th–16th centuries), which began the modern European traditions of science, exploration, and discovery. The Protestant Reformation of the 16th century ended the dominance of the Roman Catholic church over western and northern Europe, and the Enlightenment period of the 17th and 18th centuries stressed the primacy of reason. In the late 18th century, Enlightenment ideals helped spur the French Revolution, which toppled Europe's most powerful monarchy and spearheaded the movement toward democracy and equality. The late 18th century also marked the beginning of the Industrial Revolution, which led to Europe's military and political dominance over much of the world for the next century. In the early 20th century the European powers were divided in World War I, which led to the effective end of monarchy in Europe and created a host of new countries in central and eastern Europe. World War II marked the passing of world power from the states of western Europe and was followed by the rise of communism in eastern Europe, with the Soviet Union and its satellites sharply dividing the continent. The Soviet Union collapsed in the late 20th century, leading to a general demise of communism throughout the continent. Soviet satellites became independent, and most began to democratize; East and West Germany were reunified; and Yugoslavia and its successor states were devastated by ethnic conflict (see Kosovo conflict; Bosnian conflict). See also European Union; NATO. See map on following page.

Europe, Council of Organization of more than 40 European states formed to promote European unity, protect human rights, and facilitate social and economic progress. Established in 1949 by 10 western European states, it has devised international agreements on human rights and established a number of special bodies and expert committees on social, legal, and cultural issues. It is headquartered in Strasbourg, France. (The Council of Europe should not be confused with the European Council, which is a policy-making body of the European Union.)

European Aeronautic Defence and Space Co. (EADS) European aerospace company that is one of the world's largest. It was formed (2000) from the merger of Aerospatiale Matra of France, DaimlerChrysler Aerospace (Dasa) of Germany, and Construcciones Aeronáuticas S.A. (CASA) of Spain. It holds an 80% share in the European airplane manufacturer Airbus S.A.S. and is responsible for the final assembly of Airbus aircraft. It has a controlling interest in the trinational venture Astrium (created 2000), whose facilities in France, Germany, and Great Britain cover a broad range of the space business from ground systems and launch vehicles to satellites and orbital infrastructure. Its Eurocopter subsidiary produces military and civil helicopters. It also has stakes in Arianespace, which markets the commercial services of Ariane launch vehicles; the Eurofighter consortium to develop a multirole combat aircraft; and the French aerospace firm Dassault.

European Atomic Energy Community (Euratom) International organization established in 1958 to form a common market for developing peaceful uses of atomic energy. It originally had six members; it now includes all members of the European Union. Among its aims were to facilitate the establishment of a nuclear energy industry on a European rather than a national scale, coordinate research, encourage construction of power plants, establish safety regulations, and establish a common market for trade in nuclear equipment and materials. In 1967 its governing bodies were merged into the European Community.

European Coal and Steel Community (ECSC) Administrative agency designed to integrate the coal and steel industries of France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg. It originated in the plan of Robert Schuman (1950) to establish a common market for coal and steel by those countries willing to submit to an independent authority. Created in 1952, the ECSC came to include all members of the European Union. It initially removed barriers to trade in coal, coke, steel, pig iron, and scrap iron; it later supervised the reduction of its members' excess production. In 1967 its governing bodies were merged into the European Community. When the treaty expired in 2002, the ECSC was dissolved.

European Community (EC) Organization formed in 1967 with the merger of the European Economic Community, European Coal and Steel Community, and European Atomic Energy Community. The merger created a single Commission of the European Community and a single Council of Ministers. Other executive, legislative, and judicial bodies also were collected under the umbrella of the EC. In 1993 the EC became the basis of the European Union, and the European Economic Community was renamed the European Community.

European Court of Justice Judicial branch of the European Union (EU), established in 1958 to ensure the observance of international agreements negotiated by predecessor organizations of the EU. Headquartered in Luxembourg, it reviews the legality of the acts of EU executive bodies and rules on cases of civil law between member states or private parties. It can invalidate the laws of EU members when they conflict with EU law. Its bench, which is appointed by member governments, consists of 25 judges and 8 advocates-general. Prior to 2004, the ECJ met as a full chamber for all cases, but it now may sit as a "grand chamber" of 11 judges. See also International Court of Justice.

European Defense Community (EDC) Attempt by western European powers, with U.S. support, to counterbalance the overwhelming conventional military ascendancy of the Soviet Union in Europe by creating a supranational European army, including West German forces. A treaty was concluded in 1952, but the French parliament's refusal to ratify the treaty in 1954 brought an end to the project. One consequence of the French action was the decision in 1955 to rearm West Germany and allow its entry into NATO. In 1955 the EDC was replaced by the Western European Union.

European Economic Community (EEC) *later* **European Community (EC)** *known as* **the Common Market** Association of European countries designed to promote European economic unity. It was established by the Treaty of Rome in 1957 to develop the economies of the member states into a single common market and to build a political union of the states of western Europe. The EEC also sought to establish a single commercial policy toward nonmember countries, to coordinate transportation systems, agricultural policies, and general economic policies, to remove measures restricting free competition, and to assure the mobility of labour, capital, and entrepreneurship among member states. The liberalized trade policies it sponsored from the 1950s were highly successful in increasing trade and economic prosperity in western Europe. In 1967

its governing bodies were merged into the European Community. In 1993 the EEC was renamed the European Community (EC); it is now the principal organization within the European Union.

European Free Trade Association (EFTA) International organization whose purpose is to remove barriers to trade in industrial goods among its members. The EFTA's current members are Iceland, Liechtenstein, Norway, and Switzerland. It was formed in 1960 by Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and Britain as an alternative to the European Economic Community (EEC). Some of those countries later left the EFTA and joined the EEC. In the 1990s Iceland, Liechtenstein, and Norway joined the European Economic Area, which also included all members of the European Union. Each country in the EFTA maintains its own commercial policy toward countries outside the group.

European Parliament Legislative assembly of the European Union (EU). Inaugurated in 1958 as the Common Assembly, the European Parliament originally consisted of representatives selected by the national parliaments of member countries. Beginning in 1979, members of the Parliament, who now number more than 700, were elected by direct universal suffrage to terms of five years. The number of members per country varies depending on population. The Parliament's leadership is shared by a president and 14 vice presidents, elected for 30-month terms. The EU Council of Ministers, which represents the member states, consults the Parliament, which is empowered to discuss whatever matters it wishes. The Parliament's powers were expanded with passage of the Maastricht Treaty (1993). Although it has veto power in most areas relating to economic integration and budgetary policy, it remains subordinate to the Council of Ministers and does not function with the authority of a national legislature such as the U.S. Congress or the British House of Commons.

European Space Agency (ESA) *French* **Agence Spatiale Européenne** Western European space and space-technology research organization headquartered in Paris. It was founded in 1975 from the merger of the European Launcher Development Organisation (ELDO) and the European Space Research Organisation (ESRO), both established in 1964. Members are Austria, Belgium, Britain, Denmark, Finland, France, Germany, Ireland, Italy, The Netherlands, Norway, Portugal, Spain, Sweden, and Switzerland. Canada, through a special cooperative agreement, participates in some projects. The ESA developed the Ariane series of space launch vehicles, and it supports a launch facility in French Guiana. It has launched a system of meteorological satellites (Meteosat) as well as the Giotto space probe, which examined the nucleus of Halley's Comet, and Hipparcos, a satellite that measured the parallaxes, positions, and proper motions of more than 100,000 stars. It is also a participant in the construction of the International Space Station.

European Union (EU) Organization of European countries, formed in 1993 to oversee their economic and political integration. It was created by the Maastricht Treaty and ratified by all members of the European Community (EC), out of which the EU developed. The successful EC had made its members more receptive to greater integration and provided a framework for unified action by member countries in security and foreign policy and for cooperation in police and justice matters. In pursuit of its major goal to create a common monetary system, the EU established the euro, which replaced the national currencies of 12 of the 15 EU members in 2002. Originally confined to western Europe, the EU enlarged to include several central and eastern European countries in the early 21st century. The EU's principal institutions are the European Community, the Council of Ministers (a forum for individual ministries), the European Commission (an administrative bureaucracy), the European Parliament, the European Court of Justice, and the European Central Bank.

Eurotunnel See Channel Tunnel

eurypterid \yù-'rip-tə-rəd\ Member of an extinct order (Eurypterida) of arthropods, similar in body plan to the horseshoe crab, that lived c. 505–245 million years ago. Frequently referred to as giant scorpions, most eurypterids were small, although *Pterygotus buffaloenis,* a species from the Silurian period, was the largest arthropod ever known, reaching a length of about 10 ft (3 m). The eurypterids lived in brackish waters. Some were predators; others were probably bottom-dwelling scavengers.

eurythmics \yù-'rith-miks\ Method of musical training for young children. Eurythmics was developed by Swiss musician Émile Jaques-Dalcroze in the early years of the 20th century. It called for movements of the arms and legs in specific ways in response to changing rhythms and pitches. The initial aim was to encourage a physical response to music in the young, in the hope that it would educate them musically. Very popular in the early 20th century, it has declined in recent decades.

Eusebius of Caesarea \yù-'sē-bē-əs...,sē-zə-'rē-ə\ (fl. 4th century, Caesarea Palestinae, Palestine) Bishop and historian of early Christianity. Baptized and ordained at Caesarea in Palestine, he may have been imprisoned during the Roman persecutions. His fame rests on his *Ecclesiastical History* (312–324), which preserves portions of works no longer extant. He became bishop of Caesarea c. 313. Accused of Arianism, he was excommunicated in 325 but was soon exonerated by the Council of Nicaea. He was a staunch supporter of Constantine I's attempts to unify and standardize Christian doctrine, and his writings include the *Life of Constantine*.

euthanasia \,yü-thə-'nā-zhə\ *or* **mercy killing** Painless killing of a person who has a painful, incurable disease or incapacitating disorder. Most legal systems consider it murder, though in many jurisdictions a physician may lawfully decide not to prolong the patient's life or may give drugs to relieve pain even if they shorten the patient's life. Associations promoting legal euthanasia exist in many countries. The legalization movement has gained ground with advancing medical technology, which has been used to prolong the lives of patients who are enduring extreme suffering or who are comatose or unable to communicate their wishes. Euthanasia was legalized in The Netherlands in 2001 and in Belgium in 2002. In 1997 Oregon became the first state in the U.S. to decriminalize physician-assisted suicide.

Euthymides \yù-'thi-mə-,dēz\ (fl. c. 515–500 BC, Athens, Greece) Greek vase painter. He was a contemporary of Euphronius. His signature has been found on eight extant vases, six that he signed as a painter and two as a potter. A proponent of red-figure pottery, he was noted for his mastery of foreshortening and studies in movement. The amphora now in Munich's Antiquities Museum showing foreshortened figures in three-quarter view is an outstanding example of his draftsmanship.

eutrophication \yù-,trō-fə-'kā-shən\ Gradual increase in the concentration of phosphorus, nitrogen, and other plant nutrients in an aging aquatic ecosystem such as a lake. The productivity or fertility of such an ecosystem increases as the amount of organic material that can be broken down into nutrients increases. This material enters the ecosystem mainly through runoff that carries debris. Water blooms often develop on the surface, preventing the light penetration and oxygen absorption necessary for underwater life. See also water pollution.

Evagoras \i-'va-gə-rəs\ (d. 374 BC) King of Salamis, Cyprus (c. 410–374). He pursued a policy of friendship with Athens and the promotion of Hellenism. He secured Persian aid for Athens against Sparta. With help from Athens and Egypt, he extended his rule over most of Cyprus and part of Anatolia. Relations with Persia later became hostile, and he was defeated by Persia in 381. Though he remained king of Salamis in name, he was in fact a vassal of Persia. He was assassinated by a eunuch.

evangelicalism \,e-,van-'je-li-kə-,li-zəm\ Protestant movement that stresses conversion experiences, the Bible as the only basis for faith, and evangelism at home and abroad. The religious revival that occurred in Europe and America during the 18th century was generally referred to as the evangelical revival. It included Pietism in Europe, Methodism in Britain, and the Great Awakening in America. In London in 1846, the Evangelical Alliance was organized by evangelical Christians from several denominations and countries. In the U.S., the movement grew, in part, because of the popularity of preachers such as Billy Graham, the creation of institutions such as Wheaton College, the publishing of the periodical *Christianity Today*, and the founding of professional organizations and associations, such as the National Association of Evangelicals (1942). Developing a sense of international and interdenominational unity, evangelicals formed the World Evangelical Fellowship (WEF) in 1951. More than 110 regional and national organizations and some 110 million people are affiliated with the WEF, now headquartered in Singapore. See Christian fundamentalism; Pentecostalism.

Evans, Sir Arthur (John) (b. July 8, 1851, Nash Mills, Hertfordshire, Eng.—d. July 11, 1941, Youlbury, near Oxford, Oxfordshire) British archaeologist. Son of the archaeologist Sir John Evans, he served as a curator (1884–1908) at Oxford's Ashmolean Museum. Beginning in 1899 he devoted several decades to excavating the ruins of the ancient city of

© 2006 Encyclopædia Britannica, Inc.

Knossos in Crete, uncovering evidence of a sophisticated Bronze Age civilization that he named Minoan. His work, one of archaeology's major achievements, greatly advanced the study of European and eastern Mediterranean prehistory. He published his definitive account in *The Palace of Minos*, 4 vol. (1921–36).

Evans, Bill *orig.* **William John Evans** (b. Aug. 16, 1929, Plainfield, N.J., U.S.—d. Sept. 15, 1980, New York, N.Y.) U.S. pianist and composer, one of the most influential musicians in modern jazz. Evans was classically trained and influenced by pianists Bud Powell, Horace Silver, and Lennie Tristano. His subtle harmonies and lyrical melodic sensitivity were particularly well suited to modal improvisation, demonstrated on the landmark Miles Davis recording *Kind of Blue* (1959). As leader of his own trio, Evans established near-telepathic communication with his fellow musicians, creating music of rare depth and introspection. His best-known composition is "Waltz for Debby."

Evans, Dame Edith (Mary) (b. Feb. 8, 1888, London, Eng.—d. Oct. 14, 1976, Cranbrook, Kent) British actress. She made her stage debut as Cressida in William Shakespeare's *Troilus and Cressida* (1912) and joined the Old Vic company in 1925. One of the finest actresses of the 20th century, she appeared in London and on Broadway in plays by Shakespeare, George Bernard Shaw, and Noël Coward. She played Lady Bracknell in Oscar Wilde's *The Importance of Being Earnest* on stage and screen (1952). Her other films include *Look Back in Anger* (1959), *Tom Jones* (1963), *The Chalk Garden* (1964), and *The Whisperers* (1967).

Dame Edith Evans as Mrs. Ross in *The Whisperers*, 1967.
COURTESY OF SEVEN PINES PRODUCTIONS LTD.; PHOTOGRAPH, PICTORIAL PARADE

Evans, Frederick H(enry) (b. June 26, 1853, London, Eng.—d. June 24, 1943, London) British photographer. He first attracted attention as a popular London bookseller and champion of the work of George Bernard Shaw and Aubrey Beardsley. Around 1890 he began to photograph English and French cathedrals, and from 1898 he devoted himself exclusively to photography. His belief that only static views of idealized beauty were worth photographing clashed with the early 20th-century tendency to photograph fleeting images, but his architectural photographs are considered among the world's finest.

Evans, George Henry (b. March 25, 1805, Bromyard, Herefordshire, Eng.—d. Feb. 2, 1856, Granville, N.J., U.S.) British-born U.S. newspaper editor and social reformer. He immigrated to the U.S. in 1820. In 1829 he founded the *Working Man's Advocate*, the first major U.S. labour newspaper, and cofounded the *Workingmen's Party*. He organized the National Reform Association to lobby Congress for free homesteads in the West, arguing that the availability of free land would draw away excess workers from the East and keep wages high for those who remained (see Homestead Movement). His efforts led to the passage of the Homestead Act in 1862. He also fought for the abolition of slavery and advocated equal rights for women.

Evans, Maurice (Herbert) (b. June 3, 1901, Dorchester, Dorset, Eng.—d. March 12, 1989, Rottingdean, East Sussex) British-born U.S. actor. He made his professional stage debut in 1926 and achieved his first success in *Journey's End* (1929). He moved to the U.S. in 1935 and triumphed in Shakespearean roles on Broadway. During World War II he entertained U.S. troops with a short version of *Hamlet*. He later starred in Broadway revivals of four George Bernard Shaw comedies, notably *Man and Superman* (1947). His greatest Broadway hit was *Dial M for Murder* (1952). He starred in a television production of *Macbeth* (1961, Emmy Award) and appeared in 17 films, including *Rosemary's Baby* (1968).

Evans, Oliver (b. Sept. 13, 1755, near Newport, Del.—d. April 15, 1819, New York, N.Y., U.S.) U.S. inventor. Evans began early to apply himself to industrial problems. He invented an improved carding device for use in the newly mechanized production of textiles. In 1784 he built a flour mill, for which he created the first continuous production line in any industry: all movement was automatic, power being supplied by waterwheels, and grain was passed by conveyors and chutes through the stages of milling and refining to emerge as finished flour. His high-pressure steam engine (patented 1790) deserves to share the credit for the invention often given solely to Richard Trevithick. His Amphibious Digger (1805), a steam-engine scow that could run on both land and water, was the first powered road vehicle to operate in the U.S. His Mars Iron Works (founded 1806) made more than 100 steam engines for use with screw presses for processing cotton, tobacco, and paper.

Evans, Walker (b. Nov. 3, 1903, St. Louis, Mo., U.S.—d. April 10, 1975, New Haven, Conn.) U.S. photographer. He was influenced early by the photographs of Eugène Atget. In 1934 his images of New England architecture were exhibited in the first one-man photographic show at the Museum of Modern Art. From 1935 he photographed rural victims of the Great Depression for the Farm Security Administration; these images were published in *American Photographs* (1938). He collaborated with James Agee to document the life of Alabama sharecroppers in *Let Us Now Praise Famous Men* (1941). Evans's photographs appeared without titles or comment, in a section separate from Agee's text, yet the whole constitutes one of the finest collaborations between a photographer and a writer. He was later an editor of *Fortune* magazine (1945–65) and a professor at Yale University (1965–74).

Evans-Pritchard, Sir E(dward) E(van) (b. Sept. 21, 1902, Crowborough, Sussex, Eng.—d. Sept. 11, 1973, Oxford, Oxfordshire) British social anthropologist. The most influential British social anthropologist since Bronisław Malinowski and A.R. Radcliffe-Brown, Evans-Pritchard succeeded the latter at Oxford University (1946), where he served as mentor to a generation of students. His studies of African systems of belief, witchcraft, religion, politics, and oral tradition remain foundational to the study of African societies and non-Western systems of thought. Among his major works are *Witchcraft, Oracles and Magic Among the Azande* (1937), *The Nuer* (1940), and (with Meyer Fortes) *African Political Systems* (1940).

Evansville City (pop., 2000: 121,582), southwestern Indiana, U.S. A port on the Ohio River, it was founded in 1812 and grew as the southern terminus of the Wabash and Erie Canal (1853), which connected Lake Erie with the Ohio River. Coal deposits and oil fields as well as fertile farmlands surround the city, and its location as a transportation hub has made it the metropolis of southwestern Indiana and adjacent states. Diversified manufactures include pharmaceuticals and refrigeration and air conditioning equipment. It is the seat of the University of Evansville (1854). Angel Mounds State Memorial, a large archaeological site, is nearby.

evaporation Change of a liquid into the gaseous state; in particular, the process by which liquid water enters the atmosphere as water vapour. Evaporation, mostly from the sea and from vegetation, replenishes the humidity of the air. It is an important part of the exchange of energy in the Earth-atmosphere system that produces atmospheric motion, and therefore weather and climate. The rate of evaporation depends on the temperature difference between the evaporating surface and the air, the relative humidity, and wind.

evaporator Industrial apparatus for converting liquid into gas or vapour. The single-effect evaporator consists of a container or surface and a heating unit; the multiple-effect evaporator uses the vapour produced in one unit to heat a succeeding unit. Double-, triple-, or quadruple-effect evaporators may be used in industrial and steam heating plants. Some evaporators are used to concentrate a solution by vaporizing and eliminating water (e.g., in a concentration plant for sugar and syrup). In purification processes such as desalination, evaporators convert the water to vapour, leaving mineral residues behind; the vapour is then condensed into (desalinated) water. In a refrigeration system, the cooling is produced as the rapid evaporation of the liquid refrigerant absorbs heat.

evaporite \i-ˈva-pə-ˌrīt\ Any of a variety of minerals found in sedimentary deposits of soluble salts that result from the evaporation of water. Typically, evaporite deposits occur in closed marine basins where evaporation exceeds inflow. The most important such minerals include anhydrite, halite, calcite, gypsum, polyhalite, and potassium and magnesium salts such as sylvite, carnallite, kainite, and kieserite.

evapotranspiration Loss of water from the soil both by evaporation from the soil surface and by transpiration from the leaves of the plants growing on it. Factors that affect the rate of evapotranspiration include

© 2006 Encyclopædia Britannica, Inc.

the amount of solar radiation, atmospheric vapor pressure, temperature, wind, and soil moisture. Evapotranspiration accounts for most of the water lost from the soil during the growth of a crop. Estimation of evapotranspiration rates is thus important in planning IRRIGATION schemes.

Evarts \'e-vərts**, William Maxwell** (b. Feb. 6, 1818, Boston, Mass., U.S.—d. Feb. 28, 1901, New York, N.Y.) U.S. lawyer. He served as counsel for Pres. ANDREW JOHNSON in his impeachment trial (1868). After Johnson's acquittal, he served as U.S. attorney general (1868–69), then represented the U.S. in the *ALABAMA* CLAIMS arbitration at Geneva (1872). He was Republican chief counsel in the election dispute between RUTHERFORD B. HAYES and SAMUEL TILDEN in 1876. As Hayes's secretary of state (1877–81), he asserted U.S. interests over a proposed canal in Panama. He later served in the U.S. Senate (1885–91).

Evelyn \'ēv-lən, 'ev-lən**, John** (b. Oct. 31, 1620, Wotton, Surrey, Eng.—d. Feb. 27, 1706, Wotton) British writer. A country gentleman from a wealthy landowning family, he wrote some 30 books on the fine arts, forestry, and religious topics. His *Diary* (published 1818), which he kept from 1631 to 1706, is an invaluable source of information on 17th-century social, cultural, religious, and political life. His *Life of Mrs. Godolphin* (published 1847) is one of the most moving of 17th-century biographies.

evening grosbeak North American GROSBEAK (*Hesperiphona vespertina*) that is brown, yellow, black, and white. Like all other grosbeaks, it has a large conical bill. It eats seeds and tends to form loose flocks in flight.

evening primrose Any of various species of herbaceous plants of the genus *Oenothera* (family Onagraceae). They are noted for their showy flowers, especially the yellow-flowered biennial *O. biennis*, which is found widely throughout North America and and has been introduced to Europe. It has been grown by geneticists to determine certain principles of heredity. The true PRIMROSE belongs to the family Primulaceae.

Evenk See SIBERIAN PEOPLES

event horizon Boundary marking the limits of a BLACK HOLE. At the event horizon, the escape velocity is equal to the speed of LIGHT. Since general RELATIVITY states that nothing can travel faster than the speed of light, nothing inside the event horizon can ever cross the boundary and escape beyond it, including light. Thus, nothing that enters a black hole can get out or can be observed from outside the event horizon. Likewise, any radiation generated inside the horizon can never escape beyond it. For a nonrotating black hole, the SCHWARZSCHILD RADIUS delimits a spherical event horizon. Rotating black holes have distorted, nonspherical event horizons. Since the event horizon is not a material surface but rather merely a mathematically defined demarcation boundary, nothing prevents matter or radiation from entering a black hole, only from exiting one. Though black holes themselves may not radiate energy, electromagnetic radiation and matter particles may be radiated from just outside the event horizon via HAWKING RADIATION.

Everest, Mount *Tibetan* **Chomolungma** \ˌchō-mō-'lůŋ-mə\ *Nepali* **Sagarmatha** Peak on the crest of the HIMALAYAS, southern Asia. The highest point on Earth, with a summit at 29,035 ft (8,850 m), it lies on the border between Nepal and Tibet (China). Numerous attempts to climb Everest were made from 1921; the summit was finally reached by EDMUND HILLARY of New Zealand and TENZING NORGAY of Nepal in 1953. In dispute is whether the English explorer George Mallory, whose body was discovered below Everest's peak in 1999, had actually reached the peak earlier, in 1924, and was descending it when he died. The formerly accepted elevation of 29,028 ft (8,848 m), established in the early 1950s, was recalculated in the late 1990s.

Everglades Subtropical saw-grass marsh region, southern Florida, U.S. Covering about 4,000 sq mi (10,000 sq km), the area has water moving slowly through it from the lip of Lake OKEECHOBEE to mangrove swamps bordering the Gulf of MEXICO and Florida Bay. Everglades National Park, established in 1934, encompasses the southwestern portion of the marsh, covering 2,354 sq mi (6,097 sq km). The largest subtropical wilderness left in the continental U.S., it has a mild climate, which provides an environment for myriad birds, alligators, snakes, and turtles. A large portion of the glades has been reclaimed by drainage canals, altering the habitats of many species.

evergreen Any plant that retains its leaves through the winter and into the following summer or through several years. Many tropical species of broad-leaved FLOWERING PLANTS are evergreen, but in cold-temperate and Arctic areas the evergreens commonly are cone-bearing shrubs or trees (CONIFERS), such as PINES and FIRS. The leaves of evergreens usually are thicker and more leathery than those of DECIDUOUS TREES and often are needlelike or scalelike in cone-bearing trees. A leaf (or needle) may remain on an evergreen tree for two years or longer and may fall during any season.

everlasting Any of several plants that retain their form and colour when dried and are used in dry bouquets and flower arrangements. Popular everlastings include several species of the COMPOSITE FAMILY, especially the true everlastings, or immortelles, species of the genus *Helichrysum*, native to North Africa, Crete, and the parts of Asia bordering on the Mediterranean and cultivated in many parts of Europe. One of the best-known everlastings is the strawflower (*H. bracteatum*) of Australia. Many GRASSES with showy plumes or spikes are classified as everlastings.

ever-normal granaries Price-stabilizing granaries first established in the 1st century BC. Under the QING DYNASTY they were set up by all Chinese provinces in each county to keep grain on hand to offset regional food shortages in years of crop failure. By keeping the supply of grain stable ("ever normal"), the granaries stabilized prices, and even undeveloped regions of the country were protected from famine.

Evers \'e-verz**, Medgar (Wiley)** (b. July 2, 1925, Decatur, Miss., U.S.—d. June 12, 1963, Philadelphia, Miss.) African American civil-rights activist. After serving in World War II he entered business in Mississippi. He and his elder brother, Charles, began organizing local affiliates of the NAACP; in 1954 Medgar became the organization's first field secretary in Mississippi. He traveled throughout the state recruiting members and organizing economic boycotts. In June 1963, hours after a speech on civil rights by Pres. JOHN F. KENNEDY, Evers was shot and killed in an ambush outside his home. A white segregationist was charged with the murder but was set free after two trials in 1964 resulted in hung juries; he was finally convicted after a third trial in 1994. Evers's widow, Myrlie Evers-Williams, later headed the NAACP (1995–98).

Evert, Chris(tine Marie) *formerly* **Chris Evert Lloyd** (b. Dec. 21, 1954, Fort Lauderdale, Fla., U.S.) U.S. tennis player. She became in 1971 the youngest player to reach the semifinals of the U.S. championship. She won the U.S. Open women's singles six times (1975–78, 1980, 1982) and repeatedly won the Wimbledon singles (1974, 1976, 1981), the French Open singles (1974, 1975, 1979, 1980, 1983, 1985, 1986), and the Australian Open singles (1982, 1984), for a total of 18 grand-slam titles. She retired in 1989.

evidence In law, something (e.g., testimony, documents, or physical objects) presented at a judicial or administrative proceeding for the purpose of establishing the truth or falsity of an allegation of fact. To preserve legal DUE PROCESS and to prevent the jury from being misled, an extensive body of rules has sprung up regarding the handling of evidence. In the U.S., all federal and many state courts adhere to the *Federal Rules of Evidence*, which covers such elements as types of evidence, admissibility, relevance, competency of witnesses, confessions and admissions, expert testimony, and authentication. Most evidence received at trial is in the form of verbal statements of witnesses, who are subject to questioning by attorneys from both sides. Two important categories of evidence are direct evidence, which is offered by a witness whose knowledge of a factual matter is firsthand (as through sight or hearing), and CIRCUMSTANTIAL EVIDENCE. See also EXCLUSIONARY RULE.

evil eye Superstition holding that a glance can cause injury or death to those on whom it falls. The belief was found in ancient Greece and Rome as well as in folk cultures around the world, and it has persisted into modern times. Children and animals are believed to be particularly vulnerable. The evil eye is often thought to stem from envy and malice toward prosperity and beauty, and thus in many cultures unguarded praise of one's possessions or children is thought to invite misfortune. Safeguards include amulets, charms, and sacred texts; in Asia children may have their faces blackened for protection.

Evita See Eva PERÓN

evolution Biological theory that animals and plants have their origin in other preexisting types and that the distinguishable differences are due to modifications in successive generations. It is one of the keystones of modern biological theory. In 1858 CHARLES DARWIN and ALFRED RUSSEL WALLACE jointly published a paper on evolution. The next year Darwin pre-

© 2006 Encyclopædia Britannica, Inc.

sented his major treatise *On the Origin of Species by Means of Natural Selection*, which revolutionized all later biological study. The heart of Darwinian evolution is the mechanism of NATURAL SELECTION. Surviving individuals, which vary (see VARIATION) in some way that enables them to live longer and reproduce, pass on their advantage to succeeding generations. In 1937 THEODOSIUS DOBZHANSKY applied Mendelian genetics (see GREGOR MENDEL) to Darwinian theory, contributing to a new understanding of evolution as the cumulative action of natural selection on small genetic variations in whole populations. Part of the proof of evolution is in the fossil record, which shows a succession of gradually changing forms leading up to those known today. Structural similarities and similarities in embryonic development among living forms also point to common ancestry. Molecular biology (especially the study of genes and proteins) provides the most detailed evidence of evolutionary change. Though the theory of evolution is accepted by nearly the entire scientific community, it has sparked much controversy from Darwin's time to the present; many of the objections have come from religious leaders and thinkers (see CREATIONISM) who believe that elements of the theory conflict with literal interpretations of the Bible. See also HUGO DE VRIES, ERNST HAECKEL, HUMAN EVOLUTION, ERNST MAYR, PARALLEL EVOLUTION, PHYLOGENY, SOCIOCULTURAL EVOLUTION, SPECIATION.

Evripos Strait See EURIPUS STRAIT

Ewald \'ā-vəlt**, Johannes** (b. Nov. 18, 1743, Copenhagen, Den.—d. March 17, 1781, Copenhagen) Danish poet and dramatist. By age 19 he was becoming known as a writer. At 30, addicted to alcohol, he adopted a more solitary life and began producing his mature works, including *The Death of Balder* (1774), in which he became the first Danish poet to use themes from Scandinavian MYTH and SAGA. Of his dramatic works, only the operetta *Fiskerne* (1779; "The Fishermen") is still performed. He is especially known for his great personal odes and for songs such as "King Christian Stood by the Lofty Mast," used as a national anthem, and "Lille Gunver," the first Danish romance. He is considered one of Denmark's greatest lyric poets. His memoirs (published 1804) are his greatest prose work.

Ewe \'ā-wā\ Peoples of southeastern Ghana, southern Benin, and southern Togo. They speak dialects of Gbe, a KWA LANGUAGE of the NIGER-CONGO family. The Ewe never formed a single centralized state, remaining a collection of independent communities that made temporary alliances in time of war. Most Ewe are farmers; some coastal Ewe fish. Spinning, weaving, pottery making, and blacksmithing are important crafts. They number more than 3.5 million.

Ewing \'yü-iŋ**, (William) Maurice** (b. May 12, 1906, Lockney, Texas, U.S.—d. May 4, 1974, Galveston, Texas) U.S. geophysicist. He taught many years at Columbia University (1944–74) and also directed the Lamont-Doherty Geological Observatory (1949–74). Studying the structure of the Earth's crust and mantle, he made seismic refraction measurements in the Atlantic basins, along the Mid-Atlantic Ridge, and in the Mediterranean and Norwegian seas. In 1935 he took the first seismic measurements in open seas. He was among those who proposed that earthquakes are associated with the central oceanic rifts that encircle the globe, suggesting that seafloor spreading may be worldwide and episodic in nature. In 1939 he took the first deep-sea photographs.

excavation In archaeology, the exposure, recording, and recovery of buried material remains. The techniques employed vary by the type of site, but all forms of archaeological excavation require great skill and careful preparation. The process begins with site location, by means of aerial photography, remote sensing, or, commonly, accidental discovery by construction crews. This step is followed by surveying and mapping, site sampling, and developing an excavation plan. The design and execution of an excavation frequently require an interdisciplinary team of experts. The actual digging consists of the removal of surplus dirt and the painstaking examination, through observation, sifting, and other means, of remaining soil, artifacts, and context. Common dig tools include the trowel, penknife, and brush. The excavation phase is followed by artifact classification, analysis, DATING, and the publication of results. Excavation may last decades or be a short-term emergency salvage operation (as when a site is threatened by development).

exchange, bill of See BILL OF EXCHANGE

exchange control Governmental restrictions on private transactions in foreign money or claims on foreign money. Residents are required to sell foreign money coming into their possession to a central bank or specialized government agency at EXCHANGE RATES set by the government. The chief function of most systems of exchange control is to maintain a favourable BALANCE OF PAYMENTS. See also FOREIGN EXCHANGE.

exchange rate Price of one country's money in relation to another's. Exchange rates may be fixed or flexible. An exchange rate is fixed when two countries agree to maintain a fixed rate through the use of MONETARY POLICY. Historically, the most famous fixed exchange-rate system was the GOLD STANDARD; in the late 1850s, one ounce of gold was defined as being worth 20 U.S dollars and 4 pounds sterling, resulting in an exchange rate of 5 dollars per pound. An exchange rate is flexible, or "floating," when two countries agree to let international market forces determine the rate through SUPPLY AND DEMAND. The rate will fluctuate with a country's exports and imports. Most world trade currently takes place with flexible exchange rates that fluctuate within relatively fixed limits. See also EXCHANGE CONTROL, FOREIGN EXCHANGE.

Exchequer \iks-'che-kər, 'eks-ˌche-kər\ English government department responsible for receiving and dispersing public revenue. It was established by HENRY I in the 12th century, and its name refers to the checkered cloth on which the reckoning of revenues took place. Originally, the lower Exchequer was an office for the receipt and payment of money, while the upper Exchequer was a court sitting twice a year to regulate accounts. The English judicial system grew out of the upper Exchequer, and the lower Exchequer became the Treasury. "Exchequer" is still the unofficial name of the Treasury in Britain.

excitation Addition of a discrete amount of energy to a system that changes it usually from a state of lowest energy (ground state) to one of higher energy (excited state). For example, in a hydrogen atom, an excitation energy of 10.2 electron volts is required to move the lone electron from its ground state to its first excited state. The excitation energy stored in excited atoms and nuclei is usually emitted as ULTRAVIOLET RADIATION from atoms and as gamma radiation (see GAMMA RAY) from nuclei as they return to their ground states.

exclusionary rule In U.S. law, the principle that evidence seized by police in violation of the constitutional protection against unreasonable SEARCH AND SEIZURE may not be used against a criminal defendant at trial. The SUPREME COURT OF THE UNITED STATES established the validity of the rule in *Weeks* v. *U.S.* (1914). In *Wolf* v. *Colorado* (1949) the court limited application of the rule to the federal courts; this decision was overturned in *Mapp* v. *Ohio* (1961), which required the rule to be applied universally. In the 1980s the court allowed an exception to the rule, holding that evidence obtained "in good faith" with a search warrant later ruled invalid is admissible.

excommunication Form of censure by which a member of a religious body is excluded from the congregation of believers and from the rites of the church. Excommunication has been used in various religions, notably CHRISTIANITY, as a punishment for grave offenses such as HERESY. In ROMAN CATHOLICISM an excommunicated person is barred from receiving the SACRAMENTS and from burial in consecrated ground. The offender may be absolved by a priest (in some cases, only by a bishop or the pope) and received back into the church after confessing his or her SIN and doing penance for it. In PROTESTANT denominations other terms, such as "church discipline," may be attached to essentially the same censure. Although now seldom used, the practice of *ḥerem* in Judaism was a form of excommunication that excluded people from the community for prescribed times or forbade them from hearing the TORAH. The term is also applied to the expulsion of BUDDHIST monks from the SANGHA.

excretion Bodily process for disposing of undigested food waste products and nitrogenous by-products of METABOLISM, regulating water content, maintaining acid-base balance, and controlling osmotic pressure to promote HOMEOSTASIS. It refers to both URINATION and DEFECATION and to the processes that take place in the digestive and URINARY SYSTEMS, as the KIDNEY and LIVER filter wastes, toxins, and drugs from the blood and food reaches the last stage of digestion. Ammonia from PROTEIN digestion, the primary excretory product, is converted to UREA to be excreted in URINE.

executive In politics, a person or persons constituting the branch of government charged with executing or carrying out the laws and appointing officials, formulating and instituting foreign policy, and providing diplomatic representation. In the U.S., a system of CHECKS AND BALANCES

© 2006 Encyclopædia Britannica, Inc.

keeps the power of the executive more or less equal to that of the JUDICIARY and the LEGISLATURE. See also MAYOR, PRESIDENT, PRIME MINISTER.

exegesis \ˌek-sə-'jē-səs, 'ek-sə-ˌjē-səs\ Scholarly interpretation of religious texts, using linguistic, historical, and other methods. In Judaism and Christianity, it has been used extensively in the study of the BIBLE. Textual criticism tries to establish the accuracy of biblical texts. Philological criticism deals with grammar, vocabulary, and style in pursuit of faithful translation. Literary criticism classifies texts according to style and attempts to establish authorship, date, and audience. Tradition criticism seeks the sources of biblical materials and traces their development. Redaction criticism examines the way pieces of the tradition have been assembled into a literary composition by editors. Form criticism studies the way narratives are shaped by the cultures that produce them. Historical criticism looks at a text's historical context.

Exekias \ek-'sek-yəs\ (fl. c. 540–520 BC, Greece) Greek potter. He was the most famous of the black-figure vase painters (see BLACK-FIGURE POTTERY). His name is found on 13 surviving vases. He is known for his elegant drawing; his greatest gift was for conveying pathos and insight rather than overt action. Some 40 unsigned vases are attributed to him on stylistic grounds. He also made clay plaques designed to decorate tombs.

exercise Training of the body to improve health and fitness. Different types have different purposes, including AEROBICS for heart and respiratory function and weight loss, weight-bearing exercise for bone strength, weight training for muscle strength, and stretching for flexibility. Specific exercises are used in PHYSICAL MEDICINE AND REHABILITATION. Benefits include lower BLOOD PRESSURE, higher HDL CHOLESTEROL, improved disease resistance, and better general well-being.

Exeter \'ek-sə-tər\ *ancient* **Isca Dumnoniorum** City and administrative district (pop., 2001: 111,078), administrative and historic county of DEVON, England. The county town (seat) of Devon, it is located on the River Exe about 10 mi (16 km) above the English Channel and commands an important river crossing. An early British tribe, the Dumnonii, made Exeter their centre; when it was taken by the Romans, they named it Isca Dumnoniorum. The main town in southwestern England during the Middle Ages, Exeter was subjected to a number of sieges. ALFRED the Great twice held it against the Danes (877 and c. 894); the Danes finally took the city in 1003 but lost it in 1068 to WILLIAM I (the Conqueror). Exeter's Norman cathedral, consecrated in 1133, houses the Exeter Book, the largest collection extant of OLD ENGLISH poetry. The city has light manufacturing and is a service centre for an extensive region.

existentialism Philosophical movement oriented toward two major themes, the analysis of human existence and the centrality of human choice. Existentialism's chief theoretical energies are thus devoted to questions about ONTOLOGY and decision. It traces its roots to the writings of SØREN KIERKEGAARD and FRIEDRICH NIETZSCHE. As a philosophy of human existence, existentialism found its best 20th-century exponent in KARL JASPERS; as a philosophy of human decision, its foremost representative was JEAN-PAUL SARTRE. Sartre finds the essence of human existence in freedom—in the duty of self-determination and the freedom of choice—and therefore spends much time describing the human tendency toward "bad faith," reflected in humanity's perverse attempts to deny its own responsibility and flee from the truth of its inescapable freedom.

Exmouth Gulf Inlet of the Indian Ocean, Western Australia. Located between North West Cape and the mainland, the gulf is 55 mi (90 km) long and 30 mi (48 km) across the mouth. Fishing, pearling, prawning, and tourism are the main local industries. Nearby Cape Range National Park is important for the conservation of the rare yellow-footed rock WALLABY.

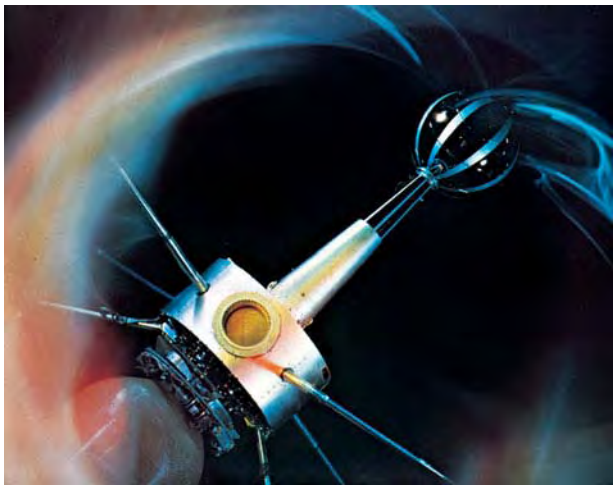
Exodus Second book of the OLD TESTAMENT. The title refers to the departure of the Israelites from Egypt under MOSES in the 13th century BC. The book begins with the story of the Israelites' enslavement in Egypt and God's call to Moses to become a prophet. It tells of the plagues sent to persuade the pharaoh to free the Israelites, and it recalls their crossing of the Sea of Reeds (or the Red Sea) and their 40 years of wandering in the Sinai desert. It also recounts how God made a COVENANT with Israel at Mount SINAI, handing down the TEN COMMANDMENTS. In Exodus God establishes his reliability as Israel's protector and savior, and lays claim to its loyalty and obedience.

exogamy and endogamy \ek-'sä-gə-mē...en-'dä-gə-mē\ Practices controlling the relation of the sexes in the selection of marital partners. Exogamous groups require their members to marry outside the group, sometimes even specifying the group into which members must marry. Such groups are usually defined in terms of KINSHIP rather than politics or territory. Exogamy is usually characteristic of unilineal DESCENT groups, in which descent is reckoned either patrilineally or matrilineally. In endogamous groups, marriage outside one's group may be forbidden, or there may merely be a tendency to marry within the group. Endogamy is characteristic of aristocracies and religious and ethnic minorities in industrialized societies but also of the CASTE system in India and of class-conscious nonliterate societies such as the MASAI of East Africa.

exorcism In Christianity, a ceremony used to drive DEMONS out of a person they have possessed. Jesus healed people tormented by evil spirits, casting them out with a word, and his followers later drove out demons "in his name." By the 3rd century this task was assigned to a specially trained class of lower clergy. Rituals for exorcism of people and places also exist in many other traditions.

expanding universe Current understanding of the state of the universe. It is based on the finding that all GALAXIES are moving away from each other. Application of general RELATIVITY to cosmology, along with the detection of REDSHIFTED light coming from galaxies outside the Milky Way Galaxy, led to the realization in the 1920s that all galaxies are receding (see EDWIN HUBBLE). It is unknown whether the universe will expand indefinitely (open universe) or eventually collapse (closed universe) into an extremely dense, congested state, as it began, according to the BIG-BANG model. See also FRIEDMANN UNIVERSE.

experimental psychology Branch or type of psychology concerned with employing empirical principles and procedures in the study of psychological phenomena. The experimental psychologist seeks to carry out tests under controlled conditions in order to discover an unknown effect or law, to examine or establish a hypothesis, or to illustrate a known law. The areas of study that rely most heavily on the experimental method include those of SENSATION and PERCEPTION, LEARNING and MEMORY, MOTIVATION, and PHYSIOLOGICAL PSYCHOLOGY. Experimental approaches are also used in CHILD PSYCHOLOGY, CLINICAL PSYCHOLOGY, EDUCATIONAL PSYCHOLOGY, and SOCIAL PSYCHOLOGY.



experimentalism See INSTRUMENTALISM

expert system Computer-based system designed to respond like a human expert in a given field. Expert systems are built on knowledge gathered from human experts, analogous to a DATABASE but containing rules that may be applied to solving a specific problem. An interface allows the user to specify symptoms and to clarify a problem by responding to questions posed by the system. Software tools exist to help designers build a special-purpose expert system with minimal effort. An outgrowth of work in ARTIFICIAL INTELLIGENCE, expert systems show promise for an ever-widening range of applications. There are now widely used expert systems in the fields of medicine, personnel screening, and education.

explanation In philosophy, set of statements that makes intelligible the existence or occurrence of an object, event, or state of affairs. Among the most common forms of explanation are causal explanation (see CAUSATION), deductive-nomological explanation (see COVERING-LAW MODEL), which involves subsuming the explanandum under a generalization from which it may be derived in a deductive argument (e.g., "All gases expand when heated; this gas was heated; therefore, this gas expanded") and statistical explanation, which involves subsuming the explanandum under a generalization that gives it inductive support (e.g., "Most people who use tobacco contract cancer; this person used tobacco; therefore, this person contracted cancer"). Explanations of human behaviour typically appeal to the subject's beliefs and desires, as well as other facts about him, and proceed on the assumption that the behaviour in question is rational (at least to a minimum degree). Thus an explanation of why the subject removed his coat might cite the fact that the subject felt hot, that the subject desired to feel cooler, and that the subject believed that he would feel cooler if he took off his coat.

Explorer Any of the largest (55-member) series of unmanned U.S. SPACECRAFT, launched between 1958 and 1975. Explorer 1, the first SATELLITE sent into orbit by the U.S., discovered the innermost VAN ALLEN RADIATION BELT. Other notable craft in this series include Explorer 38 (1968), which measured galactic radio sources and studied low radio frequencies in space, and Explorer 53 (SAS 3; 1975), which investigated X-ray and gamma-ray sources within and beyond the Milky Way Galaxy. See photo on following page.

explosive Any substance or device that can produce a volume of rapidly expanding GAS in an extremely brief period. Mechanical explosives, which depend on a physical reaction (e.g., overloading a container with compressed air until it bursts), are little used except in mining. Nuclear explosives (see NUCLEAR WEAPON) use either NUCLEAR FISSION or NUCLEAR FUSION. Chemical explosives are of two types: detonating (high) explosives (e.g., TNT, DYNAMITE) have extremely rapid decomposition and development of high pressure; deflagrating (low) explosives (e.g., black powder, smokeless powder; see GUNPOWDER) merely burn quickly and produce relatively low pressure. Primary detonating explosives are ignited by a flame, a spark, or an impact; secondary ones require a detonator and sometimes a booster. Modern high explosives use either mixtures of ammonium nitrate and fuel oil or ammonium nitrate-based water gels.

exponential function In mathematics, a FUNCTION in which a constant base is raised to a VARIABLE power. Exponential functions are used to model changes in population size, in the spread of diseases, and in the growth of investments. They can also accurately predict types of decline typified by radioactive decay (see HALF-LIFE). The essence of exponential growth, and a characteristic of all exponential growth functions, is that they double in size over regular intervals. The most important exponential function is e^x, the INVERSE of the natural logarithmic function (see LOGARITHM).

Export-Import Bank of the United States (Ex-Im Bank) One of the principal U.S. government agencies in international finance. Originally incorporated as the Export-Import Bank of Washington in 1934, its goal is to help finance U.S. exports, principally by lending money to foreign buyers of U.S. goods and services. Such assistance often consists of credits to foreign banks and governments in connection with development projects. See also DEVELOPMENT BANK.

Expressionism In the visual arts, artistic style in which the artist depicts not objective reality but the subjective emotions that objects or events arouse. This aim is accomplished through the distortion and exaggeration of shape and the vivid or violent application of colour. Its roots are found in the works of Vincent VAN GOGH, EDVARD MUNCH, and JAMES ENSOR. In 1905 the movement took hold with a group of German artists known as Die BRÜCKE; their works influenced such artists as GEORGES ROUAULT, CHAIM SOUTINE, MAX BECKMANN, KÄTHE KOLLWITZ, and ERNST BARLACH. The group of artists known as Der BLAUE REITER were also considered Expressionists. Expressionism was the dominant style in Germany after World War I; postwar Expressionists included GEORGE GROSZ and OTTO DIX. Its emotional qualities were adopted by other 20th-century art movements. See also ABSTRACT EXPRESSIONISM.

extenuating circumstance *or* **mitigating circumstance** In law, circumstance that diminishes the culpability of one who has committed a criminal offense. In many Anglo-American legal systems, provocation of the accused by the victim can reduce a charge of first-degree murder to second-degree murder or to manslaughter. In Britain, a charge of murder may be reduced to manslaughter if the accused is found to be suffering diminished capacity (see DIMINISHED RESPONSIBILITY). The Italian penal code allows consideration of motives of honour. Extenuating circumstances also are a factor in many civil actions.

extinction (of species) Dying out or termination of a species. It occurs when a species can no longer reproduce at replacement levels. Most past extinctions are thought to have resulted from environmental changes that the doomed species was either unable to adapt to or that caused it to adapt so thoroughly that it became a distinctly new species. The effect of humans on the environment, through hunting, collecting, and habitat destruction, has become the principal factor in plant and animal extinctions.

extortion Unlawful exaction of money or property through intimidation or undue exercise of authority. It may include threats of physical harm, criminal prosecution, or public exposure. Some forms of threat, especially those made in writing, are occasionally singled out for separate statutory treatment as blackmail. See also BRIBERY.

extradition Process by which one state, at the request of another, returns a person for trial for a crime punishable by the laws of the requesting state and committed outside the state of refuge. Extradition is regulated within countries by extradition acts and between countries by treaties. Some principles of extradition are common to many countries. Most decline to surrender their own nationals. Countries also generally recognize the right of political ASYLUM. In view of the solidarity of nations in the repression of crime, however, countries are usually willing to cooperate in bringing criminals to justice.

extrasensory perception (ESP) Perception that involves awareness of information about something (such as a person or event) not gained through the SENSES and not deducible from previous experience. Classic forms of ESP include telepathy, clairvoyance, and precognition. No conclusive demonstrations of the existence of ESP in any individual have been given, but popular belief in the phenomenon remains widespread, and people who claim to possess ESP are sometimes employed by investigative teams searching for missing persons or things. See also PARAPSYCHOLOGY.

extrasolar planets See PLANETS OF OTHER STARS

extravert See INTROVERT AND EXTRAVERT

Extremadura *or* **Estremadura** \es-ˌtrā-mə-ˈthü-rä,\ *Portuguese* \ˌish-tri-mə-ˈdůr-ə\ Historical region and autonomous community (pop., 2001: 1,058,503), west-central Spain. Covering an area of 16,075 sq mi (41,634 sq km), it encompasses the southwestern provinces of Cáceres and Badajoz. Its capital is MÉRIDA. During the Christian reconquest of the IBERIAN PENINSULA, the name Extremadura was used to refer to the zones outside of Moorish territory. From the late Middle Ages the term was applied to an area approximating the modern region. The countryside remains partitioned into latifundios (large estates); wheat, grapes, and olives are important crops.

extreme sports Sports events characterized by high speed or high risk. Such sports include aggressive inline skating, wakeboarding, street luge, skateboarding, and freestyle bicycle events (wherein tricks such as back flips are performed on a bicycle). Many of the events—snowboarding, skateboarding, and freestyle biking are examples—are performed on ramps and inclines or in a halfpipe, some with walls as high as 50 feet, which allows the athletes to get air, or achieve the height necessary to, for example, rotate on a bicycle. Many of these sports were made popular by the X Games (championship competitions sponsored by the cable-television network ESPN). The 1998 and 2002 Olympic Games featured extreme snowboarding events in a halfpipe, in which boarders performed jumps, rotations, and mid-air maneuvers.

extrusion Process in which metal or other material is forced through a series of DIES to create desired shapes. Many CERAMICS are manufactured by extrusion, because the process allows efficient, continuous production. In a commercial screw-type extruder, a screw AUGER continuously forces the plastic feed material through an orifice or die, resulting in simple shapes such as cylindrical rods and pipes, rectangular solid and hollow bars, and long plates. In metalworking, extrusion converts a billet of metal into a length of uniform cross-section by forcing the billet through the orifice of a die; aluminum is easily extruded. Formed sheet aluminum is used for opaque curtain-wall panels and window frames.

© 2006 Encyclopædia Britannica, Inc.

extrusive rock Any IGNEOUS ROCK derived from MAGMA that is poured out or ejected at the Earth's surface. Extrusive rocks are usually distinguished from INTRUSIVE ROCKS on the basis of their texture and mineral composition. Lava flows and pyroclastic debris (fragmented volcanic material) are extrusive; they are commonly glassy (e.g., obsidian) or finely crystalline (e.g., basalts and felsites).

Exupéry, Antoine de Saint- See Antoine de SAINT-EXUPÉRY

Exxon Mobil Corporation U.S.-based oil and gas company formed in 1999 through the merger of Exxon Corp. and MOBIL CORP. It has investments and operations in petroleum and natural gas, coal, nuclear fuels, chemicals, and ores. It also operates pipelines and one of the world's largest fleets of tankers. Exxon Mobil engages in every phase of the petroleum industry from oil fields to service stations. Both Exxon and Mobil had their origins in Standard Oil (see STANDARD OIL CO. AND TRUST) and were founded in the late 1800s. In 1926 the New Jersey subsidiary of Standard Oil, Exxon's predecessor, introduced the Esso brand name. The name was changed to Exxon in 1972. As of 2002 Exxon Mobil was the world's largest integrated oil company.

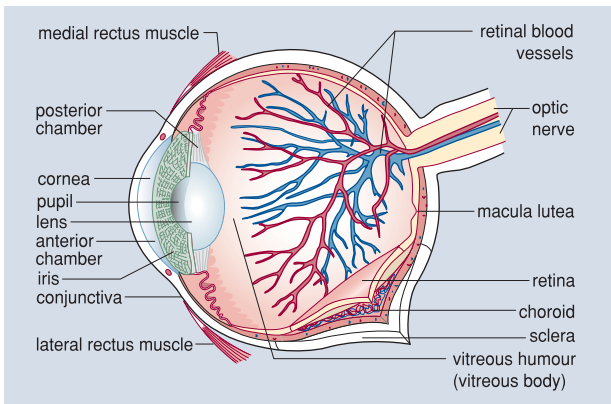
Eyasi \ā-'yä-sē**, Lake** Lake, northern Tanzania. At an elevation of about 3,400 ft (1,040 m), the lake covers an area of about 400 sq mi (1,050 sq km) and occupies the bottom of a bowl-like depression. Its walls are purple lava, enclosing a broad expanse of white alkaline shallows. Flamingos inhabit the lakeshore in vast flocks. Hominid fossils were found nearby.

Eybeschütz \'ī-bə-ˌshütz**, Jonathan** (b. c. 1690, Kraków, Pol.—d. 1764, Altona, Den.) Polish rabbi and Talmudic scholar. He served as rabbi in a number of European towns, and his scholarship gained him a loyal following. He was reputed to have mystic powers; when the women of his congregation asked him to give them protection from death in childbirth, he offered them amulets that contained a prayer to the false messiah SHABBETAI TZEVI. A prominent German rabbi, Jacob Emden (1697–1776), denounced the amulets. The dispute that ensued between Emden and Eybeschütz divided the European Jewish community.

Eyck \'īk**, Jan van** (b. before 1395, Maaseik, Bishopric of Liège, Holy Roman Empire—d. before July 9, 1441, Bruges) Flemish painter. He is recorded in 1422 as a master painter working for John of Bavaria, count of Holland, and later was employed by PHILIP III the Good, duke of Burgundy. Securely attributed paintings survive only from the last decade of his career; 10 are signed and dated, an unusually large number for the period. He produced portraits and religious subjects that are unmatched for their technical brilliance, their intellectual complexity, and the richness of their symbolism; he perfected the newly developed technique of oil painting. His masterpiece is the *Adoration of the Lamb* (1432), known as the Ghent Altarpiece, which he painted with his brother Hubert (c. 1370–1426). He is commonly regarded as the greatest northern European artist of the 15th century. His works were widely copied and avidly collected.

eye Organ that receives light and visual images. Non-image forming, or direction, eyes are found among worms, mollusks, cnidarians, echinoderms, and other invertebrates; image-forming eyes are found in certain mollusks, most arthropods, and nearly all vertebrates. Arthropods are unique in possessing a compound eye, which results in their seeing a multiple image that is partially integrated in the brain. Lower vertebrates such as fish have eyes on either side of the head, allowing a maximum view of the surroundings but producing two separate fields of vision. In predatory birds and mammals, binocular vision became more important. Evolutionary changes in the placement of the eyes permitted a larger overlap of the two visual fields, resulting in the higher mammals in a parallel line of direct sight. The human eye is roughly spherical. Light passes through its transparent front and stimulates receptor cells on the retina (cones for colour vision, rods for black-and-white vision in faint light), which in turn send impulses through the optic nerve to the brain. Vision disorders include near- and farsightedness and ASTIGMATISM (correctable with EYEGLASSES or CONTACT LENSES), COLOUR BLINDNESS, and night blindness. Other eye disorders (including DETACHED RETINA and GLAUCOMA) can cause VISUAL-FIELD DEFECTS or BLINDNESS. See also OPHTHALMOLOGY; PHOTORECEPTION. See illustration opposite.

eyeglasses LENSES set in frames to wear in front of the eyes to aid vision or correct vision defects (see OPHTHALMOLOGY, OPTOMETRY). Their use for farsightedness and nearsightedness has been known since the late Middle Ages. In 1784 BENJAMIN FRANKLIN invented bifocals, with divided lenses for distant and near vision. Eyeglasses can also correct ASTIGMATISM. Most lenses are made of glass or plastic (lighter and more shatterproof than glass but easily scratched). Sunglass lenses are tinted to reduce glare and often treated to reduce ultraviolet light exposure. See also CONTACT LENS.



Eyre Peninsula Large promontory, South Australia. Projecting into the Indian Ocean, the peninsula is about 200 mi (320 km) long and lies between the GREAT AUSTRALIAN BIGHT and Spencer Gulf. Wheat, sheep, and barley are raised there; iron is extracted in the Middleback Ranges to the northeast. There are numerous resort and fishing towns along the coasts.

Eyre \'ar**, Lake** Salt lake, northeastern SOUTH AUSTRALIA. With a total area of 3,700 sq mi (9,600 sq km), Lake Eyre is the lowest point in AUSTRALIA, 50 ft (15 m) below sea level. The lake consists of two sections: Lake Eyre North, 90 mi (144 km) long and 40 mi (65 mi) wide, is joined by the narrow Goyder Channel to Lake Eyre South, which is 40 mi (65 km) long and about 15 mi (24 km) wide. Lake Eyre is normally dry, and it fills completely only (on average) twice a century. When filled, the lake takes about two years to dry up again. The region is within Lake Eyre National Park.

Ezekiel \i-'zēk-yəl\ (fl. 6th century BC) Priest and PROPHET of ancient Israel. He was the subject and partial author of the biblical book of Ezekiel. He began to prophesy to the Jews in Palestine c. 592 BC, pronouncing God's judgment on a sinful nation. He witnessed the conquest of Jerusalem by BABYLON and saw his fellow Israelites taken away into captivity. He offered a promise of Israel's restoration in his famous vision of a valley of dry bones that revive and assemble themselves. He envisaged a theocratic community revolving around a restored Temple in Jerusalem.

Ezhov, Nikolay See Nikolay YEZHOV

Ezra (fl. 4th century BC, Babylon and Jerusalem) Jewish religious leader and reformer. He restored the Jewish community after its exile in BABYLON, persuading the people of JUDAH to return to a strict observance of Mosaic law. He served as a commissioner of the Persian government, which was tolerant of other religions but required order and authority. His efforts led to a restoration of traditional worship in the rebuilt Temple of JERUSALEM and the dissolution of all mixed marriages. For creating a Jewish community based on the Law, which could exist without political statehood, he is often considered the founder of modern JUDAISM. His story is told in the books of Ezra and NEHEMIAH.

Structure of the human eye. The outer portion consists of the white protective sclera and transparent cornea, through which light enters. The middle layer includes the blood-supplying choroid and pigmented iris. Light passing into the interior through the pupil is regulated by muscles that control the pupil's size. The retina comprises the third layer and contains receptor cells (rods and cones) that transform light waves into nervous impulses. The lens, lying directly behind the iris, focuses light onto the retina. The macula lutea, in the centre of the retina, is a region of high visual acuity and colour discrimination. Nerve fibres pass out through the optic nerve to the brain's visual centre. The eye's anterior and posterior chambers contain a watery fluid that nourishes the cornea and lens. The vitreous humour helps maintain the eye's shape. A thin layer of mucous membrane (conjunctiva) protects the eye's exposed surface. External muscles, including the medial rectus and lateral rectus muscles, connect and move the eye in its socket.

F-15 *or* **Eagle** Twin-engine jet fighter built by the Boeing Company. F-15s were delivered to the U.S. Air Force beginning in 1974 and have been sold to U.S. allies in the Middle East. The F-15 is powered by two turbofan engines that can accelerate it to more than twice the speed of sound. The single-seat F-15 is armed with a 20-mm rotary cannon and an array of short-range and medium-range air-to-air missiles. The fighter-bomber version, known as the Strike Eagle, includes a second seat for the weapons officer, who controls the delivery of missiles and bombs. It carried out much of the nighttime precision bombing of Iraqi installations in the Persian Gulf War.

F-16 *or* **Fighting Falcon** Single-seat, single-engine jet fighter built by Lockheed Martin Corp. The first model was delivered to the U.S. Air Force in 1978; it has since been sold to more than a dozen other countries. Produced to fill the need for a lightweight, cost-effective fighter, it is 49 ft (15 m) long and has a wingspan of 31 ft (9.5 m). It can accelerate to more than twice the speed of sound, and its weaponry includes a 20-mm rotary cannon and attachments under the wings and fuselage for a variety of bombs and missiles.

F-86 *also called* **Sabre** \'sā-bər\ Early U.S. jet fighter manufactured by North American Aviation, Inc. Built with wings swept back to limit transonic drag as flight speed approached the sound barrier, it could exceed the speed of sound in a dive. The first squadron became operational in 1949, and the fighter saw combat in the Korean War. Production ended in 1956. A single-seat, single-engine fighter, the F-86 was powered by a series of turbojet engines, reaching a top speed of almost 700 mph (1,100 kph) in level flight. It carried guided missiles, machine guns or cannon in the fuselage, and rockets or bombs under the wings.

Fa-hsien See Faxian

Faber \'fā-bər**, Lothar von** (b. June 12, 1817, Stein, Bavaria—d. July 26, 1896, Stein) German manufacturer of writing products and art supplies. He took over the family pencil business in Bavaria and transformed it into a worldwide firm, establishing branches throughout Europe and the U.S. and contracting in 1856 for exclusive control of all graphite being mined in Siberia. His brother John Eberhard Faber (1822–79) settled in the U.S. in 1849 and built a large Faber manufacturing plant. The Eberhard Faber Pencil Co. was incorporated in the U.S. in 1898, and in the same year the German company was renamed Faber-Castell. The contemporary company, Faber-Castell AG, manufactures pens, pencils, and art supplies.

Fabergé \fä-ber-'zhā**, (Peter) Carl** *orig.* **Karl Gustavovich Fabergé** (b. May 18, 1846, St. Petersburg, Russia—d. Sept. 24, 1920, Lausanne, Switz.) Russian goldsmith, jeweler, and designer. Educated in Europe and England, he took over his father's jewelry business in St. Petersburg in 1870. The objects he designed quickly won him the patronage of European and Russian royalty. Specializing in gold, silver, malachite, jade, lapis lazuli, and gemstones, he manufactured not only conventional jewelry but objects of fantasy, much of it inspired by the decorative arts of the Louis XVI style. He opened workshops in Moscow, Kiev, and London and became most famous for his jeweled Easter eggs for Alexander III and Nicholas II. His workshops were shut down after the 1917 revolution, and he died in exile.

Fabian Society \'fā-bē-ən\ Socialist society founded in 1883–84 in London, to establish a democratic socialist state in Britain. The name derived from Fabius Maximus Cunctator, whose elusive tactics in avoiding pitched battles led to victory over stronger forces. Fabians believed in evolutionary socialism rather than revolution, and used public meetings and lectures, research, and publishing to educate the public. Important early members included George Bernard Shaw and Sidney and Beatrice Webb. They helped organize a separate party that became the Labour Party in 1906, and many Labour members of Parliament have been Fabians.

Fabius Maximus Cunctator \'fā-bē-əs-'mak-si-məs-ˌkəŋk-'tā-tər**, Quintus** (d. 203 BC) Roman commander and statesman. He served as consul in 233 BC (an office he would hold five times) and censor in 230. Elected dictator in 217, he used a strategy of harassment and attrition in the Second Punic War against Hannibal (218–201). These cautious delaying tactics (Cunctator means "delayer") allowed Rome to recover and take the offensive, but Roman impatience led to defeat at the Battle of Cannae. He unsuccessfully opposed the invasion of Africa by Scipio Africanus in 205.

fable Narration intended to enforce a useful truth, especially one in which animals or inanimate objects speak and act like human beings. Unlike a folktale, it has a moral that is woven into the story and often explicitly formulated at the end. The Western fable tradition began with tales ascribed to Aesop. It flourished in the Middle Ages, reached a high point in 17th-century France in the works of Jean de La Fontaine, and found a new audience in the 19th century with the rise of children's literature. Fables also have ancient roots in the literary and religious traditions of India, China, and Japan.

Fables of Bidpai See Panca-tantra

fabliau \'fa-blē-ˌō\ *or* **fableau** \fa-'blō\ Short metrical tale made popular in medieval France by jongleurs. Fabliaux were characterized by vivid detail and realistic observation and were usually comic, coarse, and cynical, especially in their treatment of women. Though understandable to the bourgeois and common people, they frequently contain an element of burlesque that depends for its appreciation on considerable knowledge of courtly society, love, and manners. About 150 fabliaux survive, by both amateur and professional writers.

Fabriano, Gentile da See Gentile da Fabriano

Fabricius \fə-'brish-əs\ **(ab Aquapendente), Hieronymus** *Italian* **Girolamo Fabrici** (b. May 20, 1537, Acquapendente, Italy—d. May 21, 1619, Padua) Italian surgeon and anatomist. He studied under and later succeeded Gabriel Fallopius at the University of Padua (1562–1613). The first clear description of the valves of the veins, in his *De venarum ostiolis* (1603), provided his pupil William Harvey with a crucial point in his argument for blood circulation. His *De formato foetu* (1600) contained the first detailed description of the placenta and opened the field of comparative embryology. He was the first to perceive the larynx as a vocal organ and to demonstrate that the pupil of the eye changes size.

Fabricius \fä-'brē-sē-ùs**, Johann Christian** (b. Jan. 7, 1745, Tøndern, Den.—d. March 3, 1808, Kiel) Danish entomologist. He studied at Uppsala University with Carolus Linnaeus and from 1775 taught not only natural history but also economics and finance at the University of Kiel. He advanced theories progressive for his time, particularly the view that new species and varieties could arise through hybridization and by environmental influence on anatomical structure and function. His taxonomic research was based on insect mouthparts rather than their wings.

Fabritius \fä-'brēt-sē-ūs**, Carel** (baptized Feb. 27, 1622, Middenbeemster, Neth.—d. Oct. 12, 1654, Delft) Dutch painter. He studied with Rembrandt in the early 1640s, then settled in Delft, entering its painters' guild in 1652. The earliest work attributed to him, *The Raising of Lazarus* (c. 1645), was strongly influenced by Rembrandt, but he soon developed a personal Baroque style marked by cool colour harmonies, subtle lighting effects, and illusionistic perspective. His portraits and his genre and narrative paintings influenced Pieter de Hooch and Johannes Vermeer. All but about a dozen of his paintings were destroyed by an explosion of the Delft powder magazine, which killed him as well.

fabula \'fab-yə-lə, 'fäb-yù-lä\ Drama of ancient Rome. Particular types included the *fabula Atellana*, the earliest form of native farce in ancient Italy; the *fabula crepidata*, a form of Roman tragedy based on Greek models; the *fabula palliata*, an ancient Roman comedy based on Greek New Comedy and treating a Greek subject; the *fabula praetexta*, an ancient Roman drama with a theme from Roman history or legend; and the *fabula togata*, a Romancomedy based on Greek models but featuring Roman life and dress.

face Front part of the head, extending from the forehead to the chin and housing the eyes, nose, mouth, and jaws. The receding of the jaw and the increasing size of the brain in human evolution has made the face essentially vertical, with two distinctively human features: a prominent, projecting nose and a clearly defined chin. The face and braincase follow different patterns of growth. While the face grows more slowly, it ends up much larger compared to the braincase in adults than at birth. The facial muscles move the features to express emotion.

fact-value distinction In philosophy, the ontological distinction between what is (facts) and what ought to be (values). David Hume gave

© 2006 Encyclopædia Britannica, Inc.

the distinction its classical formulation in his dictum that it is impossible to derive an "ought" from an "is." See also NATURALISTIC FALLACY.

factor In multiplication, one of two or more numerical or algebraic components of a product. A whole number's factors are the whole numbers that divide evenly into it (e.g., 1, 2, 3, 4, 6, and 12 are factors of 12). To factor a counting number means to break it down into its PRIME NUMBER factors. To factor a POLYNOMIAL is to find its prime polynomial factors, a basic procedure for solving ALGEBRAIC EQUATIONS. According to the FUNDAMENTAL THEOREM OF ARITHMETIC, the prime factorization of any number or polynomial is unique.

factorial For any whole number, the product of all the counting numbers up to and including itself. It is indicated with an exclamation point: 4! (read "four factorial") is $1 \times 2 \times 3 \times 4 = 24$. In order for certain formulas involving PERMUTATIONS AND COMBINATIONS to work, 0! is defined to be 1. Factorials are particularly useful in calculating the number of ways an event can occur, for example, the number of possible orders of finish in a race.

factoring In finance, the selling of ACCOUNTS RECEIVABLE on a contract basis to an agency known as a factor in order to obtain cash payment before the accounts come due. The factor assumes full responsibility for credit analysis of new accounts, payments collection, and credit losses. Factoring is most often used in seasonal industries such as textiles and shoes to shift the functions of CREDIT and collection to a specialized agency.

factory Structure in which work is organized to meet the need for production on a large scale usually with power-driven machinery. In the 17th–18th century, the DOMESTIC SYSTEM of work in Europe began giving way to larger units of production, and capital became available for investment in industrial enterprises. The movement of population from country to city also contributed to change in work methods. MASS PRODUCTION, which transformed the organization of work, came about by the development of the MACHINE-TOOL industry. With precision equipment, large numbers of identical parts could be produced at low cost and with a small workforce. The ASSEMBLY LINE was first widely used in the U.S. meat-packing industry; HENRY FORD designed an automobile assembly line in 1913. By mid-1914, chassis assembly time had fallen from 12½ man-hours to 93 man-minutes. Some countries, particularly in Asia and South America, began industrializing in the 1970s and later. See also AMERICAN SYSTEM OF MANUFACTURE.

factory farming System of modern animal farming designed to yield the most meat, milk, and eggs in the least amount of time and space possible. The term, descriptive of standard farming practice in the U.S., is frequently used by animal-rights activists, who maintain that animal-protection measures routinely ignore farm animals. Animals are often fed growth hormones, sprayed with pesticides, and fed antibiotics to mitigate the problems of infestation and disease that are exacerbated by crowded living conditions. Chickens spend their lives crowded into small cages, often so tightly that they cannot turn around; the cages are stacked in high batteries, and the length of "day" and "night" are artificially controlled to maximize egg laying. Veal calves are virtually immobilized in narrow stalls for their entire lives. These and numerous other practices have long been decried by critics.

Faḍlallāh \fäd-'läl-lə**, (Ayatollah Sayyid) Muḥammad Ḥusayn** (b. c. 1935, Al-Najaf, Iraq) Muslim Shīʿite cleric associated with Lebanese HEZBOLLAH organization. He was schooled at a traditional MADRASAH in his birthplace, where he studied under many of the eminent Shīʿite scholars of his day. His scholarly acumen eventually earned him the honourific ayatollah. He moved to Lebanon (where his parents were born) in 1966 and quickly established a reputation as a leading religious authority. Faḍlallāh's eloquence led many to believe that he was Hezbollah's leader after the party was founded in 1982, but both he and the party have denied any direct link, while acknowledging his strong spiritual influence over the organization. Though impressed by the Islamic revolution in Iran (1979), he generally stood aloof from the more radical position of its leader, RUHOLLAH KHOMEINI.

Faenza majolica \fä-'en-zä-mə-'jä-li-kə\ Tin-glazed EARTHENWARE produced in the Italian city of Faenza from the late 14th century. Early Faenza jugs were decorated in green and purple with Gothic lettering and heraldic lions; the first major MAJOLICA piece is a wall plaque dated 1475. In the 15th century, Renaissance motifs appeared in dark blue, rich orange, and copper-green; vases with a peacock-feather design and a globular two-handled jar are characteristic of Faenza. The factory's most outstanding wares date from the late 15th to the mid-16th century. See also FAIENCE.

Faeroe Islands See FAROE ISLANDS

Fahrenheit, Daniel (Gabriel) (b. May 24, 1686, Gdańsk, Pol.—d. Sept. 16, 1736, The Hague, Dutch Republic) German physicist and instrument maker. He spent most of his life in the Netherlands, where he devoted himself to the study of physics and the manufacture of precision meteorological instruments. He is best known for inventing a successful alcohol thermometer (1709) and mercury thermometer (1714) and for developing the Fahrenheit temperature scale, setting zero at the freezing point of an equal mixture of ice and salt. He discovered that water can remain liquid below its freezing point and that the boiling point of liquids varies with atmospheric pressure.

Faidherbe \fe-'derb**, Louis (-Léon-César)** (b. June 3, 1818, Lille, Fr.—d. Sept. 29, 1889, Paris) Governor of French Senegal (1854–61, 1863–65) and a founder of France's colonial empire in Africa. Faidherbe was trained as a military engineer and served in Algeria and Senegal before becoming the colonial governor of Senegal. Alarmed by the growing power of the Islamic leader ʿUMAR TAL, he took the offensive, driving off ʿUmar Tal, subjugating the Moorish tribes in the north, and transforming his colony into the region's dominant power. In 1857 he founded the capital city of DAKAR.

faience \fā-'äns, fī-'ä^{n}s\ Tin-glazed EARTHENWARE made in France, Germany, Spain, and Scandinavia, similar to FAENZA MAJOLICA, for which it was named. The term is also applied to glazed earthenware made in ancient Egypt, where it was used for beads, amulets, jewelry, and small animal and human figures, most notably the blue-glazed hippopotamus figures of the Middle Kingdom (c. 2000–c. 1670 BC). Faience tiles, first made in the early dynasties, were used to decorate the walls of the subterranean chambers of the pyramids. In the New Kingdom (c. 1550–c. 1070 BC), polychrome tiles with floral designs were used in houses and palaces.

German faience lobed dish painted with chinoiserie in blue and manganese, Frankfurt am Main, c. 1690; in the Victoria and Albert Museum, London
COURTESY OF THE VICTORIA AND ALBERT MUSEUM, LONDON

fair Temporary MARKET where buyers and sellers gather to transact business. Fairs are held at regular intervals, generally at the same location and time of year. An important form of commerce before the INDUSTRIAL REVOLUTION, fairs solved the problem of distribution and made possible the demonstration of arts and crafts and the sale and BARTER of goods. They were a fixture of the Roman Empire and medieval Europe, where they were held at major caravan crossroads and near religious festivals. The rules of the fairs eventually became the basis of European BUSINESS LAW. Fairs began to die out as cities grew larger and transportation networks became more extensive, though some continued to exist as religious festivals or recreational events. County, agricultural, and livestock fairs are still held in many countries. The TRADE FAIR or trade show, often an international event in which exhibitors from one industry display their goods, gained popularity in the 20th century.

fair trade law In the U.S., any law allowing manufacturers of brand-name or trademarked goods to fix the actual or minimum resale prices of these goods. (Elsewhere the practice is called price maintenance.) Fair trade laws were passed by many states during the GREAT DEPRESSION in an effort to protect independent retailers from price-cutting by large chain stores and consequent loss of employment in distributive trades, but most were later repealed at the state level. Critics argued that such laws restricted competition; the complexity of post-World War II marketing channels also made enforcement impracticable. In 1975 the few that remained in existence were repealed by an act of Congress.

Fairbairn \'fer-ˌbern**, Sir William** (b. Feb. 19, 1789, Kelso, Roxburghshire, Scot.—d. Aug. 18, 1874, Moor Park, Surrey, Eng.) Scottish civil engineer and inventor. In 1835 he established a shipbuilding yard in London, where he constructed several hundred vessels. He was the first to use WROUGHT IRON for ship hulls, bridges, mill shafting, and structural beams. He experimented with the strength of IRON and the relative merits of hot and cold blast in iron manufacture (see BLAST FURNACE). In 1845 he

© 2006 Encyclopædia Britannica, Inc.

and Robert Stephenson designed two tubular railway bridges in Wales; Fairbairn designed the hydraulic riveters used in constructing one of them.

Fairbanks City (pop., 2000: 30,224), east-central Alaska, U.S., situated at the junction of the Tanana and Chena rivers. Founded in 1902 after a gold strike, it was named for Charles W. Fairbanks. As the northern terminus of the Alaska Highway and the railroad, it is the main supply centre for the northern Alaskan oil business (see Trans-Alaska Pipeline). Located nearby are Fort Wainwright, Eielson Air Force Base, and the University of Alaska, Fairbanks (1917). Fairbanks is the site of the annual 800-mi (1,290-km) Yukon Marathon boat race and the North American Championship Sled Dog Races.

Fairbanks, Douglas *orig.* **Douglas Elton Ulman** (b. May 23, 1883, Denver, Colo., U.S.—d. Dec. 12, 1939, Santa Monica, Calif.) U.S. film actor. Fairbanks was a Broadway star by 1910, noted for his exuberance and physical agility. He made his film debut in *The Lamb* (1915). As cofounder of United Artists (1919), he produced and starred in such films as *The Mark of Zorro* (1920), *Robin Hood* (1922), and *The Thief of Baghdad* (1924). His films were so popular that he was called the "King of Hollywood" in the 1920s. His 15-year marriage to Mary Pickford ended in 1935. Douglas Fairbanks, Jr. (b. Dec. 9, 1909, New York, N.Y., U.S.—d. May 7, 2000, New York City), Fairbanks's son by his first wife, was a debonair leading man in U.S. and British films, including *Catherine the Great* (1934), *The Prisoner of Zenda* (1937), and *State Secret* (1950). In the 1960s he hosted and sometimes acted in the British TV drama series *Douglas Fairbanks Presents*.

Fairchild, David (Grandison) (b. April 7, 1869, Lansing, Mich., U.S.—d. Aug. 6, 1954, Coconut Grove, Fla.) U.S. botanist and agricultural explorer. He studied at Kansas State University of Agriculture. From 1904 to 1928, as head of the section of plant pathology of the U.S. Department of Agriculture, he supervised the introduction of many useful plants into the U.S., including alfalfa, dates, mangoes, horseradish, and bamboos.

Fairfax (of Cameron), Thomas Fairfax, 3rd Baron (b. Jan. 17, 1612, Denton, Yorkshire, Eng.—d. Nov. 12, 1671, Nun Appleton, Yorkshire) Commander in chief of the Parliamentary army during the English Civil Wars. His tactical skill and courage helped bring about many Parliamentary victories, including the Battle of Marston Moor. As commander in chief of the New Model Army, he defeated Charles I at the Battle of Naseby. Fairfax disapproved of the purge of Parliament by his soldiers in 1648 and refused to serve on the commission that condemned Charles to death. In 1650 he resigned as commander in chief to protest the proposed invasion of Scotland. In 1658 he helped George Monck restore Parliamentary rule in the face of opposition from the army. He was a member of the Parliament that invited Charles's son to return to England as Charles II.

Fairweather, Mount Mountain, British Columbia, Canada It is located on the Alaska border in the Fairweather Range of the St. Elias Mountains, at the southwestern end of the Glacier Bay National Park. The highest peak in the province, it reaches 15,299 ft (4,663 m). It was named by Capt. James Cook, who saw the peak in 1778 while navigating the bay in "fair weather."

fairy In folklore, any of a race of supernatural beings who have magic powers and sometimes meddle in human affairs. Some have been described as of human size, while others are "little people" only a few inches high. The term was first used in medieval Europe. Fairy lore is especially common in Ireland, Cornwall, Wales, and Scotland. Though usually beneficent in modern children's stories, the fairies of the past were powerful and sometimes dangerous beings who could be friendly, mischievous, or cruel, depending on their whim. Fairies were thought to be beautiful, to live much longer than human beings, and to lack souls. They sometimes carried off human infants and left changelings as substitutes. They occasionally took human lovers, but to enter fairyland was perilous for humans, who were obliged to remain forever if they ate or drank there. See also leprechaun.

Fairy shrimp (*Eubranchipus vernalis*)
WILLIAM JAHODA—NATIONAL AUDUBON SOCIETY FROM PHOTO RESEARCHERS/EB INC.

fairy shrimp Any of the crustaceans in the order Anostraca, named for their graceful movements and pastel colours. Some grow to 1 in. (2.5 cm) or more in length. They live in freshwater ponds in Europe, Central Asia, western North America, the drier regions of Africa, and Australia. See also shrimp.

fairy tale Simple narrative typically of folk origin dealing with supernatural beings. Fairy tales may be written or told for the amusement of children or may have a more sophisticated narrative containing supernatural or obviously improbable events, scenes, and personages and often having a whimsical, satirical, or moralistic character. The term embraces popular folktales such as "Cinderella" and "Puss in Boots," as well as art fairy tales of later invention, such as those by Hans Christian Andersen. It is often difficult to distinguish between tales of literary and oral origin, because folktales have received literary treatment from early times, and literary tales can often be traced back to oral tradition.

Faisalabad \ˈfī-sə-lə-ˌbad\ *formerly (until 1979)* **Lyallpur** \ˈlīl-ˌpůr\ City (pop., 1998: 1,977,246) and district, Punjab province, Pakistan. Founded in 1890, it became headquarters of the Lower Chenab colony and in 1898 was incorporated as a municipality. A distributing centre located in the central Punjab plain, its industries produce chemicals and synthetics, textiles, and food products. It is the site of West Pakistan Agricultural University (1961 and of a number of colleges affiliated with the University of the Punjab.

faith healing Curing of an illness or disability by recourse to divine power, without the use of traditional medicine. A healer such as a clergy member or an inspired layperson may act as intermediary. Certain places, such as the grotto at Lourdes, France, are believed to effect cures among believers. In ancient Greece, temples honoring the god of medicine, Asclepius, were built near springs with healing waters. In Christianity, support for faith healing is based on the miraculous cures wrought by Jesus during his ministry. Christian Science is noted for faith healing, and it is also practiced in a more dramatic way in Pentecostalism through such customs as the laying on of hands.

Fakhr al-Dīn al-Rāzī \ˈfä-ķər-äl-ˈdēn-är-ˈrä-zē\ (b. 1149, Rayy, Iran—d. 1209, near Herāt, Khwārezm) Islamic scholar and theologian. He traveled widely before settling in Herāt (in modern Afghanistan). The author of more than 100 books (on subjects as diverse as medicine, mineralogy, and grammar), he gained fame and wealth through his scholarship and skill in debate, in which he often presented unorthodox views fully and favorably before refuting them. Though this led to accusations of heresy, it has preserved information about little-known sects. His works include one of the major commentaries on the Qur'ān, *The Keys to the Unknown* (or *The Great Commentary*), and *Collection of the Opinions of Ancients and Moderns*, a classic of kalām. His bad temper earned him many enemies, and he may have been poisoned to death.

Falange \fä-ˈlän-hā,\ *English* \ˈfā-lanj\ (Spanish: "Phalanx") Extreme nationalist political group in Spain. Founded in 1933 by José Antonio Primo de Rivera and influenced by Italian fascism, the Falange gained popularity in opposition to the Popular Front government of 1936. Gen. Francisco Franco merged the group with other right-wing factions by decree in 1937 and became the Falange's absolute chief. 150,000 Falangists served in Franco's armed forces in the Spanish Civil War. After their victory, the Falange's fascism was subordinated to the Franco regime's conservative values. On Franco's death in 1975 a law was passed permitting other "political associations," and the Falange was abolished in 1977.

Falasha \fə-ˈlä-shə\ Jewish Ethiopians. The Falasha call themselves House of Israel and claim descent from Menilek I, son of King Solomon and the Queen of Sheba. Probably descended from local Agew peoples converted by Jews in southern Arabia, they remained faithful to Judaism after the Ethiopian kingdom was converted to Christianity in the 4th century AD. Persecuted by Christians, they settled in the area around Lake Tana in northern Ethiopia. Though ignorant of the Talmud, members adhered strictly to the Mosaic law and observed some festivals of Judaism. In 1975 the Israeli rabbinate affirmed that Falashas were Jews, and from 1980 to 1992 some 45,000 Falasha emigrated to Israel, leaving probably only a few thousand in Ethiopia.

falcon Any of nearly 60 species of diurnal birds of prey in the family Falconidae, characterized by long, pointed wings and swift, powerful flight. The name is sometimes restricted to the more than 35 species of true falcons, genus *Falco*. Species range from 6 to 24 in. (15–60 cm) long. Females of the genus *Falco* are larger and bolder than males and are preferred for falconry. Falcons, found worldwide, commonly nest in tree-

© 2006 Encyclopædia Britannica, Inc.

holes or on cliff ledges. Some species capture birds in midair; others live on hares, mice, lizards, and insects. See also GYRFALCON, HAWK, KESTREL, MERLIN, PEREGRINE FALCON.

Falconet \fȧl-kȯ-'ne**, Étienne-Maurice** (b. Dec. 1, 1716, Paris, Fr.—d. Jan. 24, 1791, Paris) French sculptor. After being apprenticed to a carpenter, he studied sculpture in Paris. He developed an intimate style with a taste for erotic figures. Through Madame de POMPADOUR's influence, he became director of the Sèvres porcelain factory (1757–66), and many of his figures were reproduced in Sèvres biscuit ware. From 1766 to 1778 he worked in Russia; his masterpiece, the colossal equestrian statue of PETER I the Great in St. Petersburg (made famous as *The Bronze Horseman* by ALEKSANDR PUSHKIN), was unveiled in 1782. After suffering a stroke (1783), he gave up sculpture and devoted his time to writing. He is best known for adapting the classical style of the French BAROQUE PERIOD to the ROCOCO STYLE ideal.

falconry Sport of employing FALCONS or other HAWKS in hunting game. Falconry has been practiced in the Middle East at least since the 8th century BC. It flourished among the privileged classes in Europe in the Middle Ages. It began to die out after the advent of the shotgun and the enclosure of open lands in the 17th century, but there was a renewed interest in the sport beginning in the 1970s; there are many hawking clubs and falconry associations. The bird most commonly used is the PEREGRINE FALCON, though the goshawk and sparrow hawk have also been used. Birds are caught wild or raised from birth. Training involves selective use of a leather hood (called a rufter) and leg thongs (jesses) to keep the animal under control while familiarizing it with its new environment. During the hunt the trained bird is released to bring down its prey; it then returns to the hawker or is collected at the kill site.

Faldo, Nick (b. July 18, 1957, Welwyn Garden City, Hertfordshire, Eng.) British golfer. Faldo turned professional in 1976 and played the first of 11 successive Ryder Cup matches in 1977. He subsequently won three Masters (1989, 1990, 1996), three British Opens (1987, 1990, 1992), and many other international tournaments. In 1990 he became the first non-American to be named the PGA Player of the Year.

Falkland Islands *Spanish* **Islas Malvinas** \'ēs-ˌläs-mäl-'bē-näs\ British overseas territory (pop., 2001: 2,491), in the southwestern South ATLANTIC OCEAN. Located about 300 mi (480 km) northeast of the southern tip of SOUTH AMERICA, the Falklands are made up of two main islands, East Falkland and West Falkland, and about 200 smaller islands. The islands are spread out over some 4,700 sq mi (12,200 sq km). The capital is Stanley, on East Falkland. The population is English-speaking and of British descent. The economy is based on sheep raising. The French founded the islands' first settlement, on East Falkland in 1764, and the British settled West Falkland in 1765. In 1770 the Spanish purchased the French settlement and expelled the British, but the latter's settlement was restored in 1771. In 1820 Argentina proclaimed its sovereignty over the Falklands, but the British took them back in 1833. Argentina invaded in 1982, and the British reclaimed the islands after a brief conflict (see FALKLAND ISLANDS WAR).

Falkland Islands War *or* **Malvinas War** (1982) Brief but undeclared war between Argentina and Great Britain over control of the FALKLAND ISLANDS (Islas Malvinas) and associated island dependencies. Both countries long had claimed sovereignty over the Falklands and had been in protracted negotiations over them. On April 2, 1982, Argentina's military government, impatient with the negotiations, occupied the islands with some 10,000 troops. British prime minister MARGARET THATCHER responded by sending a naval task force to the region, and within three months British forces had defeated the Argentines and reoccupied the islands. Britain lost about 250 men, and Argentina about 700. Argentina's defeat discredited its military government and helped lead to the restoration of civilian rule in 1983.

Fall, Albert Bacon (b. Nov. 26, 1861, Frankfort, Ky., U.S.—d. Nov. 30, 1944, El Paso, Texas) U.S. secretary of the interior (1921–23). He began practicing law in New Mexico Territory in 1889. He served in the U.S. Senate from 1913 to 1921, when he was appointed Secretary of the Interior by Pres. WARREN G. HARDING. He resigned his cabinet post two years later and returned to New Mexico. In 1924 a Senate investigation revealed that Fall had accepted a large bribe to lease to private oil interests, without competitive bidding, naval oil reserve lands in the Teapot Dome reserve in Wyoming and other reserves in California. He was convicted of bribery in 1929 and served nine months of a one-year prison sentence. See also TEAPOT DOME SCANDAL.

Falla \'fä-yə**, Manuel de** (b. Nov. 23, 1876, Cádiz, Spain—d. Nov. 14, 1946, Alta Gracia, Arg.) Spanish composer. He studied with FELIPE PEDRELL and conceived a powerful musical nationalism. His first major work was the opera *La vida breve* (1905). He lived in Paris (1907–14), where he absorbed the music of CLAUDE DEBUSSY, MAURICE RAVEL, and others. The intensely Spanish ballet *El amor brujo* (1915) gained him further acclaim. The Spanish Civil War caused him to leave Spain for Argentina c. 1938, and he never returned. His other works include *Nights in the Gardens of Spain* (1915), *The Three-Cornered Hat* (1919), the puppet opera *El retablo de maese Pedro* (1923; with FEDERICO GARCÍA LORCA), a harpsichord concerto (1926), and the huge unfinished oratorio *L'Atlántida*. He is regarded as the greatest Spanish composer of the 20th century.

fallacy, formal and informal In philosophy, reasoning that fails to establish its conclusion because of deficiencies in form or wording. Formal fallacies are types of deductive argument that instantiate an invalid inference pattern (see DEDUCTION; VALIDITY); an example is "affirming the consequent: If A then B; B; therefore, A." Informal fallacies are types of inductive argument the premises of which fail to establish the conclusion because of their content. There are many kinds of informal fallacy; examples include *argumentum ad hominem* ("argument against the man"), which consists of attacking the arguer instead of his argument; the fallacy of false cause, which consists of arguing from the premise that one event precedes another to the conclusion that the first event is the cause of the second; the fallacy of composition, which consists of arguing from the premise that a part of a thing has a certain property to the conclusion that the thing itself has that property; and the fallacy of equivocation, which consists of arguing from a premise in which a term is used in one sense to a conclusion in which the term is used in another sense.

Fallen Timbers, Battle of (Aug. 20, 1794) Decisive victory of U.S. Gen. ANTHONY WAYNE over the northwestern Indian Confederation, securing white settlement of former Indian territory, mainly in Ohio. Wayne led more than 1,000 soldiers to confront the 2,000 Indians, who had been promised British support and who had gathered behind a protective tangle of fallen trees along the Maumee River (near modern Toledo). The Indians, abandoned by the British, fled in disarray. A treaty in 1795 ceded Indian lands to the U.S. and ended British influence in the area.

Fallopius \fə-'lō-pē-əs**, Gabriel** *Italian* **Gabriello Fallopio** (b. 1523, Modena—d. Oct. 9, 1562, Padua) Italian anatomist. He contributed greatly to knowledge of the ear and reproductive system. His observations of the dissection of cadavers are outlined in *Observationes anatomicae* (1561). He discovered the fallopian tubes, which connect the ovaries to the uterus, and several major nerves of the head and face. He described the semicircular canals in the ear and named the vagina, placenta, clitoris, palate, and cochlea. He and ANDREAS VESALIUS overturned many of GALEN's principles, a development essential to Renaissance medicine.

fallout Descent of radioactive materials from the atmosphere to the earth. Radioactivity in the atmosphere may arise from natural causes such as COSMIC RAYS as well as from nuclear explosions and atomic reactor operations. The explosion of NUCLEAR WEAPONS leads to three types of fallout: local, tropospheric, and stratospheric. The first, intense but relatively short-lived, occurs as larger radioactive particles are deposited near the site of the explosion. Tropospheric fallout occurs when the finer particles enter the TROPOSPHERE, and it spreads over a larger area in the month after the explosion. Stratospheric fallout, made of fine particles in the STRATOSPHERE, may continue years after the explosion, and the distribution is nearly worldwide. Many different radioisotopes are formed during a nuclear explosion, but only long-lived isotopes (e.g., CESIUM-137, STRONTIUM-90) are deposited as stratospheric fallout.

Falloux Law \fȧ-'lü\ (1850) Act granting legal status to independent secondary schools in France. It was sponsored by Count Frédéric-Alfred-Pierre de Falloux (1811–1886), minister of education in the SECOND REPUBLIC, and one of its main architects was a Catholic bishop, Félix-Antoine-Philibert Dupanloup (1802–1878). Under the guise of freedom of education, it restored much of the church's traditional influence.

False Decretals \di-'krē-təlz, 'de-krə-təlz\ Collection of church law from the 9th century, containing some forged documents. They are also called the Decretals of Pseudo-Isidore because they were issued under the

© 2006 Encyclopædia Britannica, Inc.

name St. Isidore of Sevilla. The collection was intended to protect the rights of diocesan bishops against encroachment by their metropolitan superiors and to protect the clergy from lay interference. The decretals also emphasized the authority of the pope at the expense of that of the archbishops. They consist of laws, papal letters, and decrees of councils—some genuine but many (including the famous Donation of Constantine) forgeries. Widely accepted by the end of the 10th century, the collection was not proved a hoax until the 17th century.

falsework *or* **centering** Temporary framework used during construction to support arches and similar structures while the mortar or concrete is setting or the steel is being joined. As soon as the work is set and the structure is self-supporting, the centering is struck (carefully removed).

Falun Gong \ˈfä-ˌlün-ˈgȯŋ\ *or* **Falun Dafa** \ˈdä-fä\ Controversial spiritual movement combining healthful exercises with meditation for the purpose of "moving to higher levels." Its teachings draw from Buddhism, Confucianism, Daoism, and the Western New Age movement. It was founded in China in 1992 by Li Hongzhi, a former grain-bureau clerk from Jilin province. He originally registered it as a form of the natural-healing discipline *qigong*, but he later withdrew it from China's Qigong Research Association to stress its spiritual (rather than health-related) emphasis. Its members nevertheless claim great health benefits from its practice. It claims a worldwide following of 100 million, with 70 million in China; Chinese authorities claim it has as few as 2 or 3 million members. The movement has been regarded as a threat by the Chinese government, which started arresting its followers in mid-1999. Many Falun Gong members were later tried and given long prison sentences. Li emigrated to the U.S. in 1998.

Falwell \ˈfȯl-ˌwel**, Jerry L.** (b. 1933, Lynchburg, Va., U.S.) Protestant evangelist. An engineering student before turning to religion, he founded Thomas Road Baptist Church in 1956 and later Liberty Baptist College. His *Old-Time Gospel Hour* television show serves as outreach for his church. In 1979 he organized the Moral Majority to encourage his followers to become involved in politics; he withdrew from its leadership in 1990 to return to preaching. A fundamentalist interpreter of the Bible, he is known for his sometimes extreme conservatism.

Familist \ˈfa-mə-list\ Member of the Family of Love religious sect. It was founded by a 16th-century Dutch merchant, Hendrik Niclaes, whose goal was to end religious wrangling and unite all "lovers of truth" in one great Christian fellowship of peace. His largest following was in England, where his works were privately published. Elizabeth I issued a proclamation against the Family of Love in 1580. The sect died out after the restoration of the English monarchy in 1660; some of its members may have joined the Society of Friends.

family Basic social unit consisting of persons united by ties of marriage (affinity), "blood" (consanguinity), or adoption and usually representing a single household. The essence of the family group is the parent-child relationship, whose outlines vary widely among cultures. One prominent familial form is the nuclear family, consisting of the marital pair living with their offspring in a separate dwelling. While some scholars believe this to be the oldest form, others point to the inconclusive prehistorical record and the widespread existence of other forms such as the polygynous family (a husband, two or more wives, and their offspring) and the extended family (including at least parents, married children, and their offspring). The family as an institution provides for the rearing and socialization of children, the care of the aged, sick, or disabled, the legitimation of procreation, and the regulation of sexual conduct in addition to supplying basic physical, economic, and emotional security for its members. See also adoption; marriage.

family In pedology, a group of soils that have similar profiles and include one or more subdivisions called series. The primary characteristics that define each of the nearly 6,600 identified soil families are the physical and chemical properties—especially texture, mineral composition, temperature, and depth—that are important for the growth of plants.

family planning Use of measures designed to regulate the number and spacing of children within a family, largely to curb population growth and ensure each family's access to limited resources. The first attempts to offer family planning services began with private groups and often aroused strong opposition. Activists such as Margaret Sanger in the U.S., Marie Stopes in England, and Dhanvanthis Rama Rau in India eventually succeeded in establishing clinics for family planning and health care. Today many countries have established national policies and encourage the use of public family services. The United Nations and the World Health Organization offer technical assistance. See also birth control.

family practice *or* **family medicine** *or* **general practice** Field of medicine that stresses comprehensive primary health care, emphasizing the family unit. Practitioners must be familiar to some degree with medical specialties and, especially in health maintenance organizations, are now often gatekeepers who refer patients to specialists when necessary. Once virtually the only kind of medicine, family practice has been defined as a separate field only since increasing specialization in medicine led to a shortage of practitioners. A 1963 World Health Organization report stressing the need for medical education to focus on the patient as a whole throughout life led to specific programs in family practice.

family sagas See Icelanders' sagas

famine Extreme and protracted shortage of food, resulting in widespread hunger and a substantial increase in the death rate. General famines affect all classes or groups in the region of food shortage; class famines affect some classes or groups much more severely than others; regional famines affect only a particular region of a country. Causes may be natural or human. Natural causes include drought, flooding, unfavourable weather conditions, plant disease, and insect infestation. The chief human cause is war; others include overpopulation, bad distribution systems, and high food prices. Several severe famines occurred in the 20th century, including those in China (1928–29, 5–10 million dead; 1958–62, up to 20 million), Russia (1921–22, 1.25–5 million; 1932–34, 6–8 million), India (1943–44, 1.5 million), Cambodia (1975–79, 1 million), and sub-Saharan Africa.

fan Rigid or folding handheld device used for cooling, air circulation, or ceremony or as a sartorial accessory throughout the world from ancient times. As evidenced by Egyptian reliefs, early fans were of the rigid type, with a handle or stick attached to a rigid leaf or to feathers. In China, the folding fan came into fashion during the Ming dynasty (1368–1644); much significance came to be attached to the fan in East Asia, and many great Chinese painters devoted their talents to fan decoration. Portuguese traders in the 15th century brought fans to Europe from China and Japan. Through the 19th century in the West, fan decoration and size varied with European fashion.

Fan Chung-yen See Fan Zhongyen

Fan Zhongyen \ˈfän-ˈjůŋ-ˈyən\ *or* **Fan Chung-yen** (b. 989, Wu, Jiangsu province, China—d. 1052, China) Chinese scholar-reformer whose reforms anticipated those of Wang Anshi. He attempted to abolish nepotism and corruption, reclaim unused land, equalize landholdings, create a strong local militia system, reduce corvée labor, and reform the civil-service examination system. He proposed establishing a national school system to train men to deal with the problems of history and politics; the proposal was adopted in 1044. See also Neo-Confucianism; Song dynasty.

Fanfani \fän-ˈfä-nē**, Amintore** (b. Feb. 6, 1908, Pieve Santo Stefano, Italy—d. Nov. 20, 1999, Rome) Italian premier who formed and led the centre-left coalition that dominated Italian politics in the late 1950s and '60s. Elected to Italy's constituent assembly (1946), he became secretary-general of the Christian Democratic Party (1954) after serving briefly as premier. With his party's victory in 1958, he became premier (1958–59) and stressed social reforms. Buoyed by widespread public reaction against rising neofascist activity, he was returned to the premiership (1960–63) and again promoted a reformist program. He gained Italy's election to the UN Security Council (1958) and served as president of the UN General Assembly in 1965. He again served as premier in 1982–83 and in 1987.

Fang \ˈfaŋ\ Bantu-speaking peoples of southern Cameroon, mainland Equatorial Guinea, and northern Gabon. The Fang number about 3.6 million. Under colonial rule they engaged in ivory trading and after World War I in cacao farming. By 1939 much of the population was Christian, but since 1945 syncretistic sects have grown rapidly. The Fang are politically influential, especially in Gabon.

Fang Lizhi \ˈfäŋ-ˈlē-ˈjē\ (b. Feb. 12, 1936, Beijing, China) Chinese astrophysicist and dissident held partially responsible for the 1989 student rebellion in Tiananmen Square. In 1957 he was expelled from the Chinese Communist Party for a paper decrying the Marxist position on physics. He later taught at Beijing's University of Science and Technology (Keda); in

© 2006 Encyclopædia Britannica, Inc.

1966 he was sent to a communal farm to be reeducated. After the death of Mao Zedong in 1976, Fang's party membership was restored. Appointed a vice president of one branch of Keda in 1985, he began work on restructuring it and reforming educational policy. During the demonstrations in Tiananmen Square he took refuge in the U.S. embassy, and in 1990 he and his wife were allowed to leave China. He subsequently conducted research in Britain and the U.S.

Fanon \fä-'nōⁿ**, Frantz (Omar)** (b. 1925, Martinique—d. Dec. 6, 1961, Washington, D.C., U.S.) West Indian psychoanalyst and social philosopher. He served in the French army in World War II, earned a medical degree, and became head of the psychiatric department of an Algerian hospital, where he edited the newspaper of the National Liberation Front (from 1956). In 1960 he was appointed ambassador to Ghana by the rebel provisional government. His widely read book *The Wretched of the Earth* (1961) urged colonized peoples to purge themselves of their degradation in a "collective catharsis" to be achieved through violence against European oppressors. He died of leukemia at age 36.

fantasia \fan-'tā-zhə, ˌfan-tə-'zē-ə\ Musical composition free in form and inspiration, often for an instrumental soloist. Most fantasias try to convey the impression of improvisation. The first were Italian works for lute (c. 1530). Keyboard fantasias became common in the late 16th century; both organ and harpsichord fantasias flourished in the 17th and 18th centuries in Britain, Germany, and France. Fugal, imitative texture, sometimes highly learned in character, was common from the beginning, often alternating with running passagework and highly chromatic chordal passages in free rhythms. Ensemble fantasias were widely composed as well.

fantasy Mental images or imaginary narratives that distort or entirely depart from reality. Primary fantasies arise spontaneously from the unconscious, while secondary fantasies are consciously summoned and pursued. Sigmund Freud saw fantasy as a vehicle for the expression of repressed desires (see repression). Fantasy is important in the lives of children and is a vital element in play. In adult life it is crucial to creative thinking and the making of art. Fantasy can become destructive if it serves as a constant refuge from the world of reality and a source of delusions.

Fante *or* **Fanti** \'fan-tē\ Second largest segment of the Akan peoples of the southern coast of Ghana. The Fante speak a language of the Kwa group of Niger-Congo languages. As intermediaries in colonial-era trade between the Asante to the north and the Europeans to the south, the Fante established several independent kingdoms that formed a confederacy in the late 17th century. The confederacy aided the British in wars against the Asante in the 19th century but was disbanded in 1873 under British pressure. The Akan peoples all together make up about half of the population of Ghana. An important Fante organization called the *asafo* began as a military group, but in contemporary society it serves mostly political, social, and religious functions.

Fante \fan-'tē**, John** (b. April 8, 1909, Denver, Colo., U.S. —d. May 8, 1983, Woodland Hills, Calif.) U.S. writer. Born to Italian immigrant parents, Fante moved to Los Angeles in the early 1930s. His first novel, *Wait Until Spring, Bandini* (1938), was followed by his best-known book, *Ask the Dust* (1939), the first of his novels set in Depression-era California. Other books included the story collection *Dago Red* (1940) and the novels *Full of Life* (1952) and *Brotherhood of the Grape* (1977). He also wrote numerous screenplays, including *Creature from the Black Lagoon* (1954), *Full of Life* (1956), and *A Walk on the Wild Side* (1962). Long eclipsed, he began to be rediscovered in the 1990s.

Fantin-Latour \fäⁿ-taⁿ-lȧ-'tür**, (Ignace-) Henri (-Jean-Théodore)** (b. Jan. 14, 1836, Grenoble, Fr.—d. Aug. 25, 1904, Buré) French painter and printmaker. He was trained by his father, a portrait painter, and at the École des Beaux-Arts. Though he associated with progressive artists (Gustave Courbet, Eugène Delacroix, Édouard Manet), he was a traditionalist best known for his portraits and still lifes with flowers. His portrait groups, reminiscent of 17th-century Dutch guild portraits, depict literary and artistic persons of the time; his flower paintings were especially popular in England, thanks to James McNeill Whistler and John Everett Millais, who found patrons to support him. His later years were devoted to lithography.

"Still Life," oil on canvas by Henri Fantin-Latour, 1866; in the National Gallery of Art, Washington, D.C.

Fārābī \fȧ-'rä-bē**, al-** *in full* **Muḥammad ibn Muḥammad ibn Ṭarkhān ibn Uzalagh al-Fārābī** *Latin* **Alpharabius** *or* **Avennasar** (b. c. 878, Turkistan—d. c. 950, Damascus?) A logician and one of the great philosophers of medieval Islam. He was probably the son of one of the caliph's Turkish bodyguards, and he grew up in Baghdad. From 942 he resided at the court of Prince Sayf al-Dawlah. Greatly influenced by Baghdad's Greek heritage in philosophy, especially the writings of Aristotle, he was known as the Second Teacher or the Second Aristotle. He used Artistotle's ideas in his proof of the existence of God and was influenced also by Neoplatonic ideas and Sufi mysticism. Like Plato, he believed it was the philosopher's task to provide guidance to the state. He wrote more than 100 works, notably *The Ideas of the Citizens of the Virtuous City*.

Faraday, Michael (b. Sept. 22, 1791, Newington, Surrey, Eng.—d. Aug. 25, 1867, Hampton Court) English physicist and chemist. Son of a blacksmith, he received only a basic education in a church Sunday school, but he went to work as an assistant to Humphry Davy, from whom he learned chemistry. He discovered a number of new organic compounds, including benzene, and was the first to liquefy a "permanent" gas. His major contributions were in the fields of electricity and magnetism. He was the first to report induction of an electric current from a magnetic field. He invented the first electric motor and dynamo, demonstrated the relation between electricity and chemical bonding, discovered the effect of magnetism on light, and discovered and named diamagnetism. He also provided the experimental, and much of the theoretical, foundation on which James Clerk Maxwell built his electromagnetic field theory. In 1833 he was appointed professor at the Royal Institution. After 1855 he retired to a house provided by Queen Victoria, but he declined a knighthood.

Farah, Nuruddin (b. 1945, Baidoa, Italian Somaliland) Somali writer, Somalia's first novelist and first English-language author. His first published novel, *From a Crooked Rib* (1970), describes a woman's determination to maintain her dignity in a sexist society. His other works include a trilogy—*Sweet and Sour Milk* (1979), *Sardines* (1981), and *Close Sesame* (1983)—about life under an African dictatorship. *Maps* (1986) examines identity and boundaries. The political nature of his fiction forced him into exile, and he taught in Europe, North America, and elsewhere in Africa.

farce Light, dramatic composition that uses highly improbable situations, stereotyped characters, violent horseplay, and broad humour. Farce is generally regarded as intellectually and aesthetically inferior to comedy in its crude characterizations and implausible plots, but it has remained popular throughout the West from ancient times to the present.

Fargo City (pop., 2000: 90,599), eastern North Dakota, U.S. The state's largest city, it is located on the Red River of the North. It was founded in 1871 by the Northern Pacific Railway and named for William G. Fargo of Wells, Fargo & Co. The development of wheat growing in the area consolidated the city's role as a transportation, marketing, and distribution centre. North Dakota State University (1890) is a noted centre of agricultural research. Local industries include the manufacture of farm implements and fertilizer. The meat-packing plants and stockyards in suburban West Fargo rank among the nation's largest.

Farinelli *orig.* **Carlo Broschi** (b. Jan. 24, 1705, Andria, Kingdom of Naples—d. July 15, 1782, Bologna) Italian castrato singer. After being castrated, he became a student of the composer Nicola Porpora (1686–1768), making his debut in 1720. Renowned for his vocal power and remarkable agility, he was persuaded by Porpora to go to London in 1734, where he became the greatest opera star of his time. In 1747 he abandoned the public stage for the court of Philip V in Madrid, where his singing revived the ailing monarch. Farinelli took over the court's musical establishment and engaged in highly extravagant projects. In 1759 he retired to Bologna, where he received illustrious guests, including Joseph II and Wolfgang Amadeus Mozart, in great style at his villa.

Farley, James A(loysius) (b. May 30, 1888, Grassy Point, N.Y., U.S.—d. June 9, 1976, New York, N.Y.) U.S. politician. He entered New York Democratic Party politics in 1912. As secretary of the state Democratic committee in 1928, he organized the successful gubernatorial campaigns of Franklin D. Roosevelt in 1928 and 1930. As national Democratic Party chairman (1932–40), he directed Roosevelt's 1932 and 1936 presi-

© 2006 Encyclopædia Britannica, Inc.

dential campaigns. He served as postmaster general (1933–40) but resigned that post and the party chairmanship in opposition to Roosevelt's bid for a third term as president.

farm machinery Mechanical devices, including tractors and implements, used in farming to save labour. The great variety of farming devices covers a wide range of complexity, from simple hand-held implements used since prehistoric times to the complex harvesters of modern mechanized agriculture. From the early 19th century to the present, the chief source of power in farming has changed from animals to steam power, then to gasoline, and finally to diesel. In developed countries, the number of farmworkers has steadily declined in the 20th century, while farm production has increased because of the use of machinery.

Farmer, Fannie (Merritt) (b. March 23, 1857, Boston, Mass., U.S.—d. Jan. 15, 1915, Boston) U.S. cookery expert. She became director of the Boston Cooking School in 1894 and in 1896 published *The Boston Cooking-School Cook Book.* Standardizing the methods and measurements of recipes, it became one of the best-selling cookbooks of all time; its modern versions were titled *The Fannie Farmer Cookbook*. In 1902 she established Miss Farmer's School of Cookery, with courses designed to train housewives rather than teachers of cookery.

Farmer-Labor Party (1918–44) Minor political party in Minnesota, U.S. An outgrowth of the Nonpartisan League, it was composed mainly of small farmers and urban labourers. It supported Robert La Follette in the 1924 presidential election, and its candidate, Floyd B. Olson, was elected governor in 1930. It supported Franklin Roosevelt in 1932 and 1936 before merging with the Democratic Party in 1944 to form the Democrat-Farmer-Labor Party.

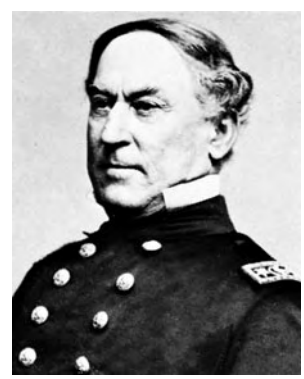
Farmer's Almanac U.S. annual journal, now called *Old Farmer's Almanac*, containing long-term weather predictions, planting schedules, astronomical tables, astrological lore, recipes, anecdotes, and sundry pleasantries of rural interest. First published by Robert B. Thomas in 1792 (for the year 1793), it went on to outlast dozens of competitors. It issued long-range weather forecasts, based on obscure interpretations of natural phenomena, long before any weather service existed, and generations of farmers planted and harvested according to its advice. Now published in Dublin, N.H., it sells some 4 million copies annually.

Farmington River River, western Liberia. The country's only river of commercial importance, it rises in the Bong Range and flows southwest for 75 mi (120 km) to the Atlantic coast. It is navigable for 10 mi (16 km) below Harbel, the port from which rubber is shipped to Monrovia for export.

Farnese, Alessandro, duke di Parma and Piacenza (b. Aug. 27, 1545, Rome—d. Dec. 3, 1592, Arras, France) Regent of the Netherlands (1578–92) for Philip II of Spain. He was educated at the court of Madrid, where he had been sent to prove his father's loyalty to the Habsburgs. In 1578 Philip II appointed him governor-general of the Netherlands, where his mother, Margaret of Parma, had been regent earlier. His great achievement was the restoration of Spanish rule in the southern provinces and perpetuation of Roman Catholicism there. He succeeded by astute statesmanship and military operations against the alliance of rebellious Protestant provinces led by William the Silent. In 1586 he succeeded his father as duke of Parma and Piacenza, but he never returned to Italy to rule.

Farnese \fär-'nā-sā\ **family** Italian family that ruled the duchy of Parma and Piacenza from 1545 to 1731. The family became noted for its statesmen and soldiers, especially in the 14th–15th century, as well as by contracting politically useful marriages. In 1545 Pope Paul III, a Farnese, detached Parma and Piacenza from the papal dominions and made them into duchies. The first duke was his illegitimate son, Pier Luigi Farnese (1503–47), whose son Ottavio (1542–86), the 2nd duke, made Parma the capital and consolidated the family's power. The 3rd duke, Alessandro Farnese, was Spain's regent of the Netherlands and duke in name only. His son, Ranuccio I (1569–1622), and grandson, Odoardo I (1612–46), left heavy financial and diplomatic debts by inconclusive military campaigns in the Thirty Years' War. In 1649 Pope Innocent X accused the Farnese of the murder of an ecclesiastic and seized the fief. Ranuccio II (1630–94) declared war and was defeated, and the duchy survived precariously. Francesco Farnese (1678–1727) tried to save the state, but his only important success was the marriage of his niece Isabella Farnese to Philip V of Spain (1714). In 1731 the duchy passed from the last Farnese of the male line, Antonio (1679–1731), to Elizabeth's son, the future Charles III.

Farnsworth, Philo T(aylor) (b. Aug. 19, 1906, Beaver, Utah, U.S.—d. March 11, 1971, Salt Lake City, Utah) U.S. engineer and pioneer inventor in the development of television. In 1927 he successfully transmitted the first image using electronic means. By 1930 he was perfecting an electronic camera tube, the Image Dissector, which he demonstrated to rival inventor Vladimir Zworykin of Radio Corporation of America (RCA). Through the 1930s Farnsworth engaged in lawsuits against RCA, both sides claiming the invention of electronic television. In 1939 RCA agreed to pay him royalties as part of a patent-licensing agreement; that same year RCA introduced the first successful television system. Farnsworth went on to patent many other inventions, but he never achieved financial success or primary credit for inventing television.



faro One of the oldest gambling games played with cards. Its name probably derives from the picture of a pharaoh on an early set. It was popular in Europe in the 18th–19th century and in the U.S. in the 19th century. The game involves betting on the rank, or number, of a card drawn from a dealing box. It is still played in a few casinos.

Faroe \'far-ō\ **Islands** *or* **Faeroe Islands** Group of islands in the Atlantic Ocean that form a self-governing region of Denmark. Area: 540 sq mi (1,399 sq km). Population: (2002 est.) 47,400. Lying north of the British Isles, the islands are politically situated within the kingdom of Denmark. There are 17 inhabited islands and many islets and reefs. The largest, Strømø, holds the capital of Tórshavn. The islands are high and rugged, with coasts that are deeply indented with fjords. The economy is based on fishing and sheep raising. First settled by Irish monks (c. 700), the islands were colonized by the Vikings (c. 800) and were ruled by Norway from the 11th century until 1380, when they passed to Denmark. They unsuccessfully sought independence in 1946 but received self-government in 1948. In the early 21st century they continued discussions with Denmark on full independence.

Farouk \fə-'rük\ **I** *Arabic* **Fārūq al-Awwal** (b. Feb. 11, 1920, Cairo, Egypt—d. March 18, 1965, Rome, Italy) King of Egypt (1936–52). Son of King Fu'ād I (1868–1936), he was educated in Egypt and England and ascended the throne in 1936. Farouk's administration was hampered by internal rivalries. His alienation of the military, especially after its loss to Israel (1948), led to his own downfall. In 1952 a coup led by Gamal Abdel Nasser forced him to abdicate. He was succeeded by his infant son, Fu'ād II, but in 1953 Egypt became a republic.

Farquhar \'fär-kər, 'fär-kwər**, George** (b. 1678, Londonderry, County Derry, Ire.—d. April 29, 1707, London, Eng.) Irish playwright. His early experience as an actor in Dublin was the source of the originality of dialogue and stage sense that gave his work its great comic power. His plays, written for the London stage and enthusiastically received, included *Love and a Bottle* (1699), *The Constant Couple* (1699), and *Sir Harry Wildair* (1701). His real contribution to English drama came with *The Recruiting Officer* (1706) and particularly *The Beaux' Stratagem* (1707), in which he introduced a verbal vigour and love of character reminiscent of Elizabethan dramatists.

Farragut \'far-ə-gət**, David G(lasgow)** (b. July 5, 1801, near Knoxville, Tenn., U.S.—d. Aug. 14, 1870, Portsmouth, N.H.) U.S. naval officer. He served in the War of 1812 and received his first command in 1824. During the American Civil War he commanded the Union blockade of the western Gulf of Mexico; in the Battle of New Orleans he captured the port through which the Confederacy received much of its war supplies. In 1863 he helped secure victory at the Battle of Vicksburg, bringing the Mississippi River under Union control. In 1864 he led a successful attack in the Battle of Mobile Bay, sending his ships across a blockade of mines ("torpedoes") with the order, "Damn the torpedoes, full speed ahead!" He became a full admiral in 1866.

David Farragut, daguerreotype.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Farrakhan \'fär-ə-ˌkän, 'far-ə-ˌkan**, Louis** *orig.* **Louis Eugene Walcott** (b. May 11, 1933, Bronx, N.Y., U.S.) U.S. religious leader. He

© 2006 Encyclopædia Britannica, Inc.

joined the NATION OF ISLAM in 1955, and for a time he assisted MALCOLM X in Boston. After Malcolm converted to SUNNI Islam, Farrakhan denounced him and replaced him as minister of Mosque No. 7 in Harlem. Farrakhan later expressed regret at having contributed to the climate of antagonism that preceded Malcolm's assassination in 1965. When Warith Deen Mohammed, ELIJAH MUHAMMAD's successor as leader of the Nation of Islam, gradually began integrating the organization into the orthodox Muslim community, Farrakhan broke away and formed his own organization, also called the Nation of Islam (1978). A compelling orator whose rhetoric often descended into overt ANTI-SEMITISM, Farrakhan was nonetheless effective in encouraging African American self-reliance and unity. He was the main organizer of the Million Man March on Washington, D.C., in 1995. In 2000 Farrakhan and Mohammed recognized each other as fellow Muslims, and Farrakhan subsequently moved his group closer to orthodox Islam and moderated his racial remarks.

Farrar \fə-'rär**, Geraldine** (b. Feb. 28, 1882, Melrose, Mass., U.S.—d. March 11, 1967, Ridgefield, Conn.) U.S. soprano. She received vocal training in New York and Paris and made her debut in CHARLES GOUNOD's *Faust* in 1901. Coached by Lilli Lehmann (1848–1929), she made her Metropolitan Opera debut in 1906, performed in the American premiere of *Madama Butterfly* opposite ENRICO CARUSO (1907), and was later a celebrated Carmen. She retired in 1922. She also acted in silent films.

Farrar, Straus & Giroux \'far-ər-'straùs...zhir-'ü\ Publishing company in New York City noted for its literary excellence. It was founded in 1945 by John Farrar and Roger Straus as Farrar, Straus & Co. After various changes in personnel and name, it took its present name in 1964, with the addition of Robert Giroux as editor in chief. The company became established as a leading independent trade publisher of writers of the first rank, including many Nobel and Pulitzer Prize winners. In 1994 a controlling interest was sold to the German publisher Georg von Holtzbrinck.

Farrell \'far-əl**, James T(homas)** (b. Feb. 27, 1904, Chicago, Ill., U.S.—d. Aug. 22, 1979, New York, N.Y.) U.S. novelist and short-story writer. A native of Chicago and a graduate of the University of Chicago, he is known for his realistic portraits of the city's lower-middle-class Irish population, drawn from his own experiences. His well-known *Studs Lonigan* trilogy—*Young Lonigan* (1932), *The Young Manhood of Studs Lonigan* (1934), and *Judgment Day* (1935)—traces the self-destruction of a spiritually crippled young man. He later planned a cycle of 25 novels, of which he completed 10. Of the 25 novels he published, *The Face of Time* (1953) is among the best. He also produced 17 short-story collections.

Farrell, Suzanne *orig.* **Roberta Sue Ficker** (b. Aug. 16, 1945, Cincinnati, Ohio, U.S.) U.S. ballet dancer. She trained at the School of American Ballet and joined the NEW YORK CITY BALLET (NYCB) at age 16, becoming a soloist at age 18. GEORGE BALANCHINE created roles for her in ballets such as *Meditation*, *Don Quixote*, and *Slaughter on Tenth Avenue*. After several years as principal dancer with MAURICE BÉJART's Ballet of the 20th Century (1970–75), she returned to the NYCB in 1975 as principal dancer. There she continued to create leading roles until she retired in 1989 and joined the faculty of the School of American Ballet, on which she served until 1993. She later formed her own company, which carried on the Balanchine tradition.

Farsi language See PERSIAN LANGUAGE

fascism \'fä-ˌshi-zəm\ Philosophy of government that stresses the primacy and glory of the state, unquestioning obedience to its leader, subordination of the individual will to the state's authority, and harsh suppression of dissent. Martial virtues are celebrated, while liberal and democratic values are disparaged. Fascism arose during the 1920s and '30s partly out of fear of the rising power of the working classes; it differed from contemporary communism (as practiced under JOSEPH STALIN) by its protection of business and landowning elites and its preservation of class systems. The leaders of the fascist governments of Italy (1922–43), Germany (1933–45), and Spain (1939–75)—BENITO MUSSOLINI, ADOLF HITLER, and FRANCISCO FRANCO—were portrayed to their publics as embodiments of the strength and resolve necessary to rescue their nations from political and economic chaos. Japanese fascists (1936–45) fostered belief in the uniqueness of the Japanese spirit and taught subordination to the state and personal sacrifice. See also TOTALITARIANISM; NEOFASCISM.

fashion Any mode of dressing or adornment that is popular during a particular time or in a particular place (i.e., the current style). It can change from one period to the next, from generation to generation. It serves as a reflection of social and economic status, a function that explains the popularity of many styles throughout costume history; in the West, courts have been a major source of fashion. In the 19th and 20th centuries, fashion increasingly became an profitable, international industry as a result of the rise of world-renowned fashion houses and fashion magazines. See also DRESS.

Fashoda \fə-'shō-də\ **Incident** (Sept. 18, 1898) Climax, at Fashoda, Egyptian Sudan, of a series of territorial disputes between Britain and France. Britain had sought to extend its empire from Cairo to the Cape of Good Hope, while France had sought to extend its own from Dakar to the Sudan. A French force under Jean-Baptiste Marchand was the first to arrive at a strategically located fort at Fashoda, soon followed by a British force under Lord KITCHENER. After a tense standoff the French withdrew, but they continued to press claims to other posts in the region. In March 1899 the French and British agreed that the watershed of the Nile and the Congo rivers should mark the frontier between their spheres of influence.

Fassbinder \'fäs-ˌbin-dər**, Rainer Werner** (b. May 31, 1946, Bad Wörishofen, W.Ger.—d. June 10, 1982, Munich) German film director. He was involved in the avant-garde theatre movement in Munich and helped form the Antitheatre (1967). His first full-length film (1969) was followed by 40 others, produced in a short period, including *The Bitter Tears of Petra von Kant* (1972), *Effi Briest* (1974), *The Marriage of Maria Braun* (1979), the 15-hour *Berlin Alexanderplatz* (1980), *Lola* (1981), and *Veronika Voss* (1982). Regarded as a leader of the German New Wave, he helped revitalize German cinema in the 1970s and '80s. His socially and politically conscious films often explore themes of oppression and despair.

fasteners In construction, connectors between structural members. Bolted connections are used when it is necessary to fasten two elements tightly together, especially to resist shear and bending, as in column and beam connections. Threaded metal BOLTS are always used in conjunction with nuts. Another threaded fastener is the SCREW, which has countless applications, especially for wood construction. The wood screw carves a mating thread in the wood, ensuring a tight fit. Pins are used to keep two or more elements in alignment; since the pin is not threaded, it allows for rotational movement, as in machinery parts. Riveted connections, which resist shearing forces, were in wide use for steel construction before being replaced by welding. The rivet, visibly prominent on older steel bridges, is a metal pin fastener with one end flattened into a head by hammering it through a metal gusset plate. The common NAIL, less resistant to shear or pull-out forces, is useful for cabinet and finishing work, where stresses are minimal.

fasting Abstaining from food, usually for religious or ethical reasons. In ancient religions it was used to prepare worshipers or priests to approach deities, to pursue a vision, to demonstrate penance for sins, or to assuage an angered deity. All the major world religions include fasting among their practices. Judaism has several fast days, notably YOM KIPPUR. For Christians LENT is set aside as a 40-day period of penitence before Easter, including the traditional fast days of Ash Wednesday and Good Friday. In Islam the month of RAMADAN is observed as a period of total abstention from food from dawn to dusk. Fasting to make a political protest is often referred to as a hunger strike; hunger strikes have been employed by, among others, 19th-century female suffragists, MOHANDAS K. GANDHI, and late-20th-century Irish nationalists. Moderate fasting is also sometimes practiced for its claimed health benefits.

Fastnachtsspiel \'fäst-ˌnäkt-ˌshpēl\ Carnival or Shrovetide play that emerged in the 15th century as the first truly secular drama of pre-Reformation Germany. Usually performed on open-air platform stages by amateur actors, students, and artisans, the plays mixed popular comic and religious elements, reflecting the tastes of their predominantly bourgeois audiences. They often contained satirical attacks on greedy clergymen and other traditional dislikes of German burghers and are believed to have been influenced by pre-Christian folk traditions.

fat Any organic compound of plant or animal origin that is not volatile, does not dissolve in water, and is oily or greasy. Chemically, fats are identical to animal and vegetable oils, consisting mainly of TRIGLYCERIDES (ESTERS of GLYCEROL with FATTY ACIDS). Fats that are liquid at room temperature are called oils. Differences in melting temperature and physical state depend on the SATURATION of the fatty acids and the length of their carbon chains. The glycerides may have only a few different component fatty

© 2006 Encyclopædia Britannica, Inc.

acids or as many as 100 (in butterfat). Almost all natural fats and oils incorporate only fatty acids that are constructed from two-carbon units and thus contain only even numbers of carbon atoms. Natural fats such as corn oil have small amounts of compounds besides triglycerides, including PHOSPHOLIPIDS, plant STEROIDS, tocopherols (VITAMIN E), VITAMIN A, WAXES, carotenoids, and many others, including decomposition products of these constituents. Sources of fats in foods include ripe seeds and some fruits (e.g., corn, peanuts, olives, avocados) and animal products (e.g., meat, eggs, milk). Fats contain more than twice as much energy (CALORIES) per unit of weight as PROTEINS and CARBOHYDRATES. DIGESTION of fats in foods, often partial, is carried out by ENZYMES called lipases. The breakdown products are absorbed from the intestine into the blood, which carries microscopic fat droplets reconstituted from digested fats (or synthesized in cells) to sites of storage or use. Fats are readily broken down—primarily into glycerol and fatty acids—by HYDROLYSIS, a first step for many of their numerous industrial uses. See also LIPID.

Fatah \ˈfät-ˀh,\ *English* \ˈfä-tä\ *inverted acronym of* **Ḥarakat al-Taḥrīr al-Waṭanī al-Filasṭīnī ("Palestine National Liberation Movement")** Palestinian guerrilla organization and political party, whose name means "conquest" in Arabic. Founded by YĀSIR ʿARAFĀT and Khalīl al-Wazīr in the late 1950s, the movement relied on guerrilla warfare and occasional acts of terrorism in an attempt to wrest Palestine from Israeli control. It eventually became the largest faction within the PALESTINE LIBERATION ORGANIZATION and attacked Israeli interests worldwide. Originally based in Damascus, it was forced to relocate several times before a political agreement was reached with Israel in 1993. A number of factions within Fatah rejected the goal of peace with Israel and split from the main organization. In 1994 the Palestinian Authority was established, and Fatah dominated the governing body for more than a decade. In the 2006 elections for the Palestinian Legislative Council, the group was unexpectedly defeated by the rival organization ḤAMĀS.

Fates In Greek and Roman mythology, the three goddesses who determined human destiny. The Fates were usually depicted as old women: Clotho, the Spinner; Lachesis, the Allotter; and Atropos, the Inflexible. Clotho spun the thread of human life, Lachesis dispensed it, and Atropos cut the thread. They determined the length of each person's life as well as its share of suffering. Their Roman names were Nona, Decuma, and Morta.

Father's Day See MOTHER'S DAY AND FATHER'S DAY

fatigue In engineering, manifestation of progressive FRACTURE in a solid under cyclic loading, as in the case of a metal strip that ruptures after repeated bending back and forth (see METAL FATIGUE). Fatigue fracture begins with one or several cracks that spread in the course of repeated application of forces until complete rupture suddenly occurs when the small unaffected portion is too weak to sustain the load. See also DUCTILITY, TESTING MACHINE.

Fátima \ˈfa-tə-mə\ Village in central Portugal, site of a shrine dedicated to the Virgin MARY. From May to October 1917, three peasant children reported a vision of a woman who identified herself as the Lady of the Rosary. On October 13, a crowd of about 70,000 witnessed an amazing solar phenomenon just after the children had seen their vision. The first national pilgrimage to the site occurred in 1927. Construction of a basilica started in 1928; now flanked by retreat houses and hospitals, it faces a square where many miraculous cures have been reported.

Fāṭimah *or* **Fatima** \ˈfa-tə-mə\ (b. c. 605, Mecca, Arabia—d. 633, Medina) Daughter of MUHAMMAD and the object of veneration in SHĪʿITE Islam. In 622 she emigrated with her father from Mecca to Medina, where she married her cousin ʿAlī. Their sons, ḤASAN and al-ḤUSAYN IBN ʿALĪ, are considered by Shīʿites to be the rightful inheritors of the tradition of Muhammad. Fāṭimah's marriage was unhappy, but she and her husband were reconciled by the Prophet, and she cared for her father in his last illness (632). She clashed with his successor, ABŪ BAKR, over property and died a year later. Later tradition added to the majesty of her life, and the FĀṬIMID DYNASTY derived its name from hers.

Fāṭimid \ˈfa-tə-məd\ **dynasty** (909–1171) Ismāʿīli Shīʿite dynasty of North Africa and the Middle East. Its members traced their descent from FĀṬIMAH, a daughter of the Prophet Muhammad. As Shīʿite Muslims, they opposed the Sunnite caliphate of the ʿABBĀSID DYNASTY, which they were determined to supplant. From Yemen they expanded into North Africa and Sicily, and in 909 their imam emerged to proclaim the new dynasty. The first four Fāṭimid caliphs ruled from Tunisia, but the conquest of Egypt in 969 occasioned the building of a new capital, Cairo. At its height, the dynasty controlled Mecca and Medina, Syria, Palestine, and Africa's Red Sea coast. Seeking to overthrow the ʿAbbāsids, the Fāṭimids maintained a network of missionaries and agents in ʿAbbāsid territories (see ASSASSIN). In 1057–59 the Fāṭimid caliph was briefly proclaimed in Baghdad, the ʿAbbāsid capital, but Fāṭimid fortunes declined thereafter. Attacks by Crusaders, Turks, and Byzantines and factionalism in the armed forces weakened the caliphate; disputes over succession to the title of caliph led to the dynasty's final end, however, as many of the Asian missionaries broke away, and the central government came to rely on non-Ismāʿīlī troops. The last caliph died in 1171, and the dynasty was succeeded by the Sunnite AYYŪBID DYNASTY.

fatty acid Organic compound that is an important component of LIPIDS in plants, animals, and microorganisms. Fatty acids are CARBOXYLIC ACIDS with a long HYDROCARBON chain, usually straight, as the fourth substituent group on the carboxyl (—COOH) group (see FUNCTIONAL GROUP) that makes the molecule an acid. If the carbon-to-carbon bonds (see BONDING) in that chain are all single, the fatty acid is saturated; artificial SATURATION is called HYDROGENATION. A fatty acid with one double bond is monounsaturated; one with more is polyunsaturated. These are more reactive chemically. Most unsaturated fats are liquid at room temperature, so food manufacturers hydrogenate them to make them solid (see MARGARINE). A high level of saturated fatty acids in the diet raises blood CHOLESTEROL levels. A few fatty acids have branched chains. Others (e.g., PROSTAGLANDINS) contain ring structures. Fatty acids in nature are always combined, usually with GLYCEROL as TRIGLYCERIDES in FATS. Oleic acid (unsaturated, with 18 carbon atoms) is almost half of human fat and is abundant in such oils as olive, palm, and peanut. Most animals, including mammals, cannot synthesize some unsaturated "essential" fatty acids; humans need linoleic, linolenic, and arachidonic acids in their diet.

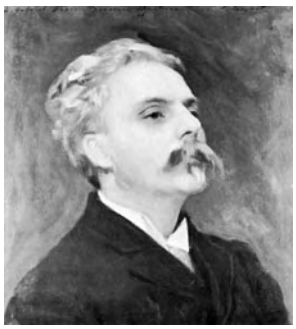
Faulhaber \ˈfau̇l-ˌhä-bər**, Michael von** (b. March 5, 1869, Heidenfeld, Bavaria—d. June 12, 1952, Munich, W.Ger.) German religious leader and prominent opponent of the Nazis. Ordained in 1892, he was bishop of Speyer before becoming cardinal and Munich's archbishop. In 1923 he contributed to the failure of ADOLF HITLER'S BEER HALL PUTSCH. During the Nazi regime he delivered the famous sermons later published as *Judaism, Christianity, and Germany* (1934), which emphasized the Jewish background of Christianity and asserted that Christian values were fundamental to German culture. Despite attempts on his life, he vigorously criticized Nazism in his sermons until the collapse of the Third Reich. After the war he received West Germany's highest award, the Grand Cross of the Order of Merit.

Faulkner \ˈfȯk-nər**, William (Cuthbert)** *orig.* **William Cuthbert Falkner** (b. Sept. 25, 1897, New Albany, Miss., U.S.—d. July 6, 1962, Byhalia, Miss.) U.S. writer. Faulkner dropped out of high school and only briefly attended college. He spent most of his life in Oxford, Miss. He is best known for his cycle of works set in fictional Yoknapatawpha County, which becomes an emblem of the American South and its tragic history. His first major novel, *The Sound and the Fury* (1929), was marked by radical technical experimentation, including stream of consciousness. His American reputation, which lagged behind his European reputation, was boosted by *As I Lay Dying* (1930), *Light in August* (1932), *Absalom, Absalom!* (1936), and *Go Down, Moses* (1942), which contains the story "The Bear." *The Portable Faulkner* (1946) finally brought his work into wide circulation, and he won the Nobel Prize for Literature in 1949. His *Collected Stories* (1950) won the National Book Award. Both in the U.S. and abroad, especially in Latin America, he was among the most influential writers of the 20th century.

fault In geology, a fracture in the rocks of the Earth's crust, where compressional or tensional forces cause the rocks on the opposite sides of the fracture to be displaced relative to each other. Faults range in length from a few inches to hundreds of miles, and displacement may also range from less than an inch to hundreds of miles along the fracture surface (the fault plane). Most, if not all, EARTHQUAKES are caused by rapid movement along faults. Faults are common throughout the world. A well-known example is the SAN ANDREAS FAULT near the western coast of the U.S. The total movement along this fault during the last few million years appears to have been several miles.

fauna All the species of animals found in a particular region, period, or special environment. Five faunal realms, based on terrestrial animal spe-

© 2006 Encyclopædia Britannica, Inc.



cies, are generally recognized: Holarctic, including Nearactic (North America) and Paleartic (Eurasia and northern Africa); Paleotropical (tropical Africa and Southeast Asia); Neotropical (Central and South America); Australian; and Antarctic.

faunal succession, law of Observation that taxonomic groups of animals follow each other in time in a predictable manner. Sequences of successive strata and their corresponding fauna have been matched to form a composite picture detailing the history of the Earth, especially from the beginning of the Cambrian Period. Faunal succession is the fundamental tool of stratigraphy and is the basis for the geologic time scale. Floral (plant) succession is also an important tool. Climate and conditions throughout the Earth's history can be studied using the successive groups because living organisms reflect their environment.

Faunus \'fô-nəs\ Ancient Italian rural deity, the Roman counterpart of the Greek god Pan. The grandson of Saturn, he was depicted as half-man, half-goat, like a satyr. He was first worshiped as a god who bestowed fertility on fields and flocks, but he ended as a woodland deity. His companions were known as fauns.

Faure \'fōr**, (François-) Félix** (b. Jan. 30, 1841, Paris, France—d. Feb. 16, 1899, Paris) President of the French Third Republic (1895–99). A successful industrialist in Le Havre, he was elected to the Chamber of Deputies (1881). After serving in several cabinet posts, he was elected president of France in an unexpected victory that was a rebuff to the political left. He opposed reopening the case of Alfred Dreyfus, the dominating issue of his presidency, and his position encouraged agitation from both left and right political factions. He died suddenly, and his funeral was the scene of a confrontation between pro- and anti-Dreyfus groups.

Fauré \fō-'rā**, Gabriel (-Urbain)** (b. May 12, 1845, Pamiers, Ariège, Fr.—d. Nov. 4, 1924, Paris) French composer. Born into the minor aristocracy, he enrolled at age nine in a Paris music school, where he studied with Camille Saint-Saëns and remained 11 years. He held the prestigious organist positions at the churches of Saint-Sulpice (1871–74) and the Madeleine (1896–1905). In 1896 he also became professor of composition at the Paris Conservatory, where he taught students such as Maurice Ravel and Nadia Boulanger. He served as its director 1905–20. In 1909 he accepted the presidency of the Société Musicale Indépendante, a group of dissident young composers. His works include the operas *Prométhée* (1900), *Pénélope* (1913), and *Masques et bergamasques* (1919), the orchestral suite *Pelléas et Mélisande* (1898), two piano quartets (1879, 1886), numerous piano nocturnes and barcaroles, a famous *Requiem* (1900), and many beautiful songs.

Gabriel Fauré, portrait by John Singer Sargent; in a private collection.
GIRAUDON/ART RESOURCE, NEW YORK

Fauset \'fô-sət**, Jessie Redmon** (b. April 27, 1882, Snow Hill, N.J., U.S.—d. April 30, 1961, Philadelphia, Pa.) U.S. novelist, critic, poet, and editor. Fauset studied at Cornell and the University of Pennsylvania. As literary editor of *The Crisis* (1919–26), she discovered and encouraged writers of the Harlem Renaissance, including Langston Hughes, Countee Cullen, Claude McKay, and Jean Toomer. In her own works, including her best-known novel, *Comedy: American Style* (1933), she portrayed mostly middle-class black characters forced to deal with self-hate as well as racial prejudice.

Faust, detail from the title page of the 1616 edition of *The Tragicall History of D. Faustus,* by Christopher Marlowe
COURTESY OF THE TRUSTEES OF THE BRITISH LIBRARY; PHOTOGRAPH, R.B. FLEMING

Faust \'faůst\ Legendary German necromancer or astrologer who sold his soul to the devil for knowledge and power. There was a historical Faust (perhaps two; both died c. 1540), who traveled widely performing magic, referred to the devil as his crony, and had a wide reputation for evil. The *Faustbuch* (1587), a collection of tales purportedly by Faust, told of such reputed wizards as Merlin and Albertus Magnus. It was widely translated; an English version inspired Christopher Marlowe's *Tragicall History of D. Faustus* (1604), which emphasized Faust's eternal damnation. Magic manuals bearing Faust's name did a brisk business; the classic *Magia naturalis et innaturalis* was known to Johann W. von Goethe, who, like Gotthold Lessing, saw Faust's pursuit of knowledge as noble; in Goethe's great *Faust* the hero is redeemed. Inspired by Goethe, many artists took up the story, including Hector Berlioz (in the dramatic cantata *The Damnation of Faust*) and Charles Gounod (in the opera *Faust*).

Fauvism \'fō-ˌvi-zəm\ Style of painting that flourished in France c. 1898–1908, characterized by the use of intensely vivid colour and turbulent emotionalism. The dominant figure of the group was Henri Matisse; others were André Derain, Maurice de Vlaminck, Raoul Dufy, Georges Braque, and Georges Rouault. The name derives from the judgment of a critic who visited their first exhibit in Paris (1905) and referred to the artists disparagingly as "les fauves" ("wild beasts"). They were influenced by the masters of Post-Impressionism, Vincent van Gogh and Paul Gauguin. Fauvism was a transitional phase for most of the artists, who by 1908, having renewed their interest in Paul Cézanne's vision of order and structure, abandoned Fauvism for Cubism. Matisse alone continued on the course he had pioneered.

favela \fə-'ve-lə\ In Brazil, a slum or shantytown. A favela comes into being when squatters occupy vacant land at the edge of a city and construct shanties of salvaged or stolen materials. Communities form over time, often developing an array of social and religious organizations and forming associations to obtain such services as running water and electricity. Sometimes the residents (*favelados*) manage to gain title to the land and then are able to improve their homes. Because of crowding, unsanitary conditions, poor nutrition, and pollution, disease is rampant in the poorer favelas, and infant mortality rates are high.

Fawkes, Guy (b. 1570, York, Eng.—d. Jan. 31, 1606, London) British conspirator. A convert to Roman Catholicism and a religious zealot, Fawkes joined the Spanish army in the Netherlands in 1593 and became noted for his military skill. In 1604 he returned to England and joined a group of Catholic zealots intent on blowing up the Parliament building. When details of this Gunpowder Plot were discovered—Fawkes had planted and camouflaged at least 20 barrels of gunpowder in a cellar under the Parliament building—Fawkes was arrested on Nov. 4, 1605. After being tortured to reveal the names of his accomplices, he was tried and executed opposite the Parliament building. England celebrates Guy Fawkes Day on November 5 with fireworks, masked children begging "a penny for the guy," and the burning of Fawkes in effigy.

fax *in full* **facsimile** Device for the transmission and reproduction of documents by digitized signals sent over telephone lines. Fax machines scan printed text and graphics and convert the image into a digital code: 1 for dark areas, 0 for white areas. The code is transmitted through the telephone network to similar devices, where the documents are reproduced in close to their original form. Though the concepts for fax technology were developed in the 19th century, widespread use did not occur until the 1970s, when inexpensive means of adapting digitized information to telephone circuits became common.

Faxa Bay \'fäk-sä\ Inlet of the northern Atlantic Ocean, southwestern coast of Iceland. At 30 mi (50 km) deep and 50 mi (80 km) long, it is the largest in Iceland. The main ports along the bay are Akranes and Reykjavík, Iceland's capital. A U.S. air base is at Keflavík on the southern shore.

Faxian *or* **Fa-hsien** \'fä-'shyen\ *orig.* **Sehi** (fl. 399–414) Chinese Buddhist monk who initiated relations with India. Eager to learn of his religion at its source, he traveled to India in 402 and spent a decade visiting the major Buddhist shrines and seats of learning, especially sites in eastern India, including Kapilavastu, Bodh Gaya, and Pataliputra. He deepened his knowledge by conversing with monks and gathered sacred texts that had not yet been translated into Chinese. He returned to China by sea in 412, after spending two years in Sri Lanka. His *Record of Buddhist Kingdoms* contains valuable information about Indian Buddhism in this era.

fayḍ \'fīd\ In Islamic philosophy, the emanation of created things from God. The term is not used in the Qur'ān, but Muslim philosophers such as al-Fārābī and Avicenna borrowed the notion from Neoplatonism. They conceived of creation as a gradual process arising from God's superabun-

© 2006 Encyclopædia Britannica, Inc.

dance. Creation begins at the most perfect level, God, and descends through the world of the spirit to the least perfect level, the world of matter. The *fayḍ* theory was refuted by al-Ghazālī in the 11th century.

Fayṣal \ˈfī-səl\ **I** (b. May 20, 1885, Mecca, Hejaz, Arabian Peninsula—d. Sept. 8, 1933, Bern, Switz.) Arab statesman and king of Iraq (1921–33). Son of Sharif Ḥusayn ibn ʿAlī, he helped his father plot Arab nationalist rebellion against the Ottoman Empire during World War I (1914–18). When the Arab revolt was declared in 1916, he played an important part in anti-Ottoman military campaigns. In 1918 an Arab military force occupied Damascus, and Fayṣal was declared king of Syria. Two years later France invaded Syria, and he went into exile in London. The British sponsored him as king of Iraq, in anticipation of a treaty providing for Iraqi independence; he was crowned in 1921, and Iraq became independent in 1932.

feather Component structure of the outer covering and flight surfaces of all modern birds. Unique to birds, feathers apparently evolved from the scales of birds' reptilian ancestors. Like hair, feathers are made of keratin, a fibrous protein. They are variously specialized for insulation, flight, formation of body contours, display, and sensory reception. Contour feathers form most of the surface of the bird, streamlining it for flight and often waterproofing it. The basal portion may be downy and thus act as insulation. The major contour feathers of the wing (remiges) and tail (rectrices) function in flight. Contour feathers grow in tracts (pterylae) separated by bare areas (apteria) and develop from follicles in the skin. Down feathers have loose-webbed barbs, all rising from the tip of a very short shaft. Their function is insulation, and they may be found in both pterylae and apteria in adult birds. They also constitute the first feather coat of most young birds. Filoplumes are hairlike feathers with a few soft barbs near the tip. They are associated with contour feathers and may be sensory or decorative in function. Bristlelike, vaneless feathers occur around the mouth, eyes, and nostrils of birds. Some bristles function as eyelashes on ground-dwelling birds; bristles over the nostrils may serve as filters. See illustration opposite.

Structures of a typical contour feather. The feather's central shaft (rachis) has a series of paired branches (barbs) forming a flattened, usually curved surface (vane). The barbs possess further branches (barbules) that are attached to one another by hooks (barbicels), a structure that stiffens the vane. Some contour feathers have a complex branch (aftershaft) that arises at the base of the vane and has the appearance of a second, smaller feather. The unbranched basal section of the rachis (calamus, or quill) is embedded in the skin at the inferior umbilicus, which channels blood to the growing feather.
© MERRIAM-WEBSTER INC.

feather star Any of the 550 living species of crinoid echinoderms (class Crinoidea) that lack the stalk that their relatives the sea lilies use to attach themselves to the ocean bottom. Most species have five feathery-fringed arms. Feather stars usually attach themselves to a surface or a floating object and feed on drifting microorganisms, trapping them in their sticky arm grooves. They live mainly on rocky bottoms in shallow water. Most abundant from the Indian Ocean to Japan, they are also found in the Atlantic.

Feather star (*Comantheria grandicalyx*)
DOUGLAS FAULKNER

featherbedding Labour union practices that require the employer to pay for the performance of unnecessary work or to employ workers who are not needed. Featherbedding provisions in labour contracts may result from the continuation of work rules that were once efficient but that have become obsolete. A union may insist on the continuation of such work rules to protect the job security of its members. See also collective bargaining.

February Revolution (1848) Rioting in France that led to the overthrow of the July Monarchy and precipitated the Revolutions of 1848. In 1840–49 there was a flowering of socialist thought begun by Charles Fourier, Pierre-Joseph Proudhon, and others that fueled urban workers' discontent. A major recession in 1846–47 added to popular unrest, as did the increasing arbitrariness of King Louis-Philippe. An opposition campaign brought police action, and crowds of students and workers gathered in the streets and clashed with police. The king tried to appease the demonstrators, but, when an army unit killed 40 of them, he abdicated rather than face civil war.

feces \ˈfē-ˌsēz\ *or* **excrement** *or* **stools** Solid bodily waste discharged from the colon through the anus during defecation. Normal feces are 75% water. The rest is about 30% dead bacteria, 30% indigestible food matter, 10–20% cholesterol and other fats, 10–20% inorganic substances, and 2–3% protein. The colour and odour are produced by bacterial action on chemical constituents. Many disorders produce abnormalities in the feces, usually constipation or diarrhea. Bleeding in the stomach or intestines may show up as dark red to black stools. Tests are needed to detect small amounts (occult blood). High fat content usually indicates disease of the pancreas or small intestine. Many diseases are spread by contamination of food with feces of infected persons.

Fechner \ˈfek-nər,\ *English* \ˈfek-nər\, **Gustav Theodor** (b. April 19, 1801, Gross Särchen, near Muskau, Lusatia—d. Nov. 18, 1887, Leipzig, Ger.) German physicist and philosopher who founded the science of psychophysics. He taught at the University of Leipzig (1834–40) but left because of ill health. He developed experimental procedures, still useful in experimental psychology, for measuring sensations in relation to the physical magnitude of stimuli, establishing that, as physical stimulation increases logarithmically, sensation increases arithmetically. Most important, he devised an equation to express Weber's law. His principal scientific work was *Elements of Psychophysics* (1860).

Federal Bureau of Investigation (FBI) Largest investigative agency of the U.S. government. It was founded in 1908 as the Bureau of Investigation within the U.S. Justice Department. J. Edgar Hoover served as its director from 1924 until his death in 1972. Since 1968 the director, who reports to the attorney general, has been appointed by the president for a 10-year term, subject to Senate approval. The FBI employs more than 10,000 special agents. Its responsibilities include investigating violations of federal criminal law (including in the areas of civil rights and organized crime), collecting evidence in civil cases to which the U.S. is a party, and providing internal security.

Federal Deposit Insurance Corp. (FDIC) Independent U.S. government corporation created to insure bank deposits against loss in the

© 2006 Encyclopædia Britannica, Inc.

event of a bank failure and to regulate certain banking practices. Established after the bank holiday in early 1933, the FDIC was intended to restore public confidence in the system. It insures bank deposits in eligible banks up to $100,000 for each deposit. All members of the Federal Reserve System are required to insure their deposits with the FDIC, and almost all commercial banks in the U.S. choose to do so.

Federal Reserve System U.S. central bank system consisting of 12 Federal Reserve districts with a Reserve bank in the principal commercial city of each district. The system is supervised by a board of governors in Washington, D.C., as well as by various advisory councils and committees. As a result of the Federal Reserve Act of 1913, all national banks are required to join the system; state banks may join if they meet membership qualifications. The Federal Reserve is responsible for monetary policy. The original act set fixed reserve requirements for the U.S. fractional reserve banking system. It allowed each district bank to determine its discount rate, the rate it charged on loans to member banks. The modern Federal Reserve resulted from the Federal Reserve Act of 1935, which allowed the board to determine reserve requirements within defined limits. It became responsible for approving the discount rates of the district banks. Most importantly, the act created the Federal Reserve Open Market Committee, which is responsible for conducting operations in financial markets that increase or decrease the amount of reserves in the system. If the Federal Reserve wants to ease monetary policy, it will use open market operations and increase the amount of reserves through the purchase of financial assets. Conversely, it can tighten monetary policy through the sale of financial assets.

Federal style Neoclassical style of American architecture and interior design that flourished 1785–1820 (later in governmental buildings) and was influenced by the Georgian style and the work of James and Robert Adam. Inspired by the Roman republic, which the new nation believed it resembled, it was especially associated with Thomas Jefferson and Benjamin H. Latrobe. Characteristics include shallow arches, slender proportions, delicate decoration, and symmetry; entrances are often framed by columns and pediments, with a fanlight over the door. The University of Virginia (1817–26) was Jefferson's greatest Federal-style project.

federalism Political system that binds a group of states into a larger, noncentralized, superior state while allowing them to maintain their own political identities. Certain characteristics and principles are common to all successful federal systems: a written constitution or basic law stipulating the distribution of powers; diffusion of power among the constituent elements, which are substantially self-sustaining; and territorial divisions to ensure neutrality and equality in the representation of various groups and interests. Changes require the consent of those affected. Successful federal systems also have a sense of common nationality and direct lines of communication between the citizens and all the governments that serve them. Examples of modern federal systems include the U.S., Brazil, Germany, and Nigeria. See also Federalist papers; Federalist Party.

Federalist papers *formally* **The Federalist** Eighty-five essays on the proposed Constitution of the United States and the nature of republican government, published in 1787–88 by Alexander Hamilton, James Madison, and John Jay in an effort to persuade voters of New York state to support ratification. Most of the essays first appeared serially in New York newspapers; they were reprinted in other states and then published as a book in 1788. A few of the essays were issued separately later. All were signed "Publius." They presented a masterly exposition of the federal system and the means of attaining the ideals of justice, general welfare, and the rights of individuals.

Federalist Party Early U.S. political party that advocated a strong central government. *Federalist* was first used in 1787 to describe supporters of the Constitution of the United States, with its emphasis on a federal union; the Federalist papers was a series of 85 papers (1787–88) published by Alexander Hamilton, James Madison, and John Jay to persuade New York voters to ratify the Constitution. By the 1790s other policies defined the party, including Hamilton's fiscal program, creation of a central bank, a tariff system, favourable treatment for U.S. shipping, friendship with Britain, and neutrality in foreign affairs. The party elected John Adams as president in 1796 but was unable to organize effectively after 1801. It lost favour for its opposition to the Embargo Act and the War of 1812; an internal split by the New England faction (see Hartford Convention) further weakened the party. By the 1820s most of its original principles had been adopted by the opposition Democratic Party, and the Federalist Party disappeared. Notable Federalists included John Marshall, Rufus King, Timothy Pickering, and Charles Pinckney.

fee In law, an inheritable freehold estate in real property (see real and personal property). The word derives from fief, as used in feudal law. Modern property law includes several varieties of fee, including fee simple (alienable and of indefinite duration), fee tail (granted to an individual and his or her descendants but subject to reversion if a tenant dies with no descendants), and life fee or life estate (held only during the lifetime of the grantee).

feed Foodstuff grown or developed for livestock and poultry to maintain the health of the animals and to increase the quality of such end products as meat, milk, or eggs. Modern feeds are derived from crops grown specifically for research or from by-products of surplus crops or foods produced for human consumption. Feeds are categorized as either concentrates (high in digestibility of nutrients but low in fibre content) or roughages (high in fibre and comparatively low in digestive nutrients). Most diets consist of a combination of feeds.

feedback inhibition Suppression of the activity of an enzyme by a product of the sequence of reactions in which the enzyme is participating. When the product accumulates in a cell beyond an optimal amount, it decreases its own production by inhibiting an enzyme involved in its synthesis. After the product has been used or broken down, inhibition is relaxed and formation of the product resumes. Enzymes whose ability to catalyze a reaction depends on molecules other than the substances on which they act directly are said to be under allosteric control.

feeding behaviour Any action of an animal directed toward obtaining nutrients. Each species evolves methods of searching for, obtaining, and ingesting food for which it can successfully compete. Some species eat only one type of food, others a variety. Among invertebrates food choices are instinctual, while among vertebrates they are learned.

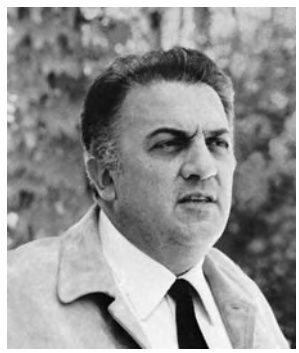
Feiffer, Jules (b. Jan. 26, 1929, New York, N.Y., U.S.) U.S. cartoonist and dramatist. Feiffer learned his trade while assisting comic-strip artists. He became famous for *Feiffer*, a satirical strip whose verbal elements are usually monologues in which the speaker (sometimes pathetic, sometimes pompous) exposes his or her own insecurities. His drawings, syndicated from 1959, are collected in books beginning with *Sick, Sick, Sick* (1958). In 1986 he received a Pulitzer Prize. His plays, including *Little Murders* (1967; film, 1971), also blend farce and social criticism. His other works include novels, screenplays (including *Carnal Knowledge*, 1971), and, in the 1990s, children's books.

Feininger \ˈfī-niŋ-ər**, Andreas (Bernhard Lyonel)** (b. Dec. 27, 1906, Paris, Fr.—d. Feb. 18, 1999, New York, N.Y., U.S.) French-born U.S. photographer and writer. Son of painter Lyonel Feininger, he graduated from the Bauhaus in 1925. After studying architecture, he moved to Sweden in 1933 and established a firm specializing in architectural and industrial photography. Among his best-known works are his richly detailed black-and-white views of New York City, which he achieved through experimental techniques and devices that he pioneered throughout his career. He also took many photographs of natural objects, such as shells, trees, and bones. In 1939 he settled in New York, and from 1943 to 1962 he worked for *Life* magazine. He also wrote prolifically on photographic technique.

Feininger \ˈfī-niŋ-ər**, Lyonel (Charles Adrian)** (b. July 17, 1871, New York, N.Y., U.S.—d. Jan. 13, 1956, New York City) U.S.-born German painter. He went to Germany in 1887 to study music but ended up studying painting instead. Around 1910, under the influence of Cubism, he developed a unique style, using prismatic interpenetrating planes of colour to depict architectural and marine subjects. He exhibited with Der Blaue Reiter in Berlin in 1913 and was later an influential teacher at the Bauhaus (1919–33). His work was a synthesis of art, science, and technology; he is noted for introducing compositional discipline and lyrical colour to German Expressionism. After the Nazis came to power, he returned to the U.S. He was the father of photographer Andreas Feininger.

feldspar Any of a group of aluminosilicate (containing aluminum and silicon) minerals that also contains calcium, sodium, or potassium. Feldspars are the most common minerals in the Earth's crust and are the major component in nearly all igneous rocks found on the Earth, on the Moon, and in some meteorites. They also are common in metamorphic and some sedimentary rocks. Their complex chemical and structural properties

© 2006 Encyclopædia Britannica, Inc.



make them useful for interpreting the origins of rocks. Natural feldspars can be divided into ALKALI and PLAGIOCLASE feldspars.

feldspar, alkali See ALKALI FELDSPAR

feldspathoid \feld-'spath-ˌȯid\ Any of a group of alkali aluminosilicate minerals similar to the FELDSPARS in composition but having a lower silica-alkali ratio or containing chloride, sulfide, sulfate, or carbonate. Their physical and chemical properties lie between those of the feldspars and ZEOLITES. The most abundant feldspathoids are nepheline and leucite. Other significant varieties include kalsilite, sodalite, nosean, and haüynite. Feldspathoids are found chiefly in igneous and metamorphic rocks; they are used as raw materials in the production of alum, glass, and ceramics.

Feller, Bob *orig.* **Robert William Andrew Feller** (b. Nov. 3, 1918, Van Meter, Iowa, U.S) U.S. baseball pitcher. Feller played for the Cleveland Indians from 1936 to 1956, frequently leading the AMERICAN LEAGUE in strikeouts and games won, earning the nickname "Rapid Robert" for his fastball. He was the first 20th-century pitcher to pitch three no-hit games (1940, 1946, 1951), and his record of 348 season strikeouts (1946) stood for 19 years. He ended his career with the outstanding win-loss record of 266–162.

Fellini, Federico (b. Jan. 20, 1920, Rimini, Italy—d. Oct. 31, 1993, Rome) Italian film director. After collaborating with ROBERTO ROSSELLINI on the screenplays for *Open City* (1945) and *Paisan* (1946), Fellini undertook his first solo venture in 1952. It failed, but his next film, *I vitelloni* (1953), was a critical success. He won international acclaim with *La strada* (1954, Academy Award), *The Nights of Cabiria* (1957, Academy Award), and *La dolce vita* (1960). He continued his distinctive autobiographical style of filmmaking—one that displayed a sympathetic fascination with the bizarre—in *8½* (1963, Academy Award) but turned to gaudy spectacle in *Juliet of the Spirits* (1965) and *Satyricon* (1969). The best of his later films are *Amarcord* (1973, Academy Award) and the nostalgic *Ginger and Fred* (1985). His wife, Giulietta Masina (1920–94), starred in several of his films.

Federico Fellini, 1965.
PARIS MATCH/PICTORIAL PARADE

felony and misdemeanour In Anglo-American law, two categories of criminal offense. A crime is classed as one or the other according to its seriousness. In U.S. law, a felony is typically defined as a crime punishable by a term of imprisonment of not less than one year. Misdemeanours are often defined as offenses punishable only by fines or by short terms of imprisonment in local jails. Crimes in Britain are classified into indictable offenses (which may be tried by a jury) and summary offenses (which may be tried by a judge without juries). Codes in Europe also distinguish offenses of greater dangerousness from lesser crimes.

felsic rock IGNEOUS ROCK dominated by the light-coloured, silicon- and aluminum-rich minerals FELDSPAR and QUARTZ. The presence of these minerals gives felsic rock its characteristic light gray colour. The presence of small amounts of dark minerals rich in magnesium and iron produces slight colour variations. Typical felsic rocks include granite and rhyolite.

felting Process that mats together fleece (raw WOOL) by subjecting it to moisture, heat, friction, and pressure. Sheep hair have scales that open somewhat when wet; layering hairs in a parallel fashion and applying some form of agitation cause the hairs to tighten together in a solid mat. The result is a lightweight, windproof, and water-resistant fabric that has been used for millennia to make hats, boots, and tents. Light felting is sometimes done to woven or knitted wool, a process known as FULLING, to create a thicker and softer fabric.

female circumcision See CLITORIDECTOMY

feminism Social movement that seeks equal rights for women. Widespread concern for women's rights dates from the ENLIGHTENMENT; its first important expression was MARY WOLLSTONECRAFT's *A Vindication of the Rights of Woman* (1792). The 1848 SENECA FALLS CONVENTION, convened by ELIZABETH CADY STANTON, LUCRETIA MOTT, and others, called for full legal equality with men, including full educational opportunity and equal compensation; thereafter the WOMAN SUFFRAGE movement began to gather momentum. From America the movement spread to Europe. American women gained the right to vote by constitutional amendment in 1920, but their participation in the workplace remained limited, and prevailing notions tended to confine women to the home. Milestones in the rise of modern feminism included SIMONE DE BEAUVOIR's *The Second Sex* (1949) and BETTY FRIEDAN's *The Feminine Mystique* (1963) and the founding in 1966 of the NATIONAL ORGANIZATION FOR WOMEN. See also EQUAL RIGHTS AMENDMENT; WOMEN'S LIBERATION MOVEMENT.

feminist philosophy Loosely related set of approaches in various fields of philosophy that emphasizes the role of gender in the formation of traditional philosophical problems and concepts and the ways in which traditional philosophy reflects and perpetuates bias against women. In social and POLITICAL PHILOSOPHY, liberal feminists have advocated making women's political and economic opportunities equal to those of men; socialist or Marxist feminists have argued that women's oppression is inherently economic in character; and radical feminists have criticized liberal political notions such as equality and autonomy as inherently "masculine" (see LIBERALISM). Similar feminist critiques have been made of notions such as rationality and objectivity in EPISTEMOLOGY and METAPHYSICS. In ETHICS, feminists have contrasted the traditional masculine approach based on impersonal and abstract rights and principles with an ethic of "care" based on personal and concrete relationships and responsibilities. In the late 20th century feminists influenced by postmodern philosophy and literary theory pointed out the potential racial, cultural, and class biases of academic feminists attempting to speak for all women and argued that no single description of women's experience or women's oppression can be valid for all (see POSTMODERNISM).

Fen River River, SHANXI province, northern China. After rising in the Guancen Mountains in northwestern Shanxi, it flows southeast to Taiyuan and then southwest through the central valley of Shanxi to join the HUANG near Hejin. Its total length is about 340 mi (550 km). With a torrential course and steep gradients, it is a useful waterway only in its lower reaches. Its valley was an early center of civilization and has remained an important route, linking the BEIJING area with the strategically vital Shanxi province and the major land routes to Central Asia.

fencing Sport involving attack and defense with a light sword, specifically a foil, épée, or sabre. There is evidence of swordplay from ancient times through the Middle Ages. In the 14th century swordplay became important in both war and the European gentleman's daily life, and by the 15th century guilds of fencing masters had formed. Strokes that were originally jealously guarded secrets of the individual guilds eventually became orthodox fencing moves. By the later 17th century various rules and conventions had been imposed. In modern competition—except for sabre matches—hits are made with the point only; in matches using foils and sabres, touches to only certain points of the opponents body are counted, whereas in épée no such restrictions apply. Each valid hit scores one or more points. Men's fencing was included in the first modern Olympic Games in 1896, women's in the 1924 games. Electrical scoring was introduced in 1936 to eliminate the frequent inaccuracy of human judgment.

Fénelon \fān-'lōⁿ**, François de Salignac de La Mothe-** (b. Aug. 6, 1651, Château de Fénelon, Périgord, France—d. Jan. 7, 1715, Cambrai) French archbishop, theologian, and man of letters. Though generally conservative, his *The Education of Young Gentlewomen* (1687), based on his experience directing a women's college, supported liberal education and argued against coercing Protestants to convert. As tutor to a grandson of Louis XIV, he composed his best-known work, the novel *Les Aventures de Télémaque* (1699), but the political ideas it seemed to express offended Louis, who banished him from the court. He was similarly condemned by the church for his leanings toward Quietism, which emphasized spiritual passivity. His liberal views on politics and education exerted a lasting influence on French culture.

Feng shui \'fəŋ-'shwā\ Traditional Chinese method of arranging the human and social world in auspicious alignment with the forces of the cosmos, including QI and YIN-YANG. It was devised during the HAN DYNASTY (206 BC–AD 220). Specialists, called diviners, use compasslike instruments to determine the exact cosmic forces affecting a site, appropriate sites being chosen particularly in relation to bodies of water and mountains. Feng shui, especially as it affects interior design, has recently become popular in Britain and the U.S.

© 2006 Encyclopædia Britannica, Inc.

fenghuang *or* **feng-huang** \'fəŋ-'hwäŋ\ In Chinese mythology, an immortal bird whose auspicious rare appearances portend world harmony, particularly upon the ascent to the throne of a new ruler. Considered to embody both male and female elements, the *fenghuang* in later descriptions is often considered the female counterpart of the male dragon and, as such, symbolizes the female portion of the yin-yang principle, notably with respect to marital harmony. Legend tells of its appearance before the death of the Yellow Emperor (Huangdi) in the 3rd millennium BC.

Fenian \'fē-nē-ən\ **cycle** *or* **Fionn** \'fin\ **cycle** *or* **Ossianic cycle** Irish tales and ballads centring on the deeds of the legendary Finn MacCumhaill (MacCool) and his war band, the Fianna Éireann. An elite volunteer corps of warriors and huntsmen skilled in poetry, the Fianna flourished in the 3rd century. Fenian lore attained its greatest popularity c. 1200, when its outstanding story, "The Colloquy of the Old Men", was written down. The cycle remains a vital part of Irish folklore and contains many of the country's best-loved folktales.

Fenian movement Irish nationalist society active chiefly in Ireland, the U.S., and Britain, especially in the 1860s. The name derived from the Fianna Éireann, a legendary band of Irish warriors led by FINN MACCUMHAILL. Plans for a rising against British rule in Ireland miscarried, but in the U.S., Fenians staged abortive raids into British Canada and caused friction between the U.S. and British governments. The Irish wing was sometimes called the Irish Republican Brotherhood, and as such continued after Fenianism died out in the early 1870s. See also SINN FÉIN.

fennec \'fe-nik\ Desert-dwelling FOX (*Fennecus zerda*) found in northern Africa and the Sinai and Arabian peninsulas. It is small (head-and-body length 14–16 in. [36–41 cm]), weighs about 3.5 lb (1.5 kg), and has large ears (6 in. [15 cm] or more in length). It has long, thick, whitish to sand-coloured fur and a black-tipped tail 7–12 in. (18–31 cm) long. Mainly nocturnal, it spends most of the day underground in its burrow. It feeds on insects, small animals, and fruit.

Fennec (*Fennecus zerda*)
ANTHONY MERCIECA—THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

fennel Perennial or biennial aromatic herb (*Foeniculum vulgare*) of the PARSLEY family, native to southern Europe and Asia Minor and widely cultivated. The greenish brown to yellowish brown oblong oval seeds smell and taste similar to ANISE. The seeds and extracted oil are used for scenting soaps and perfumes and for flavouring candies, liqueurs, medicines, and foods, particularly pastries, sweet pickles, and fish. The thickened base of Florence fennel (*F. vulgare dulce*) is eaten as a vegetable.

Fenrir \'fen-rər\ In Norse mythology, a monstrous wolf. He was the son of the god LOKI and a giantess. The gods bound Fenrir to a rock with a magical chain, where he is destined to remain until doomsday, or RAGNAROK, when he will break his chains and fall upon the gods. In one version of the myth, he will devour the sun and swallow the chief god, ODIN, only to be slain by Vidar, Odin's son. Fenrir figures prominently in Norwegian and Icelandic poetry of the 10th–11th century.

Fenton, Roger (b. 1819, Heywood, Eng.—d. Aug. 8, 1869, London) British photographer. In 1853 he helped found the Royal Photographic Society of London. In 1854 he was appointed the government's official photographer and sent to document the Crimean War. He shot some 360 photographs of the war; although they largely represent a glorified overview, showing very little of the real action or agony of war, they represent the first extensive photographic documentation of a war. On his return he exhibited successfully in London and Paris.

fenugreek \'fen-yə-ˌgrēk\ Slender, annual, herbaceous legume (*Trigonella foenum-graecum*) or its dried seeds, used as a food, a flavoring, and a medicine. Native to southern Europe and the Mediterranean, the plant is cultivated in central and southeastern Europe, western Asia, India, and northern Africa. The seeds smell and taste strong, sweetish, and somewhat bitter, like burnt sugar. Mealy in texture, they may be mixed with flour for bread or eaten raw or cooked. The herb is a characteristic ingredient in some curries and chutneys and is used to make imitation maple syrup.

fer-de-lance \'fer-dᵊl-'ants\ *French* **"spearhead"** Extremely venomous PIT VIPER (genus *Bothrops*), found in diverse tropical American habitats, from cultivated lands to forests. It has a broad, triangular head and is gray or brown, marked by a series of black-edged diamonds often bordered in a lighter colour. It is usually about 4–7 ft (1.2–2 m) long. Its bite can be fatal to humans. The name is sometimes applied to all members of the Central and South American genus *Bothrops* and to an Asian genus, *Trimeresurus*.

Fer Díad \'fär-ˌdē-əd\ Foster brother of the legendary Irish hero CÚ CHULAINN. *TÁIN BÓ CÚAILGNE* the longest tale in the ULSTER CYCLE, deals with a conflict between Ulster and Connaught over the famous brown bull of Cooley. Joining the forces of Connaught in an expedition to seize the bull, Fer Díad engages in a three-day battle with Cú Chulainn and is defeated.

Ferber, Edna (b. Aug. 15, 1887, Kalamazoo, Mich., U.S.—d. April 16, 1968, New York, N.Y.) U.S. novelist and short-story writer. Ferber began her career at age 17 as a reporter in Wisconsin. Her early stories were collected in *Emma McChesney & Co.* (1915) and other volumes. She won critical acclaim for such novels as *So Big* (1924, Pulitzer Prize) and *Show Boat* (1926), which, with music by JEROME KERN, became a seminal work of the American musical theatre. Among her later works is the novel *Giant* (1952; film, 1956). Her works offer a compassionate, lively portrait of middle-class Midwestern America.

Ferdinand (b. April 19, 1793, Vienna, Austria—d. June 29, 1875, Prague, Bohemia) Emperor of Austria (1835–48). He was the eldest son of Emperor FRANCIS II, who sought to protect the principle of succession and insisted that Ferdinand be the heir, despite Ferdinand's feeblemindedness and epilepsy. Ferdinand was crowned king of Hungary in 1830 and became emperor of Austria in 1835. Government affairs were controlled by a body of counselors, led by the chancellor, KLEMENS, PRINCE VON METTERNICH. He was the last HABSBURG king of Bohemia (1836), and in 1838 he was crowned king of Lombardy and Venetia. In the REVOLUTION of 1848 hostility was directed against his counselors, and Ferdinand abdicated in favor of his nephew, FRANCIS JOSEPH.

Ferdinand (Karl Leopold Maria) (b. Feb. 26, 1861, Vienna, Austria—d. Sept. 10, 1948, Coburg, Ger.) King of Bulgaria (1908–18). Elected prince of Bulgaria in 1887, he proclaimed Bulgaria's independence from the Ottoman Empire in 1908 and assumed the title of king or tsar. He spearheaded the formation of the BALKAN LEAGUE (1912), which led to the first BALKAN WAR. Bulgaria was defeated in the second Balkan War (1913), and Ferdinand's resentments against his former allies determined Bulgaria's participation in WORLD WAR I on the side of the CENTRAL POWERS. Following his country's military defeat in 1918, he was forced to abdicate in favour of his son, Boris III.

Ferdinand I (b. March 10, 1503, Alcalá de Henares, Spain—d. July 25, 1564, Vienna, Hapsburg domain) Holy Roman emperor (1558–64). The brother of Emperor CHARLES V, he was Charles's deputy in the Habsburg German lands (1522–58). In 1526 he took possession of Bohemia without difficulty, but he faced rival claimants in Hungary and fought periodically against the Ottoman Empire, finally agreeing in 1562 to pay tribute to the Ottoman sultan for Austria's share of Hungary. Ferdinand helped Charles defeat the Protestant SCHMALKALDIC LEAGUE, and he later compromised on the Protestant issue and signed the Peace of AUGSBURG (1555), ending the era of religious strife in Germany. Elected emperor after Charles's abdication, which separated the Habsburg domains into Spanish and Austrian parts, Ferdinand centralized the imperial administration.

ARCHIV FUR KUNST UND GESCHICHTE, BERLIN

Ferdinand I (b. Jan. 2/12, 1751, Naples—d. Jan. 4, 1825, Naples) King of the Two SICILIES (1816–25). He became king of Naples in 1759, as Ferdinand IV, when his father ascended the Spanish throne as CHARLES III. A weak ruler, he was greatly influenced by his wife, Maria Carolina of Austria (1752–1814). He engaged Naples in the Austro-English coalition against the French Revolution in 1793. The French then invaded Naples, and he fled to Sicily (1798–99, 1806–16). He returned to Naples in 1816

© 2006 Encyclopædia Britannica, Inc.

after the fall of Napoleon, as king of the united Kingdom of the Two Sicilies. His despotic rule led to an uprising in 1820, after which he was forced to grant a constitution. With Austria's aid, he overthrew the constitutional government in 1821.

Ferdinand II *known as* **Ferdinand the Catholic Spanish Fernando el Católico** (b. March 10, 1452, Sos, Aragon—d. Jan. 23, 1516) King of Aragon from 1479, king of Castile (as Ferdinand V) from 1474 (joint sovereign with Queen Isabella I until 1504), king of Sicily (as Ferdinand II, 1468–1516), and king of Naples (as Ferdinand III, 1503–16). The son of John II of Aragon (1398–1479), Ferdinand married Isabella of Castile in 1469 and fought to impose his authority over the nobles in the two kingdoms. As part of an effort to modernize Castile, they banned all religions other than Roman Catholicism, leading to the Spanish Inquisition (1478) and the expulsion of the Jews (1492). Conquest of Granada in 1492 made it possible to support Christopher Columbus's voyages to the New World. Ferdinand furthered his expansionary policies in the Mediterranean and in Africa. After the conquest of Naples in 1503, during the Italian Wars, Spain rivaled France as the most powerful state in Europe. By uniting the Spanish kingdoms into the nation of Spain, Ferdinand began Spain's entry into the modern period of imperial expansion.

Ferdinand II (Aragon) See Ferdinand V

Ferdinand II (b. July 9, 1578, Graz, Styria—d. Feb. 15, 1637, Vienna) Holy Roman emperor (1619–37), archduke of Austria, king of Bohemia (1617–19, 1620–27) and king of Hungary (1618–25). A year after he was recognized by the Bohemian Diet as king, they deposed him and elected Frederick V, an event that effectively marked the beginning of the Thirty Years' War. After annihilating the rebel army in 1620, he greatly reduced the Diet's power. A rigidly Catholic ruler, he forcibly Catholicized Bohemia and suppressed Protestantism throughout his lands. He maintained much of his power through the victories of Albrecht W.E. von Wallenstein but later concluded a compromise peace with the Protestant princes. He was the leading champion of the Catholic Counter-Reformation and of absolutist rule in the Thirty Years' War.

Ferdinand II (b. Jan. 12, 1810, Palermo, Sicily—d. May 22, 1859, Caserta) King of the Two Sicilies (1830–59). He followed his father, Francis I, as king and initially instituted reforms, but his rule gradually became authoritarian, and he severely repressed a number of liberal and national revolts. His heavy bombardment of Sicilian cities in 1848 earned him the name "King Bomba." His government's increasingly absolute character denied the Kingdom of the Two Sicilies a role in the Risorgimento and caused its collapse and incorporation into Italy in 1860.

Ferdinand III (b. July 13, 1608, Graz, Inner Austria—d. April 2, 1657, Vienna) Holy Roman emperor (1637–57), archduke of Austria (1621–57), king of Hungary (1625–57) and king of Bohemia (1627–57). Denied command of the Habsburg armies in the Thirty Years' War, Ferdinand conspired to overthrow Gen. Albrecht W.E. von Wallenstein, whom he replaced as commander (1634–35). His leadership of the so-called peace party at the imperial court led to the Peace of Prague in 1635. As emperor from 1637, he refused to allow religious freedom in his own domains, but he compromised with Europe's Protestant powers and agreed to the Peace of Westphalia, ending 30 years of religious strife in central Europe.

Ferdinand VI *Spanish* **Fernando** (b. Sept. 23, 1713, Madrid, Spain—d. Aug. 10, 1759, Villaviciosa de Odón) King of Spain (1746–59). He was the second son of Philip V and his first wife, Marie-Louise. The influence of his father's second wife, Isabella Farnese, kept Ferdinand out of politics during his father's reign. During his own reign he tried to avoid conflicts while relying on his father's minister to bring about reforms. Ferdinand, the second Bourbon Spanish king, and his wife, Maria Bárbara, were patrons of the arts and learning. On his death, the crown passed to his half brother, Charles III.

Ferdinand VII *Spanish* **Fernando** (b. Oct. 14, 1784, El Escorial, Spain—d. Sept. 29, 1833, Madrid) King of Spain (1808, 1813–33). He became king briefly in 1808 after the French invasion of Spain forced the abdication of his father, Charles IV. Napoleon soon replaced him as king with Joseph Bonaparte and held Ferdinand in France (1808–13). The Spanish populace rose against the French invaders in the name of Ferdinand, who became known as "the Desired." In 1812 independent Spaniards adopted a liberal constitution, which Ferdinand overthrew on his return as king in 1813 to rule in an absolutist style. His reign saw the loss of most of Spain's possessions in the Americas. He abolished the Salic Law of Succession to allow his daughter (the future Isabella II) instead of his brother (Don Carlos [1788–1855]) to succeed him, which triggered the opposition movement, Carlism.

Ferdinand the Catholic See Ferdinand V

Ferdowsī \fər-'daù-sē\ *or* **Firdusī** *or* **Firdousī** \fər-'dü-sē\ *orig.* **Abū al-Qāsim Manṣūr** (b. c. 935, near Ṭūs, Iran—d. c. 1020, Ṭūs) Persian poet. Though many legends surround his name, few facts are known about his life. He gave the final and enduring form to the Persian national epic, the *Shāh-nāmeh* (completed c. 1010; "Book of Kings"), a poem based mainly on an earlier prose history. His language is still readily intelligible to modern Iranians, who regard the poem's nearly 60,000 couplets as a sonorous, majestic evocation of a glorious past. He reportedly worked on the poem for 35 years to earn a dowry for his only daughter.

Ferenczi \'fer-ənt-sē\ **Sándor** (b. 1873, Miskolc, Hung., Austria-Hungary—d. 1933, Budapest, Hung.) Hungarian psychoanalyst. After receiving his M.D. from the University of Vienna and serving as an army doctor, he met Sigmund Freud in 1908 and became a member of Freud's inner circle, the Vienna Psychoanalytic Society. He founded the Hungarian Psychoanalytic Society in 1913 and began teaching psychoanalysis at the University of Budapest in 1919. He experimented with techniques of therapy and diverged from classic psychoanalytic practice in some respects (e.g., arguing that recovery of traumatic memories was not essential for modifying neurotic behaviour and emphasizing the need for therapists to create a loving, permissive atmosphere). His works include *The Development of Psychoanalysis* (with Otto Rank; 1924).

Fergana Valley *or* **Fergana Basin** \,fir-gə-'nä\ Large valley, western Central Asia. It is mainly in eastern Uzbekistan and partly in Tajikistan and Kyrgyzstan and is situated between the Tien Shan system and the smaller Gissar and Alay ranges. It has an area of 8,500 sq mi (22,000 sq km). One of the most densely populated areas of Central Asia, it is a major producer of cotton, fruit, and raw silk. Among the mineral deposits exploited are coal, petroleum, and mercury. It was conquered by the Arabs (8th century AD), Genghis Khan (13th century), and Timur (14th century). The khans of Kokand (see Qoʿqon) ruled it from the late 18th century until it was absorbed by the Russian Empire in 1876.

Fergus Warrior king in the Ulster cycle of Gaelic literature. In *The Cattle Raid of Cooley*, Fergus, an exile from Ulster, recalls the deeds of the young Cú Chulainn. Another story tells of the revelation of the *Táin* in the 7th century by the ghost of Fergus. Fergus is also the subject of poems by William Butler Yeats. He is said to have been shipwrecked off the coast of Northern Ireland c. AD 320, at the place known as Carrickfergus ("rock of Fergus").

Ferguson, Maynard (b. May 4, 1928, Montreal, Que., Can.) Canadian trumpeter and bandleader. Ferguson led a big band with his brother in his native Montreal while still a teenager. Moving to the U.S. in 1948, he performed with Jimmy Dorsey (1904–57), Charles Barnet, and Stan Kenton before forming his own big band in 1956. He became known for his mastery of the trumpet's highest register. His recording of "Gonna Fly Now" from the film *Rocky* brought him commercial success in 1978. A versatile, energetic performer (he also plays many of the woodwind and lower brass instruments), he has inspired brass players for decades with his strong tone and sure technique.

Ferlinghetti \,fer-liŋ-'ge-tē**, Lawrence (Monsanto)** *orig.* **Lawrence Ferling** (b. March 24, 1919, Yonkers, N.Y., U.S.) U.S. poet. Ferlinghetti attended Columbia University and the Sorbonne. A founder of the Beat movement in San Francisco in the mid 1950s, he established the City Lights bookstore, an early gathering place of the Beats. The publishing arm of City Lights was the first to print the Beats' poetry. His own poetry—lucid, witty, and composed to be read aloud—became popular in coffeehouses and on college campuses. His collections include *Pictures of the Gone World* (1955), the widely popular *A Coney Island of the Mind* (1958), and *Endless Love* (1981).

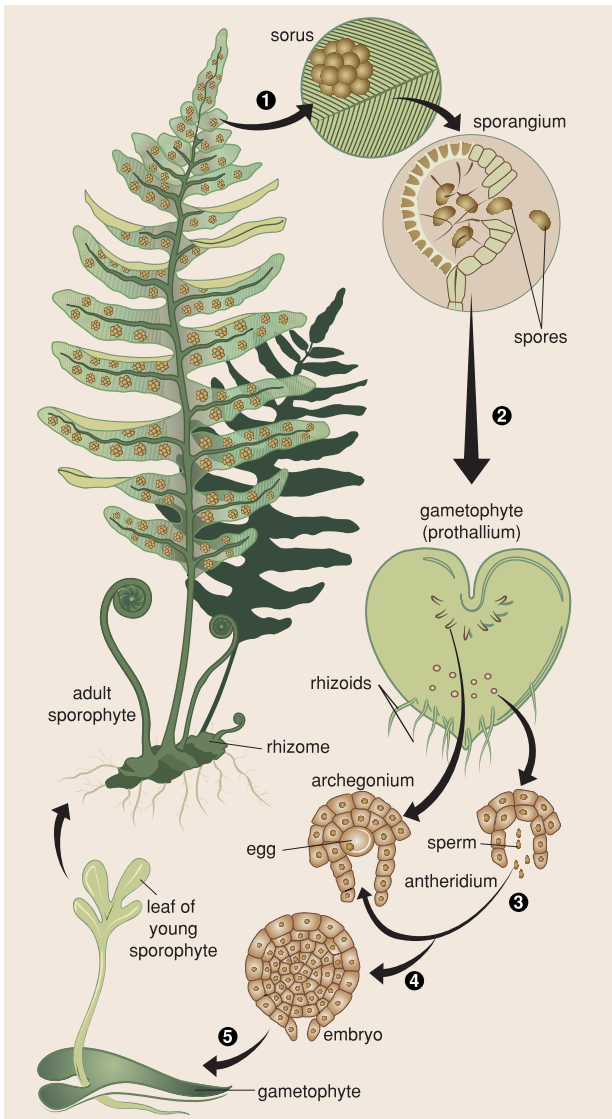
Fermanagh \fər-'ma-nə\ District (pop., 2001: 57,527), extreme southwestern Northern Ireland. Located chiefly in the River Erne basin, it was established as a district within the boundaries of the traditional county in 1973; the district seat is Enniskillen. Settled from prehistory, Fermanagh has a scattering of megaliths, cairns, and early Celtic Christian antiquities. Devenish Island, in Lower Lough Erne, is the site of an ancient monastery. During the reign of James I (1603–25), many English Anglicans were settled there. It is one of the most important tourist areas in Northern Ireland.

© 2006 Encyclopædia Britannica, Inc.

Fermat \fer-'mä**, Pierre de** (b. Aug. 17, 1601, Beaumont-de-Lomagne, France—d. Jan. 12, 1665, Castres) French mathematician. Of Basque origin, Fermat studied law at Toulouse and developed interests in foreign languages, Classical literature, ancient science, and mathematics. A jurist by profession, he produced major mathematical breakthroughs independently and collaboratively. A contemporary of René Descartes, he discovered independently the basic principles of analytic geometry, but, because Fermat's work was published posthumously, the field became known as Cartesian geometry. He found equations for tangent lines to curves through processes equivalent to differentiation and was coauthor (with Blaise Pascal) of probability theory. His work in number theory, especially divisibility, led to some of its most important theorems. He seldom demonstrated his results, which led to a centuries-long quest to prove a famous conjecture that Fermat claimed was easily shown (see Fermat's last theorem).

Fermat, portrait by Roland Lefèvre; in the Narbonne City Museums, France
COURTESY OF THE MUSEES DE LA VILLE DE NARBONNE, FRANCE

Fermat's last theorem Statement that there are no natural numbers x, y, and z such that $x^n + y^n = z^n$, in which n is a natural number greater than 2. About this, Pierre de Fermat wrote in 1637 in his copy of Diophantus's *Arithmetica*, "I have discovered a truly remarkable proof but this margin is too small to contain it." Although the theorem was subsequently shown to be true for many specific values of n, leading to important mathematical advances in the process, the difficulty of the problem soon convinced mathematicians that Fermat never had a valid proof. In 1995 the British mathematician Andrew Wiles (b. 1953) and his former student Richard Taylor (b. 1962) published a complete proof, finally solving one of the most famous of all mathematical problems.



fermentation Process that allows respiration to occur in the absence of oxygen. Biologically, it allows cells to obtain energy from molecules (e.g., glucose) anaerobically. Glycolysis, the breakdown of glucose, is a form of fermentation. Alcoholic fermentation occurs when yeast cells convert carbohydrate sources to ethanol and carbon dioxide. Fermentation reactions are common in muscle cells, yeasts, some bacteria, and plants. See also beer; wine.

Fermi, Enrico (b. Sept. 29, 1901, Rome, Italy—d. Nov. 28, 1954, Chicago, Ill., U.S.) Italian-born U.S. physicist. As a professor at the University of Rome, he began the work, later fully developed by P.A.M. Dirac, that led to Fermi-Dirac statistics. He developed a theory of beta decay that applies to other reactions through the weak force, which was not improved until 1957, when the weak force was found not to conserve parity. He discovered neutron-induced radioactivity, for which he was awarded a 1938 Nobel Prize. After receiving the award in Sweden, he never returned to fascist Italy but instead moved directly to the U.S., where he joined the faculty of Columbia University and soon became one of the chief architects of practical nuclear physics. A member of the Manhattan Project, he was an important figure in the development of the atomic bomb; in 1942 he directed the first controlled nuclear chain reaction. He received the Congressional Medal of Merit in 1946. In 1954 he became the first recipient of the U.S. government's Enrico Fermi Award. Element number 100, fermium, was named in his honour.

Fermi-Dirac statistics In quantum mechanics, one of two possible ways (the other being Bose-Einstein statistics) in which a system of indistinguishable particles can be distributed among a set of energy states. Each available discrete state can be occupied by only one particle. This exclusiveness accounts for the structure of atoms, in which electrons remain in separate states rather than collapsing into a common state. It also accounts for some aspects of electrical conductivity. This theory of statistical behaviour was developed first by Enrico Fermi and then by P.A.M. Dirac (1926–27). The statistics apply only to particles such as electrons that have half-integer values of spin; the particles are called fermions.

fermion Any of a group of subatomic particles having odd half-integral spin (½, ³⁄₂). Fermions are named for the Fermi-Dirac statistics that describe their behaviour. They include particles in the class of leptons, baryons, and nuclei of odd mass number (e.g., tritium, helium-3, uranium-233). They obey the Pauli exclusion principle. Fermions are produced and undergo annihilation in particle-antiparticle pairs. See also boson.

fern Any of about 10,000–12,000 species (division Filicophyta) of nonflowering vascular plants that have true roots, stems, and complex leaves and reproduce by spores. Though ferns were once classified with the primitive horsetails and club mosses, botanists have since made a clear distinction between the scalelike, one-veined leaves of those plants and the more complexly veined fronds of the ferns, which are more closely related to the leaves of seed plants. Ferns come in a wide variety of sizes and shapes.

The life cycle of the fern. (1) Clusters (sori) of sporangia (spore cases) grow on the undersurface of mature fern leaves. (2) Released from its spore case, the haploid spore is carried to the ground, where it germinates into a tiny, usually heart-shaped, gametophyte (gamete-producing structure), anchored to the ground by rhizoids (rootlike projections). (3) Under moist conditions, mature sperm are released from the antheridia and swim to the egg-producing archegonia that have formed on the gametophyte's lower surface. (4) When fertilization occurs, a zygote forms and develops into an embryo within the archegonium. (5) The embryo eventually grows larger than the gametophyte and becomes a sporophyte.
© MERRIAM-WEBSTER INC.

© 2006 Encyclopædia Britannica, Inc.

Many are small, fragile plants; others are treelike (see TREE FERN). The life cycle is characterized by an ALTERNATION OF GENERATIONS between the mature, fronded form (the SPOROPHYTE) familiar in greenhouses and gardens and the form that strongly resembles a MOSS or LIVERWORT (the GAMETOPHYTE). Ferns are popular houseplants.

Fernando Póo See BIOKO

Ferrara \fer-'rä-rä\ City (pop., 2001 prelim.: 130,461), northern Italy. Situated near the PO RIVER, it is probably the site of the ancient Forum Alieni. Ferrara first appears in historical records in AD 753, when it was captured from RAVENNA by the Lombards. It became a cultural centre and the seat of a principality, but it declined after its incorporation into the PAPAL STATES in 1598. The site of an Austrian garrison from 1832, Ferrara became part of the Kingdom of Italy in 1861. It was severely damaged in World War II. Sites of interest include a 12th-century cathedral, a 14th-century moated castle, and the University of Ferrara (founded 1391).

Ferrara-Florence, Council of (1438–45) Ecumenical council held in an attempt to reunify the Eastern Orthodox and Roman Catholic churches. It was called by Pope Eugenius IV; the Eastern church was represented by Emperor JOHN VIII PALAEOLOGUS and others. Fear of facing the Turks without Western support led the Eastern participants to sign the Decree of Union (1439), but on their return to Constantinople most renounced it. Union was officially declared in HAGIA SOPHIA in 1452, but the following year the OTTOMAN EMPIRE captured Constantinople, and the few partisans of the union fled. In 1448 a council of Eastern bishops condemned it officially. General support for the council and its goals strengthened the authority of the papacy and contributed to the failure of the CONCILIAR MOVEMENT.

Ferraro, Geraldine (Anne) (b. Aug. 26, 1935, Newburgh, N.Y., U.S.) U.S. politician. She received her law degree from Fordham University Law School in 1960 and was admitted to the New York bar in 1961. She practiced law in New York until 1974, when she became assistant U.S. district attorney. In 1978 she was elected to the U.S. House of Representatives as a Democrat. In 1984 the Democratic Party nominated her for vice president on a ticket with WALTER MONDALE; she thereby became the first woman to be nominated for vice president by a major U.S. political party. In 1992 and 1998 she ran unsuccessfully for the U.S. Senate.

ferret Either of two species in the CARNIVORE family Mustelidae. The common ferret (*Mustela putorius furo*) is a domesticated form of the European POLECAT. It has a long, lithe body and is brown, black, or white (albino). Its average length is 20 in. (51 cm), including the 5-in. (13-cm) tail, and it weighs about 2 lbs (1 kg). It was originally domesticated for hunting mice, rats, and rabbits; today ferrets are commonly kept as pets. The black-footed ferret (*M. nigripes*), of the North American plains, has a black mask across the eyes and brownish black markings on the feet and tail tip. It is an endangered species, owing to the loss of its main source of food, the PRAIRIE DOG.

ferrimagnetism Type of permanent MAGNETISM that occurs in solids, in which the MAGNETIC FIELDS associated with individual atoms spontaneously align themselves, some parallel (as in FERROMAGNETISM), and others antiparallel, or paired off in opposite directions (as in antiferromagnetism). The materials are less magnetic than ferromagnets, as the antiparallel atoms dilute the magnetic effect of the parallel arrangement. Ferrimagnetism occurs mainly in magnetic oxides known as ferrites. Above a temperature called the Curie point, the spontaneous alignment is disrupted and ferrimagnetism is destroyed, but it is restored upon cooling below the Curie point.

ferroalloy ALLOY of IRON (less than 50%) and one or more other metals, important as a source of various metallic elements in the production of alloy STEELS. The principal ferroalloys are ferromanganese, ferrochromium, ferromolybdenum, ferrotitanium, ferrovanadium, ferrosilicon, ferroboron, and ferrophosphorus. They usually have lower melting ranges than do the pure elements and can be incorporated more readily in the molten steel. Ferroalloys are prepared from charges of the nonferrous metal ORE, iron or iron ore, COKE or COAL, and FLUX by treatment at high temperature in submerged-arc ELECTRIC FURNACES.

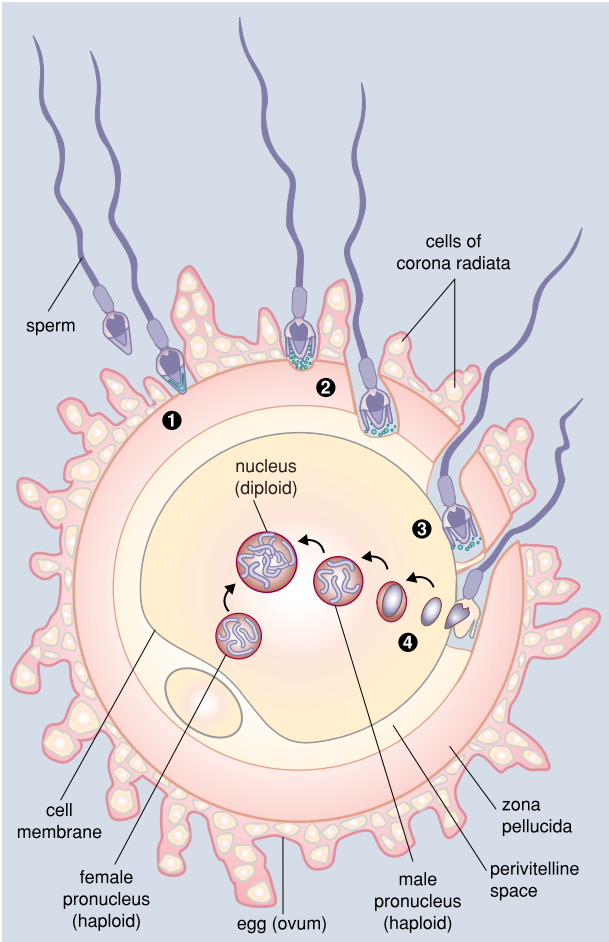
ferromagnetism Physical phenomenon in which certain electrically uncharged materials strongly attract others. It is associated with IRON, COBALT, NICKEL, and some alloys or compounds containing these elements. It is caused by the alignment patterns of the material's atoms, each of which acts as a simple ELECTROMAGNET, due to the motion and SPIN of the ELECTRONS. The tiny magnets spontaneously align themselves in the same direction, so their MAGNETIC FIELDS reinforce each other. Ferromagnetic materials are magnetized easily. Above a temperature called the Curie point, they cease to be magnetic, but they become ferromagnetic again upon cooling below the Curie point. See also FERRIMAGNETISM.

Ferry \fe-'rē**, Jules (-François-Camille)** (b. April 5, 1832, Saint-Dié, France—d. March 17, 1893, Paris) French politician. He held a number of offices in the early THIRD REPUBLIC, including mayor of Paris (1870) and premier of France (1880–81, 1883–85). His government established free, compulsory, secular education (1882), enacting such anticlerical measures as dissolving the Jesuits and forbidding their members to teach. Ferry played a major part in extending France's colonial territories in Asia and Africa, but public anger for colonial expenditures forced his resignation, though he was later elected to the Senate. He was assassinated by a madman.

Fertile Crescent Region, MIDDLE EAST. The term describes a crescent-shaped area of arable land, probably more agriculturally productive in antiquity than it is today. Historically the area stretched from the southeastern coast of the Mediterranean Sea around the Syrian Desert north of the ARABIAN PENINSULA to the PERSIAN GULF; in general, it often includes the NILE RIVER valley as well. Sedentary agricultural settlements in the Fertile Crescent can be dated to c. 8000 BC. It was the scene of the struggles and migrations of some of the earliest known peoples, including Sumerians, Assyrians, Akkadians, various Semitic groups, Babylonians, and Phoenicians.

fertility Ability of an individual or couple to reproduce through normal sexual activity. About 80% of healthy, fertile women are able to conceive within one year if they have intercourse regularly without CONTRACEPTION. Normal fertility requires the production of enough healthy SPERM by the male and viable EGGS by the female, successful passage of the sperm through open ducts from the male TESTES to the female fallopian tubes, penetration of a healthy egg, and implantation of the fertilized egg in the lining of the UTERUS (see REPRODUCTIVE SYSTEM). A problem with any of these steps can cause INFERTILITY.

fertilization Reproductive process in which a male sex cell (SPERM) unites with a female sex cell (EGG). During the process, the chromosomes of the egg and sperm will merge to form a zygote, which will divide to form an EMBRYO. In humans, sperm travel from the VAGINA through the uterus to a fallopian tube, where they surround an egg released from an OVARY usually two or three days earlier. Once one sperm has fused with the egg cell membrane, the outer layer becomes impenetrable to other sperm. See also CROSS-FERTILIZATION, SELF-FERTILIZATION. See illustration opposite on following page.



fertilizer Natural or artificial substance containing the chemical elements that improve growth and productiveness of plants. Fertilizers enhance the natural fertility of the soil or replace the chemical elements taken from the soil by previous CROPS. The use of MANURE and COMPOSTS as fertilizers is probably almost as old as agriculture. Modern chemical fertilizers include one or more of the three elements most important in plant nutrition: NITROGEN, PHOSPHORUS, and POTASSIUM. Of secondary importance are the elements SULFUR, MAGNESIUM, and CALCIUM.

Fès \'fes\ *or* **Fez** \'fez\ *Arabic* **Fās** \'fas\ City (pop., 1994: 541,162), northern Morocco. The oldest of Morocco's four imperial cities, it was founded on opposite banks of the Wadi Fès by IDRĪS I c. 789 and Idrīs II c. 809. The two parts were united by the ALMORAVID DYNASTY in the 11th century to become a major Islamic city. Fès reached its zenith under the MARINID DYNASTY as a centre of learning and commerce in the mid-14th century and has kept its religious primacy through the ages. The site of the oldest mosque in northern Africa, it is also the seat of an Islamic university founded in 859. A centre for trade and traditional crafts, it was until the late 19th century the only place where the fez hat was made.

fescue Any of about 100 species of GRASSES that make up the genus *Festuca* (family Poaceae, or Gramineae), native to temperate and cold regions of the Northern Hemisphere. Several species are important pasture and fodder grasses, and a few are used in lawn mixtures. One variety, blue fescue \(*F. ovina* 'glauca'), has smooth, silvery leaves and is planted in ornamental borders.

Fessenden, William Pitt (b. Oct. 16, 1806, Boscawen, N.H., U.S.—d. Sept. 8, 1869, Portland, Maine) U.S. politician. He practiced law in Maine before serving in the U.S. House of Representatives (1841–43)

© 2006 Encyclopædia Britannica, Inc.

Fertilization of a human egg. (1) The sperm release enzymes that help disperse the corona radiata and bind to the zona pellucida. (2) The outer sperm head layer is sloughed off, exposing enzymes that digest a path through the zona pellucida. (3) The sperm fuses with the egg cell membrane, causing the zona pellucida to become impenetrable to other sperm. (4) The tail separates from the sperm head, and the male pronucleus enlarges and travels to the female pronucleus in the center of the cell. Chromosomes merge to form a fertilized egg.

© MERRIAM-WEBSTER INC.

and Senate (1854–64, 1865–69). Originally a Whig, he opposed the extension of slavery to the territories, and he was one of the leaders of the movement that resulted in the formation of the Republican Party (1854). Despite his personal dislike for Pres. Andrew Johnson, he voted for acquittal in Johnson's Senate impeachment trial.

fetal alcohol syndrome (FAS) Various congenital disorders in a newborn caused by the mother drinking alcohol during pregnancy. The main symptoms are retarded growth, abnormalities of the central nervous system, and certain face and head abnormalities. The child may be mentally retarded. Behavioral problems (e.g., poor concentration, impulsiveness) are sometimes the only obvious symptoms. The syndrome is common in babies born to chronic alcoholics, but health care organizations now commonly recommend that women cease drinking alcohol entirely while pregnant. Other disorders have been linked to alcohol in breast milk.

fetial \ˈfē-shəl\ Any of a group of 20 Roman priestly officials who dealt with foreign relations. Selected from noble families and appointed for life, they acted as emissaries to foreign lands in times of conflict. When Rome was offended by another city-state, the fetials would visit the city-state and demand satisfaction. They also delivered treaties and made formal declarations of war, based on the decisions of the Senate. This priesthood had faded by the late republic, but was later revived by Augustus.

fetish Object believed to have magical power to protect or aid its owner, and by extension, an object regarded with superstitious or extravagant trust or reverence. In the 18th century it was applied to West African amulets; it has also been used for various items in American Indian religion. In psychology, a fetish is an object that substitutes for a person as the focus of sexual desire. See also fetishism.

fetishism In psychology, erotic attachment to an inanimate object or a nongenital body part whose real or fantasized presence is necessary for sexual gratification. The object is most commonly some other body part or an article of clothing. From the time of its identification by Sigmund Freud in 1927, fetishism was thought to occur almost exclusively among men, but in the late 20th century that notion was challenged by several new studies. See also fetish.

fetus \ˈfēt-əs\ Unborn young of any vertebrate, particularly mammals, after it has acquired its basic form. In humans, this stage begins about eight weeks after conception (see embryo). The fetal stage, marked by increased growth and full development of the organ systems, climaxes in birth (see pregnancy, parturition). By the end of the third month, the arms and legs of the human fetus begin to move and reflexive movements (such as sucking) begin. Four months after conception, the fetus is about 5.3 in. (135 mm) long and weighs about 6 oz (170 g). During the fifth month, downy hairs (lanugo) cover the body and the skin becomes less transparent. At seven months, a protective greasy substance (vernix caseosa) covers the reddish, wrinkled skin. Fat is deposited under the skin during the eighth month, when the fetus typically weighs about 5 lbs (2.2 kg). A full-term fetus is about 266 days old.

feudal land tenure System by which land was held by tenants from lords. In England and France, the king was lord paramount and master of the realm. He granted land to his lords, who granted land to their vassals and so on down to the occupying tenant. Tenures were divided into free and unfree. Free tenure included tenure in chivalry, as in the case of knight service, and socage (tenure by agricultural service fixed in amount and kind). The main type of unfree tenancy was villenage, a limited form of servitude. See also feudalism, fief, landlord and tenant, manorialism.

feudalism Term that emerged in the 17th century that has been used to describe economic, legal, political, social, and economic relationships in the European Middle Ages. Derived from the Latin word *feudum* (fief) but unknown to people of the Middle Ages, the term "feudalism" has been used most broadly to refer to medieval society as a whole, and in this way may be understood as a socio-economic system that is often called manorialism. It has been used most narrowly to describe relations between lords and vassals that involve the exchange of land for military service. Feudalism in this sense is thought to have emerged in a time of political disorder in the 11th century as a means to restore order, and it was later a key element in the establishment of strong monarchies. "Feudalism" also has been applied, often inappropriately, to non-Western societies where institutions similar to those of medieval Europe are thought to have existed. The many ways "feudalism" has been used have drained it of specific meaning, however, and caused some scholars to reject it as a useful concept for understanding medieval society.

Feuerbach \ˈfȯi-ər-ˌbäk̲**, Ludwig (Andreas)** (b. July 28, 1804, Landshut, Bavaria—d. Sept. 13, 1872, Rechenberg, Ger.) German philosopher. The son of an eminent jurist, he studied under G.W.F. Hegel in Berlin but later abandoned Hegelian idealism for a naturalistic materialism. In *Thoughts on Death and Immortality* (1830), he attacked the concept of personal immortality. His *Abelard and Heloise* (1834) and *Pierre Bayle* (1838) were followed by *On Philosophy and Christianity* (1839), in which he claimed that "Christianity has in fact long vanished not only from the reason but from the life of mankind." In *The Essence of Christianity* (1841), he proposed that God is merely the outward projection of mankind's inward nature. Some of his views were later endorsed by Karl Marx and Friedrich Engels.

Feuillants \fœ-ˈyäⁿ\ **Club** Conservative French political club in the French Revolution, which met in the former monastery of the Feuillants (Reformed Cistercians) in Paris. It was founded in 1791 by deputies who left the Jacobin Club in opposition to a petition calling for the replacement of the king. The Feuillants feared that radicalization of the Revolution would lead to destruction of the monarchy and private property. The club

© 2006 Encyclopædia Britannica, Inc.

represented a substantial group in the Legislative Assembly, but it disappeared when the insurrection of 1792 overthrew the monarchy.

fever *or* **pyrexia** \pī-'rek-sē-ə\ Abnormally high body temperature or a disease characterized by it. It most often occurs with INFECTION. Normal core body temperature, measured orally, does not exceed 99°F (37.2°C). Up to 105°F (40.6°C), fever causes weakness and is best treated with ASPIRIN, ACETAMINOPHEN, or other antipyretic drugs. At 108°F (42.2°C) or more, it can lead to convulsions and death. In treatment, it is important to know the underlying cause. Fever appears to be a defense against infectious disease, stimulating LEUKOCYTES and increasing ANTIBODY production and perhaps killing or inhibiting BACTERIA and VIRUSES that live within a narrow temperature range.

Feydeau \fā-'dō**, Georges (-Léon-Jules-Marie)** (b. Dec. 8, 1862, Paris, France—d. June 5, 1921, Paris) French playwright. Also an actor and director, he wrote 39 plays between 1881 and 1916, taking the farce to new heights on the French stage. His plots often depended on farfetched cases of mistaken identity, and he used complicated mechanical props and elaborate stage settings. His plays included *The Girl from Maxim's* (1899), *A Flea in Her Ear* (1907), and *Keep an Eye on Amélie!* (1908). His farces have remained in the repertoire of the COMÉDIE-FRANÇAISE.

Feynman \'fīn-mən**, Richard P(hillips)** (b. May 11, 1918, New York, N.Y., U.S.—d. Feb. 15, 1988, Los Angeles, Calif.) U.S. theoretical physicist. He received his Ph.D. from Princeton University. During World War II he worked on the Manhattan Project. From 1950 he taught at the California Institute of Technology. The FEYNMAN DIAGRAM was one of the many problem-solving tools he invented. With Julian Schwinger (b. 1918) and Shinichiro Tomonaga (1906–79), he shared a 1965 Nobel Prize for his brilliant work on QUANTUM ELECTRODYNAMICS. He was principally responsible for identifying the cause of the 1986 *Challenger* disaster. Famed for his wit, he also wrote best-selling books on science. His work, which tied together all the varied phenomena at work in light, radio, electricity, and magnetism, altered the way scientists understand the nature of waves and particles.

Feynman diagram Graphical method of representing the interactions of elementary particles. It was invented by RICHARD P. FEYNMAN, who introduced the diagrams as an aid to calculating the processes that occur between ELECTRONS and PHOTONS. A Feynman diagram consists of two axes, one representing space, the other representing time. Electrons are represented as straight lines, while photons are shown as wavy lines. The interaction between particles appears as a junction of three lines, or a vertex. Feynman diagrams are now used to show all types of particle interactions.

Fez See FÈS

Fezzan \fe-'zan\ *Arabic* **Fazzān** \fä-'zän\ *ancient* **Phazania** Historic region, southwestern Libya. A part of the SAHARA, most of its inhabitants dwell in oases in the interior. Southern Fezzan is noted for its date palms, which cover several hundred thousand acres scattered in numerous oases. It was conquered by the Romans in the 1st century BC and by the Arabs in the 7th century AD. The Ottomans made it part of their empire in 1842. Fezzan was made part of Tripoli by the Italians in 1912, and it became a province of the United Kingdom of Libya (1951–63). Thereafter it was part of Libya.

Fianna Fáil \'fē-ə-nə-'fòil\ *Irish* **"Soldiers of Destiny"** Political party in Ireland, also called, loosely, the Republican Party. It was formally constituted in 1926 by those opposed to the treaty with Britain that in 1921 brought about the Irish Free State. They were organized and led by EAMON DE VALERA. Fianna Fáil remained the principal governing party from 1932 until 1973, but from 1961 it did so with the aid of other parties. It returned to power in coalition governments in the 1980s and '90s. Its main opposition was from FINE GAEL.

Fiat SpA International holding company and major Italian manufacturer of automobiles, trucks, and industrial vehicles and components. In 1899 Giovanni Agnelli (1866–1945) founded the firm that was incorporated as Fiat in 1906; he led the firm until his death. His grandson Giovanni Agnelli (1921–2003) served as chairman from 1966 until 1996, when his title became honorary. Paulo Fresco was named chairman in 1998. In 1979 the corporation converted to a holding company; in 1986 it acquired the sports-car manufacturer Alfa Romeo SpA. Among its automobile brands are Ferrari and Lancia.

Fibiger \'fē-bē-gər**, Johannes Andreas Grib** (b. April 23, 1867, Silkeborg, Den.—d. Jan. 30, 1928, Copenhagen) Danish pathologist. He found that rats that had suffered stomach-tissue inflammation caused by the larvae of a worm infecting cockroaches the rats had eaten subsequently developed stomach tumours, and he induced tumours in mice and rats by feeding them infected cockroaches. His work, for which he received a 1926 Nobel Prize, supported the prevailing concept that cancer is caused by tissue irritation and led to production of chemical carcinogens for use in cancer research.

Fibonacci sequence \ˌfi-bə-'nä-chē\ In mathematics, a sequence of numbers with surprisingly useful applications in botany and other natural sciences. Beginning with two 1's, each new term is generated as the sum of the previous two: 1, 1, 2, 3, 5, 8, 13, ... The 13th-century mathematician Leonardo of Pisa (c. 1170–after 1240), also known as Fibonacci, discovered the sequence but did not explore its uses, which have turned out to be wide and various. For example, the number of petals in most types of flowers and numbers involved in branching and seed-formation patterns come from the Fibonacci sequence. The ratio of any two successive terms approaches the value of the GOLDEN RATIO as the terms become large.

fibre, dietary Food material not digestible by the human small intestine and only partially digestible by the large intestine. Fibre is beneficial in the diet because it relieves and prevents constipation, appears to reduce the risk of colon cancer, and reduces plasma CHOLESTEROL levels and therefore the risk of heart disease. Fibre also slows gastric emptying and contributes to satiety. Whole grains, vegetables, nuts, and fruits are all good sources. See also NUTRITION.

fibre optics Thin transparent fibres of glass or plastic that transmit light through their length by internal reflections, used for transmitting data, voice, and images. Fibre-optic technology has virtually replaced copper wire in long-distance TELEPHONE lines and is used to link computers in LOCAL AREA NETWORKS, with digitized light pulses replacing the electric current formerly used for the signal. TELECOMMUNICATION using fibre optics is usually conducted with infrared light. Fibre optics uses light in the visible wavelengths to transmit images directly, in various technical devices such as those developed for ENDOSCOPY.

fibreglass *or* **glass fibre** Fibrous form of GLASS, developed in the 1930s. Liquid glass issues in fine streams through hundreds of fine nozzles, and the solidifying streams are gathered into a single strand and wound onto a spool. Strands can be twisted into yarns, woven into fabrics, or chopped into short pieces and then bonded into mats. Glass filaments and yarns add strength and electrical resistivity to molded plastic products. Glass fabrics are used as electrical insulators and as reinforcing belts in automobile tires. Discontinuous fibres are formed into wools, mats, or boards, commonly used in buildings, appliances, and plumbing.

fibrillation See ATRIAL FIBRILLATION, VENTRICULAR FIBRILLATION

fibrolite See SILLIMANITE

fibromyalgia Chronic syndrome that is characterized by musculoskeletal pain, often at multiple sites. The cause is unknown. A significant number of persons with fibromyalgia also have mental disorders, especially depression. Many also have overlapping symptoms of other so-called functional somatic syndromes—especially chronic fatigue syndrome—such as fatigue, stiffness, irritable bowel syndrome, and sleep disturbances. It is common in young and middle-aged women. No treatment has been proved fully effective, although medications, physical therapy, or counseling may reduce disability and help the patient cope.

Johann Gottlieb Fichte, lithograph by F.A. Zimmermann after a painting by H.A. Daehling.
DEUTSCHE FOTOTHEK, DRESDEN, GER.

Fichte \'fik-tə**, Johann Gottlieb** (b. May 19, 1762, Rammenau, Upper Lusatia, Saxony—d. Jan. 27, 1814, Berlin) German philosopher and patriot. Fichte's *Science of Knowledge* (1794), a reaction to the critical philosophy of IMMANUEL KANT and especially to Kant's *Critique of*

© 2006 Encyclopædia Britannica, Inc.

Practical Reason (1788), was his most original and characteristic work. To demonstrate that PRACTICAL REASON is really the root of reason in its entirety, the absolute ground of all knowledge as well as of humanity altogether, he started from a supreme principle, the ego, which is independent and sovereign, so that all other knowledge is deducible from it. In his famous patriotic lectures *Addresses to the German Nation* (1807–08) he attempted to rally German nationalists against Napoleon. He is regarded as one of the great transcendental idealists. His son Immanuel Hermann von Fichte (1796–1879) was also a philosopher.

Ficino \fē-'chē-nō**, Marsilio** (b. Oct. 19, 1433, Figline, Republic of Florence—d. Oct. 1, 1499, Careggi, near Florence) Italian philosopher, theologian, and linguist. His translations and commentaries on the writings of PLATO and other Classical Greek authors marked the beginning of the Florentine Platonist Renaissance. In conceiving the universe as a hierarchy of substances that descends from God to matter, he was strongly influenced by NEOPLATONISM and medieval views. The CAMBRIDGE PLATONISTS and related movements in France and Italy reflect Ficino's interpretation of Platonism. Of his original writings, *Platonic Theology* (1482) and *Book on the Christian Religion* (1474) are most significant.

fiddler crab Any of about 65 species of DECAPODS (genus *Uca*) whose males hold one claw, always much larger than the other, somewhat like a violin. Both claws of the female are relatively small. Fiddler crabs often live in large numbers on beaches in temperate to tropical regions of the world. They inhabit water-covered burrows up to about 1 ft (30 cm) deep and feed on algae and other organic matter. Common North American species (e.g., marsh fiddler, china-back fiddler) live all along the U.S. Atlantic coast. Brightly coloured, they range in body size from about 1 to 1.2 in. (2.5 to 3 cm).

Fides \'fī-dēz\ Roman goddess of good faith and honesty, who oversaw the integrity of the Romans. She was closely associated with JUPITER, and her temple was built near his on the Capitoline Hill in 254 BC. In the later Roman period she was called Fides Publica ("Public Faith") and was considered the guardian of treaties and other state documents, which were placed in her temple for safekeeping.

fiduciary \fə-'dü-shē-ˌer-ē\ In law, a person in a position of authority whom the law obligates to act solely on behalf of the person he or she represents and in good faith. Examples of fiduciaries are agents, executors, trustees, GUARDIANS, and officers of CORPORATIONS. Unlike people in ordinary business relationships, fiduciaries may not seek personal benefit from their transactions with those they represent.

Fiedler \'fēd-lər**, Arthur** (b. Dec. 17, 1894, Boston, Mass., U.S.—d. July 10, 1979, Brookline, Mass.) U.S. conductor. Son of a distinguished violinist, he was trained in Berlin and joined the Boston Symphony Orchestra in 1915. In the 1920s he began conducting and recording with his own Boston Sinfonietta and various choral groups. In 1929 he organized a series of open-air concerts, which was successful enough to eventually become an institution, the Boston Pops. Thereafter his name was inextricably linked with the Pops, which achieved enormous success under his direction.

fief \'fēf\ In European FEUDALISM, a vassal's source of income, granted to him by his lord in exchange for his services. The fief usually consisted of land and the labor of peasants who were bound to cultivate it. The income it provided supported the vassal, who fought for his lord as a knight. Dignities, offices, and money rents were also given in fief.

field In physics, a region in which each point is affected by a force. Objects fall to the ground because they are affected by the force of earth's gravitational field (see GRAVITATION). A paper clip, placed in the MAGNETIC FIELD surrounding a magnet, is pulled toward the magnet, and two like magnetic poles repel each other when one is placed in the other's magnetic field. An ELECTRIC FIELD surrounds an ELECTRIC CHARGE; when another charged particle is placed in that region, it experiences an electric force that either attracts or repels it. The strength of a field, or the forces in a particular region, can be represented by field lines; the closer the lines, the stronger the forces in that part of the field. See also ELECTROMAGNETIC FIELD.

Field, Marshall (b. Aug. 18, 1834, near Conway, Mass., U.S.—d. Jan. 16, 1906, New York, N.Y.) U.S. department-store owner. Born on a farm, he became an errand boy for a dry-goods store at age 16. He moved to Chicago and was hired in 1856 by a mercantile house, in which he later attained full partnership. In 1867 he and a partner bought the merchandising firm they had joined two years earlier, and in 1888 he bought out his partner, creating Marshall Field and Co. In his store Field emphasized customer service, liberal credit, the one-price system, and the acceptance of returned merchandise. His DEPARTMENT STORE was the first to have a restaurant for shoppers.

Field, Sally (b. Nov. 6, 1946, Pasadena, Calif., U.S.) U.S. film actress. She played saccharine television roles in *Gidget* (1965–66) and *The Flying Nun* (1967–70) before developing her talent at the ACTORS STUDIO (1973–75), from which she emerged as a dramatic actress in the television movie *Sybil* (1977, Emmy Award). Hollywood finally rewarded her with strong roles in *Norma Rae* (1979, Academy Award), *Absence of Malice* (1981), *Places in the Heart* (1984, Academy Award), and *Steel Magnolias* (1989). Her other films include *Soapdish* (1991), *Mrs. Doubtfire* (1993), and *Forrest Gump* (1994).

Field, Stephen J(ohnson) (b. Nov. 4, 1816, Haddam, Conn., U.S.—d. April 9, 1899, Washington, D.C.) U.S. jurist. After graduating from Williams College in 1837, he practiced law in New York with his brother, the legal reformer David Dudley Field (1805–94). In 1849 he moved to California, where he later joined the state supreme court. In 1863 he was appointed by Pres. Abraham Lincoln to the SUPREME COURT OF THE UNITED STATES; he served until 1897. He became chief architect of the constitutional approach that largely exempted U.S. industry from government regulation after the American Civil War, basing his interpretation principally on the U.S. Constitution's 14th Amendment (1868), which had been passed as a civil-rights measure. Field's stance toward industry would be maintained by the Court until the 1930s.

field hockey *or* **hockey** Game played with curve-ended sticks between two teams of 11 players. It is played on a field 100 yd (91.4 m) by 60 yd (55 m) in size. The object is to use the sticks to direct a ball into the opponent's goal. Field hockey originated in English schools in the late 19th century, and the British Army introduced it into India and the Far East. By 1928 it had become India's national game. Men's field hockey has been included in the Olympic Games since 1908, women's since 1980. The game was introduced into the U.S. in 1901 and became particularly popular at women's schools, colleges, and clubs. Several international championship tournaments are held during the year, including the World Cup.

field mouse *or* **wood mouse** In general, any MOUSE that normally lives in fields; more strictly, any of about seven species of small, long-tailed mice in the genus *Apodemus* (family Muridae). Field mice in this genus are found in fields, woodlands, and mountain meadows in the warm and temperate parts of Eurasia. They are grayish or light or reddish brown and are 2–5 in. (6–12 cm) long excluding the tail. They generally live in burrows and build nests of grass and other plants. They eat seeds, roots, and other plant material, occasionally damaging crops or young trees.

Field of Cloth of Gold Setting for meetings between HENRY VIII of England and FRANCIS I of France in June 1520, near Calais, France. Splendid temporary palaces were erected for each king, and jousts and other entertainments were held. The splendor of the meetings vastly impressed contemporaries, but the political results were negligible. In July Henry met Emperor CHARLES V, Francis's rival, near Calais, and they agreed to make no new alliances with France for two years.

field theory In mathematics, the study of the structure of a set of objects (e.g., numbers) with two combining operations (e.g., addition and multiplication). Such a system, known as a field, must satisfy certain properties: ASSOCIATIVE LAW, COMMUTATIVE LAW, DISTRIBUTIVE LAW, an additive identity ("zero"), a muliplicative identity ("one"), additive inverses (see INVERSE FUNCTION), and multiplicative inverses for nonzero elements. The sets of RATIONAL NUMBERS, REAL NUMBERS, and COMPLEX NUMBERS are fields under ordinary addition and multiplication. The investigation of POLYNOMIAL equations and their solutions led to the development of field theory.

field trial Competitive trial of sporting dogs under conditions that approximate or simulate those found in the hunting field. Dogs representing individual breeds, or classes of breeds (e.g., bird dogs, spaniels, hounds), are judged on such factors as pace, range, keenness of nose, handling response, hunting ability, and game and gun manners.

Fielding, Henry (b. April 22, 1707, Sharpham Park, Somerset, Eng.—d. Oct. 8, 1754, Lisbon, Port.) British novelist and playwright. Fielding attended Eton College but left early and lost his family's support. In his 25 plays, all written early, he was essentially a satirist of

© 2006 Encyclopædia Britannica, Inc.

political corruption; because of his sharp commentary he was eventually effectively banished from the theatre, whereupon he took up the study of law. In 1748 he was appointed a magistrate, in which role he established a new tradition of justice and suppression of crime in London. He probably wrote *Shamela* (1741), a burlesque of Samuel Richardson's *Pamela* that he never claimed. In the entertaining and original *Joseph Andrews* (1742) he also parodies Richardson's novel. *Tom Jones* (1749), his most popular work, is noted for its great comic gusto, vast gallery of characters, and contrasted scenes of high- and lowlife. The more sober *Amelia* (1751) anticipates the Victorian domestic novel. In these works he helped develop the English novel as a planned, realistic narrative genre surveying contemporary society.

fieldlark See pipit

Fields, Dame Gracie *orig.* **Grace Stansfield** (b. Jan. 9, 1898, Rochdale, Lancashire, Eng.—d. Sept. 27, 1979, Capri, Italy) English music-hall comedienne. She performed in music halls from age 13 and gained notice in the touring revue *Mr. Tower of London* (1918–25). She became tremendously popular with an act composed of low-comedy songs such as "The Biggest Aspidistra in the World" and sentimental ballads such as "My Blue Heaven," performing on radio and television and in films such as *Sally in Our Alley* (1931) and *Sing As We Go* (1934).

Fields, Dorothy (b. July 15, 1905, Allenhurst, N.J., U.S.—d. March 28, 1974, New York, N.Y.) U.S. lyricist and librettist. Born to a family active in theatre (her father Lew was a comedian and impresario, and her brothers Herbert and Joseph were librettists), Fields taught drama and wrote poetry and later wrote songs for Broadway and Cotton Club revues with Jimmy McHugh, including "I Can't Give You Anything But Love" and "On the Sunny Side of the Street." With Jerome Kern, she later wrote songs for Hollywood, including "The Way You Look Tonight." Returning to Broadway, she wrote the book or lyrics for many musicals, including *Annie Get Your Gun* (1946) and *Sweet Charity* (1966).

Fields, W.C. *orig.* **William Claude Dukenfield** (b. Jan. 29, 1880, Philadelphia, Pa., U.S.—d. Dec. 25, 1946, Pasadena, Calif.) U.S. actor and screenwriter. He was a vaudeville headliner as a juggler and appeared for seven seasons (1915–21) in the *Ziegfeld Follies*. His starring role in the stage hit *Poppy* (1923) brought him to Hollywood for its film adaptation, *Sally of the Sawdust* (1925). He emerged as a top film comedian only after the advent of sound pictures, when audiences could hear his distinctive raspy voice. His screen personality—an unlovable but hilarious con man, braggart, misanthrope, and hater of children and dogs—was largely his own. Fields wrote and improvised the action for most of his films, which include comedies such as *You Can't Cheat an Honest Man* (1939), *My Little Chickadee* (1940), *The Bank Dick* (1940), and *Never Give a Sucker an Even Break* (1941). His only serious role was Mr. Micawber in *David Copperfield* (1935).

Fiesole, Mino da See Mino da Fiesole

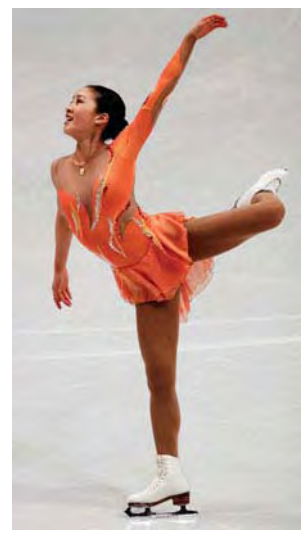
Fife Council area (pop., 2001: 349,249) and historic county, eastern Scotland. An ancient Pictish kingdom, Fife became one of Scotland's leading provinces and one of the kingdom's seven earldoms. Modern Fife consists largely of an agricultural northeast and an industrial southwest. Coal mining long dominated its industry but has all but ceased; manufacturing and light industries now predominate. The service sector includes consulting services for Scotland's petroleum industry. Fife's administrative headquarters is Glenrothes.

Fifth Republic System of government in France from 1959 to the present. Under the constitution crafted by Charles de Gaulle with the help of Michel Debre, executive power was increased at the expense of the National Assembly. It came into being in 1959 after de Gaulle was elected president, with Debré as his prime minister. In 1962 de Gaulle pushed through a constitutional amendment that provided for direct popular election of the president, and in 1965 he became the first French president elected by popular vote since 1848. He was succeeded by Georges Pompidou (1969–74), Valery Giscard d'Estaing (1974–81), Francois Mitterrand (1981–95), and Jacques Chirac (from 1995).

fig Any plant of the genus *Ficus*, in the mulberry family, especially *Ficus carica*, the common fig. Yielding the well-known figs of commerce, *F. carica* is native to an area from Asiatic Turkey to northern India, but natural seedlings grow in most Mediterranean countries, where figs are used extensively, both fresh and dried. It is a bush or small tree with broad, rough, deciduous leaves (see deciduous tree). Hundreds of different varieties are grown in various parts of the world. The fig was one of the first fruit trees to come under cultivation. Its fruit contains significant amounts of calcium, potassium, phosphorus, and iron.

Figaro, Le Morning daily newspaper published in Paris, once one of the great newspapers of France and of the world. Founded in 1826 as a witty gossip sheet on the arts, by 1866 it was a well-written daily filled with political discourse. Though the paper's reputation faltered at times and it suspended publication during World War II, in the postwar years it became the voice of the French upper middle class, providing broad subject coverage while maintaining an independent editorial stance. In the 1960s and '70s the staff was rent by conflicts over its leadership. In 1975 the paper was bought by the conservative Robert Hersant, who ran it until his death in 1996. U.S. investment firm Carlyle Group owned a minority share in Le Figaro Group from 1999 to 2002, when full ownership passed to Socpresse.

fighter aircraft Aircraft designed primarily to secure control of essential airspace by destroying enemy aircraft in combat. Designed for high speed and maneuverability, they are armed with weapons capable of striking other aircraft in flight. Developed early in World War I, they engaged in aerial combat with other fighters, shot down enemy bombers, and conducted various tactical missions. Most were biplanes with wooden frames and cloth skins, equipped with light machine guns synchronized to fire through the propeller. World War II saw the development of all-metal monoplanes that exceeded speeds of 450 mph (725 kph). Famous fighters of the period included the Focke-Wulf 190, the P-47 and P-51, and the Zero. Jet aircraft were produced at the end of the war, and jet fighters such as the U.S. Sabre and the Soviet MiG saw extensive service in the Korean War and later conflicts. See also air warfare, F-15, F-16.



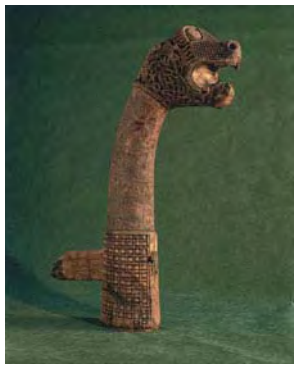
Fighting Falcon See F-16

fighting fish See Siamese fighting fish

Figueres \fē-'ger-ās\ **(Ferrer), José** (b. Sept. 25, 1906, San Ramón, Costa Rica—d. June 8, 1990, San José) Costa Rican statesman and president (1948–49, 1953–58, 1970–74). Educated in Costa Rica, Mexico, and the U.S., he became an opponent of the right-wing regime of Rafael Ángel Calderón, and in 1948 he led an uprising to force Calderón to yield the presidency to the democratically elected Otilio Ulate. A junta dominated by Figueres wrote a new constitution that abolished the army and gave women the right to vote, and the presidency was turned over to Ulate in 1949. Figueres himself was elected president by a landslide in 1953; governing as a moderate socialist, he adopted a pro-U.S. policy and quickly outlawed the Communist Party. Returned to power in 1970, he became a symbol of the democratic left and is given much credit for Costa Rica's enduring stability and democracy.

figure of speech Form of expression used to convey meaning or heighten effect, often by comparing or identifying one thing with another that has a meaning or connotation familiar to the reader or listener. An integral part of language, figures of speech are found in oral literatures as well as in polished poetry and prose and in everyday speech. Common figures of speech include simile, metaphor, personification, hyperbole, irony, alliteration, onomatopoeia, and puns.

figure skating Sport in which ice skaters, singly or in pairs, perform various jumps, spins, and footwork. The figure skate blade has a special serrated toe pick, or toe rake, at the front. Figure-skating events, held in the 1908 and 1920 Olympic Games, have constituted part of the Winter Olympics since they were inaugurated in 1924. Until 1991, competition included a compulsory section in which prescribed figures were traced. Competition for individuals includes two free-skating programs: a short



Michelle Kwan (U.S.) performing at the world figure-skating championships, Vancouver, B.C., Can., 2001.

© 2006 Encyclopædia Britannica, Inc.

program with mandatory requirements and a long program designed to show the skater's skill and grace. Jumps fall into two main groups: the edge jumps (such as the axel, the salchow, and the loop), which take off from one foot; and the toe jumps (such as the toe loop, the flip, and the lutz), which are edge jumps assisted by a vault off the toe pick of the other foot. Additional pair moves, involving a man and a woman skating together, include lifts and throw jumps. Figure-skating programs are judged on both technical merit and artistic impression. See also ICE DANCING.

figurehead Ornamental symbol or figure placed on a prominent part of a ship, usually at the bow. It could be a religious symbol, a national emblem, or a figure symbolizing the ship's name. The custom of decorating a ship probably began in ancient Egypt or India and was followed by the Chinese, Phoenicians, Greeks, and Romans. As early as 1000 BC, the stem- and sternposts were carved and painted to distinguish one ship from another. The Vikings built ships with high bows and a projecting stem bearing a menacing figurehead, similar to the ships of William I the Conqueror as seen in the BAYEUX TAPESTRY. Figureheads have historically varied in size from 18 in. (45 cm) to 8–9 ft (2.5 m). They remained popular until after World War I.

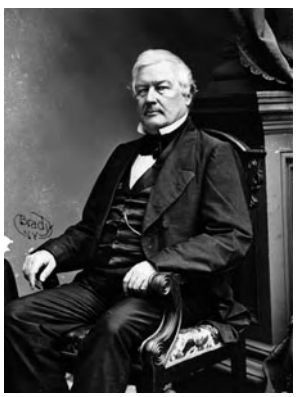
figwort Any of about 200 species of coarse plants that make up the genus *Scrophularia* (family Scrophulariaceae), native to open woodlands in the Northern Hemisphere. Figworts are tall, frequently foul-smelling plants with purple, greenish, or yellow flowers in large branched spikes.

Fiji *officially* **Republic of Fiji** Country and archipelago, South Pacific Ocean. It lies east of Vanuatu and southwest of Samoa. Area: 7,055 sq mi (18,272 sq km). Population (2005 est.): 846,000. Capital: SUVA. The majority of Fijians are of mixed Melanesian-Polynesian ancestry, with a large South Asian minority. Languages: English (official), Fijian. Religions: Christianity (mostly Protestant, also other Christians, Roman Catholic), Hinduism, Islam. Currency: Fiji dollar. Fiji lies 1,300 mi (2,100 km) north of New Zealand and comprises some 540 islets and 300 islands, of which about 100 are inhabited. The main islands are Viti Levu and Vanua Levu. Fiji also includes, since 1881, Rotuma, an island located about 400 mi (640 km) to the northwest. The two large islands are mountainous and volcanic in origin, rising abruptly from densely populated coasts to forested central mountains. The smaller islands are also volcanic, and all are ringed by rocky shoals and coral reefs. The coastal deltas of the principal rivers contain most of the fertile arable land. The climate is tropical oceanic. Fiji has a market economy based largely on agriculture (particularly sugar production), tourism, and light industries; gold and silver are mined. Fiji is a republic with two legislative houses; its chief of state is the president, while the head of government is the prime minister. Archaeological evidence shows that the islands were occupied in the late 2nd millennium BC. The first European sighting was by the Dutch in the 16th century; in 1774 the islands were sighted by Capt. JAMES COOK, and in 1792 Capt. William Bligh explored them. Traders and the first missionaries arrived in 1835, and European settlers began arriving in the 1860s. In 1874 Fiji was proclaimed a crown colony. It became independent as a member of the COMMONWEALTH in 1970 and was declared a republic in 1987 following a military coup. Elections in 1992 restored civilian rule. A new constitution was approved in 1997.

Filarete \ˌfē-lä-ˈre-tā\ *orig.* **Antonio di Pietro Averlino** (b. c. 1400, Florence?—d. c. 1469, Rome) Italian architect and sculptor. In 1451 he entered the service of the duke of Milan. He designed the Ospedale Maggiore in Milan (1457–65), which is among the first Renaissance buildings in Lombardy. He is chiefly important for his *Trattato d'architettura* ("Treatise on Architecture"), which describes an ideal Renaissance city called Sforzinda. Among the projects he envisioned was a tower of vice and virtue, with a brothel on the 1st floor and an astronomical observatory on the 10th.

filarial worm Any of a group of parasitic NEMATODES that usually require two hosts to complete the life cycle: an ARTHROPOD and another animal, which is bitten by the arthropod. The female worm produces large numbers of microscopic, active embryos, called microfilariae, that pass into the bloodstream of the primary host. These enter the body of an insect when it bites the infected animal; within the insect the microfilariae grow into larvae, which are passed to an animal the insect bites, where they complete their growth. See also HEARTWORM.



filbert *or* **hazel(nut)** Any of about 15 species of deciduous trees and shrubs that make up the genus *Corylus*, in the BIRCH family, native to the northern temperate zone; also, the edible NUTS they produce. Choice nuts are produced by two Eurasian trees, the European filbert (*C. avellana*) and the giant filbert (*C. maxima*), and by hybrids of these species. Some varieties are valuable HEDGEROW and ornamental trees. An oil from *C. avellana* is used in food products, perfumes, and soaps; the tree yields a soft, reddish-white timber that is useful for small articles such as tool handles and walking sticks.

file In hardware and metalworking, bar- or rod-shaped tool of hardened steel with many small cutting edges raised on its surfaces. Files are used for smoothing or forming objects, especially of metal. A file's cutting or abrading action results from rubbing it, usually by hand, against the workpiece. The single-cut file has rows of parallel teeth cut diagonally across the working surfaces. The double-cut file has rows of teeth crossing each other. Rasp teeth are disconnected and round on top; rasp files are usually very coarse and are used primarily on wood and soft materials.

file transfer protocol See FTP

filibuster Tactic of delaying action on a bill by talking long enough to wear down the majority in order to win concessions or force withdrawal of the bill. The tactic is normally employed by a group that cannot muster enough votes to defeat a bill by vote. Filibustering is possible in the U.S. Senate because Senate rules allow unlimited debate on a bill. A filibuster may be carried out by a group or a single member, and the speech need not be related to the bill under discussion. Calling for a vote to limit debate (cloture)—which requires 60 votes, the votes of three-fifths of the entire membership, in the U.S. Senate—or holding around-the-clock sessions to tire the speakers are measures used to defeat filibusters.

Fillmore, Millard (b. Jan. 7, 1800, Locke Township, N.Y., U.S.—d. March 8, 1874, Buffalo, N.Y.) 13th president of the U.S. (1850–53). Born into poverty, he became an indentured apprentice at age 15. He studied law with a local judge and began to practice in Buffalo in 1823. Initially identified with the Anti-Masonic Party (1828–34), he followed his political mentor, THURLOW WEED, to the Whigs and was soon a leader of the party's northern wing. He served in the U.S. House of Representatives (1833–35, 1837–43), where he became a follower of HENRY CLAY. In 1848 the Whigs nominated Fillmore as vice president, and he was elected with ZACHARY TAYLOR. He became president on Taylor's death in 1850. Though he abhorred slavery, he supported the COMPROMISE OF 1850 and insisted on federal enforcement of the FUGITIVE SLAVE ACT. His stand, which alienated the North, led to his defeat by WINFIELD SCOTT at the Whigs' nominating convention in 1852. He was an early champion of U.S. commercial expansion in the Pacific. In 1853 he sent MATTHEW PERRY with a fleet of warships to Japan to force its isolationist government to enter into trade and diplomatic relations. He returned to Buffalo and was nominated for president by the KNOW-NOTHING PARTY in 1856.

Millard Fillmore.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

film See MOTION PICTURE

film noir \ˈnwär\ *French* **"dark film"** Film genre that offers dark or fatalistic interpretations of reality. The term is applied to U.S. films of the late 1940s and early '50s that often portrayed a seamy or criminal underworld and cynical characters. The films were noted for their use of stark,

E | F | G

© 2006 Encyclopædia Britannica, Inc.

expressionistic lighting and stylized camera work, often employed in urban settings. The genre includes films such as John Huston's *The Maltese Falcon* (1941), Jacques Tourneur's *Out of the Past* (1947), Alfred Hitchcock's *Spellbound* (1945), and Billy Wilder's *Double Indemnity* (1944) and *Sunset Boulevard* (1950). The trend was on the wane by the mid-1950s, but the influence of these films is evident in many subsequent ones, including classics such as Roman Polanski's *Chinatown* (1974) and Ridley Scott's *Blade Runner* (1982). More recent examples include *L.A. Confidential* (1997) and *The Man Who Wasn't There* (2001).

film theory Theory developed to explain the nature of films and how they produce emotional and mental effects on the audience. It recognizes the cinema as a distinct art form. See also auteur theory, documentary film, Sergei Eisenstein, film noir, New Wave.

filter-pressing Process that occurs during crystallization of certain igneous rocks, in which liquid is separated from the crystals by pressure. As the crystals grow and accumulate in magma, a crystal mesh may be formed. Pressure applied by the weight of crystals above or by outside forces may force the more mobile liquid out of the mesh and also may fracture or crush the remaining crystals. Filter-pressing has been used to explain the formation of rocks consisting of only one kind of mineral.

fin whale *or* **finback whale** *or* **razorback whale** *or* **common rorqual** \'fin-ˌhwāl\ Swift, slender-bodied baleen whale (*Balaenoptera physalus*) named for the ridge on its back. It is 59–89 ft (18–27 m) long, with a triangular dorsal fin, short baleen, and several dozen grooves along its throat and chest. It is gray, with white on the underparts and on the right side of the lower jaw. It is found in oceans worldwide, in groups of a few to several hundred. It lives in polar waters in summer, feeding on crustaceans and small fishes, and moves to warmer waters in winter to breed. Once commercially valuable, it has been substantially reduced in numbers by overhunting and is now listed as an endangered species.

finance Process of raising funds or capital for any kind of expenditure. Consumers, business firms, and governments often do not have the funds they need to make purchases or conduct their operations, while savers and investors have funds that could earn interest or dividends if put to productive use. Finance is the process of channeling funds from savers to users in the form of credit, loans, or invested capital through agencies including commercial banks, savings and loan associations, and such nonbank organizations as credit unions and investment companies. Finance can be divided into three broad areas: business finance, personal finance, and public finance. All three involve generating budgets and managing funds for the optimum results. See also corporate finance.

finance company Specialized financial institution that supplies credit for the purchase of consumer goods and services. Finance companies purchase unpaid customer accounts at a discount from merchants and collect payments due from customers. They also grant small loans directly to consumers at a relatively high rate of interest.

Financial Times Morning daily newspaper published in London. Founded in 1888, it competed for many years with four other finance-oriented papers, finally in 1945 absorbing the last of them. Known as one of England's best papers, it specializes in reporting international business and financial news while maintaining an independent editorial outlook. Printed as a broadsheet on distinctive pink newsprint, it has had a strong influence on the British government's financial policies, and its circulation is one of the world's highest among financial newspapers.

finback whale See fin whale

finch Any of several hundred species of small, conical-billed, seed-eating songbirds (in several families), including the bunting, canary, cardinal, chaffinch, crossbill, Darwin's (Galapagos) finch, goldfinch, grass finch, grosbeak, sparrow, and weaver. Finches are small, compact birds 3–10 in. (10–27 cm) long. Most use their heavy bill to crack seeds; many also eat insects. Many finches are brightly coloured, often with shades of red and yellow. Found throughout the temperate areas of the Northern Hemisphere and South America and in parts of Africa, finches are among the dominant birds in many areas, both in numbers of individuals and species. They are often kept as singing cage birds.

Fine Gael \'fē-nə-'gāl\ *Irish* **"Gaelic Nation"** Major political party in Ireland, also known as United Ireland Party. It was founded in 1933 in the amalgamation of several parties, including the Cumann na nGaedheal ("Society of Gaels"), which had been formed by members of the Dáil (assembly) who accepted the Anglo-Irish treaty of 1921. It held power briefly in 1948, but Fianna Fáil dominated Irish politics until 1973. From the mid-1970s, both Fine Gael and Fianna Fáil vied for power in competitive elections, with Fine Gael forming several coalition governments.

finery process Early method of converting cast iron to wrought iron, superseding the bloomery process after blast furnaces became widespread. Pieces of cast iron (see pig iron) were placed on a finery hearth, on which charcoal was being burned with a plentiful supply of air, so that carbon in the iron was removed by oxidation, leaving semisolid malleable iron behind. From the 15th century on, this two-stage process gradually replaced direct making of malleable iron. It was in turn replaced by the puddling process.

Finger Lakes Group of narrow, glacial lakes, western New York state, U.S. They lie in north-to-south valleys between Syracuse and Geneseo. The region, which embraces more than 20 state parks, is noted for its scenery, has many resorts, and produces fruits (especially grapes) and vegetables. Seneca Lake, the largest in the group, is 67 sq mi (174 sq km).

fingerprinting Act of taking an impression of a person's fingerprint. Because each person's fingerprints are unique, fingerprinting is used as a method of identification, especially in police investigations. The standard method of fingerprint classification was developed by Sir Francis Galton and Sir Edward Henry; their system was officially introduced at Scotland Yard in 1901. The U.S. Federal Bureau of Investigation maintains a fingerprint file on more than 250 million people; fingerprints retrieved from a crime scene may be compared with those on file to identify suspects. DNA analysis, which examines regions of DNA unique to each person, is sometimes called DNA fingerprinting.

Fink, Mike (b. 1770/80, Fort Pitt, Pa.—d. 1823, Fort Henry? [North Dakota]) U.S. keelboatman. He won fame in his youth as a local marksman and Indian scout. Later, when keelboats became the chief vessels of commerce on the Ohio and Mississippi rivers, he was known as "king of the keelboatmen." Renowned as a marksman, roisterer, and champion rough-and-tumble fighter, he became a legendary hero of the American tall tale; even in his own time, his name was synonymous with the braggadocio of Western frontiersmen. He was shot and killed on a fur-trapping expedition to the upper Missouri River.

Finke River \'fiŋk\ River, central Australia. Rising south of Mount Ziel in the MacDonnell Ranges, it flows southeast for some 400 mi (640 km) through the southern Northern Territories and northern South Australia. It reaches Lake Eyre in South Australia only during times of flood, when it may spread for hundreds of square miles beyond its banks. It contains Finke Gorge National Park.

Finland *officially* **Republic of Finland** Country, northern Europe. Area: 130,559 sq mi (338,145 sq km). Population (2005 est.): 5,244,000. Capital: Helsinki. The majority of the people are Finns; there is a small Sami (Lapp) population in Lapland. Languages: Finnish and Swedish are both "national" languages; the Sami speak a Finno-Ugric language. Religion: Christianity (predominantly Protestant; also Eastern Orthodox). Currency: euro. Finland is one of the world's most northern and geographically remote countries, about one-third of it lying north of the Arctic Circle. Heavily forested, it contains thousands of lakes, numerous rivers, and extensive areas of marshland. Except for a small highland region in the extreme northwest, Finland's relief doesn't vary greatly. The south has relatively mild weather; the north has severe and prolonged winters and short summers. Finland has a developed free-market economy combined with state ownership of a few key industries. It is among the wealthiest countries in Europe and in the world. Lumbering is a major industry, and manufacturing is highly developed; service industries are also notable. Finland is a republic with one legislative house; its chief of state is the president, and the head of government is the prime minister. Archaeological discoveries have led some to suggest that human habitation in Finland dates back at least 100,000 years. Ancestors of the Sami apparently were present in Finland by about 7000 BC. The ancestors of the present-day Finns came from the southern shore of the Gulf of Finland in the 1st millennium BC. The area was gradually Christianized from the 11th century AD. From the 12th century Sweden and Russia contested for supremacy in Finland, until in 1323 Sweden ruled most of the country. Russia was ceded part of Finnish territory in 1721; in 1808 Alexander I of Russia invaded Finland, which in 1809 was formally ceded to Russia. The subsequent period saw the growth of Finnish nationalism. Russia's losses

© 2006 Encyclopædia Britannica, Inc.

in World War I and the Russian Revolution of 1917 set the stage for Finland's independence in 1917. Finland was defeated by the Soviet Union in the Russo-Finnish War (1939–40) but renewed its fight with the Soviets (the "War of Continuation") after Germany attacked the U.S.S.R. in 1941. In 1944, facing defeat again, Finland made peace with the Soviets, ceding territory and paying reparations. Finland's economy recovered after World War II. It joined the European Union in 1995.

Finlay \fin-'lī**, Carlos J(uan)** (b. Dec. 3, 1833, Puerto Príncipe, Cuba—d. Aug. 20, 1915, Havana) Cuban epidemiologist. He is known for his discovery that yellow fever is transmitted by a mosquito. Though he published experimental evidence in 1886, his ideas were ignored for nearly 20 years. He urged the study of means of transmission and stated that the carrier was the mosquito *Culex fasciatus* (now called *Aedes aegypti*). In 1900 Walter Reed confirmed Finlay's theory, leading to the eradication of yellow fever in Cuba and Panama by William Gorgas. After his death, the Cuban government created the Finlay Institute for Investigations in Tropical Medicine.

Finley, Charles O(scar) (b. Feb. 22, 1918, Ensley, Ala., U.S.—d. Feb. 19, 1996, Chicago, Ill.) U.S. baseball club owner. Born on a farm in Alabama, Finley worked in a steel mill after his family moved to Gary, Ind. During a protracted illness Finley conceived of the insurance company that would make him a millionaire in two years. He became a wealthy executive and in 1960 acquired the Kansas City (later Oakland) Athletics. Under Finley they achieved three consecutive World Series victories (1972–74), even as he constantly stirred controversy among players, managers, civic leaders, and baseball officials with his promotional ideas. He sold the team in 1980.

Finn MacCumhaill *or* **Finn MacCool** \'fin-mə-'kül\ Hero of the Irish Gaelic tales and ballads of the Fenian cycle. He was chief of a band of warriors, the Fianna Éireann, who were skilled in poetry, hunting, and warfare and supposedly flourished in the 3rd century AD. In time, the king and people turned against the Fianna, and they were defeated in the Battle of Gabhra, which Finn's son Oisín survived.

Finnbogadóttir, Vigdís (b. April 15, 1930, Reykjavík, Ice.) Teacher and president of Iceland (1980–96). After graduating from Reykjavík College in 1949, Finnbogadóttir attended the University of Grenoble and the Sorbonne in France and the University of Uppsala in Sweden. She also studied in Denmark and at the University of Iceland, where she later taught. From 1972 to 1980, while serving as director of the Reykjavík Theatre Company, Finnbogadóttir presented French lessons and cultural programming on Iceland State Television. In 1980 she was drafted as a candidate for the presidency of Iceland and was narrowly elected, defeating three male opponents, thereby becoming the first woman in the world to be elected head of state in a national election. She was reelected three times (1984, 1988, and 1992) before retiring from office in 1996.

Finney, Albert (b. May 9, 1936, Salford, Lancashire, Eng.) British actor. He established himself as a Shakespearean actor in the late 1950s. In 1960 he won praise as a working-class rebel in the play *Billy Liar* and the film *Saturday Night and Sunday Morning*. He played the lead in *Luther* on Broadway and became an international star in the film *Tom Jones* (1963). He later starred in films such as *Two for the Road* (1967), *The Dresser* (1983), *Under the Volcano* (1984), *Miller's Crossing* (1990), and *Erin Brockovich* (2000).

Finnish language Finno-Ugric language of Finland, spoken by some six million people worldwide, including perhaps 200,000 speakers in North America. Finnish was an unwritten language until the 16th century, when Mikael Agricola (1509–57) produced an alphabet book (1543) and a translation of the New Testament (1548); he is regarded as the founder of the Finnish literary language. Finnish was accorded official status in 1809, when Finland entered the Russian Empire after six centuries of Swedish domination. The publication in 1835 of the national folk epic, the *Kalevala*, created from folk songs collected by Elias Lönnrot, gave increased impetus to the movement to forge a common national language encompassing all dialect areas. Finnish shares with other Baltic Finnic languages a stock of ancient loanwords from Germanic, Baltic, Slavic, and Sami.

Finno-Ugric \'yü-grik\ **languages** Branch of the Uralic language family spoken by about 25 million people in northeastern Europe, northern Asia, and (through immigration) North America. More than 20 million are accounted for by two languages, Finnish and Hungarian. The Ugric subbranch comprises Hungarian and Ob-Ugrian. The latter consists of two language complexes of western Siberia, Khanty and Mansi, spoken by fewer than 15,000 people. The Finnic branch comprises the Sami (Saami, Lappish) languages, the Baltic Finnic languages, Mordvin, Mari, and the Permic languages. Sami is spoken by some 20,000 people in northern Scandinavia and adjacent Russia. Baltic Finnic comprises Finnish, Estonian (with 1.1 million speakers worldwide), and a string of declining languages in Latvia and Russia. Mordvin is spoken by 1.1 million people in scattered enclaves of central European Russia. Mari is also spoken in central Russia and in scattered areas east toward the Ural Mountains; its two major varieties have about 600,000 speakers. The Permic languages, spread over a broad swath of northeastern European Russia, comprise Udmurt (spoken by some 500,000 people) and Komi (spoken by fewer than 400,000 people but with two literary forms). Finno-Ugric languages written in Russia use variants of the Cyrillic alphabet, while those outside Russia use the Latin alphabet.

Finno-Ugric \ˌfi-nō-'yü-grik\ **religion** Pre-Christian belief systems of the Finno-Ugric peoples, who lived in northern Scandinavia, Siberia, the Baltic region, and central Europe. Surviving Finno-Ugric groups include the Sami (Lapps), Finns, Estonians, and Magyars. The geographic and cultural diversity of these peoples led to the evolution of varying religious beliefs. The most common Finno-Ugric creation myth is the earth-diver myth, in which the Devil is forced to dive into the sea and gather sand, from which God forms the earth. Another myth tells of the creation of the world from a cosmic egg. The chief deities usually included a sky god and an earth mother. While the major gods were remote, there were guardian spirits at hand to regulate daily life; they resided in households, natural sites such as lakes and forests, and natural phenomena such as wind or fire. Ancestor worship was practiced. Religious functionaries included shamans, sacrificing priests, guardians of the sanctuary, professional weeping women, and performers of wedding ceremonies. Cult centres ranged from home sanctuaries to sacred groves and sacrificial stones.

fiord See fjord

Fiordland \'fyȯrd-ˌland\ **National Park** Park, southern South Island, New Zealand. Established in 1952, it is one of the largest national parks in the world, with an area of 4,834 sq mi (12,519 sq km). It is renowned for the grandeur of its fjords, mountains, forests, waterfalls, and lakes. The park is bordered by mountains on the east and by the Tasman Sea on all other sides. It is the site of Sutherland Falls, one of the highest waterfalls in the world, which drops 1,904 ft (580 m) in three cascades.

fir Properly, any of about 40 species of trees that make up the genus *Abies*, in the PINE family. Many other evergreen CONIFERS (e.g., DOUGLAS FIR, HEMLOCK fir) are also commonly called firs. True firs are native to North and Central America, Europe, Asia, and northern Africa. They are distinguished from other genera in the pine family by their needlelike leaves, which grow directly from the branch and have bases, shaped like suction cups, that leave conspicuous circular scars when the leaves fall. North America boasts 10 native species of fir, found chiefly from the Rocky Mountains westward. The wood of most western North American firs is inferior to that of pine or SPRUCE but is used for lumber and pulpwood. Of the two fir species that occur in the eastern U.S. and Canada, the better known is the balsam fir (*A. balsamea*), a popular ornamental and Christmas tree.

Firdusi See FERDOWSĪ

fire Rapid burning of combustible material, producing heat and usually accompanied by flame. For eons, LIGHTNING was the only source of fire. The earliest controlled use of fire seems to date to c. 1,420,000 years ago, but not until c. 7000 BC did Neolithic humans acquire reliable firemaking techniques, including friction from hardwood drills and sparks struck from flint against PYRITES. Fire was used initially for warmth, light, and cooking; later it was used in fire drives in hunting and warfare, and for clearing forests of underbrush to facilitate hunting. The first agriculturalists used fire to clear fields and produce ash for fertilizer; such "slash-and-burn" cultivation is still used widely today. Fire also came to be used for firing pottery and for smelting bronze (c. 3000 BC) and later iron (c. 1000 BC). Much of the modern history of technology and science can be characterized as a continual increase in the amount of energy available through fire and brought under human control.

fire ant Any of a genus (*Solenopsis*) of insects in the ANT family, several species of which are common in southern North America. They are red or yellowish and can inflict a severe sting. The semipermanent nest consists of a loose mound with open craters for ventilation. The workers (see CASTE) are notorious for damaging planted grain and attacking poultry.

fire escape Means of rapid egress from a building, primarily intended for use in case of fire. Building codes define an exit as an enclosed and protected path of escape in the event of a fire, leading from an exit access through a combination of corridors, stairways, and doors to an exit discharge at an exterior court or public way. The term fire escape usually refers to open iron or steel balconies with steep stairways on the outside of buildings; often a retrofit of older buildings, these are rare in new construction. Other means of escape are by balconies leading to adjacent buildings, or through chutes, often used in hospitals.

Fire Island Elongated sandspit, off the southern shore of LONG ISLAND, New York state, U.S. The island measures 32 mi (51 km) long and 0.5 mi (1 km) at its widest, and its name refers to fires that were built there as signals to ships during the WAR OF 1812; a lighthouse was built at its western tip in 1858. Now a popular summer resort, it is connected to Long Island by two bridges and by ferry. Fire Island (now Robert Moses) State Park was opened in 1908, and a 19,000-acre (7,700-hectare) section of the island was dedicated as a national seashore in 1964.

fire walking Religious ceremony that involves walking across hot coals, red-hot stones, or burning wood. It has been practiced in many parts of the world, including ancient Greece, India, Japan, China, Tahiti, New Zealand, Bulgaria, and Spain. The most common form of fire walking involves striding across a layer of embers spread thinly over the bottom of a shallow trench. More rarely, devotees may walk through a blazing log fire. The reasons for fire walking include purification and as an ordeal to prove innocence. Devotees believe that only those who lack faith will be burned, and many fire walkers do escape without injury.

firefly *or* **lightning bug** Any of the nocturnal luminous BEETLES of the family Lampyridae, consisting of about 1,900 species that inhabit tropical and temperate regions (including the common GLOWWORM). Adult fireflies are 0.2–1 in. (5–25 mm) long and have light-producing organs on the underside of the abdomen. The soft, flattened, dark-brown or black body is often marked with orange or yellow. Some adult fireflies do not eat; others feed on pollen and nectar. Most fireflies produce short, rhythmic flashes in a pattern that is characteristic of the species and an important mating signal.

fireplace Opening made in the base of a chimney to hold an open fire. The opening is framed, usually ornamentally, by a mantel (or mantelpiece). A medieval development that replaced the open central hearth for heating and cooking, the fireplace was sometimes large enough to accommodate a sitting space called an inglenook. Early fireplaces were made of stone; later, brick came into use. In 1624 Louis Savot developed a fireplace in which air was drawn through passages under the hearth and discharged into the room through a grill, a design adapted in the 20th century.

fireproofing Use of fire-resistant materials in a building to prevent structural collapse and allow safe egress of occupants in case of fire. The fire-resistive ratings of various materials and constructions are established by laboratory tests and usually specified in terms of hours a material or assembly can be expected to withstand exposure to fire. Building codes require application of cementitious material or insulation to structural steel frames, fire-resistant construction (e.g., using concrete block) of enclosures around exits, flame-spread ratings of finish materials such as carpeting and wall coverings, and use of such inherently fire-resistant materials as reinforced concrete and heavy timber.

Firestone, Harvey S(amuel) (b. Dec. 20, 1868, Columbiana, Ohio, U.S.—d. Feb. 7, 1938, Miami Beach, Fla.) U.S. industrialist. Firestone established a retail tire business in 1896 and in 1900 formed a company to sell rubber carriage tires. In 1904 his business began manufacturing automobile tires. Sales to FORD MOTOR CO. helped put Firestone Tire and Rubber Co. at the top of the U.S. tire industry. Firestone promoted the use of trucks for hauling freight and lobbied for the construction of vast highway systems. He ran his company until 1932, when his son replaced him. Firestone was purchased by Bridgestone Tire Co., a Japanese firm, in 1988.

firewall Computer security system that controls the flow of data from one computer or NETWORK to another. Firewalls are mainly intended to protect the resources of a private network from being directly accessed by a user from an external network, especially via the Internet. Users inside the private network may also be prevented from directly accessing external computers. To accomplish this, all communications are routed through a "proxy server" that determines whether a message or file will be allowed to enter or exit the private network.

fireweed Perennial wildflower (*Epilobium angustifolium*) of the EVENING-PRIMROSE family. Its spikes of whitish to magenta flowers, which grow up to 5 ft (1.5 m) high, can be a spectacular sight on prairies of the temperate zone. Its seeds can lie dormant for many years, awaiting the warmth necessary for germination. Fireweed is one of the first plants to appear after a forest or brush fire; it also rapidly covers scrub or woodland areas that have been cleared by machine. It has limited use in wild gardens, where it must be carefully checked and confined.

fireworks EXPLOSIVES or combustibles used for display. Of ancient Chinese origin, fireworks evidently developed out of military rockets and explosive missiles and accompanied the spread of military explosives westward to Europe in the Middle Ages. In force-and-spark compositions, potassium nitrate, sulfur, and ground charcoal are used; additional ingredients produce various types of sparks. In flame compositions, such as the stars that shoot out of rockets, potassium nitrate, salts of antimony, and sulfur may be used; for coloured fire, potassium chlorate or perchlorate is combined with a metal salt that determines the colour. Rockets are lifted by recoil from the jet of fire thrown out by the burning composition.

first cause In philosophy, the uncreated or self-created cause to which every series of causes must ultimately be traced. Used by ancient Greek thinkers, the concept was adopted by the Christian tradition and became the basis of one version of the COSMOLOGICAL ARGUMENT for the existence of God. According to this argument, every observed event is the result of a series of causes that must end in a first cause, which is God. The argument was given its classic formulation by ST. THOMAS AQUINAS. It was rejected by many later thinkers, including DAVID HUME and IMMANUEL KANT.

First International *officially* **International Working Men's Association** Federation of workers' groups, founded in 1864 by British and French trade-union leaders. Its structure was highly centralized, based on local groups that were integrated into national federations. It was split by conflicting schools of socialist thought, including those of KARL MARX, Pierre-Joseph PROUDHON, LOUIS-AUGUSTE BLANQUI, and MIKHAIL BAKUNIN. A clash between Marx's centralized SOCIALISM and Bakunin's ANARCHISM in 1872 caused the International to split, and it was dissolved in 1876. Though it was feared at the time as a formidable power with millions of members, and several countries tried to have it outlawed, its membership was never more than 20,000 and it served mainly as a unifying force for labour in Europe.

first lady Wife of the president of the U.S. Although the first lady's role has never been codified or officially defined, she figures prominently in the country's political and social life. Representative of her husband on official and ceremonial occasions both at home and abroad, the first lady is closely watched for some hint of her husband's thinking and for a clue to his future actions. The wife of the president played a public role from the founding of the U.S., but the title *first lady* did not come into general use until much later, near the end of the 19th century. By the end of the 20th century, the title had been absorbed into other languages and was often used, without translation, for the wife of a country's leader—even in countries where the leader's consort received far less attention and exerted much less influence than did her counterpart in the U.S. Although unpaid and unelected, she is able to influence behaviour and opinion, and some first ladies have used their influence to affect legislation on important matters such as temperance reform, housing improvement, and women's rights.

FIS See Islamic Salvation Front

fiscal policy Measures employed by governments to stabilize the economy, specifically by adjusting the levels and allocations of taxes and government expenditures. When the economy is sluggish, the government may cut taxes, leaving taxpayers with extra cash to spend and thereby increasing levels of consumption. An increase in public-works spending may likewise pump cash into the economy, having an expansionary effect. Conversely, a decrease in government spending or an increase in taxes tends to cause the economy to contract. Fiscal policy is often used in tandem with monetary policy. Until the 1930s, fiscal policy aimed at maintaining a balanced budget; since then it has been used "countercyclically," as recommended by John Maynard Keynes, to offset the cycle of expansion and contraction in the economy. Fiscal policy is more effective at stimulating a flagging economy than at cooling an inflationary one, partly because spending cuts and tax increases are unpopular and partly because of the work of economic stabilizers. See also business cycle.

Fischer projection Method of representing the three-dimensional structures of molecules on a page, devised by Emil Fischer. By convention, horizontal lines represent bonds projecting from the plane of the paper toward the viewer, and vertical lines represent bonds projecting away from the viewer. Fischer projections are a convenient way to depict chiral molecules (see optical activity) and distinguish between pairs of enantiomers (see racemate). They are most often used to depict isomers of the sugars. See also chemical formula.

Fischer, Bobby *orig.* **Robert James Fischer** (b. March 9, 1943, Chicago, Ill., U.S.) U.S. chess master. He became a grandmaster at age 15, then a record. In 1972 Fischer defeated Boris Spassky to become the only American to win the world chess championship. An intense and eccentric personality, he was a devout Christian fundamentalist who frequently condemned the Soviet Union for godlessness; he was deprived of his title in 1975 after refusing to meet his Soviet challenger, Anatoly Karpov. He remained out of the game thereafter except for a victorious private rematch with Spassky in Yugoslavia in 1992; the game violated U.S. sanctions against Yugoslavia, and Fischer has remained abroad ever since.

Fischer, Emil (Hermann) (b. Oct. 9, 1852, Euskirchen, Prussia—d. July 15, 1919, Berlin, Ger.) German organic chemist. He received his Ph.D. in 1874. He determined the structures of uric acid, caffeine, and related compounds, showing that all are derivatives of a single compound he named purine. This led him to study protein structure and the ways in which amino acids are combined in proteins. He determined the molecular structures of glucose, fructose, and many other sugars, verifying his results by synthesizing each, and distinguished the 15 stereoisomers of glucose (see isomer; configuration; optical activity). His researches into the sugars were of unparalleled importance to organic chemistry and earned him in 1902 the second Nobel Prize for Chemistry. His investigations of fermentation laid the foundations of enzyme chemistry.

Fischer-Dieskau \ˈfi-shər-ˈdēs-ˌkaů**, Dietrich** (b. May 28, 1925, Berlin, Ger.) German baritone and conductor. He had his first extensive performance experience as a prisoner of war in Italy, and he made his professional debut in 1947. One of the most remarkable singers of his time, he was equally successful in the often mutually exclusive realms of opera and lied. His lyrical voice was supported by his commanding presence, intelligent musicianship, and superb artistry. He recorded most of the standard art-song repertoire, as well as numerous unusual and contemporary works; his many premieres included Benjamin Britten's *War Requiem* (1962).

fiscus *Latin* **"basket"** Treasury of the Roman emperor, so-called because the money was stored in baskets. Funds were also stored in the public treasury, the *aerarium*. The *fiscus* took in taxes from imperial provinces, forfeited property, and unclaimed lands. After Vespasian, it became independent of the *aerarium* and controlled most of the empire's income, supplying funds for the army and fleet, official salaries, and postal subsidies.

fish Any of more than 24,000 species of cold-blooded vertebrates found worldwide in fresh and salt water. Living species range from the primitive lampreys and hagfishes through the cartilaginous sharks, skates, and rays to the abundant and diverse bony fishes. Species range in length from 0.4 in. (10 mm) to more than 60 ft (20 m). The body is generally tapered at both ends. Most species that inhabit surface or midwater regions are streamlined or are flattened side to side; most bottom dwellers are flattened top to bottom. Tropical species are often brightly coloured. Most species have paired fins and skin covered with either bony or toothlike scales. Fish generally respire through gills. Most bony fishes have a swim bladder, a gas-filled organ used to adjust swimming depth. Most species lay eggs, which may be fertilized externally or internally. Fishes first appeared more than 450 million years ago.

Fish, Hamilton (b. Aug. 3, 1808, New York, N.Y., U.S.—d. Sept. 6, 1893, New York City) U.S. secretary of state (1869–77). He served New York state as lieutenant governor (1847–48), governor (1849–50), and U.S. senator (1851–57). As secretary of state in the administration of Pres. Ulysses S. Grant, he helped draft the Treaty of Washington (1871), which provided for international arbitration of the dispute with Britain over the Alabama claims; he also obtained an agreement with Spain regarding its seizure of the U.S. ship *Virginius*. As a respected member of Grant's cabinet, he worked to counter graft, improper appointments, and violations of the civil liberties of African Americans.

fish poisoning Illness from eating varieties of poisonous fishes. Most cases are caused by one of three TOXINS: ciguatera poisoning, from fishes in whose flesh DINOFLAGELLATES have produced toxins; tetraodon poisoning, from a nerve toxin in certain pufferlike fish (fugu); and scombroid poisoning from spoilage bacteria in fish of the mackerel family. Shellfish poisoning from eating certain mussels, clams, and oysters has in some instances been traced to the plankton they sometimes feed on.

fisher Rare species of MARTEN (*Martes pennanti*, family Mustelidae) found in northern forests of North America. The fisher is related to WEASELS and is similarly shaped. It has a bushy tail, tapered muzzle and low, rounded ears. Adults are usually 20–25 in. (50–63 cm) long, excluding the 13–17-in. (33–43-cm) tail, and weigh 3–15 lb (1.4–6.8 kg). Fishers hunt on the ground and in trees, attacking various rodents and other animals; they also eat fruits and sometimes nuts. It has been trapped for its valuable brownish black fur.

Fisher, Irving (b. Feb. 27, 1867, Saugerties, N.Y., U.S.—d. April 29, 1947, New Haven, Conn.) U.S. economist best known for his work in the field of capital theory. He received his Ph.D. from Yale University. As a professor at Yale (1892–1935), he examined the relationship between changes in the quantity of money and the general level of prices. He also promoted the concept of the "compensated dollar"—a dollar of constant purchasing power, defined in terms of an index of commodity prices rather than in terms of a given weight of gold. See also PRICE INDEX.

Fisher (of Kilverstone), John Arbuthnot Fisher, 1st Baron (b. Jan. 25, 1841, Ceylon—d. July 10, 1920, London, Eng.) British admiral and first sea lord. He entered the navy at 13 and saw combat in Crimea, China, and Egypt. Promoted to the Admiralty board in 1892, he became first sea lord in 1904. He reorganized and strengthened the British navy to counter the rapid expansion of the German navy, and his reforms and innovations—including the conception of the battleship *DREADNOUGHT*, which revolutionized naval construction—ensured the Royal Navy's dominance in World War I. He retired in 1910; recalled in 1914 by WINSTON CHURCHILL, he resigned the next year in protest against the DARDANELLES CAMPAIGN.

Fisher, Sir R(onald) A(ylmer) (b. Feb. 17, 1890, East Finchley, Middlesex, Eng.—d. July 29, 1962, Adelaide, S.Aus., Austl.) British statistician and geneticist. As statistician for an agricultural research institute, he investigated the linkage of genes for different traits. To avoid unintentional bias in selection of materials used in experiments, he introduced the principle of randomization. It states that before an experimental effect can be attributed to a given cause or treatment, the experiment must be repeated on control units of the material and that all material used in experiments must be selected at random from the whole population it intends to represent. He also developed the concept of the analysis of variance, a statistical procedure used to design experiments that answer several questions at once.

fishing *or* **sport fishing** Sport of catching fish—freshwater or saltwater—typically with rod, line, and hook. Fishing is as old as the human ability to use tools to capture prey. The first significant modern innovations, including use of a reel, a rod with line guides, and a hook with an offset point, came in the late 17th and early 18th centuries. Horsehair was used as line until the mid 19th century, when it was replaced by textile materials; these in turn were replaced by nylon in the 1930s. Wood and bamboo rods yielded to rods of fibreglass and other synthetic materials. Forms of sport fishing practiced today include fly fishing (freshwater), in which a fly-like hook is repeatedly cast upon the water surface to attract biting fish; bait fishing (fresh- and saltwater), in which live or artificial bait is set or drawn below the surface; and big-game fishing (saltwater), in which heavy-duty tackle is used to land large marine species (including tuna, marlin, and swordfish) from a motorized boat.

fishing industry Taking, processing, and marketing of fish and other seafood from oceans, rivers, and lakes. Fishing is one of the primary forms of food production; it ranks with farming and probably predates it. The fishing industry employs more than 5 million people worldwide. The major countries engaged in marine fishing are Japan, China, the U.S., Chile, Peru, India, South Korea, Thailand, and the countries of northern Europe. The aquatic life harvested includes both marine and freshwater species of fish, shellfish, mammals, and seaweed. They are processed into food for human consumption, animal feeds, fertilizers, and ingredients for use in other commercial commodities.

Fisk, James (b. April 1, 1834, Bennington, Vt., U.S.—d. Jan. 7, 1872, New York, N.Y.) U.S. financier. He worked his way up from circus hand to stockbroker and corporate official. He joined DANIEL DREW and JAY GOULD against CORNELIUS VANDERBILT in the "Erie War," in which the three tried to maintain control of the ERIE RAILROAD CO. by issuing fraudulent stock. They also attempted to corner the gold market by inflating the price, a venture that led to the panic of 1869. Known as "the Barnum of Wall Street," Fisk produced theatrical shows and dallied with showgirls; he was fatally shot by an associate at age 37 after quarreling over business matters and a mistress.

fission-track dating Method of determining the age of a mineral that utilizes the damage done by the spontaneous fission of uranium-238, the most abundant isotope of URANIUM. The fission results in radiation damage, or fission tracks, that can be made visible by preferential leaching (removal of material by solution) of the host substance with a suitable chemical reagent; the leaching process allows the etched fission-track pits to be viewed and counted under a microscope. The amount of uranium present can be determined by irradiation that produces thermal fission of uranium-235, which produces another population of tracks, related to the uranium concentration of the mineral. Thus, the ratio of naturally produced, spontaneous fission tracks to induced fission tracks is a measure of the age of the sample. See also DATING.

fitnah \ˈfit-nə\ *Arabic* **"trial" or "test"** In the Islamic tradition, trials or temptations that test the unity of the Muslim community. The term may be used to describe insurrection or civil warfare or, more specifically, to define a tribunal over doctrinal issues, broadly similar to the Christian INQUISITION. There were four *fitnah*s in the early history of Islam. The first (656–661) followed the murder of the third caliph, ʿUTHMĀN IBN ʿAFFĀN. It brought up the question of ʿAlī's right to rule and prompted a military conflict that eventually resulted in the schism between the SUNNITE and the SHIʿITE branches. The second coincided with the caliphate of YAZĪD I (680–683); it was a continuation of the struggle between claimants to the caliphate and led to the death of al-ḤUSAYN IBN ʿALĪ at the Battle of KARBALĀʾ—another formative event in the Sunnite-Shīʿite split. The third *fitnah* (744–750) resulted in the ascendancy of the ʿABBĀSID DYNASTY. The fourth evolved from the caliphate's support for the MUʿTAZILITE theological school and successfully challenged the caliph's authority to enforce doctrinal rigour.

FitzGerald, Edward (b. March 31, 1809, Bredfield, near Woodbridge, Suffolk, Eng.—d. June 14, 1883, Merton, Norfolk) British writer. After graduating from Cambridge University, he lived chiefly in seclusion. He is best known for *The Rubáiyát of Omar Khayyám* (1859), a free adaptation from OMAR KHAYYAM's verses that is itself a classic of English literature. Many of its images, such as "A jug of wine, a loaf of bread, and thou" and "The moving finger writes, and, having writ, moves on" have passed into common currency. He also freely translated *Six Dramas of Calderón* (1853).

Fitzgerald, Ella (b. April 25, 1917, Newport News, Va., U.S.—d. June 15, 1996, Beverly Hills, Calif.) U.S. singer. She won an amateur contest at Harlem's Apollo Theatre in 1934 and became the star of drummer Chick Webb's big band the following year. Her association with manager and impresario Norman Granz in the late 1940s led to performances with Jazz at the Philharmonic and a famous series of "Songbook" recordings, each featuring the work of a single popular-song composer. Fitzgerald was one of the greatest scat singers in jazz; her clear, girlish voice and virtuosity made her one of the best-selling vocal recording artists in history.

Fitzgerald, F(rancis) Scott (Key) (b. Sept. 24, 1896, St. Paul, Minn., U.S.—d. Dec. 21, 1940, Hollywood, Calif.) U.S. novelist and short-story writer. Fitzgerald attended Princeton University but dropped out with bad grades. In 1920 he married Zelda Sayre (1900–48), daughter of a respected Alabama judge. His works, including the early novels *This Side of Paradise* (1920) and *The Beautiful and Damned* (1922) and the story collections *Tales of the Jazz Age* (1922) and *All the Sad Young Men* (1926), capture the Jazz Age's vulgarity and dazzling promise. His brilliant *The Great Gatsby* (1925; film, 1926, 1949, 1974; TV movie 2001), a story of American wealth and corruption, was eventually acclaimed one of the century's greatest novels. In 1924 Scott and Zelda became part of the expatriate community on the French Riviera, the setting of *Tender Is the Night* (1934; film, 1962). His fame and prosperity proved disorienting to them both, and he became seriously alcoholic. Zelda never fully recovered from a mental breakdown in 1932 and spent most of her remaining years in a sanitarium. In 1937 Scott moved to Hol-

lywood to write film scripts; the experience inspired the unfinished *The Last Tycoon* (1941; film, 1976). He died of a heart attack at age 44.

Fitzroy River River, eastern Queensland, Australia. Formed by the confluence of the Dawson and Mackenzie rivers, on the slopes of the Eastern Highlands, it flows northeast across the Broadsound Range and then southeast to enter the Coral Sea after a course of 180 mi (290 km). It is navigable 35 mi (56 km) from its mouth.

Fitzroy River River, northern Western Australia. It rises in the Durack Range and flows southwest through the King Leopold Ranges and the Geikie Gorge (where freshwater crocodiles are found). Turning northwest, it completes its flow of 350 mi (560 km), emptying into the Indian Ocean at King Sound. Sandbars and snags prevent navigation. Fitzroy Crossing, a town on the upper river, is in an area of large waterholes that sustain wildlife; just above it is the Geikie Gorge National Park.

Fiume question \ˈfyü-mā\ Post–World War I controversy over control of the Adriatic port of Fiume (modern Rijeka, Croatia). The secret Treaty of London (1915) had assigned Fiume to Yugoslavia, but the Italians claimed it at the Paris Peace Conference. In 1919 Gabriele D'Annunzio mustered a small force and occupied Fiume. After Italy concluded the Treaty of Rapallo (1920) with Yugoslavia, which provided for a free state, it sent a battleship to scare him off. When Benito Mussolini came to power, he pressed for a new treaty (1924) that recognized Fiume as Italian and the suburb of Susak as Yugoslav. After World War II, Fiume became part of Yugoslavia.

Five, The *or* **The Mighty Five** Group of Russian composers who, in the 1860s, banded together in an attempt to create a truly national school of Russian music. The Five were César Cui (1835–1918), Aleksandr Borodin, Mily Balakirev, Modest Mussorgsky, and Nikolay Rimsky-Korsakov. A somewhat larger group around this core was referred to as "the Mighty Handful."

Five Articles Oath See Charter Oath

Five Classics *Chinese* **Wujing** Five ancient Chinese books associated with Confucius. For more than 2,000 years they were invoked as authorities on Chinese society, government, literature, and religion. Chinese students usually studied the shorter Four Books before attempting the Five Classics, which consist of the *Yijing* ("Classic of Changes"), the *Shujing* ("Classic of History"), the *Classic of Poetry,* the *Collection of Rituals,* and the *Chunqiu* ("Spring and Autumn Annals"). The Five Classics were taught from 136 BC (when Confucianism became the state ideology of China) until the early 20th century. Proficiency in the texts was required for any scholar applying for a post in the vast government bureaucracy. After 1950 only select texts were taught in public schools. See Chinese examination system.

Five Dynasties Period in Chinese history betweeen the fall of the Tang dynasty (907) and the founding of the Song dynasty (960), when five would-be dynasties (the Hou Liang, the Hou Tang, the Hou Jin, the Hou Han, and the Hou Zhou) followed one another in quick succession in northern China. The period is also called the Ten Kingdoms because of the 10 regimes that dominated separate regions of southern China in the same period. Though unstable politically, culturally it was a period of great accomplishment. Printing with wooden blocks was fully developed; the first complete printing of the Confucian Classics was completed in 953. The form of lyric poetry called *ci* (*tz'u*) flourished, and flower painting, previously distinctively Buddhist, became a branch of nonreligious painting.

Five Pecks of Rice Daoist-inspired popular movement that occurred near the end of China's Han dynasty (206 BC–AD 220) and greatly weakened the government. It became a prototype of the religiously inspired popular rebellions that were to erupt periodically in China throughout its history. Its founder, Zhang Daoling, is considered the first patriarch of the Daoist church in China. He was originally a faith healer, and the movement's name came from the five pecks of rice a year that clients paid him for their cure or as dues to the cult. During a time of poverty and misery, Zhang's grandson Zhang Lu set up an independent theocratic state that grew to encompass all of present-day Sichuan province. In AD 215 Zhang Lu surrendered to Cao Cao. See also Daoism; White Lotus; Yellow Turbans.

Five-Year Plans Method of planning economic growth over limited periods, through the use of quotas, used first in the Soviet Union and later in other socialist states. In the Soviet Union, the first Five-Year Plan (1928–32), implemented by Joseph Stalin, concentrated on developing heavy industry and collectivizing agriculture, at the cost of a drastic fall in consumer goods. The second plan (1933–37) continued the objectives of the first. Collectivization led to terrible famines, especially in the Ukraine, that caused the deaths of millions. The third (1938–42) emphasized the production of armaments. The fourth (1946–53) again stressed heavy industry and military buildup, angering the Western powers. In China, the first Five-Year Plan (1953–57) stressed rapid industrial development, with Soviet assistance; it proved highly successful. Shortly after the second plan began in 1958, the Great Leap Forward was announced; its goals conflicted with the five-year plan, leading to failure and the withdrawal of Soviet aid in 1960.

fjord *or* **fiord** \fē-ˈȯrd\ Long, narrow arm of the sea, often extending well inland, that results from marine inundation of a glaciated valley. Many fjords are remarkably deep; it is assumed that the huge glaciers that formed in these valleys were so heavy that they eroded the bottoms of the valleys far below sea level. After the glaciers melted, the waters of the sea invaded the valleys.

flag Combination of symbols represented on a piece of cloth, serving as a medium of social, typically political, communication. It is usually rectangular and attached by one edge to a staff or is hoisted on a pole with halyards. Flags appear to be as old as civilized human society, though their origin is not well understood. The Chinese may have been the first to develop cloth flags, and it is believed that they were introduced to Europe by returning Crusaders. Most national flags in use today were designed in the 19th and 20th centuries.

flagellants \ˈfla-jə-lənts\ Medieval religious sects that included public beatings with whips as part of their discipline and devotional practice. Flagellant sects arose in northern Italy, and had become large and widespread by c. 1260. Groups marched through European towns, whipping each other to atone for their sins and calling on the populace to repent. They gained many new members in the mid-14th century while the Black Death was ravaging Europe. Though periodically suppressed by the authorities, flagellant sects enjoyed sporadic resurgences into the 16th century.

flagellum \flə-ˈjel-əm\ Hairlike structure that acts mainly as an organelle of movement in the cells of many living organisms. Characteristic of the protozoan group Mastigophora, flagella also occur on the sex cells of algae, fungi (see fungus), mosses, and slime molds. Flagellar motion causes water currents necessary for respiration and circulation in sponges and cnidarians. Most motile bacteria move by means of flagella. The structures and patterns of movement of flagella in prokaryotes differ from those in eukaryotes. See also cilium.

Flagler, Henry M(orrison) (b. Jan. 2, 1830, Hopewell, N.Y., U.S.—d. May 20, 1913, West Palm Beach, Fla.) U.S. financier. He initially worked as a grain merchant. His friendship with John D. Rockefeller led to their establishing a firm that in 1870 became the Standard Oil Co. Flagler served as a director of Standard Oil of New Jersey until 1911. He was hugely influential in the development of Florida as a vacation centre, involving himself in such enterprises as extending the Florida East Coast Railway, dredging Miami's harbour, and the construction of a chain of luxury hotels.

Flagstad \'fläg-stä,\ *English* \'flag-ˌstad**, Kirsten (Marie)** (b. July 12, 1895, Hamar, Nor.—d. Dec. 7, 1962, Oslo) Norwegian soprano. Born to musician parents, she made her operatic debut in 1913. In 1934 she sang Sieglinde in *Die Walküre* and Gutrune in *Götterdämmerung* at Bayreuth. Recognized as the greatest Wagnerian soprano of her generation, she made her Metropolitan Opera debut in 1935. With New York as her base, she toured widely until 1941, returning to Norway to be with her husband, a member of VIDKUN QUISLING's government. Though cleared of charges of collaboration with the Germans, her later U.S. appearances were controversial. She was the first director of the Royal Norwegian Opera (1958–60).

Flaherty \'flä-ər-tē, 'fla-ər-tē**, Robert (Joseph)** (b. Feb. 16, 1884, Iron Mountain, Mich., U.S.—d. July 23, 1951, Dummerston, Vt.) U.S. filmmaker, considered the father of the DOCUMENTARY. He grew up in remote northern Canada and later led explorations of the area (1910–16). He lived with the Eskimos for 16 months and filmed their way of life. His resulting film, *Nanook of the North* (1922), was an international success and established the model for the documentary film. His later documentaries include *Moana* (1926), *Tabu* (1931), *Man of Aran* (1934), *The Land* (1942), and *Louisiana Story* (1948).

flake tool STONE AGE devices, usually flint (see CHERT AND FLINT), shaped by flaking off small particles or by breaking off a large flake to use as a TOOL. Prehistoric humans preferred flint and similar siliceous stones because of the ease with which they could be chipped and for their sharp cutting edges. They also used SANDSTONES, QUARTZITES, QUARTZ, OBSIDIAN, and volcanic rocks. Stone tools were chipped by striking a block of flint with a hammer of stone, wood, or bone or by striking the block itself on the edge of a fixed stone. Pressure flaking consists of applying pressure by means of a pointed stick or bone near the edge of a flake or blade, to detach small flakes, and was used mostly to put the finishing touches on tools. See also STONE-TOOL INDUSTRY.

Flamboyant style Phase of late GOTHIC ARCHITECTURE in 15th-century France and Spain. It evolved out of the RAYONNANT STYLE's increasing emphasis on decoration. Its most conspicuous feature is the dominance in stone window TRACERY of a flamelike S-shaped curve. Wall surface was reduced to the minimum to allow an almost continuous window expanse. Structural logic was obscured by covering buildings with elaborate tracery. Attractive French examples include Notre-Dame d'Épine near Châlons-sur-Marne, Saint-Maclou in Rouen (c. 1500–14), and the northern spire of CHARTRES CATHEDRAL. Spanish Flamboyant architects developed their own intricate forms of vaulting with curvilinear patterns; the Capilla del Condestable in Burgos Cathedral (1482–94) and Segovia Cathedral (begun 1525) provide examples. Flamboyant Gothic, which became increasingly ornate, gave way in France to Renaissance forms in the 16th century.

flamen \'flā-mən\ One of 15 priests in ancient Rome, each of whom was devoted to the service of a specific god. The most important were those who served JUPITER, MARS, and QUIRINUS. Chosen from the patrician class and supervised by the pontifex maximus (chief priest), they offered daily sacrifices and led strictly regulated lives. Their wives assisted them and were also bound by ritual regulations. In imperial times a group of *flamines* were devoted to the worship of deified emperors.

flamenco \flə-'meŋ-kō\ Form of song, dance, and instrumental (mostly guitar) music commonly associated with the Andalusian ROMA (Gypsies) of southern Spain. (There, the Roma people and their language are known as Caló, or Gitano.) The roots of flamenco, though somewhat mysterious, seem to lie in the Roma migration from Rajasthan (in northwest India) to Spain between the 9th and 14th centuries. Its essence is *cante*, or song, often accompanied by guitar music and improvised dance. The *cante jondo* ("profound song" or "deep song"), thought to be the oldest form, is characterized by profound emotion and deals with themes of death, anguish, despair, or religious doubt. After the mid-19th century, flamenco song was usually accompanied by guitar music and a *palo seco* (Spanish: "dry stick," a stick that was beat on the floor to keep time) and a dancer performing a series of choreographed dance steps and improvised styles. *Baile*, or dance, has been the dominant element of flamenco since that time, though it is never performed without accompaniment. Essential to traditional flamenco is the *duende*, an intensely focused, trancelike state of transcendent emotion. It is usually enhanced by rhythmic hand clapping and encouraging interjections (*jaleo*) from fellow performers.

flamethrower Military assault weapon that projects a stream of blazing oil or gasoline against enemy positions. It consists of one or more fuel tanks, a cylinder of compressed gas to supply the propelling force, and a flexible hose with a trigger-nozzle that ignites and sprays the fuel. Portable flamethrowers are carried on the backs of ground troops; larger units may be installed on tank turrets. Modern flamethrowers, first used in combat in World War I, were used by all major powers in World War II and later wars. They are often used in areas of dense underbrush and against fortified positions at close range.

flamingo Any of five species of tall wading birds constituting the family Phoenicopteridae. The plumage is mainly pink, and the face is bare. Flamingos have webbed feet, a slender body, a long thin neck, large wings, and a short tail. They are about 3–5 ft (90–150 cm) tall. Flamingos flock by the hundreds (sometimes by the millions) in flight formations and wading groups. They walk the shallows, stirring up organic matter, especially tiny mollusks and crustaceans, which they strain from the muddy water with their sievelike bills. The various species are found along Atlantic and Gulf coasts of tropical and subtropical North America and in South America, Africa, southern Europe, Asia, Madagascar, and India.

Flamininus \ˌflam-ə-'nī-ē-nəs**, Titus Quinctius** (b. c. 227 BC—d. 174) Roman general and CONSUL (198 BC). As consul he tried to formulate a peace treaty with PHILIP V of Macedonia, but negotiations broke down and fighting broke out. He defeated Philip at Cynoscephalae (197) and granted freedom to the Greeks (196), for which he was hailed as a saviour. He kept Roman troops in Greece until 194. After the defeat of ANTIOCHUS III and Aetolia at Thermopylae (191), he helped reestablish peace in Greece.

Flaminius \flə-'min-ē-əs**, Gaius** (d. 217 BC) Roman political leader. As TRIBUNE (232) he supported Roman expansion in northern Italy; his land bill (232) gave land to Roman PLEBEIANS and gained him great popularity, but the bill's passage was seen as the cause of the Gallic invasion of 225 (repelled in 223), and he was held responsible. He was elected CONSUL in 223 and 217. As censor (220) he built the Circus Flaminius in Rome and the Via Flaminia to Ariminum (Rimini). He died fighting HANNIBAL in the Second PUNIC WAR.

Flanders *Flemish* **Vlaanderen** \'vlän-də-rən\ Medieval principality extending along the coast of the LOW COUNTRIES. Its lands are now included in the French *département* of Nord, the Belgian provinces of East Flanders and West Flanders, and the Dutch province of Zeeland. Ruled by Baldwin I in 862, Flanders began to grow as a commercial centre, fostered by its strategic location between the Mediterranean Sea and the Scandinavian and Baltic countries. It passed to BURGUNDY in 1384 and then to the Austrian HABSBURGS in 1477. It remained part of the Netherlands under Spanish rule in the 17th century. It was the scene of fighting during both World War I and World War II. Limited autonomy was granted to Belgian Flanders in the 1980s, and it became one of the three regions in the new federation of Belgium in 1993.

Flandin \flä^{n}-'da^{n}**, Pierre-Étienne** (b. April 12, 1889, Paris, France—d. June 13, 1958, Saint-Jean-Cap-Ferrat) French politician. He served in the Chamber of Deputies (1914–40) and held various ministerial posts in the THIRD REPUBLIC, serving briefly as premier (1934–35). As foreign minister when the Germans marched into the Rhineland in 1936, he failed to convince the French and British governments to act and accepted German dominance, though when he returned briefly as foreign minister in the VICHY regime, he resisted German demands. Later charged with treason, he was acquitted in 1946.

flare star STAR that varies in brightness repeatedly but sporadically, sometimes by more than one MAGNITUDE, within a few minutes. The cause is thought to be the eruption of flares like those observed on the Sun but much larger (see SOLAR FLARE). Proxima Centauri, in ALPHA CENTAURI, the closest star to the Sun, is a flare star.

flat See PLAYA

flatfish Any of about 600 species (order Pleuronectiformes) of oval-shaped, flattened BONY FISHES (e.g., FLOUNDER, TURBOT) found from tropical to cold waters. Most are marine and live at moderate depths along the

Flatfish (*scophthalmus*)
JACQUES SIX

© 2006 Encyclopædia Britannica, Inc.

continental shelf, but some enter or live permanently in fresh water. Flatfishes are carnivorous bottom dwellers that habitually rest on one side, often partly buried in the sand or mud. Some can also change colour to blend with their surroundings. Both eyes are on one side of the head. The eyed side of the fish (uppermost as it lies on the bottom) is pigmented, but the lower, blind side is normally white. Species vary from 4 in. (10 cm) to 7 ft (2 m) long, and some (e.g., the Atlantic HALIBUT) may weigh as much as 720 lb (325 kg). Many species are highly valued as food. See also PLAICE; SOLE.

flatfoot Congenital or acquired flatness of the arch of the FOOT, in which the foot and heel usually also roll outward, resulting in a splayfooted position. Initially, it may result from LIGAMENT stretching and muscle weakness. Later, altered shape of the bones may make the deformity rigid. In a few cases it seems to result from excessive weight or an injury. Symptoms may include pain, spasm, and awkward gait, but many patients have no disability or pain. Treatment to correct arch and heel position employs proper shoes and muscle strengthening; arch supports are indicated only for severe pain or excessive fatigue.

Flathead North American Indian people living in Montana, U.S. Salish is what they call themselves, and their language is of Salishan linguistic stock. The name Flathead is now customary, although it is a misnomer; they themselves did not practice head-flattening, but some of their slaves came from tribes that did. The Flatheads, who inhabited what is now western Montana, were the easternmost group of the PLATEAU INDIANS, but they exhibited many cultural traits of the PLAINS INDIANS just east over the Rocky Mountains. They acquired horses and went on bison hunts on the Plains, often warring with Plains tribes. The Plains TEPEE was the usual dwelling. Western Flatheads used bark canoes, and fishing was important for all groups. Religious belief centred on guardian spirits, with whom one communicated in visions. Since 1872 the Flatheads have resided primarily on a reservation north of Missoula, Mont. In the 2000 U.S. census some 3,300 individuals claimed sole Salish descent and about 3,500 Salish and Kootenoi.

Flathead River River, southeastern British Columbia, Canada, and western Montana, U.S. Rising in the MacDonald Range, it flows south for 240 mi (385 km) across the Canada-U.S. boundary into Montana. After passing between the Whitefish Range and GLACIER NATIONAL PARK, it enters Flathead Lake and emerges to join the CLARK FORK. The Flathead valley is a resort region with diversified farming and fruit growing, lumbering, and mining.

Flatt, Lester (Raymond) (b. June 19, 1914, Duncan's Chapel, near Sparta, Tenn., U.S.—d. May 11, 1979, Nashville, Tenn.) U.S. BLUEGRASS and country music guitarist and singer. He worked in textile mills until the late 1930s, when he and his wife, Gladys, began performing as a duo. In 1945 he joined BILL MONROE's Blue Grass Boys. There he met Earl Scruggs (b. 1924), a native of Flint Hill, N.C., who had played banjo since age 5 and had begun playing on radio by the age of 15. Scruggs eventually perfected a picking technique involving the thumb and first two fingers of the right hand that came to be called the "Scruggs style." In 1948 the two men left Monroe's band to form Flatt and Scruggs and the Foggy Mountain Boys. They made dozens of records in the 1950s and '60s and hosted their own syndicated radio and TV shows. Scruggs's original instrumental compositions, including "Foggy Mountain Breakdown," were especially popular. They parted ways in 1969 when Scruggs joined his sons Gary and Randy (and later Steve) in the Earl Scruggs Revue.

flatworm *or* **platyhelminth** Any of a phylum (Platyhelminthes) of soft-bodied, usually much-flattened WORMS, including both free-living and parasitic species. Flatworms live in a variety of marine, freshwater, and terrestrial habitats worldwide. They range in length from much less than an inch (a fraction of a millimeter) to 50 ft (15 m) and are of three main types: turbellarians (including the PLANARIAN), trematodes (see FLUKE), and cestodes (see TAPEWORM). Flatworms are bilaterally symmetrical and lack respiratory, skeletal, and circulatory systems and a body cavity. Turbellarians are mostly free-swimming, but trematodes and cestodes are parasites.

Flaubert \flō-'ber**, Gustave** (b. Dec. 12, 1821, Rouen, France—d. May 8, 1880, Croisset) French novelist. Flaubert abandoned law studies at age 22 for a life of writing. His masterpiece, *Madame Bovary* (1857), a sharply realistic portrayal of provincial bourgeois boredom and adultery, led to his trial (and narrow acquittal) on charges of immorality. His other novels include the exotic *Salammbô* (1862), set in ancient Carthage; *A Sentimental Education* (1869), a classic bildungsroman of disillusionment in a time of social and political change; and *The Temptation of Saint Anthony* (1874), notable for its depiction of spiritual torment. *Trois Contes* (1877) contains three novellas set in the ancient, medieval, and contemporary periods. Renowned for his lapidary style, he is regarded as the foremost exponent of French REALISM.

Flavian dynasty \'flā-vē-ən\ (AD 69–96) Ancient Roman imperial dynasty of VESPASIAN and his sons TITUS and DOMITIAN, members of the Flavia gens, or clan. Vespasian sought to give the office of emperor permanent form, by means of a formal system of titles to replace personal names, an insistence on the rights of office, and a move to make Caesarism (dictatorship) hereditary by natural descent or adoption. Worship of the deified caesars (subemperors) became the symbol of imperial continuity and legitimacy.

flavin \'flā-vən\ Any of a class of organic compounds, pale yellow biological pigments that fluoresce green. They occur in compounds essential to life as COENZYMES in METABOLISM. Plants and microbes can synthesize them, but animals must consume them in the diet. RIBOFLAVIN is the best-known flavin.

flavonoid \'flā-və-ˌnȯid\ *or* **flavone** Organic compound, any member of a class of biological PIGMENTS containing no nitrogen that are found in many plants. They include anthoxanthins, which give yellow colours, often to flower petals, and anthocyanins, largely responsible for the red colouring of buds and young shoots and the purple and purple-red colours of autumn leaves. Their biological function is unknown; they may attract pollinators and seed dispersers.

flax family Family Linaceae (order Linales), composed of about 14 genera of herbaceous plants and shrubs found throughout the world. The genus *Linum* includes flax, perhaps the most important member of the family, grown for LINEN fibre and linseed oil and as a garden ornamental. *Reinwardtia* species are primarily low shrubs, grown in greenhouses and outdoors in warm climates; *R. indica*, yellow flax, is notable for its large yellow flowers, borne in profusion in late fall and early winter.

Flaxman, John (b. July 6, 1755, York, Eng.—d. Dec. 7, 1826, London) British sculptor, illustrator, and designer. In 1770 he entered the Royal Academy schools. After 1775 he worked for pottery designer JOSIAH WEDGWOOD, producing designs based on Classical antiquity. He directed the Wedgwood studio in Rome (1787–94), but his book illustrations were of far greater importance; his illustrations for the *Iliad* (1793), *Odyssey* (1795), and *Divine Comedy* (1807) became very well known. The leading NEOCLASSICAL artist in England, he became the Royal Academy's first professor of sculpture (1810). In his own day his reputation as a sculptor, notably of monuments with large groups of free-standing figures, was exceeded only by that of ANTONIO CANOVA and BERTEL THORVALDSEN.

flea Any member of 1,600 species and subspecies of small, wingless, bloodsucking (parasitic) INSECTS (order Siphonaptera), found from the Arctic Circle to the Arabian deserts. Specialized anatomical structures allow the flea to attach itself to the skin of mammals or birds and consume their blood. Though domestic cats and dogs are well-known hosts, rodents are the mammals most commonly afflicted by fleas. The adult flea is 0.04–0.4 in. (1–10 mm) long and lives from a few weeks to more than a year. Powerful leg muscles allow it to jump distances up to 200 times its body length. Flea infestations have had enormous consequences; fleas were the principal transmission agents of the bubonic PLAGUE in the medieval epidemics.

Flea (*Ctenocephalides*)
WILLIAM E. FERGUSON

© 2006 Encyclopædia Britannica, Inc.

flea beetle Any member of the BEETLE subfamily Alticinae (family Chrysomelidae), found worldwide. It is tiny (less than 0.25 in. [6 mm] long) and dark or metallic in colour. The enlarged hind legs are adapted for jumping. Flea beetles are important PESTS of cultivated plants (e.g., grapes, cucumbers, melons, tobacco, potatoes, and tomatoes). The adults feed on the leaves, the larvae on the roots. Some flea beetles carry plant diseases (e.g., early potato BLIGHT).

Fleischer, Max and Dave (respectively b. July 19, 1883, Vienna, Austria—d. Sept. 11, 1972, Woodland Hills, Calif., U.S.; b. July 14, 1894, New York, N.Y., U.S.—d. June 25, 1979, Hollywood, Calif.) U.S. animators. The brothers worked as newspaper cartoonists before founding their own studio in 1921 to make animated cartoons. In the mid 1920s they produced the first sound-on-film animations. They later created and produced the popular cartoon series *Betty Boop* (1931–39), *Popeye the Sailor* (1929–42), and *Superman* (1941–42) and the feature-length cartoon *Gulliver's Travels* (1939).

Fleming, Sir Alexander (b. Aug. 6, 1881, Lochfield, Ayr, Scot.—d. March 11, 1955, London, Eng.) Scottish bacteriologist. While serving in the Royal Army Medical Corps in World War I, he conducted research on antibacterial substances that would be nontoxic to humans. In 1928 he inadvertently discovered penicillin when he noticed that a mold contaminating a bacterial culture was inhibiting the bacteria's growth. He shared a 1945 Nobel Prize with ERNST BORIS CHAIN and HOWARD WALTER FLOREY, who both carried Fleming's basic discovery further in isolating, purifying, testing, and producing penicillin in quantity.

Fleming, Ian (Lancaster) (b. May 28, 1908, London, Eng.—d. Aug. 12, 1964, Canterbury, Kent) British suspense novelist. He worked as a Moscow journalist, banker, stockbroker, naval intelligence officer, and newspaper manager before publishing *Casino Royale* (1953), the first of 12 novels featuring James Bond, the stylish, high-living secret service agent 007, one of the most successful characters of 20th-century fiction. Packed with violent action, espionage, and sex, all 12 books—including *From Russia, with Love* (1957), *Dr. No* (1958), *Goldfinger* (1959), and *Thunderball* (1961)—became popular movies.

Fleming, Peggy (Gale) (b. July 27, 1948, San Jose, Calif., U.S.) U.S. figure skater. She won the first of five consecutive U.S. women's championships when she was 15. She finished first in the world championship three consecutive years (1966–68) and won a gold medal at the 1968 Olympics in Grenoble, France. She was celebrated for her exceptional grace and artistic expression.

Flemish art Art of the 15th to early 17th century in Flanders. The precursors of the Flemish school were located in Dijon, the first capital of the dukes of BURGUNDY, who established a powerful Flemish-Burgundian political alliance that lasted from 1363 to 1482. PHILIP III (the Good) moved the Burgundian capital to Bruges and in 1425 hired JAN VAN EYCK as his painter. The next generation of artists built on van Eyck's heritage and, toward the end of the 15th century, began looking to Italy for pictorial inspiration. ROGIER VAN DER WEYDEN, PETRUS CHRISTUS, DIRCK BOUTS, HUGO VAN DER GOES, HANS MEMLING, and GERARD DAVID brought innovation, but little of their work compared to van Eyck's artistic vision. In the 16th century PIETER BRUEGEL THE ELDER, under the influence of HIËRONYMUS BOSCH, depicted peasant life with an eye for the grotesque. The great master of the 17th century, PETER PAUL RUBENS, demonstrated unrivaled skill in oil painting; his style epitomized the Flemish BAROQUE PERIOD. See also EARLY NETHERLANDISH ART.

Flemish language See DUTCH LANGUAGE

Fletcher, John See Francis BEAUMONT

Fleury \flœ-'rē**, André-Hercule de** (b. June 22, 1653, Lodève, France—d. Jan. 29, 1743, Paris) French cardinal and chief minister of LOUIS XV (1726–43). A priest, he was made almoner (distributor of alms) for Louis XIV. In 1715 he was appointed tutor for the future LOUIS XV, who later created Fleury a cardinal and minister of state (1726). Domestically, Fleury restored economic and financial stability to France; in foreign policy, his efforts prevented the hostilities between Spain and Britain in 1727 from becoming a European conflict. Drawn into the War of the POLISH SUCCESSION (1733–38) on the side of STANISŁAW I, Louis's father-in-law, he was able to limit the conflict's scope.

Flexner, Abraham (b. Nov. 13, 1866, Louisville, Ky., U.S.—d. Sept. 21, 1959, Falls Church, Va.) U.S. educator. He taught high school for almost 20 years. When the Carnegie Foundation asked him to evaluate the 155 U.S. and Canadian medical colleges, his report (1910) had a sensational impact; many of the colleges he severely criticized closed, and others revised their policies and curricula. Flexner thereafter channeled over half a billion dollars from the Rockefeller Foundation into improving U.S. medical education. In 1930 he founded the Institute for Advanced Study in Princeton, N.J., to which he brought some of the world's outstanding scientists.

Flick, Friedrich (b. July 10, 1883, Ernsdorf, near Bonn, Ger.—d. July 20, 1972, near Lake Constance, Switzerland) German industrialist. Before World War II he built an industrial empire that included iron-ore and coal mines, steel mills, trucks, airplanes, and munitions. He became ADOLF HITLER's biggest industrial supplier, and at the NÜRNBERG TRIALS he was convicted of using slave labour in his mines and plants. Though much of his empire was confiscated, he later amassed another fortune in coal and steel, and at the time of his death was probably West Germany's wealthiest man.

flicker Any of six species of New World WOODPECKERS (genus *Colaptes*) noted for spending much time on the ground eating ants. The sticky saliva of the flicker is alkaline, perhaps to counteract the formic acid that ants secrete. Its bill is more slender than that of most woodpeckers and is slightly down-curved. Most flickers have a white rump, black breast band, and varied head markings, and most are about 13 in. (33 cm) long.

Yellow-shafted flicker (*Colaptes auratus*)
B.M. SHAUB

flight recorder Instrument that records the performance and condition of an aircraft in flight. REGULATORY AGENCIES require these devices on commercial aircraft to make possible the analysis of crashes or other unusual occurrences. They are housed in heavy steel within layers of insulation, protecting them against impacts and fires. The recording tape is also protected against inadvertent erasure and contact with seawater. It records airspeed, altitude, heading, vertical acceleration, and aircraft pitch. It also includes a separate device that records voice communication within the aircraft and by radio. Both recorders are carried in the tail of the aircraft.

Flinders, Matthew (b. March 16, 1774, Donington, Lincolnshire, Eng.—d. July 19, 1814, London) British mariner and hydrographer. In two expeditions (1795–99, 1801–03) he circumnavigated Australia and Tasmania, charting their coasts and waters. His *Voyage to Terra Australis* (1814) recounted his adventures. His name was given to several geographic entities in Australia. FLINDERS PETRIE was his grandson.

Flinders Ranges Mountain region north of ADELAIDE, SOUTH AUSTRALIA. Continuing the Mount Lofty Ranges from Gulf ST. VINCENT, it extends some 500 mi (800 km) to the northeast. The Flinders exceed 3,000 ft (900 m) at several points, reaching 3,842 ft (1,171 m) at St. Mary Peak, the state's second highest peak. The ranges feature scenic landscapes and include Flinders Ranges National Park and Gammon Ranges National Park.

Flinders River River, QUEENSLAND, Australia. It rises on the southwestern slopes of the Gregory Range and flows west and then north to the Gulf of CARPENTARIA through two mouths, the second known as the Bynoe River, after a course of 520 mi (837 km). The river's valley was first settled in 1864; its lands are used in part for raising cattle and sheep. Only its lowest 70 mi (113 km) are usually perennial, with the rest of the river drying up during certain seasons of the year.

flint See CHERT AND FLINT

Flint City (pop., 2000: 124,943), eastern Michigan, U.S. Originally the site of a trading post, the city was laid out in 1836 and became a fur-trading and agricultural centre. Abundant supplies of timber led to the development in 1886 of the Durant-Dort Carriage Co., and by 1900 it was producing more than 100,000 horse-drawn vehicles a year. Some of the

© 2006 Encyclopædia Britannica, Inc.

companies became suppliers for what would become the General Motors Corp. By the 1950s, the city was second only to Detroit in U.S. automobile manufacturing. The closing of various GM plants in the 1980s and '90s left Flint with a shrinking economy. The GMI Engineering and Management Institute (1919) and the University of Michigan-Flint (1956) are located there.

flintlock Ignition system for firearms developed in the early 16th century. It superseded the matchlock and the wheel lock and remained in use until the mid-19th century. The most successful version, the true flintlock, was invented in France in the 17th century. When the trigger was pulled, a spring action caused the frizzen (striker) to strike the flint, showering sparks onto the gunpowder in the priming pan; the ignited powder, in turn, fired the main charge in the bore, propelling the ball.

Flodden, Battle of (Sept. 9, 1513) English victory over the Scots, fought in Flodden Field, near Branxton, Northumberland, Eng. To honour his alliance with France and divert troops from the main English army, then in France under Henry VIII, James IV of Scotland crossed the English border on August 22 with an army of about 30,000 men supported by artillery. Henry's lieutenant, the future 3rd duke of Norfolk, gathered an army of 20,000 and issued a challenge to James, who agreed to fight on September 9. By nightfall the Scottish army had been annihilated and James was dead, together with more than 10,000 of his subjects.

flood High-water stage in which water overflows its natural or artificial banks onto normally dry land, such as a river inundating its floodplain. Uncontrollable floods likely to cause considerable damage commonly result from excessive rainfall in a brief period, but they may also result from ice jams during the spring rise in rivers, and from tsunamis. Common measures of flood control include improving channels, constructing protective levees and storage reservoirs, and implementing programs of soil and forest conservation to retard and absorb runoff from storms.

floor Rigid building assembly that divides space horizontally into stories. It forms the bottom of a room. It may consist of joist-supported wood planks or panels, decking or panels supported by wood or steel beams, a slab of stone or concrete on the ground, or a reinforced-concrete slab carried by concrete beams and columns. The floor assembly must support its own dead load plus the live load of occupants, activities, and furnishings. The horizontal supports beneath its top surface—and the vertical supports into which they frame—must be sufficiently large and spaced closely enough to prevent sagging of the assembly.

floor covering Finish material on floors, including wood strips, parquet, linoleum, vinyl, asphalt tile, rubber, cork, epoxy resins, ceramic tile, and carpeting. Wood-strip flooring, attached to a subfloor of plywood, is most popular, especially for residences. Vinyl tiles and sheets have displaced linoleum in most residential and commercial work. Nonslip rubber and cork are used for commercial and industrial applications. Terrazzo provides a hard, durable surface for public spaces. The Greeks used pebble mosaics as early as the 8th century BC. Tessellated pavement (mosaics of regularly shaped cubes) appeared in the Hellenistic Age and by the 1st century AD had come into popular use in and around buildings throughout the Roman empire. Inlaid stone, popular in Byzantine, Renaissance, and Gothic architecture, is now only occasionally applied in lobbies and entranceways of grand spaces.

floor exercise Event in gymnastics competition consisting of various ballet and tumbling movements (including jumps, somersaults, and handstands) performed without apparatus. Women's routines are performed with musical accompaniment, men's routines without it. The whole routine must be performed with rhythm and harmony and must be designed to use a major portion of an area 12 m (39 ft 4 in.) square. It was included as an Olympic medal event for men in 1936 and for women in 1952.

floppy disk *or* **diskette** Magnetic storage medium used with computers. Floppy disks are made of flexible plastic coated with a magnetic material, and are enclosed in a hard plastic case. They are typically 3.5 in. (9 cm) in diameter. Data are arranged on their surfaces in concentric tracks. A disk is inserted in the computer's floppy disk drive, an assembly of magnetic heads and a mechanical device for rotating the disk for reading or writing purposes. A small electromagnet, called a magnetic head, writes a binary digit (1 or 0) onto the disk by magnetizing a tiny spot on the disk in different directions, and reads digits by detecting the magnetization direction of the spots. With the increasing use of e-mail attachments and other means to transfer files from computer to computer, the use of floppy disks has waned, though they are still widely used to keep second (backup) copies of valuable files.

Flora Roman goddess of flowering plants. Her cult was supposedly introduced into Rome during its earliest years by the Sabine king Titus Tatius. Her temple stood near Rome's Circus Maximus, and her festival, the Floralia, was instituted in 238 BC.

flora All species of plants that are found in a particular region, period, or special environment. Six floral kingdoms are commonly distinguished: Boreal (Holarctic), Paleotropical, Neotropical, South African (Capensic), Australian, and Antarctic. These kingdoms are further broken down into subkingdoms and regions, over which there is some dispute.

floral decoration Art of arranging living or dried plant material for adornment of the body or home, for public and religious ceremonies, or for festivals. Line, form, colour, texture, balance, porportion, and scale are important aspects of floral arrangement, as is the container. The earliest pictorial example is a 2nd-century Roman mosaic from the villa of Hadrian at Tivoli depicting a basket of cut flowers. Dutch and French still-life paintings of the 17th–18th centuries show the popularity of floral arrangements. Their long history in China and Japan is often associated with religious and philosophical beliefs; Japanese forms have become influential in the West. See also ikebana.

Florence *Italian* **Firenze** \fē-'rent-sā\ City (pop., 2001 prelim.: 352,227), capital of Tuscany, central Italy. Built on both sides of the Arno River, the city has been during its long history a republic, a seat of the duchy of Tuscany, and a capital (1865–71) of Italy. Founded as a Roman military colony in the 1st century BC, it was controlled in turn by the Goths, Byzantines, and Lombards. A leading city of Tuscany by the late 12th century, it was ruled after 1434 by the powerful Medici family. It became a republic under religious reformer Girolamo Savonarola, after whose downfall the Medici were restored as dukes of Florence (1531). Florence's vernacular became the Italian language, and from the 14th to the 16th century Florence was among the greatest cities of Europe, preeminent in commerce, finance, learning, and the arts. Many notables flourished there, including Leonardo da Vinci, Michelangelo, Filippo Brunelleschi, Dante, Niccolò Machiavelli, and Galileo. The buildings, including the Baptistery of St. John, the Gothic Duomo, and the Uffizi Gallery, are works of art themselves abounding in yet more works of art. Among the palaces and parks are the Pitti Palace and its Boboli Gardens. The university was founded in 1321. The economy is based primarily on tourism, though it also has developed newer sectors such as information technology and high-fashion clothing. The region around the city has a modern and dynamic economy based on small industrial production and quality exports.

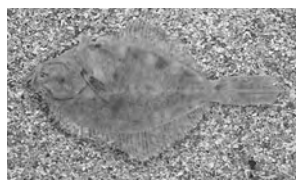
Florentine canvas work See bargello

Florey, Howard Walter, Baron (b. Sept. 24, 1898, Adelaide, S.Aus., Austl.—d. Feb. 21, 1968, Oxford, Oxfordshire, Eng.) Australian pathologist. Educated in Britain and the U.S., Florey taught at the University of Oxford from 1935. Investigating tissue inflammation and secretion of mucous membranes, he succeeded in purifying lysozyme, a bacteria-destroying enzyme found in tears and saliva, and characterized the substances it acted on. He surveyed other naturally occurring antibacterial substances, concentrating on penicillin, which he, with Ernst Boris Chain, isolated and purified for general clinical use. The two demonstrated penicillin's curative properties in human studies and developed methods for producing it in quantity. In 1945 he shared a Nobel Prize with Chain and Alexander Fleming, and in 1965 he was created a life peer.

floriculture Branch of ornamental horticulture concerned with growing and marketing flowers and ornamental plants, as well as with flower arrangement. Because flowers and potted plants are largely produced in plant-growing structures in temperate climates, floriculture is largely thought of as a greenhouse industry; however, many flowers are cultivated outdoors. Both the production of bedding plants and the production of cuttings to be grown in greenhouses or for indoor use (foliage plants) are usually considered part of floriculture. See also nursery.

Florida State (pop., 2000: 15,982,378), southeastern U.S. Comprising a peninsula and adjoining mainland areas, it is bordered by Alabama and Georgia, with the Gulf of Mexico lying to the west and the Atlantic Ocean to the east. It covers 58,599 sq mi (151,771 sq km); its capital is Tallahassee. Indian groups entered Florida from the north as early as 10,000 years ago. It was explored by Juan Ponce de León c. 1513, and in 1565 Spaniards founded St. Augustine. Florida became a British possession in

© 2006 Encyclopædia Britannica, Inc.



1763 after the French and Indian War. The area reverted to Spanish control after the American Revolution (1783) but was used by the British as a base of operations during the War of 1812. Andrew Jackson's capture of Pensacola during the First Seminole War (see Seminole Wars) led to the cession of Florida to the U.S. in 1819. Florida became a state in 1845. It seceded from the Union in 1861, then was readmitted in 1868. In the late 20th century it became one of the fastest growing states in the U.S. It produces about 75% of the nation's citrus fruits and is second only to California in vegetable production. Tourism is a leading industry, with Disney World a major attraction. Electronics manufacture is important, and the aerospace industry, led by the Kennedy Space Center (see Cape Canaveral), employs many thousands of people. The state, and especially the city of Miami with its large Cuban population, plays a major economic role in the Caribbean region. Among its many recreational areas is Everglades National Park.

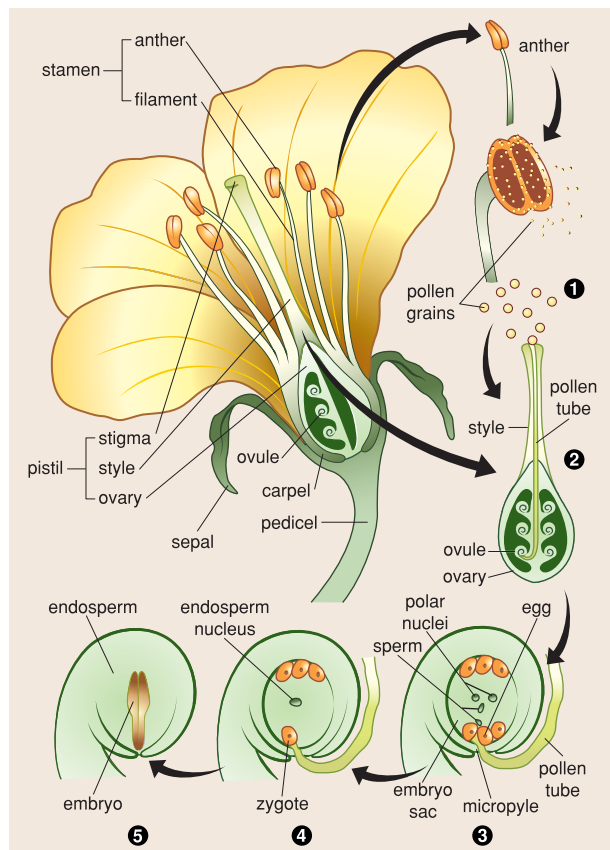
Florida, Straits of Passage connecting the Gulf of Mexico with the Atlantic Ocean. Extending for about 110 mi (180 km) between the Florida Keys on the north and Cuba and the Bahamas on the south, the straits mark the area where the Florida Current, the initial part of the Gulf Stream, flows east out of the Gulf of Mexico. The Spanish explorer Juan Ponce de León first recorded sailing through the straits in 1513.

Florida Controversy, West See West Florida Controversy

flotation *or* **froth flotation** Most widely used process for extracting many minerals from their ores. The method separates and concentrates ores by altering their surfaces so that they are either repelled or attracted by water. Unwetted particles, which adhere to air that is bubbled through the water, will float in the froth, while wetted particles will sink. The process was developed on a commercial scale early in the 20th century to remove very fine mineral particles that formerly had gone to waste in gravity concentration plants. With its use to concentrate copper, lead, and zinc minerals, which commonly accompany one another in their ores, many complex ore mixtures formerly of little value have become major sources of certain metals.

flounder Any of about 300 species of flatfishes (order Pleuronectiformes). When born, the flounder is bilaterally symmetrical, with an eye on each side, and it swims near the sea's surface. After a few days, it begins to lean to one side, and the eye on that side migrates to what eventually becomes the top side. With this development comes changes in bones, nerves, and muscles, and the underside loses its colour. As an adult, the flounder lives on the sea bottom with the eyed side on top.

Flounder (*Platichthys*)
F. GREENAWAY—NATURAL HISTORY PHOTOGRAPHIC AGENCY/EB INC.



flour Finely ground cereal grain or other starchy portions of plants. Flour, especially wheat flour, is a basic ingredient of baked goods (see baking). In the production of refined flour, the starchy endosperm is separated from the other parts of the kernel by milling through rollers. In the production of whole-wheat flour, all parts of the kernel are used. Following milling, the particles of endosperm (called semolina) are ground to flour and often bleached to imitate natural aging. Flour grades are based on the residual amount of branny particles. When flour is mixed with water to make dough, its protein content is converted to gluten, an elastic substance that forms a continuous network throughout the dough and is capable of retaining gas, thus causing the baked product to expand, or rise.

flow See deformation and flow, laminar flow, turbulent flow

flow meter Device that measures the velocity of a gas or liquid. It has applications in medicine as well as in chemical engineering, aeronautics, and meteorology. Examples include pitot tubes, venturi tubes, and rotameters (tapered graduated tubes with a float inside that is supported by the flowing fluid at a level that depends on the flow rate). Ultrasonic flow meters, in which reflecting ultrasound off a flowing liquid leads to a Doppler shift (see Doppler effect) that is calibrated to provide the flow rate of the liquid, have important industrial applications and have also been used to measure arterial blood flow.

flowchart Graphical representation of a process, such as a manufacturing operation or a computer operation, indicating the various steps taken as the product moves along the production line or the problem moves through the computer. Individual operations can be represented by closed boxes, with arrows between boxes indicating the order in which the steps are taken and divergent paths determined by variable results.

flower Reproductive portion of any flowering plant (angiosperm). Popularly, the term applies especially when part or all of the reproductive structure is distinctive in colour and form. Flowers present a multitude of combinations of colour, size, form, and anatomical arrangement. In some plants, individual flowers are very small and are borne in a distinctive cluster (inflorescence). Each flower consists of a floral axis that bears the essential organs of reproduction (stamens and pistils) and usually accessory organs (sepals and petals); the latter may serve both to attract pollinating insects (see pollination) and to protect the essential organs. Flower parts are arrayed usually in whorls, but sometimes spirally. Four distinct whorls are common: the outer calyx (sepals), the corolla (petals), the androecium (stamens), and, in the centre, the gynoecium (pistils). The sepals are usually greenish and often resemble reduced leaves; the petals are usually colourful and showy. Pollen is produced in the stamens. A pollen-receptive stigma rests atop each pistil. The pistil, made up of one or more carpels, encloses an ovary that contains the ovules, or potential seeds. After fertilization, the ovary enlarges to form the fruit. Flowers have been symbols of beauty in most civilizations of the world, and flower giving is still among the most popular of social amenities.

The life cycle of a flowering plant. (1) A pollen grain is released from the anther and settles on the stigma. (2) A pollen tube forms and grows through the style toward the ovule opening (micropyle). (3) Two of the nuclei (polar nuclei) in the ovule's embryo sac migrate to the centre to form a single cell. Three cells migrate to the micropyle, and one enlarges to become the egg. Two sperm that have formed from mitotic division of the pollen grain's generative cell enter the embryo sac through the micropyle. (4) One sperm fuses with the egg, resulting in a fertilized egg (zygote), which develops into an embryo. The second sperm fuses with the two polar nuclei to form the endosperm nucleus. (5) This nucleus divides to form a tissue (endosperm) that provides nutrients for the developing embryo.
© MERRIAM-WEBSTER INC.

© 2006 Encyclopædia Britannica, Inc.

flowering plant Any of the more than 250,000 species of angiosperms (division Magnoliophyta) having roots, stems, leaves, and well-developed conductive tissues (XYLEM and PHLOEM). They are often differentiated from GYMNOSPERMS by their production of seeds within a closed chamber (the ovary) within the flower, but this distinction is not always clear-cut. The division is composed of two classes: monocots and dicots (see COTYLEDON). Monocots have flower parts in threes, scattered conducting strands in the stem, and usually prominent parallel veins in the leaves, and they lack a CAMBIUM. Dicots have flower parts in fours or fives, conducting strands arranged in a cylinder, a net-veined pattern in the leaves, and a cambium. Flowering plants reflect an immense diversity in habit, size, and form; they account for more than 300 families growing on every continent, including Antarctica. Flowering plants have adapted to almost every habitat. Most reproduce sexually by seeds via the specialized reproductive organs that are present in all flowers.

flu See INFLUENZA

flügelhorn Brass musical instrument, a valved BUGLE. It has three valves and a wider bore than the CORNET and is usually pitched in B-flat. The flügelhorn was invented in Austria in the 1830s. It has maintained its identity—particularly its bore and its squat shape—better than has the formerly very similar cornet. Long used in European military bands, it is now also used in jazz and popular music.

fluid Any liquid or gas that cannot sustain a shearing force when at rest and that undergoes a continuous change in shape (see flow) when subjected to such a STRESS. Compressed fluids exert an outward PRESSURE that is perpendicular to the walls of their containers. A perfect fluid lacks VISCOSITY, but real fluids do not.

fluid mechanics Study of the effects of forces and energy on liquids and gases. One branch of the field, HYDROSTATICS, deals with fluids at rest; the other, fluid dynamics, deals with fluids in motion and with the motion of bodies through fluids. Liquids and gases are both treated as fluids because they often have the same equations of motion and exhibit the same flow phenomena. The subject has numerous applications in fields varying from aeronautics and marine engineering to the study of blood flow and the dynamics of swimming.

fluke *or* **trematode** Any member of almost 6,000 species of parasitic FLATWORMS. Flukes are found worldwide and range in size from about 0.2 to 4 in. (5–100 mm) long. They most commonly parasitize fish, frogs, and turtles, but also humans, domestic animals, and invertebrates such as mollusks and crustaceans. They include external parasites (ectoparasites), internal parasites (endoparasites), and semi-external parasites (those that attach to the lining of the mouth, to gills, or to the cloaca). Most flukes are flattened and leaflike or ribbonlike and have muscular suckers on the bottom surface, as well as hooks and spines, for attachment to the host. Fluke infestations may cause illness (e.g., SCHISTOSOMIASIS) or death in humans.

Liver fluke (*Fasciola hepatica*)
GRANT HEILMAN

fluorescence Emission of ELECTROMAGNETIC RADIATION, usually visible light, caused by EXCITATION of ATOMS in a material, which then reemit almost immediately (within about 10^{-8} seconds). The initial excitation is usually caused by absorption of energy from incident radiation or particles, such as X-rays or electrons. Because reemission occurs so quickly, the fluorescence ceases as soon as the exciting source is removed, unlike PHOSPHORESCENCE, which persists as an afterglow. A fluorescent lightbulb is coated on the inside with a powder and contains a gas; electricity causes the gas to emit ultraviolet radiation, which then stimulates the tube coating to emit light. The pixels of a television or computer screen fluoresce when electrons from an electron gun strike them. Fluorescence is often used to analyze molecules, and the addition of a fluorescing agent with emissions in the blue region of the spectrum to detergents causes fabrics to appear whiter in sunlight. X-ray fluorescence is used to analyze minerals.

fluorescent lamp Type of ELECTRIC DISCHARGE LAMP consisting of a glass tube filled with a mixture of argon and mercury vapor. A current of electricity causes the vapor to produce ultraviolet radiation that, in turn, excites a phosphor coating on the inside of the tube, causing it to fluoresce, or reradiate the energy as visible light. Fluorescent lamps are cooler and more efficient than INCANDESCENT LAMPS. They are commonly installed with diffusers as part of a suspended ceiling system. See also FLUORESCENCE.

fluoridation of water Addition of fluoride compounds to water (see FLUORINE) at one part per million to reduce dental CARIES (cavities). This practice is based on the lower rates of caries seen in areas with moderate natural fluoridation of water and on studies showing that sound teeth contain more fluoride than cavity-prone teeth and that fluorides help prevent or reduce dental caries. Fluoridation decreases the number of decayed, missing, and filled teeth in children (which increases if fluoridation is stopped), but it has provoked controversy in some cases. Excess fluoride may cause tooth mottling (a problem of appearance only) and, in higher doses, bone abnormalities. Fluoridation also helps prevent RICKETS in infants and children and helps the THYROID maintain a normal basal metabolic rate.

fluorine \'flůr-ˌēn, 'flȯr-ˌēn\ Nonmetallic chemical ELEMENT, chemical symbol F, atomic number 9. The lightest HALOGEN, it is the most reactive element, forming compounds with all others except helium, neon, and argon (the lighter NOBLE GASES). Its only VALENCE is 1, in F_2 (the diatomic molecule) and fluorides. A toxic, pale yellow gas with a pungent odour, it can be produced only by ELECTROLYSIS under special conditions. Its chief source is FLUORITE; it also occurs in cryolite, fluorapatite, seawater, bones, and teeth. Hydrogen fluoride (HF) is a raw material for many other fluorides. Its water solution, hydrofluoric acid, is used to clean metals and to polish, etch, or frost glass. Other fluorides are useful CATALYSTS and raw materials. Sodium fluoride (NaF) is added to water and tin fluoride (SnF_2) to dental-care products to reduce dental CARIES (see FLUORIDATION OF WATER). Fluorocarbons are HYDROCARBONS in which some hydrogen atoms have been replaced by fluorine atoms; examples include FREONS and TEFLON.

fluorite *or* **fluorspar** Common HALIDE MINERAL, calcium fluoride (CaF_2); the principal fluorine mineral. Fluorite occurs most commonly as a vein mineral and is often associated with lead and silver ores; it also occurs in cavities, sedimentary rocks, pegmatites, and hot-springs areas. It is widespread in China, South Africa, Mongolia, France, Mexico, Russia, and the central U.S. Fluorite is used in the manufacture of steel, aluminum fluoride, artificial cryolite, and aluminum. It is used in glassmaking, in iron and steel enamelware, in the production of hydrofluoric acid, in the refining of lead and antimony, and (as a catalyst) in the manufacture of high-octane fuels.

Flushing Northern section, QUEENS, New York, New York, U.S. Located at the head of Flushing Bay in the EAST RIVER, it was settled in 1645 by English nonconformists and became a centre for Quakers (see Society of FRIENDS). In the late 18th and early 19th centuries, it flourished as a township and then a village until it was absorbed by Queens in 1898. Flushing Meadow–Corona Park was the site of the 1939–40 and 1964–65 New York world's fairs (the Hall of Science remains as an exhibition centre), and in 1946–49 it was the temporary headquarters for the UN. Flushing is the scene of the U.S. Open tennis championships and home to Shea Stadium.

flute WOODWIND INSTRUMENT in which the sound is produced by blowing against a sharp edge. In its broad sense, a flute may be end-blown, like the RECORDER, or may have a globular shape, like the ocarina. In its narrow sense, discussed below, flute refers to the transverse flute of Western music. The transverse flute, a tubular instrument held sideways to the right, appeared in Greece and Etruria by the 2nd century BC. By the 16th century a family of boxwood flutes, with fingerholes but no keys, was in use in Europe. Keys began to be added in the late 17th century. THEOBALD BOEHM's 19th-century innovations resulted in the modern flute, which permits thorough expressive control and great agility. The cylindrical tube may be made of wood or, more often, a precious metal or alloy. Its range is from about middle C to the C three octaves higher. The flute family includes the piccolo (pitched an octave higher), the alto flute, and the rare bass flute. See also SHAKUHACHI.

flux In METALLURGY, any substance introduced in the SMELTING of ores to promote fluidity and to remove objectionable impurities in the form of SLAG. LIMESTONE is commonly used for this purpose in smelting IRON ores. Other materials used as fluxes are silica, dolomite, lime, borax, and fluorite. In SOLDERING, the flux removes oxide films, promotes wetting, and prevents reoxidation of the surfaces during heating. Rosin is widely used as a noncorrosive flux when electronic equipment is soldered; in other applications, a water solution of zinc chloride and ammonium chloride may be used.

© 2006 Encyclopædia Britannica, Inc.

Fluxus \'flək-səs\ International avant-garde group of artists founded in Germany by U.S. artist George Maciunas (1931–78) in 1962. Its members, including Joseph Beuys, John Cage, and Yves Klein, explored media ranging from performance art to poetry to experimental music. Opposed to tradition and professionalism in the arts, the Fluxus group shifted the emphasis from what an artist makes to the artist's personality, actions, and opinions. Throughout the 1960s and '70s they staged "action" events, engaged in politics and public speaking, and produced sculptural works featuring unconventional materials. Though it was an influential movement in Europe, the group's work frequently conflicted with authority and aroused much controversy.

fly In general, almost any small flying insect. In entomology, the term refers specifically to the approximately 85,000 species of two-winged, or "true," flies (DIPTERANS). Other insects called flies have wing structures that differ from that of dipterans.

Fly River River, New Guinea Island. One of the island's largest rivers, it flows almost wholly through Papua New Guinea. For a short stretch of its middle course, it forms the border between Papua New Guinea and Indonesia. Rising in the Victor Emanuel Range in the central highlands, it flows south for about 700 mi (1,100 km) to the Coral Sea; much of it is navigable.

flycatcher Any of numerous small PASSERINE birds that capture insects on the wing, particularly more than 100 Old World species of the family Muscicapidae and more than 400 New World species called tyrant flycatchers (family Tyrannidae). The most common Old World species, the spotted flycatcher (*Muscicapa striata*), is 5.5 in. (14 cm) long and streaked grayish brown. It inhabits open woodlands and gardens eastward from Europe, where it breeds, through Asia. Tyrant flycatchers include the manakins, pewees, kingbirds, becards, and cotingas, among others. Most have a large head, short legs, and a broad bill (e.g., PHOEBES).

flying buttress Masonry structure typically consisting of an inclined bar carried on a half arch that extends ("flies") from the upper part of a wall to a pier some distance away and carries the thrust of a roof or vault. A pinnacle (vertical ornament of pyramidal or conical shape) often crowns the pier, adding weight and enhancing stability. The flying buttress evolved in the Gothic era from earlier simpler, hidden supports. The design increased the supporting power of the BUTTRESS and allowed for the creation of the high-ceilinged churches typical of Gothic architecture.

flying fish Any of about 40 species of oceanic fishes (family Exocoetidae). They are found worldwide in warm waters and are noted for their ability to "fly." All species are less than 18 in. (45 cm) long and have winglike, rigid fins and an unevenly forked tail. Two-winged species have only the pectoral fins enlarged; four-winged species have both the pectoral and the pelvic fins enlarged. Rather than flying, they actually glide after jumping from the water. They can make several consecutive glides; the strongest fliers can travel as much as 600 ft (180 m) in a single glide, and compound glides may cover 1,300 ft (400 m). The behaviour is primarily a means of escaping predators.

Flying Fortress See B-17

flying shuttle MACHINE that represented an important step toward automatic WEAVING. It was invented by John Kay in 1733. In previous LOOMS, the SHUTTLE was thrown, or passed, through the threads by hand, and wide fabrics required two weavers seated side by side passing the shuttle between them. Kay mounted his shuttle on wheels in a track and used paddles to shoot the shuttle from side to side when the weaver jerked a cord. Using the flying shuttle, one weaver could weave fabrics of any width more quickly than two could before.

flying squirrel Any member of two distinct groups of RODENTS that are able to make gliding leaps by means of parachute-like membranes connecting their forelegs and hind legs on each side. North American and Eurasian flying squirrels, in the SQUIRREL family (Sciuridae), are slender, long-limbed forest dwellers with soft fur and large eyes. They are 3–24 in. (8–60 cm) long, excluding the often-flattened tail, and feed on nuts, fruit, other plant material, and insects. They seldom descend to the ground. They can glide 200 ft (about 60 m) or more from one tree to another. The scaly-tailed flying squirrels of Africa (family Anomaluridae) have rows of scales on the underside of their tufted tail that help them climb and cling to trees. They are similar in appearance and feeding preferences to the sciurids and are about 4–16 in. (10–40 cm) long without the tail.

Flying Tigers *or* **American Volunteer Group** Group of U.S. civilian volunteer pilots recruited by Col. Claire Chennault to fight the Japanese in Burma (Myanmar) and China in 1941–42. Surprise, mobility, precision flying, and unorthodox tactics enabled the Tigers to outwit the Japanese and inflict considerable damage on their air and ground forces.

Flynn, Errol (Leslie Thomson) (b. June 20, 1909, Hobart, Tas., Austl.—d. Oct. 14, 1959, Vancouver, B.C., Can.) Australian-U.S. film actor. He sought adventure in New Guinea before turning to acting in Australia and England. In 1935 Warner Brothers brought him to Hollywood, and he became an instant success as the swashbuckling hero of *Captain Blood*. He continued to play dashing heroes through the 1940s in films such as *The Charge of the Light Brigade* (1936), *The Adventures of Robin Hood* (1938), *The Sea Hawk* (1940), *They Died with Their Boots On* (1941), and *Gentleman Jim* (1942). After a period marred by scandal and bad roles, he returned to critical and popular praise in *The Sun Also Rises* (1957).

flysch \'flish\ Sequence of shales interbedded with thin, hard, GRAYWACKE-like sandstones. Such sequences are usually thousands of yards thick, but the individual beds are only a few inches to a few yards thick. The occasional presence of fossils indicates marine deposition. The term originally was applied to a formation of the Tertiary Period in the northern Alpine region, but it now denotes similar deposits of other ages and places.

flytrap See Venus's-flytrap

flywheel Heavy wheel attached to a rotating shaft to smooth out delivery of power from a motor to a machine. The inertia of the flywheel opposes and moderates fluctuations in the speed of the engine and stores the excess energy for intermittent use. In automobile engines, the flywheel smooths out the pulses of energy provided by the combustion in the cylinders and provides energy for the compression stroke of the pistons. In power presses the actual punching, shearing, and forming are done in only a fraction of the operating cycle. During the longer, nonactive period, the speed of the flywheel is built up slowly by a comparatively low-powered motor. When the press is operating, most of the required energy is provided by the flywheel.

FM *in full* **frequency modulation** Variation of the frequency of a carrier wave (commonly a RADIO WAVE) in accordance with variations in the audio signal being sent. Developed by American electrical engineer Edwin H. Armstrong in the early 1930s, FM is less susceptible to outside interference and noise (e.g., thunderstorms, nearby machinery) than is AM. Such noise generally affects the amplitude of a radio wave but not its frequency, so an FM signal remains virtually unchanged. FM is also better able to transmit sounds in stereo than AM. Commercial FM broadcasting stations transmit their signals in the frequency range of 88 megahertz (MHz) to 108 MHz.

Fo, Dario (b. March 24, 1926, Leggiuno-Sangiano, Italy) Italian playwright. He and his wife, Franca Rame, founded a theatre company that developed a leftist theatre of politics and later established an acting troupe with funding from the Italian Communist Party. In 1970 they set up a touring collective to perform in factories and other public sites. Fo's popular one-man show *Mistero Buffo* (1973) was censured by the Vatican. He wrote more than 70 plays, including the satire *Accidental Death of an Anarchist* (1974) and *The Pope and the Witch* (1989). He was awarded the Nobel Prize in 1997.

Foch \'fōsh,\ *English* \'fäsh**, Ferdinand** (b. Oct. 2, 1851, Tarbes, France—d. March 20, 1929, Paris) French commander of Allied forces in World War I. He entered the artillery corps in 1873 and from 1885 periodically taught military strategy at the war college, becoming its commandant in 1908. After World War I broke out, he commanded an army detachment and planned the strategy that enabled Joseph-Jacques-Césaire Joffre to win the First Battle of the Marne. After commanding at the Battles of Ypres and the Somme, Foch was appointed chief of the general staff (1917), adviser to the Allied armies, and then commander in chief of all Allied armies (May 1918), in which capacity he prevailed on the battlefield against Erich Ludendorff. When Germany was forced to ask for an armistice, the conditions were dictated by the recently promoted Marshal Foch. Considered the leader most responsible for the Allied victory, he was showered with honours after the war and was buried near Napoleon in the Invalides.

© 2006 Encyclopædia Britannica, Inc.

Focke-Wulf 190 (Fw 190) \'fō-kə-'vůlf\ FIGHTER AIRCRAFT of Nazi Germany, second in importance only to the MESSERSCHMITT 109 in the German air force in World War II. It began service in 1941, was superior to all its opponents until 1942–43, and remained a successful fighter and fighter-bomber until the war ended. A single-seater, it was armed with four 7.9-mm machine guns; later versions also carried cannons. The model produced near the end of the war had a top speed of about 430 mph (690 kph).

fog CLOUD of small water droplets near ground level that is dense enough to reduce horizontal visibility to less than about 3,000 ft (1,000 m). Fog may also refer to clouds of smoke particles (SMOG), ice particles, or mixtures of these components. When visibility is more than 3,000 ft, the phenomenon is termed mist or haze, depending on whether it is caused by water drops or by solid particles. Fog is formed by the condensation of water vapour on condensation nuclei that are always present in natural air. The most stable fogs occur when the surface is colder than the air above. Fogs can also occur when cold air moves over a warm, wet surface and becomes saturated by the evaporation of moisture from the surface. Convection currents carry the fog upward as it forms, and it appears to rise as steam or smoke from the wet surface.

Foix \'fwä\ Historical region, southern France. It corresponds approximately to the modern *département* of Ariège in the *région* of Midi-Pyrénées. Foix was a quasi-independent power from the 11th to the 15th century. Bounded by LANGUEDOC and by the territories of the counts of Roussillon and the kings of ARAGON, it became part of the crown lands at the ascension of HENRY IV as king of France (1589).

Fokine \fō-'kēn**, Michel** *orig.* **Mikhail Mikhaylovich Fokine** (b. April 23, 1880, St. Petersburg, Russia—d. Aug. 22, 1942, New York, N.Y., U.S.) Russian-born U.S. dancer and choreographer. He trained at the Imperial Ballet School in St. Petersburg and debuted at the MARIINSKY THEATRE at age 18. Following his creation of *The Dying Swan* for ANNA PAVLOVA in 1905, he was in demand as a choreographer. When his ambitious scenario for a ballet on the story of Daphnis and Chloe was rejected, SERGEY DIAGHILEV in 1909 engaged Fokine at the BALLETS RUSSES in Paris, where he choreographed works such as *The Firebird* (1910), *Petrushka* (1911), and *Daphnis and Chloe* (1912). In these ballets he strove for a greater dramatic and stylistic unity than had been previously known. He moved to New York City in 1923 and thereafter choreographed works for companies in the U.S. and Europe.

Fokker, Anthony *orig.* **Anton Herman Gerard Fokker** (b. April 6, 1890, Kediri, Java, Netherlands East Indies—d. Dec. 23, 1939, New York, N.Y., U.S.) Dutch-U.S. aircraft designer and manufacturer. He built his first plane in 1910 and taught himself to fly. In 1912 he established a small aircraft factory near Berlin. In World War I he produced over 40 types of airplanes for Germany, having originally offered his designs to both sides. He also developed a gear system that allowed a machine gun to fire through a spinning propeller's field. In 1922 he moved to the U.S. and opened an aircraft factory, where he produced numerous commercial aircraft that were used in the newly developing U.S. airlines business.

Anthony Fokker.

ULLSTEIN BILDERDIENST

folate See FOLIC ACID

fold In geology, an undulation or wave in the stratified rocks of the Earth's CRUST. Stratified rocks were originally formed from sediments that were deposited in flat, horizontal sheets, although in some places the strata are no longer horizontal but have warped. The warping may be so gentle that the inclination of the strata is barely perceptible, or it may be so pronounced that the strata of the two flanks are essentially parallel or nearly flat. Folds vary widely in size; the tops of large folds are commonly eroded away on the Earth's surface.

foliation Planar arrangement of structural or textural features in any rock type, but particularly that resulting from the alignment of constituent mineral grains of a METAMORPHIC ROCK along straight or wavy planes. Foliation commonly occurs parallel to original bedding, but it may not be obviously related to any other structural direction. Foliation is exhibited most prominently by sheety minerals, such as mica or chlorite.

folic acid \'fō-lik\ *or* **folate** Organic compound essential to animal growth and health and needed by bacteria as a growth factor. Part of the VITAMIN B COMPLEX, folic acid is necessary for synthesis of NUCLEIC ACIDS and formation of the heme component of HEMOGLOBIN in red blood cells. To prevent NEURAL TUBE DEFECTS in babies, it should ideally be taken by women starting at least a month before conception. Dietary folate sources include leafy and dark green vegetables, citrus fruits, cereals, beans, poultry, and egg yolks, but free folic acid is available only in supplements. Low intake leads to FOLIC ACID DEFICIENCY ANEMIA.

folic-acid-deficiency anemia ANEMIA resulting from too little FOLIC ACID, needed for red-blood-cell maturation (see ERYTHROCYTE). White-cell and platelet levels are also often low. Progressive gastrointestinal problems develop. It may result from poor diet or from malabsorption, CIRRHOSIS of the liver, or anticonvulsant drugs; it may also occur in the last three months of pregnancy and in severe hemolytic anemia (in which red cells break down). The blood profile resembles that of PERNICIOUS ANEMIA. Taking folic acid causes rapid improvement; an adequate diet cures cases caused by malnutrition.

Folies-Bergère \fō-'lē-ber-'zher\ MUSIC HALL AND VARIETY THEATRE in Paris. It opened in 1869 and soon became a major music hall, presenting operettas and pantomimes. By the 1890s its repertory also included vaudeville sketches, acrobats, ballets, and magicians. After the vogue of nudity appeared in Parisian music halls (1894), the Folies produced sensational displays of women in scanty but opulent costumes that soon overshadowed its other performances. Under the management of Paul Derval (1918–66), the Folies achieved an international reputation and became one of Paris's major tourist attractions. Each show requires about 10 months of preparation, 40 sets, and 1,000 costumes.

folk art Art produced in a traditional fashion by peasants, seamen, country artisans, or tradespeople with no formal training, or by members of a social or ethnic group that has preserved its traditional culture. It is predominantly functional, typically produced by hand for use by the maker or by a small group or community. Paintings are usually incorporated as decorative features on clock faces, chests, chairs, and interior and exterior walls. Sculptural objects in wood, stone, and metal include toys, spoons, candlesticks, and religious items. Folk architecture may include public and residential buildings, such as eastern European wooden churches and U.S. frontier log cabins. Other examples of visual folk arts are woodcuts, scrimshaw, pottery, textiles, and traditional clothing.

folk dance Dance that has developed without a choreographer and that reflects the traditional life of the common people of a country or region. The term was coined in the 18th century and is sometimes used to distinguish between dances of the people and those of the aristocracy. Courtly and formal dances of the 16th–20th centuries often developed from folk dances; these include the GAVOTTE, GIGUE, MAZURKA, MINUET, POLKA, SAMBA, TANGO, and WALTZ. See also COUNTRY DANCE; HULA; MORRIS DANCE; SQUARE DANCE; SWORD DANCE; TAP DANCE.

folk music Music held to be typical of a nation or ethnic group, known to all segments of its society, and preserved usually by oral tradition. Knowledge of the history and development of folk music is largely conjectural. Musical notation of folk songs and descriptions of folk music culture are occasionally encountered in historical records, but these tend to reflect primarily the literate classes' indifference or even hostility. As Christianity expanded in medieval Europe, attempts were made to suppress folk music because of its association with heathen rites and customs, and uncultivated singing styles were denigrated. During the

© 2006 Encyclopædia Britannica, Inc.

Renaissance, new humanistic attitudes encouraged acceptance of folk music as a genre of rustic antique song, and composers made extensive use of the music; folk tunes were often used as raw material for motets and masses, and Protestant hymns borrowed from folk music. In the 17th century folk music gradually receded from the consciousness of the literate classes, but in the late 18th century it again became important to art music. In the 19th century, folk songs came to be considered a "national treasure," on a par with cultivated poetry and song. National and regional collections were published, and the music became a means of promoting nationalistic ideologies. Since the 1890s, folk music has been collected and preserved by mechanical recordings. Publications and recordings have promoted wide interest, making possible the revival of folk music where traditional folk life and folklore are moribund. After World War II, archives of field recordings were developed throughout the world. While research has usually dealt with "authentic" (i.e., older) material not heavily influenced by urban popular music and the mass media, the influence of singer-songwriters such as Woody Guthrie, Pete Seeger, Joan Baez, and Bob Dylan expanded the genre to include original music that largely retains the form and simplicity of traditional compositions.

folk psychology Ways of conceptualizing mind and the mental that are implicit in our ordinary, everyday attributions of mental states to ourselves and others. Philosophers have adopted different positions about the extent to which folk psychology and its generalizations (e.g., those portraying human actions as governed by intention) are supported by the findings of scientific psychology. Some consider it indispensible to understanding human conduct. Others ("eliminative materialists") think that it can and perhaps will be replaced by scientific psychology.

folklore Oral literature and popular tradition preserved among a people. It may take the form of fairy tales, ballads, epics, proverbs, and riddles. Studies of folklore began in the early 19th century and first focused on rural folk and others believed to be untouched by modern ways. Several aims can be identified. One was to trace archaic customs and beliefs. In Germany Jacob and Wilhelm Grimm published their classic collection of fairy tales in 1812. James George Frazer's *The Golden Bough* (1890) reflects the use of folklore as a tool to reconstruct ancient beliefs and rituals. Another motive for the study of folklore was nationalism, which reinforced ethnic identity and figured in struggles for political independence. The catalog of motifs of folktales and myths developed by Antti Aarne and Stith Thompson encouraged comparisons of variants of the same tale or other item from different regions and times. In the mid-20th century, new trends emerged. Any group that expressed its inner cohesion by maintaining shared traditions qualified as a "folk," whether the linking factor be occupation, language, place of residence, age, religion, or ethnic origin. Emphasis also shifted from the past to the present, from the search for origins to the investigation of present meaning and function. Change and adaptation within tradition were no longer necessarily regarded as corruptive.

folly In architecture, an eccentric, generally nonfunctional (and often deliberately unfinished) structure erected to enhance a romantic landscape. Follies were particularly in vogue in England in the 18th and early 19th century. They might resemble medieval towers, ruined castles overgrown with vines, or crumbling Classical temples complete with fallen, eroded columns. In the U.S., the term has been applied to ornate gazebos. It may also be applied to any unusual building that is extravagant or whimsical in style.

Folsom complex Prehistoric culture of North America on the eastern side of the Rocky Mountains that is known from stone tools. It is characterized by leaf-shaped flint projectile points having a concave base with side projections and a longitudinal groove on each face. The complex was first identified at Folsom, N.M., U.S. It includes a variety of scrapers, knives, and blades and is generally dated to 8000–9000 BC. Like the earlier Clovis complex, it is considered to be part of a Paleo-Indian big-game hunting tradition.

Fon \'fän\ People of southern Benin and adjacent parts of Togo. They speak a dialect of Gbe, a Kwa language of the Niger-Congo language family. Numbering about 3 million, the Fon are mainly farmers. Craft specialists include male ironworkers, sculptors, and weavers and female potters. The primary Fon social unit is the polygynous family, each woman and her children occupying a house within a compound. The village under a hereditary chief is the traditional political unit. Dahomey kingdom was peopled principally by Fon. See photo above.

MARC AND EVELYNE BERNHEIM—WOODFIN CAMP AND ASSOCIATES

Fonda, Henry (Jaynes) (b. May 16, 1905, Grand Island, Neb., U.S.—d. Aug. 12, 1982, Los Angeles, Calif.) U.S. actor. He achieved success on Broadway in *The Farmer Takes a Wife* (1934), which led him to Hollywood for the film version (1935). He portrayed thoughtful men of integrity in films such as *Young Mr. Lincoln* (1939), *The Grapes of Wrath* (1940), and *The Ox-Bow Incident* (1943). He also made comedies such as *The Lady Eve* (1941) and *The Male Animal* (1942). He returned to the stage in *Mister Roberts* (1948, Tony Award; film, 1955). His last film, *On Golden Pond* (1981, Academy Award), also starred his daughter Jane Fonda. His son, Peter (b. 1939), also achieved fame as a screen actor.

Fonda, Jane (Seymour) (b. Dec. 21, 1937, New York, N.Y., U.S.) U.S. film actress, political activist, and fitness enthusiast. The daughter of actor Henry Fonda, she made her film debut in *Tall Story* (1960), which began a career that took dizzying turns. After playing comic roles in such films as *Cat Ballou* (1965) and *Barefoot in the Park* (1967), she appeared as a sex kitten in husband Roger Vadim's (married 1965–73) futuristic *Barbarella* (1968). She then plunged into leftist political activity, marrying the activist Tom Hayden (married 1973–89) and loudly condemning the Vietnam War, and made socially conscious films including *They Shoot Horses, Don't They?* (1969), *Klute* (1971, Academy Award), and *Coming Home* (1978, Academy Award). She later marketed a series of hugely popular exercise books and videotapes. After marrying Ted Turner in 1991 (divorced 2001), she retired from the screen.

Fonseca \fōn-'sā-kə**, Gulf of** Inlet of the Pacific Ocean, Central America. Bounded by El Salvador to the northwest, Honduras to the northeast, and Nicaragua to the southeast, it reaches inland about 40 mi (65 km) and widens to about 50 mi (80 km). Its entrance, marked by Cape Amapala in El Salvador and Cape Cosigüina in Nicaragua, is about 20 mi (32 km) across. The shores are covered by mangrove swamps except where Conchagua Volcano rises sharply in the west.

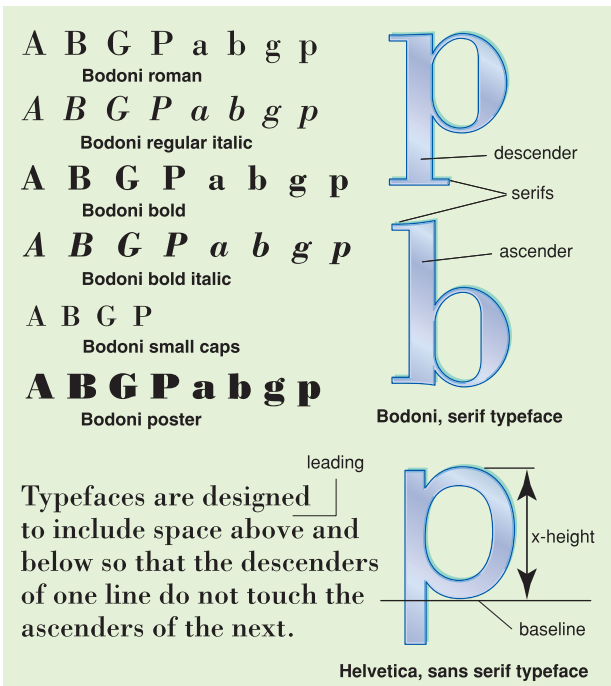
font *or* **typeface** *or* **type family** Assortment or set of type (alphanumeric characters used for printing), all of one coherent style. Before the advent of computers, fonts were expressed in cast metal that was used as a template for printing. Fonts are now stored as digitized images that can be scaled and otherwise modified for printing on electronic printers or digital phototypesetters. Fonts typically include the normal typeface (roman) as well as italic, bold, bold italic, and sometimes extra-bold versions. See also typesetting, typography. See illustration opposite on following page.

Fontaine, Jean de La See Jean de La Fontaine

Fontainebleau \fōⁿ-ten-'blō\ Château in northern France, southeast of the town of Fontainebleau. One of the largest structures built by the kings of France, it was originally a medieval hunting lodge, but was rebuilt (from 1528) under Francis I. Its numerous renovations show the transition from early Renaissance to Mannerist (Late Renaissance) styles. The château is a succession of five courts of different shapes. Of particular interest is the Gallery of Francis I (c. 1533–45), a long, narrow room decorated with stucco relief sculpture and painting by Rosso Fiorentino.

Fontainebleau, school of French and foreign artists associated with the court at Fontainebleau in the 16th century. In 1528 Francis I began to rebuild the palace and hired Rosso Fiorentino and Francesco Primaticcio to produce the mural decoration, stuccowork, and sculptural reliefs; also

© 2006 Encyclopædia Britannica, Inc.



among the Italian artists was Benvenuto Cellini. Many engravings were made of the work being done, and much of the most decorative painting and sculpture can still be seen there. The Italian masters successfully adapted their own styles to the French taste and were assisted by French and Flemish artists; together they produced a distinctive style of Mannerism. The innovation of stucco ornament in combination with mural painting had great influence on French art of the time.

Diana the Huntress, oil on canvas by an anonymous artist of the school of Fontainebleau, c. 1550; in the Louvre, Paris.
GIRAUDON/ART RESOURCE, NEW YORK

Fontane \fōn-'tä-nə\, **Theodor** (b. Dec. 30, 1819, Neuruppin, Brandenburg—d. Sept. 20, 1898, Berlin) German writer. He began his career as a journalist and wrote books based on his travels before turning to the novel late in life. *Before the Storm* (1878) is considered a masterpiece of historical fiction. *Effi Briest* (1895), known for its superb characterizations and skillful portrayal of his native Brandenburg, is one of his several sympathetic treatments of women in circumscribed domestic lives. He is considered the first master of modern German realism.

fontanel *or* **fontanelle** \'fän-tə-ˌnel\ One of six soft spots at the junctions (sutures) of the cranial bones in an infant's skull, covered with tough, fibrous membrane. They allow molding of the head during birth. Some close by three months, others after a year, and still others by two years.

The term *font* commonly refers to a type family such as Bodoni or Helvetica, which includes the entire alphabet in various weights (regular, bold, extra bold, etc.) and styles (roman, italics, or display type such as Bodoni poster). Type can be set in capitals ("caps"), lowercase, or small caps. The x-height of a font (the height of a lowercase letter that has no ascender or descender) will vary from typeface to typeface. The space between lines of type is referred to as "leading"—a term that dates back to a time when spacing was added with strips of lead. The specification of the example above is indicated as 10/11, or 10-point type with 11 points from baseline to baseline.

Fontanne, Lynn See Alfred Lunt and Lynn Fontanne

Fonteyn \fän-'tān\, **Dame Margot** *orig.* **Margaret Hookham** (b. May 18, 1919, Reigate, Surrey, Eng.—d. Feb. 21, 1991, Panama City, Pan.) British ballerina. She debuted with the Vic-Wells Ballet (later Royal Ballet) in 1934 and soon became its leading dancer, creating many roles in works by Frederick Ashton, including *Horoscope*, *Symphonic Variations*, and *Ondine*. In the 1960s she won worldwide acclaim for her appearances with Rudolf Nureyev in ballets such as *Swan Lake*, *Raymonda*, and *Le Corsaire*. She continued to dance as a guest artist into the mid 1970s.

Foochow See Fuzhou

Food and Agriculture Organization (FAO) UN agency whose purpose is to improve nutrition and eliminate hunger by coordinating the efforts of governments in agriculture, forestry, and fisheries. It also assists countries through research, training, development, and field missions, and it has helped with disaster and emergency relief. The FAO was established in 1945. Beginning in the 1960s, it concentrated on developing high-yield grain, eliminating protein deficiencies, supporting rural development, and encouraging agricultural exports. In the 1980s and '90s, the FAO emphasized strategies for sustainable agriculture and rural development that were economically feasible, environmentally sound, and technologically appropriate to the skill level of the host country. The organization, which has more than 180 members, is governed by the biennial FAO conference, in which each member country, as well as the European Union, is represented. Its headquarters are in Rome. See also World Food Programme.

Food and Drug Administration (FDA) Agency of the U.S. Department of Health and Human Services. Established in 1927, it inspects, tests, approves, and sets safety standards for foods and food additives, drugs, chemicals, cosmetics, and household and medical devices. It can prevent untested products from being sold and take legal action to halt the sale of undoubtedly harmful products or of products that involve a health or safety risk. Its authority is limited to interstate commerce; it cannot control prices nor directly regulate advertising except of prescription drugs and medical devices.

food chain Sequence of transfer of matter and energy from organism to organism in the form of food. These interconnected feeding relationships intertwine locally into a food web because most organisms consume or are consumed by more than one other type of organism. Plants and other photosynthetic organisms (such as phytoplankton), which convert solar energy to food, are the primary food source. In a predator chain, a plant-eating animal is eaten by a larger animal. In a parasite chain (see parasitism), a smaller organism consumes part of a larger host and may itself be parasitized by even smaller organisms. In a saprophytic chain, microorganisms live on dead organic matter. Because energy, in the form of heat, is lost at each step, or trophic level, chains do not normally encompass more than four or five trophic levels.

food poisoning Acute gastrointestinal illness from eating foods containing toxins. These toxins may be poisons that occur naturally in plants and animals, chemical contaminants, or toxic products of microorganisms. Most cases are due to bacteria (including salmonella and staphylococcus) and their toxins (including botulism). Some strains of E. coli can cause severe illness. Chemical poisons include heavy metals (see mercury poisoning), either from food or leached out from cookware by acidic foods. Food additives may have a long-term cumulative toxic effect. See also fish poisoning; mushroom poisoning.

food preservation Any method by which food is protected against spoilage by oxidation, bacteria, molds, and microorganisms. Traditional methods include dehydration, smoking, salting, controlled fermentation (including pickling), and candying; certain spices have also long been used as antiseptics and preservatives. Among the modern processes for food preservation are refrigeration (including freezing), canning, pasteurization, irradiation, and the addition of chemical preservatives.

fool *or* **jester** Comic entertainer whose madness or imbecility, real or pretended, made him a source of amusement and gave him license to abuse and poke fun at even his most exalted patrons. Professional fools flourished in diverse societies from ancient Egyptian times until the 18th

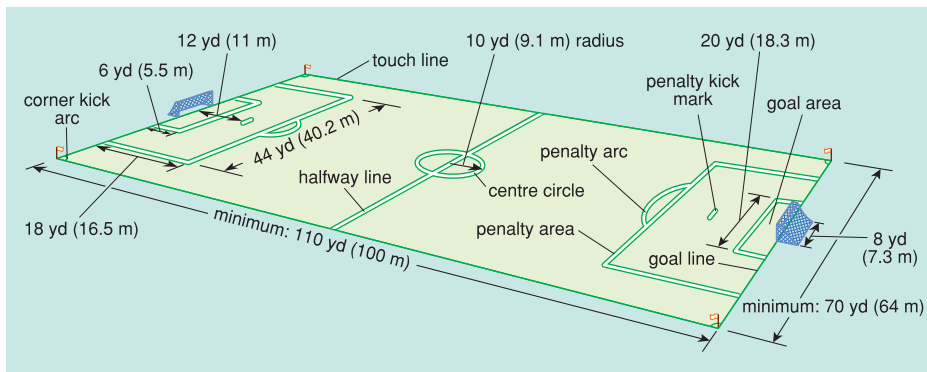
© 2006 Encyclopædia Britannica, Inc.

century. Often deformed, dwarfed, or crippled, fools were kept for luck as well as amusement, in the belief that deformity can avert the evil eye and that abusive raillery can transfer ill luck from the abused to the abuser. In some societies, they were regarded as inspired with poetic and prophetic powers. The greatest literary characterization of the fool is found in William Shakespeare's *King Lear.*

fool's gold See pyrite

foot In measurement, any of numerous lineal measures (commonly 9.8–13.4 in. [25–34 cm]) based on the length of the human foot. It is used exclusively in English-speaking countries. In most countries and in all scientific applications, the foot (with its multiples and subdivisions) has been superseded by the metre. In the U.S. the definition of the foot as exactly 30.48 cm took effect in 1959. See also inch; International System of Units; yard.

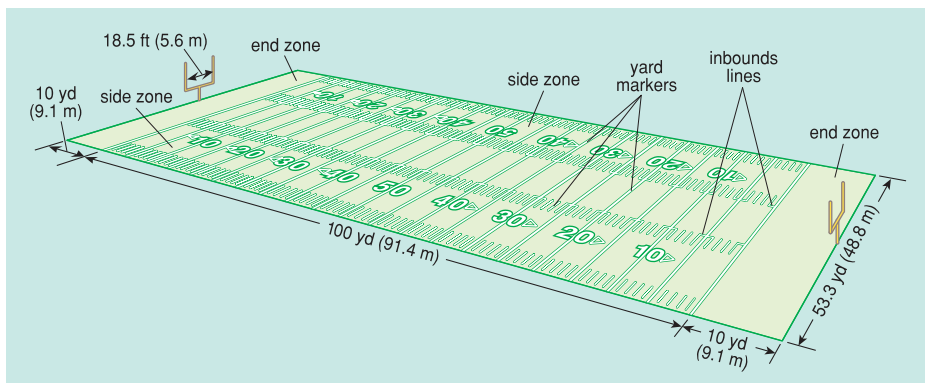
foot End part of the leg, consisting of the heel, arch, and toes, on which a person stands. Its major function is locomotion. The human foot cannot grasp and is adapted for running and striding (a step unique to humans that can cover great distances with minimal energy expenditure). Its arched structure helps it support the body's weight. See also podiatry.



foot, metrical Basic unit of verse metre. Any of various fixed combinations or groups of stressed and unstressed (or long and short) syllables comprise a foot. The prevailing kind and number of feet determines the metre of a poem. The most common feet in English verse are the iamb, an unstressed followed by a stressed syllable; the trochee, a stressed followed by an unstressed syllable; the anapest, two unstressed syllables followed by a stressed syllable; and the dactyl, a stressed syllable followed by two unstressed syllables. See also prosody.

Foot, Michael (b. July 23, 1913, Plymouth, Devon, Eng.) Leader of Great Britain's Labour Party (1980–83). He worked as a newspaper editor and columnist (1937–74) and served in Parliament (1945–55, 1960–92). He served in Harold Wilson's cabinet as secretary of state for employment (1974–76) and leader of the House of Commons (1976–79). A left-wing socialist, Foot became the party's chief in 1980 by defeating its right-wing candidate. This and other left-wing trends caused some Labourites to resign to found the Social Democratic Party. His books include *Aneurin Bevan* (2 vol.; 1962, 1973).

foot-and-mouth disease (FMD) *or* **hoof-and-mouth disease** Highly contagious viral disease of cloven-footed mammals (including cattle), spread by ingestion and inhalation. The afflicted animal develops fever and painful blisters on the tongue, lips, other tissues of the mouth, muzzle or snout, teats, and feet. FMD is endemic in many places. Because of its rapid spread and impact on animal productivity, it is considered the most economically devastating livestock disease in the world. It is not a human health hazard. No effective treatment exists; vaccines control epidemics but have not eliminated them. Since the virus can persist, quarantine, slaughter, cremation or burial of carcasses, and decontamination must be rigorous. Strict surveillance has kept North America largely FMD-free since 1929. In early 2001 a major outbreak occurred in the United Kingdom, followed shortly by outbreaks in The Netherlands and France.



football *or* **association football** *or* **soccer** Game in which two 11-member teams try to propel a ball into the opposing team's goal, using any part of the body except the hands and arms. Only the goalkeeper, when positioned within the penalty area in front of the goal, may use hands and arms. The game's first uniform set of rules was put in place in 1863, when England's Football Association was created. Professional leagues began appearing in the late 1880s, first in England and then in other countries. The Fédération Internationale de Football Association (FIFA) was founded in 1904, and has hosted the World Cup every four years since 1930. Football has been included in the Olympic Games since 1908. Now played on all continents in over 150 nations, with over 40 million registered players, it is the world's most popular ball game. See also Australian Rules football; Gaelic football; football, gridiron; and rugby.

football, gridiron Game played, predominantly in the U.S. and Canada, on a rectangular field having two goalposts at each end. In the U.S. it is played between two teams of 11 players each. The object is to get an oblong ball, in possession of one side at a time, over a goal line or between goalposts by running, passing, or kicking. A team must advance the ball 10 yards in four attempts (called downs) in order to continue to have the ball for another four downs. A kick through the goalposts (field goal) counts as three points. A run or completed pass over the goal line (touchdown) counts as six points. Following a touchdown, a team may attempt to kick the ball through the goalposts for one additional point or

A professional football (soccer) field. International rules allow for variations in the overall field dimensions, but the touch lines must be longer than the goal lines. Play begins with a kickoff at the center line. When the ball is driven across the touch line, it is put back in play by a throw-in by the opposing side. A ball driven over the goal line but not into the goal by the attacking team is returned to play with a goal kick by the opposing goalkeeper. A player fouled in the penalty area is awarded a penalty kick at the goal, which is defended only by the goalkeeper. Within the goal area the goalkeeper may use his hands to stop and hold the ball.

© MERRIAM-WEBSTER INC.

An American professional football field. The standard college field is nearly identical but has a wider inbounds zone. Whenever the ball is downed in a side zone, it is put in play on the next down at the nearest inbounds line. The line marking the end zone (within which the ball may be caught) is the goal line.

© MERRIAM-WEBSTER INC.

© 2006 Encyclopædia Britannica, Inc.

to run or pass the ball over the goal line for two additional points. Gridiron football (so-called because of the markings on the field), derived from RUGBY and soccer (see FOOTBALL), emerged in the late 19th century as a collegiate sport; the early rules were mostly written by representatives from Yale, Harvard, and Princeton universities. Each year the college football season concludes with a host of bowl games held on and around New Year's Day. Professional football began in the 1890s but did not become a major sport until after World War II. The NATIONAL FOOTBALL LEAGUE was formed in 1922. The NFL is now divided into an American and a National conference; the conference winners compete for the SUPER BOWL championship. A Football Hall of Fame is located in Canton, Ohio, U.S. Canadian football differs from U.S. football principally by having 12 players on a team rather than 11, employing a larger field, and allowing only three downs to move the ball 10 yards. These variations allow for a more wide-open style of game, with an emphasis on passing. See also CANADIAN FOOTBALL LEAGUE.

Foote, (Albert) Horton (b. March 14, 1916, Wharton, Texas, U.S.) U.S. dramatist. He studied acting at the Pasadena Playhouse in California and in New York City. He is probably best known for his screenplays for *To Kill a Mockingbird* (1962, Academy Award) and *Tender Mercies* (1983, Academy Award). He also wrote an acclaimed series of nine plays about rural Texas, the "Orphans' Home" Cycle; these include *Valentine's Day* (1980), *1918* (1982), and *The Widow Claire* (1986). His low-key but insightful play *The Young Man from Atlanta* (1994) won the Pulitzer Prize.

footlights Row of lights set across the front of a stage floor to light the scene. The oil lamps and candles in use in the 17th century eventually gave way to gas and electricity. As more advanced overhead lighting techniques were developed, footlights became less necessary, except to create special shadows on actors' faces.

forage \'fôr-ij\ Vegetable food, including CORN and HAY, of wild or domestic animals. Harvested, processed, and stored forage is called SILAGE. Forage should be harvested in early maturity to avoid a decrease in protein and fibre content as crops mature.

Forbes, Edward (b. Feb. 12, 1815, Douglas, Isle of Man—d. Nov. 18, 1854, near Edinburgh, Scot.) British naturalist. After studying medicine, he left the field to devote himself to natural history. He conducted extensive research on mollusks and sea stars, participating in dredgings and expeditions. While studying ocean life, he developed an interest in the geographic distribution of animals. Later he divided the plants of Britain into five well-defined groups, maintaining that most of them, like land animals, had migrated to the islands over continuous land during three separate periods: before, during, and after the glacial passage. He held numerous institutional and academic posts, and he was a major figure in establishing the fields of oceanography, biogeography, and paleoecology.

Forbes family U.S. publishing family. Bertie Charles Forbes (1880–1954) emigrated from Scotland to the U.S. in 1904. He founded *Forbes* magazine, a business and finance magazine, in 1916. He became a U.S. citizen in 1917. His son, Malcolm S. Forbes (1919–90), was decorated for his service in World War II, and he later took over the publishing business, then foundering, turning it into a success. He ran unsuccessfully in New Jersey's 1957 gubernatorial election. His colourful lifestyle—marked by lavish parties, motorcycling with Elizabeth Taylor, and sailing in hot air balloons—was celebrated in *Forbes* magazine and in books both by him and about him. On his death, his eldest son, Malcolm S. ("Steve") Forbes, Jr. (b. 1947), took over the magazine, assisted by his three brothers. He tried unsuccessfully for the Republican nomination for U.S. president in 1996 and 2000.

Forbidden City Imperial Palace complex in Beijing, containing hundreds of buildings and some 9,000 rooms. It served the emperors of China from 1421 to 1911. No commoner or foreigner was allowed to enter it without special permission. The moated palaces, with their golden tiled roofs and red pillars, are surrounded by high walls with a tower on each corner. The palaces consist of the outer throne halls and an inner courtyard, each palace forming an architectural whole. North of the front gate, a great courtyard lies beyond five marble bridges. Farther north, raised on a marble terrace, is the massive, double-tiered Hall of Supreme Harmony, once the throne hall, one of the largest wooden structures in China. The palaces and buildings are now public museums.

Forcados River \fôr-'kä-dōs\ River, southern Nigeria. A navigable channel of the NIGER RIVER, it leaves the main course of the Niger about 20 mi (32 km) downstream from Aboh and flows 123 mi (198 km) westerly to the Bight of BENIN. Since c. 1900 it has been the chief link for small-ship traffic between the Niger and the Gulf of GUINEA.

force Action that tends to maintain or alter the position of a body or to distort it. It is a VECTOR quantity, having both magnitude and direction. Force is commonly explained in terms of NEWTON'S LAWS OF MOTION. All known natural forces can be traced to the FUNDAMENTAL INTERACTIONS. Force is measured in newtons (N); a force of 1 N will accelerate a mass of 1 kg at a rate of 1 m/sec/sec. See also CENTRIFUGAL FORCE; CORIOLIS FORCE; ELECTROMAGNETIC FORCE; ELECTRIC FORCE; MAGNETIC FORCE; STRONG FORCE; WEAK FORCE.

Force Acts Series of four acts passed by the U.S. Congress (1870–75) to protect the rights guaranteed to blacks by the 14th and 15th Amendments to the CONSTITUTION OF THE UNITED STATES. The acts authorized federal authorities to penalize any interference with the registration, voting, officeholding, or jury service of blacks. Violations produced over 5,000 indictments and 1,250 convictions throughout the South. The Supreme Court later ruled sections of the acts unconstitutional.

Ford, Ford Madox *orig.* **Ford Hermann Hueffer** \'hwəf-ər\ (b. Dec. 17, 1873, Merton, Surrey, Eng.—d. June 26, 1939, Deauville, France) English novelist, editor, and critic. Ford collaborated with JOSEPH CONRAD on *The Inheritors* (1901) and *Romance* (1903). As the founder of the *English Review* (1908), he generously encouraged younger writers. He was gassed and shell-shocked in World War I; after the war he changed his name to Ford. Of more than 70 published works, his best known are *The Good Soldier* (1915), a novel about the demise of aristocratic England; and the tetralogy Parade's End—*Some Do Not* (1924), *No More Parades* (1925), *A Man Could Stand Up* (1926), and *Last Post* (1928)—which explores the breakdown of Edwardian culture and the emergence of new values.

Ford, Gerald R. *in full* **Gerald Rudolph Ford, Jr.** *orig.* **Leslie Lynch King, Jr.** (b. July 14, 1913, Omaha, Neb., U.S.) 38th president of the U.S. (1974–77). While he was still an infant, his parents were divorced; his mother later married Gerald R. Ford, Sr., who adopted the boy and gave him his name. He received degrees from the University of Michigan and Yale Law School (1941). He joined the Navy during World War II and served in the South Pacific, attaining the rank of lieutenant commander. He served in the U.S. House of Representatives for 25 years (1948–73), becoming Republican minority leader in 1965. After SPIRO AGNEW resigned as vice president in 1973, RICHARD NIXON nominated Ford to fill the vacant post. When the WATERGATE SCANDAL forced Nixon to resign, Ford became the first president who had not been elected to either the vice presidency or the presidency. A month later he pardoned Nixon; to counter widespread outrage, he voluntarily appeared before a House subcommittee to explain his action. His administration gradually lowered the country's high rate of inflation by slowing down the economy, though at the cost of a severe recession (1974–75) and high unemployment. Ford had a tense relationship with the Democrat-controlled Congress, vetoing more than 50 bills (more than 40 were sustained). In September 1975 he was twice the target of assassination attempts. In the final days of the VIETNAM WAR, he ordered an airlift of 237,000 anti-communist Vietnamese refugees, most of whom came to the U.S. The public's revulsion at the events of Watergate contributed to his narrow defeat by JIMMY CARTER in 1976.

Ford, Harrison (b. July 13, 1942, Chicago, Ill., U.S.) U.S. film actor. He played minor roles on screen and television before achieving stardom in GEORGE LUCAS's hit *Star Wars* (1977) and its sequels, *The Empire Strikes Back* (1980) and *Return of the Jedi* (1983). He also starred in the adventure film *Raiders of the Lost Ark* (1981) and its sequels (1984, 1989). He graduated to dramatic roles in *Blade Runner* (1982), *Witness* (1985), *The Fugitive* (1993), and *Clear and Present Danger* (1994). His rugged good looks and wry charm made him, by some measures, the most popular actor of his time.

Ford, Henry (b. July 30, 1863, Wayne county, Mich., U.S.—d. April 7, 1947, Dearborn, Mich.) U.S. industrialist and pioneer automobile manufacturer. Ford worked his way up from a machinist's apprentice (at age 15) to the post of chief engineer at the Edison Company in Detroit. He built his first experimental car in 1896. In 1903, with several partners, he formed the FORD MOTOR COMPANY. In 1908 he designed the MODEL T; demand became so great that Ford developed new MASS-PRODUCTION methods, including the first moving ASSEMBLY LINE in 1913. He developed the Model A in 1928 to replace the Model T, and in 1932 he introduced the V-8 engine. He observed an eight-hour workday and paid his workers far

© 2006 Encyclopædia Britannica, Inc.

above the average, holding that well-paid labourers become the consumers that industrialists require, but strenuously opposed labour unions. As the first to make car ownership affordable to large numbers of Americans, he exerted a vast and permanent influence on American life. See also FORD FOUNDATION.

Ford, John *orig.* **Sean Aloysius O'Feeney** *or* **O'Fearna** (b. Feb. 1, 1895, Cape Elizabeth, Maine, U.S.—d. Aug. 31, 1973, Palm Desert, Calif.) U.S. film director. In 1914 Ford went to Hollywood to join his brother, who was there acting in films. Ford became a director of westerns, achieving success with *The Iron Horse* (1924). His distinctive style united action with colourful characterization and reflected his sense of American identity. He is best remembered for such westerns as *Stagecoach* (1939), *My Darling Clementine* (1946), *She Wore a Yellow Ribbon* (1949), and *The Man Who Shot Liberty Valance* (1962), many of which starred JOHN WAYNE. He also directed such historical dramas as *Mary of Scotland* (1936) and *Young Mr. Lincoln* (1939). He received Academy Awards for *The Informer* (1935), *The Grapes of Wrath* (1940), *How Green Was My Valley* (1941), and *The Quiet Man* (1952), and also for his wartime documentaries *The Battle of Midway* (1942) and *December 7th* (1943).

Ford, John (baptized April 17, 1586, Ilsington, Devon, Eng.—d. 1639?) British dramatist. Early in his career he studied law and wrote collaboratively with several other playwrights, but little more is known of his life, and the dating of many of his works is uncertain. His revenge tragedies are characterized by scenes of austere beauty, insight into human passions, and poetic diction of a high order. His reputation rests on the first four plays he wrote alone, only one of which can be dated with certainty: *The Broken Heart*; *The Lover's Melancholy* (1628); *Perkin Warbeck*; and *'Tis Pity She's a Whore*, an eloquently sympathetic story of incestuous lovers that is his best-known work.

Ford, Richard (b. Feb. 16, 1944, Jackson, Miss., U.S.) U.S. novelist and short-story writer. His first novel, *A Piece of My Heart* (1976), showed the influence of WILLIAM FAULKNER. *The Sportswriter* (1986) and its sequel, *Independence Day* (1995, Pulitzer Prize), drew on his experience as a writer for a sports magazine in the 1980s. His story collection *Rock Springs* (1987) examines the lives of the lonely and alienated.

Ford, Tennessee Ernie *orig.* **Ernest Jennings** (b. Feb. 13, 1919, Bristol, Tenn., U.S.—d. Oct. 17, 1991, Reston, Va.) U.S. COUNTRY MUSIC singer. He studied music in Cincinnati. After World War II he worked in radio in the Los Angeles area and soon signed a recording contract with Capitol. His "Mule Train" and "Shot Gun Boogie" made him famous by 1951. He became a staple on the GRAND OLE OPRY and had many crossover hits, including "Sixteen Tons" and "Ballad of Davy Crockett." He later switched his emphasis to GOSPEL MUSIC; his 1957 album *Hymns* enjoyed great success. He continued recording into the 1970s.

Ford Foundation U.S. philanthropic foundation. It was established in 1936 with gifts and bequests from HENRY FORD and his son, Edsel (1893–1943). By the early 21st century its assets exceeded $10 billion. Its chief concerns have been international affairs (particularly population control and alleviation of food shortages), humanities and the arts, communications (especially public television), and, in later years, resources and the environment.

Ford Motor Co. U.S. automotive corporation. Founded in Detroit, Mich., in 1903 by HENRY FORD and a group of investors, the company introduced the hugely successful MODEL T in 1908 and by 1923 was producing more than half of all U.S. automotive vehicles. Through the Lincoln Motor Co. (acquired in 1922), Ford produced luxury Lincolns and Continentals. After years of declining sales, the Model T was succeeded by the Model A in 1927; other companies such as General Motors took the opportunity to make serious inroads into Ford's dominance. The company was reincorporated in 1919, with Ford and his family acquiring full ownership. Henry's son Edsel served as president 1919–43, and Henry's grandson Henry Ford II led the company 1945–79, reviving its fortunes considerably. Its stock was first publicly traded in 1956. Ford acquired the British automaker Jaguar in 1989–90, bought the rental car company Hertz Corp. in 1994, and purchased the automobile division of Volvo in 1999. Later acquisitions included Aston Martin and the Land Rover brand of sport utility vehicles. Ford also owns a significant share of the MAZDA MOTOR CORP. The company manufactures passenger cars, trucks, and tractors as well as parts and accessories.

foreclosure Legal proceeding by which a borrower's rights to a mortgaged property may be extinguished if the borrower fails to live up to the obligations agreed to in the loan contract. The lender may then declare the entire debt due and owing and may seek to satisfy it by foreclosing. Foreclosure is commonly by a court-decreed sale of the property to the highest bidder, who is often the lender. See also MORTGAGE.

foreign aid Transfer of capital, goods, or services from one country to another. Foreign aid may be given in the form of capital transfers or technical assistance and training for either civilian or military purposes. Its use in the modern era began in the 18th century, when Prussia subsidized some of its allies. After World War II, foreign aid developed into a more sophisticated instrument of foreign policy. International organizations, such as the UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION, were created to provide aid to war-ravaged countries and newly freed colonies. Foreign aid is often given with conditions attached, such as the requirement that all or part of it be used to buy goods from the donor country. See also INTERNATIONAL MONETARY FUND; MARSHALL PLAN; WORLD BANK.

foreign exchange Purchase or sale of one national CURRENCY in exchange for another nation's currency, usually conducted in a market setting. Foreign exchange makes possible international transactions such as imports and exports and the movement of capital between countries. The value of one foreign currency in relation to another is defined by the EXCHANGE RATE.

Foreign Legion *French* **Légion Étrangère.** French military corps consisting originally of foreigners but now including many Frenchmen. It was founded in 1831 as a highly disciplined professional army to help control French colonies in Africa. Since its founding, it has been in almost continuous combat; its forces have fought or been stationed in such places as Europe, the Crimea, Mexico, Syria, and Indochina. The new volunteer swears to serve not France but the legion; after serving one enlistment (five years) with good conduct, foreign-born soldiers are eligible for French citizenship. Since it keeps a volunteer's past secret, it has been romanticized as a haven for those seeking new identities, including criminals, but most legionnaires are professional soldiers who enjoy combat. Originally headquartered in Algeria, the legion moved its headquarters to France after Algerian independence.

Foreign Ministers, Council of Organization of the foreign ministers of the U.S., Britain, France, and the Soviet Union—the World War II ALLIED POWERS. In meetings between 1945 and 1972, they attempted to reach postwar political agreements. They produced treaties of peace with Italy, Hungary, Romania, Finland, and Bulgaria and resolved the TRIESTE problem in 1946. They convened the Geneva Conference on the KOREAN WAR in 1954, and in 1955 agreed on an Austrian treaty. They recessed after failing to agree on German unification in 1959; in 1972 they paved the way for both East and West Germany to enter the UN.

foreign policy General objectives that guide the activities and relationships of one state in its interactions with other states. The development of foreign policy is influenced by domestic considerations, the policies or behaviour of other states, or plans to advance specific geopolitical designs. Leopold von RANKE emphasized the primacy of geography and external threats in shaping foreign policy, but later writers emphasized domestic factors. DIPLOMACY is the tool of foreign policy, and war, alliances, and international trade may all be manifestations of it.

foreign service *or* **diplomatic service** Staff of a state's international-affairs department that represents the state's interests in foreign countries. It fulfills two functions, diplomatic and consular. The standards for foreign-service jobs are similar in most countries. Before the 20th century, wealth, aristocratic standing, and political connections were the chief requirements for high-ranking diplomatic positions. Political appointees still hold the top positions in many foreign missions, but their subordinates generally must demonstrate their education and intellectual ability through a competitive examination. Foreign-service personnel have special legal rights (e.g., they do not have to pay taxes to their host country). See also AMBASSADOR.

foreign workers Those who work in a foreign country without initially intending to settle there and without the benefits of CITIZENSHIP in the host country. Some are recruited to supplement the workforce of a host country for a limited term or to provide skills on a contractual basis that the host country seeks. Others are recruited directly by a private employer, which may need to certify that it cannot find workers among the coun-

© 2006 Encyclopædia Britannica, Inc.

try's own citizens. Host countries may also import foreign workers for jobs their citizens refuse to do. Large influxes of foreign workers can awaken xenophobia, particularly when the host country's population is ethnically and culturally homogeneous and the foreign workers' culture and appearance are significantly different or when economic downturns heighten the tendency to assign blame to others.

Foreman, George (b. Jan. 10, 1949, Marshall, Texas, U.S.) U.S. boxer. Foreman grew up in Houston, Texas, and learned to box in a U.S. Job Corps camp in Oregon. He won the Olympic gold medal in heavyweight boxing in 1968. His first world heavyweight title victory was his second-round knockout of Joe Frazier in 1973. He had won all 40 of his professional bouts, many by knockout, before he fell in eight rounds to Muhammad Ali in 1974 in the so-called "Rumble in the Jungle" in Kinshasa, Zaire, one of the most famous matches in modern boxing history. He retired in 1978 but began a remarkable comeback in 1987 at age 38; he regained the title in 10 rounds against Michael Moorer in 1994 to become, at 45, the oldest titleholder ever. He announced his retirement again the next year but fought a few more times in 1996–97. He has been an ordained minister since 1977.

forensic medicine Science of applying medical knowledge to legal questions, recognized as a specialty since the early 19th century. Its primary tool has always been the autopsy, to identify the dead (e.g., plane-crash victims) or determine cause of death, which can significantly affect trials dealing with insurance and inheritance. Forensic psychiatry determines the mental health of an individual about to stand trial. Forensic genetics allows paternity to be determined and can identify blood or other tissue samples as coming from a particular person (see DNA fingerprinting). Forensic toxicology, concerned with such topics as intentional poisonings and drug use, is increasingly important in cases of industrial and environmental poisoning.

forensic psychology Application of psychology to legal issues, often for the purpose of offering expert testimony in a courtroom. In civil and criminal cases, forensic psychologists may evaluate individuals to determine questions such as competency to stand trial, relationship of a mental disorder to an accident or crime, and potential for future dangerous behaviour. In addition to conducting interviews and administering psychological tests, they usually gather a forensic history, which includes information such as hospital records, police reports, and statements of witnesses. They are also expected to have a grasp of relevant legal questions. In a child-custody case, a forensic psychologist may be asked to evaluate home environments, parents, and the character of the child in order to recommend a custody decision in the child's best interests.

forest Complex ecosystem in which trees are the dominant life-form. Tree-dominated forests can occur wherever the temperatures rise above 50 °F (10 °C) in the warmest months and the annual precipitation is more than 8 in. (200 mm). They can develop under various conditions within these limits, and the kind of soil, plant, and animal life differs according to the extremes of environmental influences. In cool, high-latitude subpolar regions, taiga (boreal) forests are dominated by hardy conifers. In more temperate high-latitude climates, mixed forests of both conifers and broad-leaved deciduous trees predominate. Broad-leaved deciduous forests develop in midlatitude climates. In humid equatorial climates, tropical rainforests develop. There heavy rainfall supports evergreens that have broad leaves instead of the needle leaves of cooler evergreen forests. Having extensive vertical layering, forests are among the most complex ecosystems. Conifer forests have the simplest structure: a tree layer, a shrub layer that is spotty or even absent, and a ground layer covered with lichens, mosses, and liverworts. Deciduous forests are more complex (the tree canopy is divided into an upper and lower story), and rainforest canopies are divided into at least three layers. Forest animals have highly developed hearing, and many are adapted for vertical movement through the environment. Because food other than ground plants is scarce, many ground-dwelling animals use forests only for shelter. The forest is nature's most efficient ecosystem, with a high rate of photosynthesis affecting both plant and animal systems in complex organic relationships.

Forest, Lee De See Lee De Forest

Forester, C(ecil) S(cott) (b. Aug. 27, 1899, Cairo, Egypt—d. April 2, 1966, Fullerton, Calif., U.S.) British novelist and journalist. Forester abandoned medicine for writing and achieved success with his first novel, *Payment Deferred* (1926). He is best known as the creator of the naval officer Horatio Hornblower, whose rise from midshipman to admiral and peer during the Napoleonic Wars is told in 12 novels published 1937–67. Many of his novels were adapted into movies, including *The African Queen* (1935; film, 1951).

forestry Management of forested land (see forest), together with associated waters and wasteland, primarily for harvesting timber but also for conservation and recreation purposes. The science of forestry is built around the principle of multiple-use land management, though the harvesting and replanting of timber are the primary activities. The main objective is to maintain a continuous supply of timber through carefully planned harvest and replacement. The forest manager is also responsible for the application of other land controls, including the protection of wildlife and the implementation of programs to protect the forest from weeds, insects, fungal diseases (see fungus), erosion, and fire. The planned management of forests originated in early medieval Europe, where laws regulated the felling of timber and the use of forests for hunting. In the 19th century private forestry schools were established in Europe; and in 1891 the U.S. government authorized its first reserves of forested land. During the 20th century many nations have undertaken reforestation or afforestation programs.

forge Open furnace for heating metal ore and metal for working and forming, or a workshop containing forge hearths and related equipment. From earliest times, smiths (see smithing) heated iron in forges and formed it by hammering on an anvil. A bellows operated by an assistant or by a foot treadle provided the forced draft for raising the temperature of the fire. Later, a waterwheel or animal power was often used to operate the bellows; modern forges have mechanically powered bellows or rotary blowers.

forgery In law, the making of a false writing with the intent to defraud. "Writing" need not be handwriting: the law of forgery also covers printing, engraving, and keyboarding. Counterfeiting is usually regarded as a specific type of forgery. Checks, negotiable instruments, contracts, wills, and deeds are examples of documents that may be forged. Evidence may also be forged. Forgery requires fraudulent intent; it is not forgery to sign another's name, fill in blanks, or alter a genuine writing in the honest, though mistaken, belief that such conduct is authorized.

forget-me-not Any of about 50 species of plants that make up the genus *Myosotis*, in the borage family, native to temperate Eurasia and North America and to mountains of the Old World tropics. Some are favoured as garden plants for their clusters of blue flowers. The woods forget-me-not (*M. sylvatica*), like most other species, changes colour from pink to blue as the tubular, flaring, five-lobed flower matures.

Woods forget-me-not (*Myosotis sylvatica*)
INGMAR HOLMASEN

forging In metallurgy, the process of shaping metal and increasing its strength by hammering or pressing. In most forging an upper die is forced against a heated workpiece positioned on a stationary lower die. To increase the force of the blow, power is sometimes applied to augment gravity. The number of blows struck is carefully gauged by the operator to give maximum effect with minimum wear on the die. Forging presses employ hydraulic or mechanical pressure instead of blows; most can exert only a few hundred tons of pressure, but giant presses, used for forging parts of jet aircraft, are capable of up to 50,000 tons of pressure. See also drop forging.

form In the philosophy of Plato and Aristotle the active, determining principle of a thing. The term was traditionally used to translate Plato's *eidos*, by which he meant the permanent reality that makes a thing what it is, in contrast to the particulars that are finite and subject to change. Each form is the pattern of a particular category of thing in the world; thus, there are forms of human, stone, shape, colour, beauty, and justice. Whereas the physical world, perceived with the senses, is in constant flux and knowledge derived from it restricted and variable, the realm of forms, apprehensible only by the mind, is eternal and changeless. Particular things derive what reality they have by "participating" in, or imperfectly copying, the forms. Aristotle rejected the abstract Platonic notion of form and argued that every sensible object consists of both matter and form, neither of which can exist without the other. For Aristotle, the matter of
